# THE LANCET.

Vol. I.] LONDON, SATURDAY, OCTO ER 4. [13] 8-9.

ADDRES

READERS OF THE LANCET.

Many circumstances have occurred of any the last twelve months, which suggest to us the propriety of submitting a few Feliminary observations to our readers, before cetering upon our labours for the ensuit, medical year, the sixth since the commencement of this Publication.

We stated, about this time last yes, that, "as Medical Journalists, we had no opposition, still less any competition, to intend with; but that, though we had no literary convetitors, we had an abundancy of enamies, whose malignity was one of our strongest claims to the support and confiduce of our readers." Farly in the month of October, however, an opposition to this/ournal was attempted; if, Indeed, that term can be applied to a contemptible in tation of our plan, acasoned with an out-pouring of vulgar and malignant acurry ty, directed against private character. It is uaneeesanry for na in this place to insist on the distinction between slander of private character, and personal attacks, as they are termed, on men who fill public situations, and whose character and conduct, in their public especities, are fair topics of animaliversion. Of the former we challenge our enemies to point out a single instance in t pages of this Journal ; A the latter, the instances are abundant in proportion to t occasions which called forth honest censure ; and if they were not to be found in the proportion, our publication would come to deserve the subgium which was pronor upon it by the highest judicial authority in the kingdom, that of being "a work very great utility." That in the discharge of our duty, as independent Joornaliza, shoold have incurred the hatred of some iodividuals, whose public character may l suffered from our animadversions, is not surprising; but it is plain that the repeated attacks upon our private character, even if they were as well for they are false and malignant, would furnish no answer to the facts or argu-

No. 266.

<sup>. &</sup>quot;I feel it my duty to state, that The LANCET appears to me to be a work of stilling, certainly of very great utiling."—Loan Chancallon Eldon, on dissistant information belonged by Mr. Abankaruy.

which we may fom our censure of a public functionary, or mointain the expediency of correcting an eating abuse. As a public journal ought never to be made the vahicle of attacks up private character, so neither is a public journal aft place for repelling auch attacks. A Court of Justice is the only arona in which we have concesseded, or aver we conceaced, to meet calumnistors who slander because they cannot cope with us; father the source of their malignity is to be found in the vast and increasing circulation of his Journal, and in the total and humiliating failure of all their ettempts to diminiating influence.

The first wretched and abule attempt to imitate the plan, and at the same time injunt the reputation of Tue Ancar, was ten despicable to obtain even a passing notice in the pages of this Job al. The politication to which we allude expired, if we mistake not, in the ninth neek 'its existence; but its dissolution was immediately succeeded by the appearance of a ther imitation of the plan of THE LANCET, precisely similar to the former in all reape s, save that of being unbered into the world under the auspices of respectable, and, conquently, responsible publishers. The arrangement of nur matter was servicely cop & in both publications, so as to give to much tha appearance of a mock Laucer. There were in each an imitation of nur Lectures, an imitation of our Foreign Department, an ministion of our Leading Articles and Reviews, and an imitation of nur Haspital Rapins. The axecution of the design was slike feeble in both instances, but the plan we in both instances a servile copy of that c Tas Laucer, with one distinguishing exception indeed, namely, the systemst devotion of a portion of the columns of the publications to the aspersion of privat character. A part of the small empiral embark in the second enterprise was, we have reason to believe, supplied by Mr. Banniz, We has divised from it the suvantage of being enabled to puff bimself without stint, though, when the extremely limited channel through which his auto-panegyrles are circulated,'s taken into the account, the pleasure of lauding himself in print bas, in all probability, ben dearly paid for. In the chalce of an Editor, the manufacturers of the Meck Lawer were siegularly unhappy, for they fixed upon an "nld back of a Journalist," why had long since wearied and disgusted the profession as editor of the Yelinw Fungs, and from whose intellectual efforts nothing could be reasonably expected, but the dulness and the imbeeility which have marked the origin and an-progress of thoughertaking. The thing still exists, but It exists under eircumstances of which its frends are sabamed, and with a circulation which its publishers must regard as injurious to the character of their astablishment.

While we are taking a retrospective glance at these two publications, we cannot forbear noticing the meaner in which their appearance was auccessively halled by a consumporary, Dr. James Jamestanes, if it be and a missioner to est him a contemporary,
whose defunct as a Quarterly Jameslist, and moribund as a publisher of half-monthly
finesteall. His delight at the appearance of new combatants, in a contest which had
proved fatal to his new reputation, was equalled only by the spirit of abject humility
with which he declared his readiness to fight under their benners. It seems to be the
"seatiny of the Doctor in all his literary measurers, to accomplish his new humilistion,
"Our first formidable opponent axpired in the very week wherein the Doctor triumphantly stated, that Tas Larcar had at length "found its match;" and, at the commeasurement of the year, the Doctor underwent the further mortification of announcing
the decease of his own Quarterly Journal, As to the pumphlets which he still pale-

٠

lishes, under the title of Fasciculi, the affidavit which the Doctor makes once a fortnight to the fact of their finding purchasers, affords pregnant avidence of the astimation in which they are held by the prefession.

Such is the character, and such has been the success, of the epposition made to this Joureal during the past year. Nor have our enemies been more successful in the field of jurisprudence that in that efficienture. In one of the we actions to which we siluded is the Prefacu to our volumes for the last year, Romanck Maclaob, the Editor of the Yellow Fungus, who had charged us, in his declaration, with malicious sttempt to degrade him in the eyes of his employer, and thereby eprive him of the means of subsistence, obtained Fiva Pounds from the jury, as a compensation for the injurnating of the have been done to his professional and literary character. A more trumpery action was never brought into a court of justice, and we helieve that the jury would not have swarded even the sum of five pounds to the plaintiff, if the production of a squib, which appeared the day before the trial in this Journal, as a piece of evidence in sepport of the plaintiff's case, bad not been, upon technical grounds, objected to. The weakness of a cause, which required the sid of the paragraph in question, hy wey of make weight to the charge against us, could accreasly have failed to atrike the jury, had the reading of the squib, as evidence, been sequiesced in. As it was, the passage technically objected to, was, in point of fact, read, and probably made an erroneous impression on the minds of the jury.

The circumstances under which the setion, commenced against The Lancar by Mr. Guthsis, was shandoned, are fully detailed in the pages of this Journal. The secret history of the transactione connected with that action, is now matter of record; and we may truly say, that a more unjustifiable attempt to obtain a verdict per fas et negas against a Public Journal, was never yet detected and exposed. The history of these transactions is pregnant with instruction to juries, whose duty it may heresfer be to protect the press against similar attempts to convert the law into an instrument of injustice and oppression. Let it not be forgotten, that Mr. Guthrix commenced legal proceedings against The Lancer, with the full consciounness that he had no more cause of action against us than against his own colleague—that he continued those proceedings; under the persuasion that he abould be shie to suppress the testimony of that colleague—and that he only abandoned them at the twelfth hour, upon fielding that his colleague refused to tamper with his oath, and co-operate in a conspiracy against this Journal.

The recovery of damages, in an action against a hospital aurgeon, who mistook a piece of flint, at the distance of more than one inch from his patient's entire patella, for a portion of that patella, was an event of no light importance, as the result of this trial proved that the pressige of nominal distinctions was at an end, and that the ettempt of six hospital surgeous to secure their colleague from the consequences of his incapacity, was justly appreciated by an intalligent and discriminating jury. For the consequence which we felt it our duty to make on this case, we ware threatened with an action by:

Mr. Stanley; but that gentleman, either in tenderness to us or to himself, forbore the carry his threst into execution.

Of the action now pending against us, for our report of the extraordinary case all lithosomy at Guy's Flospital, in which Mr. Braneby Cooper extracted the stone at the end of fifty-five minutes—the everage minimum of time in which this operation in formed by akilful surgeons being five or aix minutes—we shall only say that we have not a Juverpreation of the Taurus of the alleged libel upon the record.

The Report of the Parliamentary Committee on Anatomy furnishes satisfactor. evidence of the utility of the discussions which have been carried on through t' medium of a free medical press; and even the enemies of this Jaurana must cancede ns the credit of having zesluosly urged the expediency of thuse measures which are now recommended to the adoption of the Legislatura. The spirit in which the lata inquiry was conducted sugars Fell for the cause of medical reform; and the recommendation with which the Confuittoe closed its report may be regarded as a first step towards the attainment of that most desirable object. Let aurgical reformers and in this designation is comprehended the great body of the profession-be on the slert to take the field, and be assured that, though political evecus have for awhile retended, nothing eno prevent the ultimate, and even the speedy, accomplishment of their wishes. Lest the recent election of Mr. Lawagnes to a seat in the Council should here raised a doubt in any quarter, whether that gentleman still remains atsucch to the cause, we take this opportunity of assuring the profession that when the members of the College shell again essemble for the purpose of petitioning Parliament for a reform of abuses, Mr. LAWNENCE will again be found at his poet, ready, as he has ever been, to prove himself the firm and enlightened advocate of the rights and intorests of his professional brothren.

From the outset of this publication, one of the objects of which we have never lost alght has been to promote the interests of medical pupils. We have endeavoured ty protect them against the capidity, the injustice, and the negligence of their privileges teachers; and we have, on some occasions, endeavoured to protect them against the consequences of their own thoughtlessness and inexperience. Nor can it he denied that our efforts have been, in some degree, successful, if the memoer in which medical pupils were commonly trented, five years ago, be contrasted with the influence which they now possess, and the comparative attention which they now receive at the hands of their instructors. Pupils may be assured that the receive of many of the grievances of which they have still reason to complain lies in their own hands.

We shall call the attention of our readers, et an early period, to the abuses which result from the extent to which the out-patient system at our public hospitals and dispensaries has been corried, and to the ruinous influence which that system has on the interests of the great body of medical practitioners.

Before concluding these observations, we must revert to a subject which concerns ourselves. There is no charge which has been more frequently brought against this publication by those who are interested in upholding existing abuses, and who seek, therefore, to depreciate the character of a Journal which they have lung felt as a thorn : in their sides, than that we have dishonourally appropriated the lubours of medical teachers to our own profit, without the consent of those teachers, and even in spite of their removatrances against the publication of their lectures. This charge has been so often, and so confidently made, that we doubt not there are many persons, who, nowever otherwise dispused to think well of this publication, believe that we have out only published Mr. Animarana's Lectures without his conscot, but that in many, or most, of the instances in which courses of lectures have been published in The LANCET, his consent of the Lecturers has not been obtained. We shall insert the charge in the hisquage of one of our columnintors, and we shall be content to forfeit that laduence which has rendered us the objects of su much slander and onsrepresentation, if the mawer we alkall give to it, he oot such as must for ever silence our enemies, if thay .have the smallest regard for decency or truth.

"A few years ago," says Roorsick Macked, "a set of literary plunderers broke in on the peace and quiet of our profession. Lecturers who had speet their lives in ellecting knowledge, stranging it for communication, and acquiring the difficult art of il instruction, saw the produce of their lives suddenly anatched from them, and published for the profit of others, with the additional mortification of floding what they had been so much puins with, diafigured by bad Eeglish, and ridiculaus or mischiavous slunders."

It eso scarcely be necessary to ramind nur readure of the distinction which we have always recognised between the aituation of a public templer and that of a private one, ns of the principle upon which we elaimed the right athublishing the Lectures of Mr. A ORONETHY. The Lectures of private teachers, which we acknowledge to be private property, we have never published, as we shall presently show, without the canaent of the Lecturers; but the Lectures of public medical teachers, delivered attain the walls of public haspitals, stand, as we have uniformly contended, upon a tatally different footing. We maintained this point feerlessly and manfully against Mr. Aren-NATHY in a Court of Equity, and the issue of the contest was, that the injunction which that Cientleman ubtained against the publication of his Lectures was finally dissolved by the Lord Chancellor, So maich for Mr. Anseneruv's Lectures. Sir ASTLEY COURSER'S Lectures come within the principle na which we relied in nur contest with Mr. Authoritay; but Sir Astract Course cannot, at any rate, bu one of those who has been plundered of his siterary property, for Sir Asylay Charen gave wis express consent to the publication of his Lectures. The Lectures of Dr. Brundert ou Midwifery, though delivered within the walls of Gny's Hospital, we did not ennaider on public Lectures three years ago, because, at that time, no certificates of attendance on Chursos of Midwifery were required by the Colleges ny the Univarsities. We applied, therefore, for permission to publish them, which was not at that time conceded. Subsequently certificates of attendance on courses of Midwifery have been required, and Dr. Bernner, has not only not withheld his coosent from the publication of his Lectures io this Journal, but, as thay were to go before the public, has added to their value by a revision of the proof sheats. Dr. Annavanno's Lectures on the Thenry sod Practice of Medicina, were published in consequenen of the intimation of one of his pupils, that the Lecturer would not offer any abjection. Dr. Annarmone slid, however, after the appearance of the first Lecture, object to the principle of publishing private Lectures, in which objection we acquiesced; but horing expressed his opinion, he added, that he should leave the matter entirely to nurselves. We arged the ground of public utility—and as he found that the pupils were desirous of passessing his Lectures, he afterwards consented to their publicatinn, and acknowledged their securacy. Mr. ALCGER's Lectures on some Practical points of Surgery, were published with his consent, and the proof sheets were revised by him. Mr. LAWBERGE's Lectures on the Anatomy, Physiology, and Diseases of the Eye were published with his causent, and the proof sheets were revised by him. Dr. Chuttraures's Lectures on the Theory and Practice of Physia were published with his consentand the proof sheets were also revised by him. Dr. Spenznem's Lectures on Phrints logy in like manner appeared with the consent, and underweut the revision of the Lacturer. The Lectures of Mr. Busne nn Chemistry, and those of Dr. Hagram on the Intellectual Composition of Man, were also published with the express consent of the Lecturers. All these fauts we have had the permission and authority of the several; Lecturers to state, from the periods of which their respective Courses were completed. an distinctly as we now atole them; but we have hitherto disdained to give this con-

S-24 ...

clusive answer to the calomnies of our enemies, and we have now, once for all, adopted this course, in order that anch calumnies, if they be again repeated, may be as much contemned in all other quarters, as they have been eniformly contemned by ourselvos. We may further atate, that so far have we been from the imputed necessity of seeking to obtain Lectures by indirect or dishonourable means, that our difficulty, on the contrary, has been to deal with the summerous applications which have been made to us for the publication of Lectures, and to appearse teachers, to whose argent solicitations we have not deemed it expedient togicald.

That nothing may be left unag swared in the above-cited charge, we proceed to that part : fait in which we are accused of distorting the style, and misrepressuting the meaning of the different Lecturers. It is syident, from the statement which we have just made, that the naly Lecturers who could, by possibility, be injured in this way, were Sir Astray Coopen and Mr. Arrawathy, insamoch as all the other gontlemen to whom the paragraph could apply in point of time, have actually either acknowledged their accuracy or revised the proof-sheats of their own Lectures. Let us examine, then, the ground of this heavy accusation, as it applies to the two supposed sufferers; sed, first, as it respects Sir Asrasy Cooras. To all who know the worthy Beronet, whose non-professional education has, truth to say, been a little neglected, it might appear a nufficient answer to this charge to auggest, that his English was not likely to auffer much from the necessary rapairs bestowed upon it in the Reports of Tue Lancer. But we have a atronger argument for our vindication. Although Sir Asrasy Coopes did not revise the proof sheets of pur ! Reports, he has revised the exclusively genuine edition of his Lectures, published by his nephew Mr. Transal. Now this exclusively goomine edition, put forth by the test Simon Pons, is so faithful a transcript of our Raports, that even the typographical errors of our early editions have been retained init; may, passages which, from circumstances we have formerly explained, Sir Asrney Conesa never uttered, have also been faithfully retained in the exclusively genuine edition published by his nephew. So much for the wrongs austained by Sir Asrasy Chorse, as touching the felicities of his style, and the faithful representation of his manoing. Now for Mr. Assaurany. As regards this gentleman, we have, if possible, a more conclusive mawer to the charge then in the case of Sir Astlat Coorsa. The worthy Baronet has, in a letter prefined to Amon's evolutively genuine edition of his Lesturns, borns testimony to the accuracy of der reports. But Mr. Assawers w has gone further; for he has octually swonn to "the whate fidelity" with which his Lectures were reported in this Journal. We refer our readers to the stildsvit which he made on applying to the Court of Chancery for an Injunction against THE LANCET, + and we shall merely sdd, that as the fact of " minute fidelity" was sworn to on the one hand, and admitted on the other, we were precluded, in the argument, from taking any advantage of the difficulty which Mr. ARERNETHY would otherwise have had in proving that Lectures not committed to writing were, which nirbis, the Lectures which appeared in our publication.

Hed the charge been, that our Reporter, or Prieter, had put bad Frenck into the months of the worthy Baronet, it night, we believe, in one or two instances, have been cachetantiated. Hotel de Diou, we remamber was, by some inadvertence, printed in one of Sir Astley's Lectures; but this error was faithfully copied by Simon Pure into the amissionly genuine edition of his natic's Lectures.

7 See Tits Lancer, vol. v., page 356.

We feel satisfied that our readers will now be of opinion that we have given a most complete and conclusive answer to the calumnies and unfounded charges which have been directed against the character of this Journal. We have shown that, although we maintain the right of publishing the Lectures of public hospital teachers, yet, in every instance, save one, wherein a course of Lectures, whether public or private, has been published in this Journal, it has been published with the consent of the lecturer. In the excepted instance, we boldly maintained, and failly astablished, in a court of xquirry, the principle for which we contended, as far at that principle could be established by the retrest of our adversary, and the dissolution of the injunction which he had obtained against as. With this exception, for which we take credit to cerelves for the exertions we made in vindication of the freedom of the medical press, in what respect has our practice of publishing Lectures differed from that of our imitators? We have published Lectures with the consent of the lecturers, and our imitators have done the same thing.

With regard to hospital reports, these, let it be remembered, were equally denounced by our enemies, when we first set the example of publishing them. The times, however, are obanged, and hospital reports are now recognised by all, except those funetionaries who, by reason of their imbecility, have cause to dread them, as an integral portion of the stock of public information. But there is this material difference hotween the bospitsl reports published in this Journal, and those which have been recently put forth by our imitators, that the latter have been supplied by the functionaries themselves, who have a manifest interest in suppressing whatever facts may be unfavourable to their reputation; whereas, our interest as clearly liss in giving a faithful and impartial detail of facts, whether favourable or unfavourable to the hospital surgeons. In France, as in this country, where an attempt has been lately made to give currency to reports furnished by hospital functionaries themselves, it is well known to the profession, that no reliance can be placed on the fidelity of the Reporters. As men, who pay themselves without a check on their liberal propensities, ore seldom parsimonious. oo ourgeons, who report their own cases, are so generous as BRODIE, when their own dexterity is to be recorded, and as little disposed to be communicative on the subject of their balluciostions and mishaps.

One word with respect to the increased circulation of THE LAXER, a substantial test, undoubtedly, of the estimation in which our Journel is held by the profession and by the public. We believe that we shell rather raise the envy than the incredulity of one of our contemporaries, who has expressed an anxiety to be informed on this subject, when we state, that our circulation during the last twelvementh has far exceeded that of any preceding year. We should, indeed, deserve the derision to which our contemporary, has exposed himself, if we had recourse to an Alderman to hear us make a voluntary offidavit to this fact; but we will point out e way in which our angules may, if they think proper, obtain evidence of the amount of our increased circulation, under a senction not liable to the suspicion which attoches to a nugatory ecrement, and the forthcoming trial between Mr. Bransar Couran end The Laxer. The great increase which has recently taken place in our circulation, is obviously to be attributed to the influence of contrast. The claims of the Journal to public confidence and approbation have been placed in atranger light by the imherility of our opponents and imitators.

#### LONDON UNIVERSITY.

Tue first course of Lectures dedicated to the medical classes of this Institution, was commenced on Wednesday last, by Mr. CHARLES BLLL, the Professor of physiology and surgery. He prefixed his Lecture with the following speech. The theptre, which is capable of containing nearly one thou-sand persons, was crowded in e cry part. Gentlemco,—It will aomewhat iminish the oppressive nature of my duty te-day, if you will permit me to say, that although I have the benour of first sprearing before you. a circumstanco accidental,-I speak my iodividual sentiments only, as your Professor merely looked upon as a situation introducof physiology and surgery.

The munificent strangements made for science and education, and the numorous and icexperienced men. Let us hope that, andience now assembled, must not lead on instead of this rapid auccession, this Unifor a moment to assume that the lebonr of versity may be able to raise the Professors the Professors will be light or easy. The

commencing.

The success of the University will depend on the relation estellished betwist the teacher end the pupil; the devotion of the one to the interests of science and to the instruction of youth; and the gratitude of having nequired the habit of attention to a the other for the highest benefit that can be course of reasoning; nor are they sequeintreceived—the improvement of his mind and | ed with those sciences which are really nethe acquisition of a profession: through the cessary to prepare them for comprehending improvement of his mind, incelculohlo in- the elements of their own profession. But crease of heppineas, and, by the equisition in this place this is probably the last time of a profession, the hest security for inde-they will be unprepared, for example, for pendence that the condition of society ad- such subjects as we must touch on to-day. mits .- (Applsusc.)

If I value highly the influence of this great establishment, it is because I hore-been long engaged in teaching, and have experienced all the difficulties of forming n medical school. For ohvious reosons, London must continue to be the principal school of medicine; but whilst there sro many fawonrable circumstances, there are also many unfavourable, to regular aturly; and it is now to be demonstrated that it is possible

avoid the defects.

In colleges, such as have been instituted in former ages, the Professors cujoy the advantages of independence and seclusion, tion is necessary. They are on an necivity, prospects—and how prone is gening to be so rather in a rushing atroam, where they distrustful of itself, and to add glannu to will be carried down, if they do not codes—poverty and solitude; here he is watched

your to ascend. In the course of thirty years I have seen the establishment of many schools attempted; but it bas always happened, that the temptation of following a lucrative practice, has far outweighed the desire of reputation to be guined by teaching; and, consequently, just when the Pro-fessor become useful by the knowledge he was capable of communicating, he has withdrawn binnedf: and so the attnation of o medical tracher, instead of being the high-eat, and entitling him who holds it to be consolted in cases of difficulty, as being of the seniors of his profession, one-who has withstood petty solicitations, and hea maturely atudied as well as practised,—it la tory to business; one of expectancy, and to be occupied in rapid auccession by young of science to higher consideration, induce that which awaits us is a very difficult one; men of talents to prepare themselves for we must win our way to public confidence, tesching, and to continue their public lass if our professional exertions were but bours to a later period of life.

With respect to our students, the defects in their mode of education ere acknowledged on all hands: they are of once sugaged in medical studies, without adequate preparation of the mind; that is to my, without In future they will come here to apply the principles they have sequired to the other closs reoms to a new and more useful science.

Another disadvantage of the mode of con-ducting our medical schools, has seisen from the too numerous engagements of the hends of schools, sod a went of the necessary division of labour. In consequence of this, there is nu onn to toke an interest in the atudent's welfare-to recommend regulanow to be demonstrated that it is possible rity—to observe his character—to notice to retain that which is favourable, nod to his moral or religious conduct. Is shart, there can be no condition more solitary and neglect d thon that of a young man, whn has come to Landon to pursue his studies, ontil he form his own society; and thus, and are removed from the distraction of our without a guide, he makes the first and Bore professional men are differently situ- give a colour to all his future objects. How give a colour to all his future objects. How different his condition here! Instead of itsel, and more activity is requisite, perhaps different his candition here! Instead of a different kind, leas contemplative or the annoticed privacy of his chamber, where there is anthing to give him the hope of the distinguished place, unceasing every distinction through study, or to gird his transportation.

with solicitude, not by his Prafessors only, I do not speak of this conductor or much but by those able and willing to raise bim to on students as an advantage, but merely as a non-square of their mode of the students of t extensive influence, who have given abundance oducation. As an odvocate for that body of dant proofs of their desire to display the men with whom I have been so long confair rewards of virtue, to faster genius, and to open the prospects of the unfriended stodent. (Cheers.)

something peculiar in the character of the young men.

medical student.

Ilis ocennationa lead him off from muthority of an immature and dangerous time of life. The pursuit of experimental philosowhich ho is now introduced, tend to give him a mean opinion of the efforts of indivi-dusts, sed to beget a suspicion of any thing like authoritative language. Ilis mind suddenly illuminated, and feeling all the delights which arise from the cootemplation of nature, and the cultivation of science, if you love him and value his permanent good, touch with extreme delicucy upon his reli-gious opinions. The man of classical accomplishments only bos lost his influence upon him, and hence arises a jealousy in many plans and learned men of the cultiand names have no setharity with them. considering thu test of intellectual emineace?

In classical learning,-thot is, io works of imagination,-the nucleuts must have anticipated oll the most natural and obvious allusious, and in simplicity, force, and beauty, far surpass the modorns. But in physical science, the course of discovery is progressive and expanding, and the facts discovered daily are more and more interesting and important. The consequence is noturally this: the student of the former are more omenable to outhority: they look back on ancient times as being worthy of all admiration, whilst the atudent of the latter class is conscious that he knows o great deal more than the most ingenious or inquisitive of those who lived a hundred years before him, and considers them as having lived in the childbood of the wurld.

nected, I ask, if we shall not find clorgymen. who, animated by a seal for religion, will fit themselves to become guides to this im-There is a character that attaches to our portant classically acquiring another claim medical atudonts, whialf well deserves the upon their titention, besides the authority consideration of all who desire their in- in which the are already clothed, and who provement. Besides the pleasure and the ladderendence of mind which a young man tent of their superiority by the exidependence of mind which a young man finds, resulting from labits of study, there is such as can be best appreciated by these

> If religious duties have, in the early part of life, been tought with parental affectionif the valuatory labours of some of nur professors extend these lessons in e manner suited to the growing especity of our students-if our students have a place of public worship, and If, on such occasions, they ore order the eye of those by whom they have been instructed during the week, there is, in this respect, incolculable improvement in their condition.

When the indifference with which young men are ant to took un this subject shall have given place to experience and mature re-Section,—when they shall have learned the importance of right principles and just modes of thicking, and look back with vators of philosophy. They find, they gratitude to the examples they have had in scarcely know how, that the youth have this place,—then may the Luiversity be escaped from their couroul. In our cut. said to be catablished; for its establishment deuts, books are no longer tallsmans and must ultimately depend on the character of spells; they have no respect for antiquity, those educated in it, and their influence on and names have no sethority with them, saciety. At present, whilst this beoutful Taught to surrender their judgment in ex-periment only, eas we be surprised that workmen are only suspended, and elamour they require to be reasoned with? and to is excited, it requires some exertion of the have the example before them of men mind to rid us of the influence of these presshighly informed in those departments of ing circumstances, and fully to anticipote knowledge which they are in the habit of and oppreciate the advantages to be derived considering the text of intellectual emi. from this Cullege, and not from this College only, but from nthers formed after its example, by the exertions of those who, although they may not have had the genius to conceive the plan, yet may have the virtoe to imitato it. (Gient applause.)

There is only one runre reflection which I shall venture to express—great advantage ond estisfaction result from a combination of learned men, each active in his nwn aphere, whilst all combine for the greater object; and what so laudable and inspiring as the improvement of science and literature ! (for I deem the right teaching any department of science the surest way of improving it). But, however much men feel the advantage and necessity of such combinations, they selde combino, ucleas drawo together by the tie of some regular establishment.

One happy effect of this is, the uninter-

rapted progress of science; for, hitherto, those with have taught in our schools, have had successors to their places, without auccessors to their information or their opinions. Too often, those who succeed, attempt to depreciate the labours of their predecessors; but where the professors are united, this connot take place. The opinion and the mades of teaching are apprecipted and re-membered when the individualtia lost, and the coarse of improvement I ils on un-broken from one sge to another. It Uni-versities, a posthumous reputition amplies the interval after the loss of a great man, till new men of authority arise. In the general body the excellence, whatever it msy be, is perpetuated, because the society is permanent, and not fluctuating with the atuden ta.

This mutual aid, this common interest, these bigb abjects, I trust, will units us in the most friendly intercourse, and will be a

that there is an irregularity, not a complete descant upon it to the extent he wished.] He concluded thus:-

man frame, arises from our ignorance; for gard as being faced on one and the same when we approach the inquiry with humi-organic procees. lity and due dillgence, the proofs of deeign and order multiply in proportion to the knowledge we possess, and se the aubject iles in interect, we are borne away in sdapplause.)

At the conclusion of the Lecture, the warden announced that the whole of the University was open to the inspection of

the persons present.

building has been fitted up as a refreshthat room, in which the students may be ied, at a very moderain rate, with bers, breakfasts, and other refreshments. Any thing like an approach to insury has vasorum in inflammetione, nort. J. Kalten-ting which a worlded, but all that is neces-brenner, M.D., and Magandie's Journal.

#### FOREIGN DEPARTMENT.

ON THE CONDITION OF THE SLOOD AND THE VASSALS IN LUTLAMMATION.

Tas numerous experiments of Haller and Spallansani, and this more recent ones of Doellinger, Thomson, and Hastinga, might seem to have completely eabsusted the in-formation to be darived from the use of the microscops, with regard to the phenomena of inflammation; it appears, bowaver, from Dr. Kaltenbrenner's most slaborate work, that this is by no musna the case; his observations, in some respects only, confirm those of his predecessors; but in others avidently lead to contrary results.

Our author has abosen for his abservations the organs of animals of three different classes : the tail of the cobitie foesills, the lasting source of gratification and advantage, was of the frog's foot, the lungs of the frog [The Professor now entered into a and salamander, the mesentery and liver of long disquisition, with a view of removing the frog, the mesentery, liver, and mucous the mistaken notion of the young atudent, intestinal membrane of the rat and rabbit, and the apleen of the mouse. The means adaptation of all the different parts one to by which inflammation was excited in these another, in the human system, adverting organo, wern also very various; incision, particolarly to the circulation of the blood, contusion, and puncture; iscerstion, preswhich he demonstrated by the laws of hy aure, burning, culd, and bust; espoanre of draulics; but time did not permit him to the intestises to air, water, and different gases; hunger and poisona; especielly sub-limate, ammonis, alcohol, opium, and tha I must interrupt this inquiry for the pre- muristes of sods and smmonis, were sucsent, but I mesn to estend my examples in cessfully employed for this purposa. The a future Lecture, and to go generally into action of these different manne on the were, the privilege and the plessure of in the circulation of the blood, and in the drawing you to the conclusion, that what vessels; all which, considered under a cerappears irregular and accidental in the hu- tain point of view, the author is led to re-

After death, the arterice are found empty, the blood having entirely passed into the veins; this phenomenon was well known to ities in interect, we are borne away in ad-ities in interect, we are borne away in ad-miration; and here let mo say, gentlemen, in the mesentery of the frog. The anc-that admiration is involuntary praise. (Loud cessive changes which, by mesns of the microscope, are eeen in an organ at the mo-ment of its being deprived af life, ara the following: on the approach of death, tha diminiches in size, till, st iact, the veesela song the many judicious arrangemente contain only half of the usual quantity; thu which have been made for the accommo- atresm is uninterrupted, rapid, and without dation of pupile, is one which will oliviste any visible pulsatione, which, however, may bome of the objections that have been raised be observed after some time, corresponding against the institution. The lower part of with those of the neert, and gradually becoming more and more distinct; at last,

<sup>\*</sup> Experimenta circa atstum sanguinie et

however, they become unequal and indis- | the substance of the liver are surrounded tinet, and, at the same time, the column of hy a net-work of veins, in which the blood tinet, and, at the same time, the common of my a network of versa, in which has shown blood decreases, till it disappears entirely; as agrates after death; when seen by the the arteries are now quite empty, and naked eye, the circumference of the sofmi organic life is estinct. Whilst the arterial appears of a red, and their centre of a light stream is uniterrupted, no disturbance is seemir; but nader the microscope, this exception of the sofmi property of the versa; but as soon as the arterial circulation becomes unequal and irregular, the blood is accumulated in the veins; and from the moment that ne more blood is carried into them, that which they contain stagnatus entirely, retaining however, for some time, an undulatory motion, passing into the branches, and then return-ing again; these undulations gradually di-minish, and become reduced to smaller limits; the globules of the blood are conginmerated, all spontaneous metion cesses, and the mechanical lews determine its further direction. This undulation of the venous blood is observed not only in dying snimels, but slee in perts divided from the living body, and in those which, by a very tight ligature, have been separated from the eystem. In these cases, the arterias are emptiad as soon as they receive no more blood; the fluid of the capillary vessels, from this moment, is thrown into andalations, which press the blood towards the veins, end, lastly, tarminates in complete stagnetion. This fact is a decisive proof, that the metion of the blood in the smaller artories, and capecially in the cepillary cystem sod veins, is, in some degree, independent of the action of the beart.

the blood is aqually distributed to all the organa of the body, nales: any of them had been the seat of inflammatice; this is not membrano of the smell intestines, it appears, the case: in the extremities, the acroun even to the naked eye, that camell portion membranes, the lungs, &c., the blood retires from the capillary system into the larger vains; in other organs, as, for iustance, in the splcon and liver, the capillary vessels do not completely empty themselves. It is very interesting to observe that in different from those observable in healthy fishes, the blood of the smeller vessels is organs. The blood is conveyed from all not emptied inte the veius, but that from the moment when the circulation is arrested, it is infiltrated into the cellular tissue, where it is found in reddish masses; a fact, which ean only be accounted for, hy assuming that these small vessels are caucia without proper parietes. In the liver of the frog, the same and the blood accumulatee in the inflamed

is net-week, from which the veins of the circumference arise; according to the greater or amilier quantity of blood accumulated in the liver, the centre of the scial appears of a pas red, or dark-red coluur. In the spleet, the small vessels undergo

s very singular change at the moment of death. During life, the distribution of the vessels in this organ is very similar to that in the substance of the liver; after deeth, the same phenomenon takes place as in the copillary system of fishes; the smaller arteemit their blood into the cellular tissus, where it is found in red massee; the larger arteries eed veins only retain their blood, of which, in the amaller vessels, ne trace can be discovered; this accounts for the general opinion that, ie the spleen, the arterial blood is poured into cella, from which it is taken up by the veins; at the same time, it explains why ell ettempts to inject the arteries of the apleen from the veins have failed. Whoever has examined the edges of the spleen of the mouse under a microscope, will be convinced that after death the blood of the capillary system is infiltrated into the parenchymotous tissue, It is a general epinion, that after death but be will never, during life, observe its emission into cella.

On examining, after death, the macous of the blood is retained in the capillary vessels, the rest being carried into the larger veins.

The changes which the circulation of inflamed perta undergoes efter death, is very parts with accelerated motion, towards tha centre of inflammation; the arterial is not changed inte venous blood, end ite cnagulatory power is much increased. If in this state death teles place, the column of blood in the autrounding vessels diminishes to size, rabbit, which, efter death, is feend mest no perfectly emptied; at this mement the beentifully injected. M. Kaltenbranner endeavoured to dis- time efternerds andulations are visible, by tinguish the red and white substance, which which the blond is graduelly carried towards some anatomists say they have discovered the centre of inflammetion. Sod which finish the structure of the liver; but having sensity terminate in atomation. This pine never associeded, be doubts the existence of tion, subsequent to the death of the animal, these two substances, end accounts for the is else observed in the newly-formed tesarror of these anatomists in the following sels. In a leaser degree of inflammation, manner: the small acini which compose the blood is only occelerated in its motion,

and does not approach to a complete stasis; | tions, whether any of those organs have, the centripetal undulations are size visible, | during life, been the sect of inflammation. but ultimately the blood is carried into the veins. In such esses the ioflamed parts nxhibit hardly any reducas after death.

It appears, that in somn organs, infismmation is more disposed to form the infiammatory centres described above, thas in others; in the latter division bto which tho serons membranes seem est cially to belong, oxudation is most frequently observed. If eald water is injected into the peritoneal cavity, inflammation is soone excited, ond quickly followed by exudation; the afflux of blood te-o violeut, as to make the membrane oppear like a net-work of injected vessels; from the moment that life ceases, the blood gradually leaves them, and is compictely poured isto the veins, so that, after dusth, but very slight traces of the proceding inflammation can be perceived.

The abdomen of an animal being opened, or its intestices and mesentery being drawn out, the contact of atmospheric air soon causes ioflammation, which increases very rapidly in the meacniery, but sluwly in the intestines. When, however, it has arrived at a certain pitch in the latter, it auddenly diminishes in the former, and gradually subsides, till at last its vessels ore emptied, and the inflammation is costiscil to the intestinea nlone. Tho same phenomenon takeo place if the mescutery is first irritated, and the intestine is afterwards exposed to any exeiting esusc. It neems, then, that inflammation is much more readily excited in the serous membraces, than in the organs which they envelop, but that it subsides very rapidly, and in the same proportion, as it io-creases in the iotestines. The tissue of the lungs appeara also to be little disposed to form influminatory centres, while in the liver the coutrary obtains. The circulation of the latter organ is, even in the state of health, very alow and favourable to considerable secumulatios of blood; in inflammation, it is first sceelerated, but gradually retarded, and, lastly, n complete stagostion takes place. The same is observed in infammation of the spinen.

Violent inflammation of the mucous intestinal membrane, often leoves no traces whatever; the blood with which, during life, the capillary vessels were gorged, is, after death, so complotely conveyed into the .veins, us to rander this membrane almust as severity uf the symptoms, and with conpale as in its healthy state; this is even aiderable temporary reliaf, but without most striking in the most scute inflammation, preventing or miligating the violence of the so that in this respect, the mucous are ap- subsequest paroxysms. Some time after-

Wa need hardly observe, that these ob-

When the espillary vessels are wounded, scarecly any extravasation appears to take place, only n few glubules escape, and tho eirculation through the wounded vessols is not at all disturbed, but continues as before. If very small orteries are divided, the hæmorrhagn is also very trifling; but tho blood ccoses to eirculate through the wound. ed vessels, and passes entirely into the arterial branch next shove the division. Whou n larger artery is divided, a considerable hemorrhage ensues from the two ends, and the blood of the neighbouring arteries is seen moving towards the wound na lowords a centre; ofter some time, an undulatory motion is observed in the ends of the orterice, so that at oso moment the blood moves towards the polut of division, end, in the next, returns into the vessel; these undulations gradually decrease, till the morement of the blood towards the divided sxtremities ecases entirely, the blood being carried through the next arterial branches,

We strongly recommend to our readers an attentive perusal of Dr. Kaltenbrenoer's work, and seriously regret, that want of space prevents our giving more than a very imperfect abridgment of it.

CAORS OF INTERMITTENT FEVER, IN WOLCH BLAFBING WAS EMPLOYED IN THE COLD BI AGE.

By Jone Mackinton, M.D., Lecturer on the Practice of Physic, Se., in Edinburgh.

Case 1-James Ward - admitted into Royal Ordnaneo Houpital, in November 1853.

liss suffered several attocks of intermittent annually, since the year 1809, when he served in the expedition to Walcheren. Of lata his indispositions were long, and left him more and more dchilitated. Several of my pupils watched this man closely for somn time, with a view to bleed him in the cold stags, but they were not fortunate ecough to arrive in time; they bled him twice, however, in the hot fit, from the passably very similar to the acrous mem-words, in the presence of Drs. Lucas and Rohinson, two of my pupils, now in the Ordensee Medical Department, I bled him accretions ought to atakn us very esutious from a vein in the erm, during the cold in determining, by post-morton examina- stage; it was very severe; the rigours were

violent, and the acram of coldness is sup-stools during the next twenty-four hoors; portable. He camplaised much of his head was found perfectly easy next day. On the und toins; his face was of a livid calour, following day he was convalencent, looked and the vessels of the conjunctive turgid well, and saked for more food, and had no with blood. Pulse 100 or 105, and op- return of the disranc. pressed; breathing short and anxious, and, pressed; presthing short and anxious, and, to use his own expression, he falt "a heavy be load about his heart." When the vein was opened, the blood trickled slowly from the wound, but it soon come is a jet. By the time eight ounces were taken, the rigours cessed, and he expressed great surprise at the suddemness of the relief; when twelve ounces were abstracted, he was free from all complaint, and his akin had a comfort-able moist feel. He sunverd a rood night:

8. Call & sooms on a claracter Abstract. able moist feel. He enjoyed a good night; he had no returo of the intermittent ; and his recovery was rapid.

I had an upportunity of seeing this man daily fur some months afterwards, and his constant tale was, that he " had not felt so well, or so much of a man," sisce he went after the bleeding were laxatives and infu-

sion of quassis.

Cutliste mail, travelling to Edinburgh. The puroxysm was evidently produced by exposore in bad westher, first to rain, and then Wben to a keen frost, with wet clothes. I visited him in hospital, he had isbonred under the rigours for no less a period thus twenty-six hours, -in truth, it was the dressed; oppetite improved. He escaped most severe cold stage I had ever seen in far eight days. my country; he had severe pain in the great that it shook the very bedstend on passed a bad night; pulse 120, oppressed. io convulsions. Tos gue londed, but moist; the privy. A ven wan opened in \ 1 srm, breathing hurried and laborious; pulse 65, and lourieen onnees of blood were a ractbreathing hurried and Ishorioua; pulse 63, oppressed; skin not below the natural sensation of extreme collness. Fortunately, ing stage followed. I maile a good orifice, which is not always easily slope from the tresture, and the blund flowed in a good stream; twelve nunces were abstracted in three minutes, with very become more and more easy, and the rigour ceased completely. This pound was abstracted in two misnies; the arm was tied up on the approach of syncope, from which, peured to be cut shurt by a warm drink; however, he sooo recovered. He lay quite no fever fullowed; passed a good night; easy; his body, and even the extremities, became of a proper temperature; und his 22. Had a slight sessation of cold this skin felt moist; the pulse ross from 65 to marring, but there was no hot stage; says 196; he passed a good night; had several he feels quite well; bowels slow.

Case S .- Thomas Bullock, a strong

8. Cold fit came on at three A.M. After it had continued half an hour, and was well formed, his pulse besting 84, and oppressed, a vein was upened to the num by alr. Marshall, (onn of my most zvoluus pupils, now assistant-surgeon of the 87th Regt.,) in the presence of several other gentlemen. to Walcheren. The only remedies used When fifteen onaces of blood were abstracted, the rigour ceased; the poin of head and loins, and the appression of praecardia vanished; the breuthing became natural; CASE 2.—James Aitchison, aged 53, had the pulse rose to 95; to half an hour ofter had repeated attacks of ague. Was seized the operation, and he felt quite well; us with severe rigours when on the top of the hot fit followed; overy gentle moisture apthe operation, anid he felt quite well; uo peared on the surface, but there was no

sweating stage; pulse 95.

10. Says he feels quite well, and free from that unxiety and oppression which has uffected him from the time he caught cald us Woolwich; is oble to be out of bed and

18. Wus again attacked with rigonrs u head, back, and luins; oppression at præ-cordia. Warm drinks, stimulauts, and hot, now in acvere well-formed cold fit; breath-opplications had been employed, without ing hurried med lahorious; he whole body brackt. The ngitution of his body was no is in a tremour; tongue rather louded; which he lay, and threatened to terminate Attributes this psroxysm to cold ches in ed before the fit was subdued; there was no standard over the trunk, but all his extre- tendency to syncope; pulse tto, full, and mities were cold, and he complained of a of good strength. No hot stage; no sweat-

19. Yesterday, for some time after the bleeding, he appeared free from all camplaint; but tuwnrds evening was attacked with violent bealach nod pain in the belly. Blood was ngain taken from the same uritrifling relief, except to his breething; but Blood was again taken from the same uri-during the fluw of the second pound, he fire, to the assount of twelve onness, with complete relief, since which he has been

easy und slept well; howels slaw. 20. Slight chill this morning, which ap-

bowels not muved,

22. Had a slight sessation of cold this

23, 24, and 25. Reports that he went on | ter, and has some appetite; pulse natural; improving.

\$6. Saye he doce not feel so well; but there has been no tendency to rigour; bowele bound.

31. He went on improving in health, and without any return of the disease till this day. He was found, f: the time of visit, in the het stage, which is accreely percaptible, after having furperienced a slight rigour, which lasted for twenty minutee ; tongue white and log ed.

April 2. Ilad a severe rigour at ten A.M., which was followed by fever and the awesting stege; of iwo r.m. he was found quite free from complaint. illa beeltl: went on Improving gradually till the 25th, when he was discharged the hospital cured.

The same individual reported himself sick on 30th Mey following, and was taken into hospital, after a severe paroxysm of inter-mittent; states, that since his discharge, his health had been very good, and his strungth increasing, but that he has had three slight rigours; hie appearance, however, is much improved.

3t. Says he expects the paroxysm to-morrow morning et nine o'clock; bowels regular; appetite good. He was ordered to take three grains of sulphate of quinine every half hour, commencing three hours before the expected time of ettack.

June 1. He took air doses of the quinine; escaped the paroxyam; had no return afterwards, and was discherged on the 4th.

Caes 4.-Robert Smith, a stout men, whose health had formerly suffered from a residence in a warm climete, ctates, that be had bad an intermittent fover five years ago, when stationed at Woolwich, but has not had a return of the disease till now; was taken into hospital on 7th Merch 1826, labouring under febrile action, which be id came on after a severa rigour; the febrile symptoms continued with disturbed sleep till the 13th dey, with little varietion. He was thee seized with a severe rigour, attended by secastione more then usually distressing; above all he complained scattly of hie head. He was bled during the cold stage to twelve quaces, when the tremours and the other symptoms ceased at once; he soon after foll into a profound aleep, his skin having a geetle moiature; there was no hot atege.

14. Slept wall, and feels free from all antilaie t

15. Slight chill, but no subsequent pyby a dose of salts; tongue loaded; pulse charged cured on the 24th. metaral.

tongue less loaded.

17 and 18. Improving; half diet.

19. Ilad enother cold perspiration in the night, but asys he feele wall; howals rether

20. Complained of severe headach yeaterday ofternoon, attended with some febrile setion ; ceys he ie now better ; appetite improving.

21. Slight ohill, which continued for nearly on hour, estended with griptog, but no febrile action followed; bowele regular.

22. Had a severe rigour this morning, attanded with difficulty of breathing, op pression at pracurdis; pain in beak and loius, and severe pain in the head. At the visit, was found in the hot stage, complaining much of headach; tongue loaded; pulse t30; bowels open; cold water to be anplied to the head.

23. The heedech has continued violently since the commencement of the cold fit yesterday; cold applications produced temporary relief only.

Applicentur hirudines zii. capiti. Habent

ulverom laxantom statim 24. Leeches relieved the head; had another paroxyam this morning.

25. Passed a had night; no headach.
Hubent tinet, opil gtt, xxx. h. s.

26, 27, 28. Same report, " doing well;" bowele regular.

29. Says he feels pretty well, but that he has occasional headache.

30 and 31. Had elight paroxyems each day, with some heedach; pulse not higher than 96.

April i. Another peroxysm, with savers beadach, after e bad reatless night.

Capillitio obrasa applicentur hirudines, 22. Repetatur pulvis lazans.

2. Experienced another paroxysm at half past nine this morning; etill complaine, although he is perspiring, of oppression at pracordie, difficulty in inflating the lungs, and handsch; had a recticas night; sixteen of the lecchee only fastened; they bled well, relieving his head for the time.

Applicantur hirudines sil. capiti, et repetatur

pulvis laxons. Feela better; no parexysm; had a bad night, during the whole of which the perepiretion continued; leeches bled well, and relieved the hand completely.

From this time to the 8th he gradually improved, having lad, however, a slight paraxyam on the 4th, 6th, and 8th. Next day he began the use of the quinine in fivegrain doses, and suffered no return. He canin; no appetita; howels freely moved took in all 116 graine, and he was dis-

46. Had a sold aweet during the night; Case 5,-William Massaley was admitted no return of paroxyem; says he feels bet- into the Royal Ordunnes Hoppital an

Wednesdey, Stat of May, labouring under e severe hot fit, ettended with the usual cymptoms, great headach, severe paid in the back, loins, sed limbs ; great oppression of presordie, extreme heat, thirst, end gameral unessiness; tongue loaded; pulse hurried. This etage lasted for five hours before

parapiration appeared.
Thie was the accoud paroxysm, with a

day intervening

June 1. Had no alcop during the night, but feels pretty well to-day; two atools.

2. Had a navere cold etaga at two, P.M., which lasted till fnor. He was visited at ave, when he wen in the hot fit, rigour came on this morning at half-peat enffering from ell the cymptoma formerly described.

S. The sweating stage did not appear last evening till eight o'clock. Has had no sleep; two stools; tonges clean.

4. The paragyam took place et one o'clock, r.m., this day; chout twelve o'clock the pulse was sociated, and was found to heet 84, and oppressed; the precursory symp-toms had just commenced; at hell purious twelve the pulse was 66, and atil more op-pressed. This rigour was very severe; the tremours of his body shook the bed, end his seese of cold was insupportable, at the time that e thermometer placed uoder the tongue stood et 100. His complaiced of greet oppression; pain of back and lnius; respira-tion difficult and hurried. The rigour was allowed to he formed for ten or twelve minutes before e vein was opened, which was effected with difficulty, owlog to the tremours. He bled from a smell crifice until twenty-four ounces were drawn, which occupied sixteen minutes, when the rigour ceased, and all its unpleasant symptoms.

Juce 5. Last evening he began to com plain of e severe pain in the back and head, with thirst. Heet 103°; pulse 115, but soft. Relief soon followed the exhibition of forty draps of laudenum in an ounce of the spirit of mindererus; passed e good night, with much perspiration; esys ha facis quite easy to-day; much easier than he has been et any time since the first paroxysm; bowels slow.

Had ettacks of a slight nature on the 6th, 8th, 10th, 19th, 14th, and the following reort was made on the 15th. Health evidently improving; sleeps well; howels regular; tongue eleen and moiet; thirst diminished.

16. Had a severe rigourat eleven, a.m. It was of very chort doration. Considerable re-netion followed. Had two slight parenymes on the 18th and 19th; and, on the 20th, he was ordered to take five doses of the quisine | each dose to consist of foer as after which, he had no return of the

Case 6.-Alexander Clark, a stout wellmede young man, with a florid complexion. Had three attacks of tertian intermittent

before he reported himself sick; come into hospital on 21st May, 1826, with the fourth parosysm upon him. He was attacked at sevan, A.w., with rigours; the fit was very severe. The hot stage had given way to the sweating when I saw him. He could assign no cours, except thet he hed done duty at Woollyich e few months hefore. Tangue foul; ever diet. 23. Was fire from complaint yesterdey;

had aix atools from the laxative. sir, end went through the regular stages with the usual distressing symptoms. Tongue much loaded; bowels regular; no

eppetits; urine scanty.

He experienced severe paroxysms on the \$4th end 26th, attanded with headach, and e severe paie ie right hypochendrium.

28. Rigour came on et eleven, A.M. Five minutes efter it was well formed, e vein was opened, but the operation was badly performed, owing to the violent tremours; twenty ounces of blood were slawly drawn, when the rigour crasse, together with the tremours, the difficulty of breathing, the oppression et pracordia, and the breadach, de. The paisful some of cold gave way all et once to a placeant feeling of heet, and the pulse became natural. The bleeding was not carried the length of producing syncope. There was no hot stage, and the skin was covered with e gentle moisture. In half an hour his only complaiet was of slight nsuses; he is chie to change his position et pleasure, and facls disposed to alsep.

29. Had considerable heat of skin and thirst yesterdey evaning, which he ettribated to the pressure of too many bed-clothes; the blenkets not having been removed, which he had caused to be heaped upon himself on the approach of the cold stags. Slept well during the night; feels quite easy; no

30. Had an exceedingly slight paroxys at moon; alept well last night; no appailite; had five evacuations from the bowel

St. Had another slight chill this afternoon, but there was no rigour or hot stage-complains of paic in left hypochondrium. Passed a good night; howeld require repaniderable thirst; tongue still toul; pulse 100, very full, but soft.

Imponetur vericatorism parti delegali.

If is general health and appearance im-proved rapidly after this period, but he contiened to exparience daily slight attacks till the 7th Juoz, when he get, thrice a-day, ave-grain doors of the quicina.

June 8. Took the quicine at cleves, at one, and three o'clock, nevertheless he had

a paroxyam at a quarter past three, which he is disposed to attribute tu exposure when of Eyemouth, was seized with us Interasteen between two open windows; high mittent of the quartan type when in lan-axcitement followed the rigonr, which ter- columbire, in August last. He had used vaminated in the awenting stage.

Ila continued to take the quinine on tha 9th and 10th, and had no return of the dia-

case. He regained his health and strength rapidly, and was discharged una 17th.
Dr. Kellie, of Leith, was present when Clark and Macauley were bled; so were several gentlamen who we've attending my lectures at the time.

he gladly aubmitten to the treatment of the property of the cold stage, which Mr. Mar-bleeding in the cold stage, which Mr. Mar-lend had seen so successfully performed in On Thursday, 28th December, 1826, at cold fit is very severe; tha feet cold; heat of the superior extremities rather above the natural atandard, and moist; pulse very small, not casily perceived; pain of head excessive; great thirat; pain in back con-siderable; compluing of distressing sense of weight at the precordin. He solicited me to do something for him, as he could not long andure the sense of cold. I opened a veia in the arm by n pretty large orifice. At first the blood trickled down the arm, but abortly eating in a full stream. When ten ounces of had bowed, the shivering rated, and all the had symptoma vanished. Half an hour after the bleeding, says ha is quite well. On the 14th, 16th, 18th, ac return of fever." Mr. Marahall assured me that he had had no return of the complaint paper.

Case 8 .- Georga Scott, aged 36, a nativa rious remedies, and among the rest burk, without relief. The paruxyama bava coutinued with soch regularity, that be has not escaped a singla attack since the commencement of the disease. His health and strength have suffered so much, that he has been anable to work for a canaiderable time, and came to Ediahurgh, almost in deapair, to seek relief. Having applied to my friand, Case 72-20... "Typiball, assistant-surgeon of the 87th regimest, whose nama I have emactated; he appears the wreck of a strong had occasion to mention before, when on a made active man. He gave the above account visit to his frieads in the west of Scotland, of himself, and nided, that he has great was called to sen a middle-aged man who thirst and no appetite, that he aleeps hadly, had served in the army in a warm climate, in never frea from pain in the back part of and who bad suffered most severaly for the head and left hypochondrium, and that some years from intermittent fever. Every, he has become as weak as a child; and that kind of remedy had been tried in vain, and his vision has lately become impaired. he gladly aubmitted to the treatment of Pulse 100, and wask; tongan clean; bowels

aliall bad seen so successfully performed in On Thursday, 26th December, 1826, at aimilar cases, "Ou the 6th July, 1826," two, p. M., the rigour commenced; nod anya Mr. Marshall, "I was asked to visit when it had continued for half an bour, I this man for the first time. Previous to my opened a vein in the arm, having placed going, I informed Mr. Staff. Surgeon Mor- him in the sitting poature; his whole body shall of the nature of the case, in as far ms was affected by violent tremmure; bis teeth I was enabled from the history given by his clustrared; ha complained of intense cold; relations. Mr. Marshall recommended a dimness of sight; severa pain in the back grain of opium to be given every hour for part of the head, and in the left side, loins, three hours previous to the attack. The and inferior extremities; his pulse was abivering commenced regularly about six io weak and fluttering, an as and to be conneed, the evening. The opium was given at and the countenance expressed great sufferthree, four, and five o'clock, r.w. with no im. Owing to the violence of the trorelief. 8th. Opium continued as directed; mours, a had orifice was made in the vein, no relief; bowels opened by rhubarh, and the blood flowed slowly. When about 10th. No relief from the opinm. 12th. The twelvn ounces were abstracted, the rigours diminished, the uneasy feelings began to subside; and hy the tima aixteen unucea were taken, he was free from tremour and pain, and said he felt quite well. The pulau was now a good pulse, but I neglected to make a memorandum of its number at the time. He showed some tendency to syncope before his arm was tiad up.

My friends, Drs. Robertson and Scott, and Mr. Syme, together with several other geatlemen, were present, when the operation was performed. He was ngain visited in an hour, when he was found breathing asturally, in a sweet sleep. Pulse 84, and of good strength. I was told ha had been very faint, and bad vomited immediately after we left the house.

In an hour after last visit I saw him when he last visited him, which was several again; his body had the natural beat; months after the bleeding, and that the cure there was no perspiration; he was still seemed to be as audden, and apparently as saleep: pulse 80, and full. He was roused permanent, as that which took place in after the pulse was numbered, for the pur-Ward's case, the first recorded in this poss of ascertaining the exact nature of his facilings. He said he had not felt so free

from indisposition since the first period of "2. Such application does not arrest the the attack, and that he had been long a deleterious ection of the poison by withatranger to such a comfortable refreshing drawing it from the exposed auriace. On sleep; took some gruel, soon fell saleep the contrary, the fatal effects are wholly again, and passed an excellent night.

himself "a new mao."

Sundey 31. He oame to the dispensary where the skin is sound or unbroken, the again, and was seized with the puroxyam a wund being without the month of the little after the bour of visit. The fit was glass, none of the poisonons substance will preceded and accompanied by much slighter be removed, and yet no indication of its pains and general disturbance than any action will be presented during the time of former attack. In shout ten minutes after the application of the glass.

The constitutional aymptoms, such the fit could be said to be well formed, the j. "3. The constitutional aymptoms, such nue nt ceuid de asid to be well formed, the ! "is. The constitutional approma, such rigours were very severe, the tremours vio, is tetasic convilsions, &c., are arrested by leut, and the feeling of debility was so over—the establishment of a vecuum on the poi-powering, that he declared that he could not apport himself longer un a chair; bis sen by an incision through the intogumeets, breathing was quick and laborious, end his the life of the animal is preserved. The test contact were abstracted, the juncy son cessel, for the purpose of introducing the tube centre. It is the arter mediant agent, taining the tubic on and while it described. and with it all the other uopleasunt aprapatations to poison, and this is deposited toms. Although a minute before he had ueder the akin heyond the circumference declured that he could not sit up a moment of the glass, none of the effects are manilonger from debility, yet he now said he fested during the continuance of the vafelt his strength restered, and had nu wish cuum; but as soon as the cup is removed, to lie down; in less than teu minutes, I bad, the action of the deleterious article comthe pleasure of seeing him runoing home. mences. There was no subsequent heat of skin, and no sweating; his pulse, before he left the cupping-glass, placed as jost atated, an dispensery, was 86, and of good strength; incisien he made between its edge and the whereas, before the bleeding, it was 100, place at which the poison has been ludged, and so weak as scarcely to he counted.

Munday, January 1. I sent to inquire atmospheric pressure had not been removed. how my patient felt; the messenger was told that he had had a good night, and was for a given time to the sound skin over the out making merry with some friends.

On Wednesday he had a slight chill withaut subsequent fever or sweating; he after wards gut the sulphate of quiniue, and had uo murc of the disease.

(To be continued.)

CUPPING-GLASSES TO PRISONED WOUNDS.

Du. PENNOCK, of Philadelphia, bas recently instituted a series of experiments ou the application of cupping-glasses to poiaoned wounds. The results are thus stated :

" 1. The usual effects of poisoned wounds cannut take place during the absence of the atmospheric pressure procured by the appoisoned weepuna-plication of cupping-glasses.

prevented, though not a particle of the Friday 29. Said he felt quito well; was auhatance employed has been abatracted, free from the pain of bead eed left byo. In proof of this, if a poisou in powder ebondrium, and he thought bin strength im. Cutychnine or araenic, for instance) be proved; in fact, he walked to the diaconveyed by a tube through a narrow pensary by himself; bowels regular; tongue wound, in an oblique direction under the clean.

Saturday 30. He came to the dispensary opening by which it is introduced, end at the visiting bour, and said that he felt there daposted, and, under these circum-himself "a new mae."

" 6. If, after the application of the glass sput where the poisou has been deposited, the glass be removed, death will then ensue as won as if no such application had been made.

The practice of applying capping-glasses to reisoued wounds is of very sucient date : Celsus expressly recommends it-" Voneuum extrahendom eat. Id cucurbitula optime facit."-(Lib. v.) Whilm transcribing this article, we have lying before as an old work, entitled the " Marrow of Chirurgery," and published in 1650, in which the aethor treats of the use of " cups" in " venomous" wounds. The prectice is adopted amongst many of the arrage tribes who fight with

#### THE LANCET.

London, Saturday, October 4, 1828.

THE London University opened on Wednesday, under the most favourable puspices. Mr. CHARLES BELL, before commencing la coorse of Physiological Lectures, delivered an Address, which will It found in another part of our publication. The thenshout eight bnodred persons, was completely filled, and the audience assembled on this occasion was of the highest respectability. the students.

Evra since the invention of letters, it has been a very general opinion among men, that books were composed with the intention of being read. It had become customary, at a very early period, to establish libraries, where men might indulge their natural desire for information. anxiously contended for the honeur of have us all the members of that corporation, both ing their works in places of public secess, students and licentistes, contribute somechurch of Rome itself was searcely an ex. no law should be passed by that body, caption to this general feeling, heing a very which might directly or indirectly exclude, liberal fnunder of libraries, as most of our without a sufficient cause, any member from old cathedrals atteat by their magnificent; the ndvnntages of such library. That the collections. To the practice of reading it library of the Dublia College is a purely did not offer any bjection, or oppose any corporate one we have tangible proof, in the unnecessary Confruction; but having taken | fuet, that n sum is annually granted for its charge of the souls of its spiritual subjects, support out of the common fund of the it could not, consistently with its notions of corporation, which fund is drawn from the their salvation, permit them to peruse those fees of the pupils, as well as from the mempresumed to be mortal to the reader. The library be not common property, then the

ridiculously charitable; but the Dublin College of Surgeous has considerably improved on its absurdity. It has lately enacted a law, by which, together with the payment of three guiness, the candidate for the honour uf rending in the library, is to be hallotted for, and one-third, at least, of the whole votes required to secure his election. We do not knuw, or, at least, we do not profess to understand the mysterious grounds upon which the College adopted this singular tre, which is anythin of accommodating by-law. Were this library founded by private auhacription, or by endowment, we do not preteud to deny that the persons who bought it for their uwn use, or the indi-We shall, in a future Number, give some vidoal who hequesthed his property for its detail of the admirable arrangements which support, would ondoubtedly bave a right to have been made for the accommodation of admit the public to its use, under such restrictions only as these individuals pleased to impose, no matter how impolitic or illiberal the exercise of this right might be. The case, however, is very different with the library of a Corporation, which owes its existence to a faithful discharge of our of its legal obligations, and which draws its support from a common corporate fund. Here the diffusion of knowlege is one of the duties which the law of chartern requires Private individuals were so impressed with from literary or scientific corporations, and the utility of this practice, that they expended us a library is one of the principal means large fortunes for this purpose, while authors by which this duty is to be performed; and where they might be easily consulted. The thing towards its support, it is obvious that poisonous productions, whose contents it bers and licentistes of the College. If the "Index Expurgatorius" was, therefore, lindividuals alone who have paid apocific.

1100

fees for its usa, might to-morrow set the comprehensible advantages of this law: let collection up to auction, and sell it to the us look to the more probable and palpable last volume; while the College has grossly effects which its application may produce. betrayed its own interests, and the confi- Let us suppose, for example, that one of the dence reposed in it, if it suffered out of its licentiates of the College made himself beat apartments to he occupied by the pro- obnoxious to that body, by opposing its perty of individuals over which it can exer- measures; that he had a private or public cise no control, and allowed the example of quarrel with some of its members; that his those individuals in supplying themselved religious principles, or his politics, (by no with a library, to pass without imitation for means adduposable case in Ireland,) were the good of the whole corporation. Con- disagreeable to them; that, in abort, he had sideriog this library, therefore, na a cor- offended their co-porate sensibility in any porate one, we conceive the College has no one of the thousand ways in which he might right to easet a law, which might, in any do so; does not this law afford the most mauner, deprire either the student or the ample means of gratifying private malignity, licentiate of the adventages of this library, or erucking an open opponent? His name to which both have contributed a portion of is posted up for the ballot; his friends and its support. It is but fair, however, to himself anspecting no opposition, (for state the reasons which we have heard ad- bonesty is seldom ouspicious,) stay at vanced in favour of this law: " it is possi. home; revenge, whose vigilance never ble," say its advocates, "that omong the sleeps, is sure to be couched for its victim; licentiates of the College, there may he the fatal nrn is shaken, sod by this worst now, or hereafter, persons who are not species of ostracism, he is is not merely grutlemen; and what a profanation it would deprived of the use of a library, but an inbe, to sit in company with an individual, jury is indicted on his character, the more who, instead of committing the contents of galling to his feelings, because the assassin's n volume to his head, would summarily hand which inflicts it, is for ever cooccaled transfer the whole volume to his pocket, or from his view. Let un but imagine a case who, perhaps, would be so hasely celtish, as of this kied to occur in every lustrum of the to apply the fruits of his reading to a suffer- whole existence of the College, would not ing fellow erenture, under the standard rate its injustice outweigh oil the good which of surgical fees in Dublin?" The law was could ever be derived from the operation of drawn up for the punishment of all such this neferious institute, which, revorsing high misdemeanours as these; and was, we the properties of a just and prudent law, the believe, intended to be put in force ogainst production of positive good, and the evasion Mr. Lealie, at the time of his expected ad- of contingent evil, makes the former promission into the College. But would this blematir, and the latter certain? But why law really accomplish the ends for which it should it he necessary to argue the question was framed? We thick not; for it would in this monner? Wa can only answer, that he as impossible to know (as it would be the misconduct of the g werners of all such unjust to oct on the preaumption) on indi- institutions have made this apparently unvidual who would be guilty of a theft in a necessary task necessary. There is scattely library, until he was detected in the com- o library in these countries, which the mission of the fact, when it would be the fashionable spirit of monopoly has not proper time to asolude him, ur to axercise fanced round with some impossible or inmay control over the mural conduct of the convenient conditions of admission. It is licentiates of the College. Such are the in- this "dog in the manyer" spirit which has

Mr. Lacye considered it placed beyond the shadow of doubt, the fact having been proved by the experimentum crucis.

Mr. LAMBERT inquired whether, io the ligature, which he thought at all times, if opinion of the Society, there were say possible, ought to be ovoided. He had instances of pure spanoodie asthers, without effected cares by vaccioation, but at times urganic disease? He binaself believed in the he had failed. He had, on occasions, existence of such cases, and that the disease succeeded by cataplasma, covered with was owing to a spasmodic contraction of the turtarized antimony; but again, on others, muscular substance aurrounding the ramifi-failed; and he should certainly now give cations of the bronchin. He wished tu dia-Mr. Lloyd's treatment a trial, in a case in tunguish this form of asthma from thuse which he had been foiled in his attempt at which are evidently produced by structural removed by voccination. He had known a derangement of the luogs themselves, us case, in which the srm, the whole of the bronchitis, s.e. The exting course of the neck and head, oe the affected side, were apassmodio contraction of the bronchial very much enlarged—the cones greatly is tubes, Mr. Lambert considered might be creased in size—the car, the eye, the inci-remote; as, for instance, in the heart, or sion teeth, nod so nn, were all very much large vessils. In two cases of snearism of larger than those on the opposite side—the innominate which he had seee, the pabere operation could got be thought of. The tients had died auddenly, without any rupchild died under the age of a twelvemooth, turo of the vessel, but apparently frum sufso that cothing was rescertained as to its focation. Is many cases of apassmodic atate of intellect. and to bring about the asme result.

Mr. L. Lovo doubted not that gentlemes, thu are as thick as treacle. Where there or that he kimself, might find uut, in the was less prostration of power, great relief, coerse of tine, an injection equal to, if not better, than the one he had mentioned; at num—even a drachm.

Dr. Shearman's opinion was in accord-

ance with Mr. Lambert's. Ho deemed a is principally inconvenient from its size and atrong duse of other and oplum most likely weight. His general health is in a very to afford relief.

the indefinite terms the profession had got fers from dysoness. into the habit of using.

Mr. Hnwaywood thought the affection might exist without organio disease. He had been attending a most painful cone of eathma, which he had only been shie to relieve by galvanism,

Mr. ILIFF mentioned some cases in which the smelt of certain aubatances, one in particular, in which the smell of ipseucuanha alterative medicing the repeated applicainvariably brought on the most violent at- tion of lesohes to the tamour, and after the tacks. He had been told, that inflating the employment of these meses, the insertion, lungs with a pair of believes, hy introducion the nozle ieto the mouth, during on attack afforded great relief. He had not used this remedy, but recommended a trial of it to an old shoemaker.

Mr. Leave thought the plen an excellent one for speedily blowing a man up. (Much laughter.) le his upinian, the offection either syrang from nrganic disease, or, at all will he obliged to you to iosert in the next, events, that disease existed in the course of or any subsequent Number, of THELANGET; the nerves supplying the organ.

BE AN ENGRHOUS TUMOUR OF THE THREAK, SUPPOSED TO HAVE BEEN EXOSTORIS.

Communicated by T. PARKER, Jun., Esq., Hobern,

In No. 215, Vol. 1., 1827-8, p. 48, of The Lascer, will be found the following report from the " Hospital of Sprukky:

" Case of Enormous Exestosis of the Sternum.

"The following secount will olow to what a size pure exostosis can musin, and will likewise exhibit the difference between it and the true estee-succomatous enlarge-

sent to the Hospital by Dr. Scott, of Barnes. Arising by a very broad attachment, from posing it to have originated from the sternearly the whole of the aternom, except the superior part of its upper bone, odhering to the cartilages of the ribs, and extending so far outwards as to elevate the papille, is opened the thurax is the usual way, expecta very large ossesus tumour, messurieg elghteen inches in circumference; its surface, which is smooth, and not marked hy any of those protuberances which were a distinguishing feature in the case of osteosercems, is evidently composed throughout thus found the spex of the tumour projectof the same solid materials, and does not leg with the disphrogm before it, within an afford to the finger that feeling of elasticity inch of the unthilicus. Without disturbing which was experienced in the other, at those any of the viscers, I endeavoured to trace places where the fleahy intermixture estit through its whole extent; this I was in places where the fleshy intermixture en- it turougu ne whole to do, though not issue. The leteguments covering the swell- some measure enabled to do, though not measure and the contract of the passing ing are much stretched, and have become, completely to my satisfoction. On passing at the least protuberant point, inflamed.— my hand between the tumour and the arch.

indifferent state; he is dyspeptie, subject The Parsineur very mech objected to to rheumatic stracks, sed occasionally suf-

> "The tumnor commenced nice years ago, without any apparent cause, with general enlargement of the sternum at that serface where it is now attached, which has gradually increased, till it has assumed its pre-sent immer sise.

" The treatmest recommended was, great ettention to the general health, the use of at its base, of two or three small setons.

Withle the last month, I have had an opportunity of making a post-mortem examiination of the disease, and as its character appeared to possess considerable interest and instruction, I have drawn up a abort account of the dissection, which I with the observations and opicion as given at the time the patient presented himself at the hospital. Unfortuousely for surgery, this case is strikingly illustrative of the fallibility of human judgment. The tumour, on examination, possessed no character of examtosis, nr osteo saroma; throughout, its tex-ture was noft, though anlid, nod appeared tn have been well supplied with vessels. To give a familiar idea of its appearance and consistency, it very much resembled adipocere, except in colour, which was, for the most part of a diugy red. On dissecting back the integument on either side, it was ubserred, that the left pectoral muscle was remarkably pallid and attenuated; the muscle of the opposite side presented outling ra-markable. The tumour was covered with a , about fifty years of age, was thin layer of adeps, without the appearance of any distinct capsule or investment. Supnum, I attempted to dissect it off satire, but finding it more deeply imbedded then the nituation of the bone would explain, I ing that the extent and cannexions of the discuse would be at mos C related. Thin was by no mesus the case, and to satisfy myself as fully as pussible, I extended the opening to the parietes of the abdomen, and at the most protuberant poiet, is samed.— my hand between the tumour and the arch The disease is attended with little pain, and of the ribs, considerable resistance was

offered from adhesions, apparently of long; the parts were considerably relaxed; at attanding. Having accomplished its detach: 3 r.m., enems repeated. BENJAMIN MORGAN, wtat. thirty-two, of given period of the day, and to keep, the sanguiren - melancholic temperament, uotes uf every esse. Mr. Lloyd has repeatedly made a similar tender, yet this gonorrhees about fire years ago, if which brauch of justruction, it may be said, is; he was quickly cured to but shortly after, wholly unattended to. Mr. Lloyd stated to the stream of his urine became smaller the pupils, in the wards, the other day, that than usual. It continued so the lingth of he should again make an uffer of his ser- time, but as he suffered no pain, he did not vices. He thought he should be able to consider that any evil consequence would prevail on the Governors to make an order, result. He continued in this state for more that all dying in the house should be exa-than three years, without any unpleasant

never amounted to on actual stuppage till that the bledder had hurst. I felt something

Friday, the 25th ult., at 22, Chorles Street, contents of the bowels. After some little time his belly swelled, and ba was very sick. An apothecary was sent for, who introduced, or attempted to introduce, a catheter; for i twenty-hours before I auw him. I attempted to introduce a tolerable-sized catheter which I bad with me, but I found it impossible to get it in further than about two inches and a balf, the urethra being hard and coutracted within that distance of its crifice. From the great distention of the abdomea, the feel of fluctuation even as high as the epigastria regioo, and the man stating that he did not feel as if he had say water te make, I was led to suspect that the bladder had berat. While I went to obtain a small aised catheter, I ordered him to be bled, to have pills of colocysts, estomet, and opiom, redicines had produced oue cupines dejection, but no prine had passed; and he expressed himself much relieved by the bleeding and the discharge from his bowels. As

the present attack. During all this time loposed to the ond of the instrument, which, he pursued his business—that of a news-from its elastic feel, I thought to be a polymen, serving newspapers at the houses of pus of the bladder. I withdraw the instructions and at public offices, his general mant, and gave may princin to his friends the health being pretty good. He occasionally his life sould not be preserved. In the nourse indulged in the use of apirituous liquors, of the svening all bis symptoms become but was not a habitual tippler. He naver aggrerated; violent atercoraceous vomiting took medical advice for the urinary symp. came un, and he sapired in the course of toms, as he considered his disease to be the night. I obtained leave to open the gravel, which, though it might annoy him, body the next day, when the following ap-yet he believed it would never kill; hence peraneces were observed: — Un cutting the neglected to take any remady. When I was called to see this man on its carity, there issued out about three quarts of urine. The perltoneum was much I learned the shove particulars. I found thickened with fiskes of congulable lymph him in great agony: his abdomen was dispersed upon it. The villous coat of the greatly distanced, and so painful that the atomach was very vascular, and somewhat alightest touch occasioned bin to scream; thickneed. The lining of the duodenum there was at intervals, or when he took was more vascular than natural; but, on ony drink, violent vomiting; his pulse was the whole, there were little more than quick and tremulons, his countenance mise. signs of incipient inflammation throughout rably anxious, and bis breathing very moch the remainder of the intestinal causi, which hurried. These symptoms, so I was in was occupied entirely by finus. I put down formed, cams on rather suddenly. The my hand into the pelvis, to feel for the evening before, ha was in his usual state of bladder, and discovered it projecting a health, and went to stool, when, without little from under the pubes, in the form of any previous pain, bo felt somothing, as it is hard, scarcely elastic mass, like to a were, jump up suddenly in bla belly; and schirrua uterus. By removing the luteafrom that moment he became unable to pass tives, I viewed it in situ, oud on the posany urine, neither could be discharge the terior part I found it thin for about an inch square, in the middle of which was a hola with three fisps, evidently produced by rapture. There was no mark of ulceration. The aides, in all directions, with the excould not learn whether the instrument bad ception of this small pertion, were increased passed into the bladder or not. In urine, in thickness to shout helf on inch, herd, or forces, had been discharged for nearly and almost as unviriding as certifage. In autting, it offered much resistance to the knife, giving a seusation to the band as if the blade was passing through buodles of whip-chord. The interior presented large busiles of white strong chords, resembling small catgut striogs, intorsecting each other lika the musculi pecticati in the heart, but more prominent, and leaving the interstices more marked and deeper. The mucous covering on those was amouth and glossy, but searcely thickened. The cavity of the organ was lessened in all directions, and could nut contain more than four ur hye ounces of fluid. The space on the posterior followed by a terminithinate enema, and to part, which remained thin, was the only bave occasions doses of effervescing mixture, portion which was yielding, and this sermed I also directed that a warm bath abould be jto have been much atrotched before it gave preserred. On my return, I found that the way. Round the spot where the rupture took place, the characteristics of the parieten of this organ were lost; as, by the slightest press with the finger, it would tear with edges, as if a cutting instrument a warm bath coold not be procured, I tried had been applied. As I was anxious to get without, to introduce a very small-sized it away, for the perpose of making a propaestheter, which, after nuch resistance and tation, I was obliged to effect my paysome delay, I got toto the bladdar, but no pose claudastinely, and with expedicing, and water came. This confirmed my suspicion I cut it out, taking the prostate gland with

hoving a propertionable increase in size to to relinquish his work for n few days. The the coets of the bladder. It was hard ond pais, which continued upwards of three unyielding, and cut like semicartilage. If months afterwards, heame of n dull aching cut from the bladder, by itself it would character, and extended dawnwards on the weigh shout an ounce. There were several inner aids of the thigh. At the expiration strictures of long standing is the course of of about four months from the receipt of the urethra, and it was those, and the die- the jojury, it entirely left him; but shortly essed siste of the prostate gland, which afterwards, a tumour appeared in the grois, gave such resistance to the introduction of This continued to increase during eight the smullest sized collecter. The ureters months, and by degrees it extended itself were cularged to some distance up from the bludder. I did not get time from the frienda Up to this time, however, he persevered in to examine the kidneys, and all I could learn following his employment. At length his wos, that the man never complained of any health become so exceedingly impaired, and uspleasant sensation in the regions of these the found himself so unable to work, that he organs sluring life. I have made a preparation sulted Mr. Caatle, of Bermondaey, untion of the bladder and prostate, which I sler whose care he remained a short time, have presented to my talented friend, Dr. and then applied to the Hospital.

MALIGNANT TUMOUR OF THE BERAST.

Elizabeth Pegram, wtat. 21, of apare chargo, sed the entremely reduced state of limbit, was admitted into Dorcas Werd, on

She stated, that about twelve months back, she acridentally discovered a tumour in her breast, which at that time was not larger than a nut. It was uniformly hard, and she occasionally felt a dull aching pain. each time on the commencement of the der these circumatures, she came under secretion of the milk the breavt lad felt the care of Mr. Key, who tried various vary painful. Since she had ensed to means, but without any beneficial effect, suckle it had become much harder and and he then advised an operation; she acordingly came into the Hospital for that urpose. When admitted, the tumour was and and firm, but was perfectly moveable. andling it created a dull aching pain, blob lasted for some hours afterwards.

The operation was performed on the 25th. August, and the tumour was found to be untained in a perfect oyst, which was also accised. A section of the diseased part preented a granulated appearance. It was accassively hard, but there were no appearances of strize, or of any deposite of that peuliar matter which is found in true actralus. Various opinious were advanced as o its nature; some asserting that it was a thronic enlargement of an absorbant gland, and others, that it was fungoid disease. It is certain, however, that it was of a inficiently anapicious character to justify is removal.

On the second day after the operation, an arysipelatous inflammation attacked the wound, and apeadily extended itself over the chest to the arai. The dressings were immediately removed, a cold brand position was applied to the wood, and a kinn, composed of the carbonate of aumonia, apriri if wine, and water, was ordered to be kept constantly applied to the inflamed parta. Five grains of ealune! were prescribed.

28. The inflammation has increased considerably. The checks are flushed; pract 190, quick, and hard; howels relieved twice, and the evacuations exceedingly offecsive. Tongue loaded with a light yellow fur; aurface hot, sometimes a clammy perapiration aupervenes. Ordered to take two drachms of the sulphate of maguesia in peppermint water immediately, and a salice effervescing dreught every six hours after the bowels have been excueated.

30. Has passed a restless night. The isfiammation atill continues; the wound is dry and infiamed; toogue loaded; pulse irritable and quick, and the checka much flushed. This meraieg vamiting came on and also was ordered to discontinue the fever medicinea, and to take ten grains of calcined magnesis, and two ounces of peppermint water every eight hours.

Sept. t. She has had a very sleepless night. The akin is still clasmy and hot; checks flushed. The atools are still excessively offensive. The crysipelstous inflammation has extended to the opposite arm and sheulder. Ordered to take three grains of calonel immediately, and a grain of colonel immediately, and a grain of colonel immediately.

opinm at night.

5. The npins procured a good night, but the febrile symptoms are not abated. The howels have been copiously purged, and the stools are less offensive. Ordered to take two grains of quicksliver and clulk, and two of the attract of opium, high and memiss. There is a slight discharge of

ardingly came into the Hospital for that puriform fluid from the wound, and less urpose. When admitted, the tumour was aurrounding infammation.

surrounding Inflammation.

4. Much better to-day; last evening she had rigora, and suppuration is now established. The tongue less coated; polse less irritable, and the inflammation very much subsided. An emollicat poultice was applied to the wound, and she was ordered to continue har medicines.

Wine, and a generous diet.

5. Better in every reapect, though she is much debilitated, and nervous. The discharge from the Jound is getting thicker, and is more copious; ordered four grains of subcarbonate of ammonis in water, three times a day.

11. She has continued improving to the present date; the cryaipelas has entirely left her; healthy granulations are forming, and the wound is fast healing. Ordered to take a dose of calomel and rhubarb occasionally.

22. The wound has nearly healed, and the patient is now convalencent.

Macleary, a boy about seven years of age, was admitted into Heury's Ward on the

His friends stated, that he had fullen out labouring and intermitting, and he ha of a first floor window, (a height of about Io

sulargoment of the testicle; electation of He was immediately conveyed to the hospital, where, on examination, it was found that there was a largo would of the scalp, with an extensive fracture of the skull, just at the upper and posterior part of the os There was considerable depression on one sids of the fracture, and a largo piece of bone was fuund so loose ood detached, that it was readily removed with the forceps. On Tuesday, Sept. 9. Mr. Green per The wound was then dilated, and the deformed the operation of historomy upon a pressed portion removed with a trephine. This portion of the booo had been so much driven in as to wound the dura mater, and lacerate the brain. When admitted, the child was insensible to surrounding objects; but he was sessible of paio, and in an hour afterwards was much more so. Tho papils were much dilated.

After the operation, the wound was lightly dressed, and the patient placed in bed. He remained tolerably quiet for some hoors: in the night, however, re-action came on, and early on Sunday morning he alterably dilated; and he hugered out till

Monday, when he expired.

#### Inspectio Cadaceris.

11. Slept the greater part of the night; On removing the scalp, it was found that the belly is soft and free from tenderners; the fracture, was of a radiated description, some of the urine has escaped by the penis, extending almost in every direction through the nose, and likewise flownwards and back-13. He has passed rather a restless night, wards to the occipital and parietal bones. The castor oil produced much sauses and upon each side. On removing the calvaria vomiting. He complains of considerable and dura mater, there was found extensive tenderness of the belty; the tongue is abrasion of the surface of the brain beneath white, pulse jerky, and quick. Bled to ten the fracture; there was considerable extraounces. Fomentations ordered to be ap vasation upon the back part of the right hemisphere, and on the anterior part of the 14. He passed a good night; the bleed- left hemisphere a large abscess was found,

> SIMPLE CHACTURE OF THE CRANGEN, WITH EXTENSIVE DEPRESSION.

> On Thursday forenoon last, another fatal case of fracture of the skull, with depression, was brought into the hospital.

The patient was a muscular old man, about sixty years of age. It appeared from the evidence given by those who brought him, that he had fallen a coosiderable height from a ladder, and had pitched first upon the vertex of his head, and afterwards, hy a kind of rebounding motion, upon his back and occiput. When admitted, he was perforencou of Saturday, the 1.3th of Septem- feetly insensible. The pupils were dilab ber, under the care of Mr. Green. breathing difficult and atertorous, pu morrisge from the mouth and left a feet,) and pitched upon the top of his head. There was no wound upon the easin; upon

the vertex there was a little contusion, the bleeding, the pulse became more full; and extravasation beceath the scalp, and bowels open; pupils fixed; skin of a yel-an indistinct crepitus was felt. Lipue exalpose to but bue. mining the occiput, however, a most exteosivo fracture was detected, and a large portion of the occipital bone could be felt to be driven in under the parietol. Ileaction never took place, and the patient died in about an hour efter his admission.

The body was immediately removed by the fricods, and consequently no inspection

#### was permitted.

#### ST. GEORGE'S HOSPITAL.

COMPOUND PRACTURE OF THE BEILL. OPERATION ON THE POURTH BAY BY MR. R. REATE-DLATE.

James Pankus, a labouring man, of about 34 years of age, was admitted, no the 2d of September, noder the care of Mr. Keate. It appears that, io an affray with some Irishmen, he received two or three violent blows still answers questions; pulse 110, and on the fired, which rendered him iosensi lard; aklo hot; has been blooded to the ble, io which state he was cooveyed home, and on the accoul day after the accident,; was brought to the Hoapital, still le ao josensible state, but capable of being roused day he appears better; the would la healwhen loudly apoken to. On examination, ing. Cootinue the medicine. there appeared a nuperficial scalp wound, over the posterior part of the parietal bone, and ecchymosis of the eye of the aame. side. He was extremely restless, and when pain in head; pupils rather more nutivo; disturbed, become very noisy; pupils dilated; pulse about 90, but weak; he was blonded to the extent of 16 ounces, which was repeated in a few hours, and 8 ounces taken away. An aperiont draught ordered.

S. He was rather quieter when we tirst saw him to day, but towards the afternoon became very restless; during the night, he continued in a very disturbed state, so much no, as to require confinement; pulse 82; bowels freely upon; pupils atill aluggish, He was ordered salino medicioe, with two drachms of aulphato of magnesia every aixth hour. He mawers questions with great difficulty; complains of pain in the he od.

4. In the same state as yesterday; co-deavours to get out of bed, and exhibits other aymptoms of cootinual reatleaness; during the night he bad two atrong convulsions. Bowels open, pulse 90, and papils fixed; the bandage slipped during the night, and he lost four or five nunces of

3. Her had several convulsions; his breathing is now laborious, and he is inca-public of being roused. Has again been skinded to the extent of 2 ounces. After

- 6. To-day blr. Kesto enlarged the wound, and, on exposing the bone, a fractore was percaived, extendiog from the upper and anterior part of the parietal bone; three circular piaces of bone were removed, and a great quantity of blood was discovered lying on the dura mater. The integument was brought together by ligature. Some time after the operation, he seemed a little more sensible, and is capable of being roused when spoken to; the pupils ore a little more activo; pulse frequent, but small; bowela opeo.
- 7. Alore sensible when roused, but generally continues in a doning state; at times, however, starting, and talking locoherently. Pulse, bowelo, and pupils the same; tongue rather furred. Continue the medicine.
- 8. Pulse rising; skin bot; bled to eight QUOCES.
- 9. To day he is worse, but, when roused. extent of 12 conces; blood inflamed.
- 10. Yeaterday he had a shivering fit, which lasted upwards of ten minutes.
- 11. He was cupped yesterday, and six ounces of blood abstracted. Complains of
  - 12. Rather better.
- 13. Rather better, and answers most questions put to him. The sulphate of magoceia has been omitted in his medicioe.
- 14. Ilse coother shivering fit this morning, and now complains much of his head; pulse 150, and feeble; bowels open.
- 15. The shivering returned last night in a violent manner; the pulse this morning scareely perceptible. About noon the man died.
- On the post-morten examination, it was found that the fracture extended to the left side of the head, as far as the petrous portion of the temporal hone, and there was great eatravasation of field noder the scalp. The dura mater was thickened, and mattoe formed on the aurface of the brain, and also between the bone and the dara mater. The thoracic and abdomical viscers were healthy.

#### PRACTICAL MIDWIFERT.

To the Editor of THE LANCEY. Sra, -In fustice to our British Accoucheurs, I feel confident you will receive and diffuse,

by your widely-circulated Journal, these few lines.

In THE LANCET, No. 264, under the head "FORTON DEFARMENT," there is a letter regarding the study of midseifery, as it is examinations.

You seem to think, Mr. Band, of Leith, two prizes—ditto ditto. that the represed contained in that letter Mr. J. P. Needham, of Yorkshire, for easay, attaching to the French technols, applies Mr. J. Duncan, Roxburghahire, ditto, with equal force to our own. It is said— Mr. Colm Rogers, Pertbahire, ditto. " In fact, in Paris, and in this country, Mr. J. Purteus, of St. Helans, for examifor the most part, there are only theore-natino.

tical courses, and no practical exercises under Mr. A. Tudbope, Roxburghabire, dittotical courses, and no practical exercises under the eye of the tascher; and what is obstetri- Nr. F. Cooper, Durbam, ditto. on instruction without the latter? Howe- Mr. A. Anderson, Selkirkshire, ditto. var excellent the former may be, where will the student learn the art of observation? Mr. J. Adams, Cheltenham, ditto. Where acquire the capacity of self-acting? Mr. J. Mrkay Cunningham, Ireland, ditto. Where acquires the capacity of self-acting? Mr. Dymock. Edinburgh, ditto. Now, Sir, I am happy in being able and Mr. Dymock. Edinburgh, ditto. And the self-acting are the self-acting? Mr. Crambe, Edinburgh, ditto. Mr. Thomas Ward, Edinburgh, ditto. The Mr. Goo. A. Munro, Huntingdonshire, ditto. Mr. Goo. W. Jones, Warwick-shire, ditto. Mr. Goo. W. Jones, Warwick-shire, ditto. the art is practically taught by Mr. Waller, the Consulting Accoucheur. In his returns, the Consulting Accoucheur. In his returns, give a number of small prizes to his pupils, the next exhibits, with the utmost minuter than one or two of greater value; it should be a diffuse real and attention to the consulting of diffuse real and attention. deem it necessary, before they attend any labour, he gives them a private lesson at minimums. He had 196 pupils, among his own house, on the machinery. To whom 19 prizes were distributed, their management to the machinery. their management, he furnishes an unlimited supply of cases; but will not permit them to remain at the bed-side, without his resence, one moment longer than they fully understand every circumstance that for the Districtor Menical Ountleman transpires. As soon as any thing occurs; beyond their comprehension, without waiting for difficulty in the labour, they are obliged to send off a messenger for him : he attenda instanter, makes an examination, and either goes through with the conduct! of the case, or gots the pupil to proceed with it under his immediate eye-he, Mr. Waller, explaining every event.

This must be greatly to Mr. Waller's eredit, as it is most serviceable to the student. If this be oot, " practical exercise under the eye of the teacher," I am totally at a loss to know what would he; as to ony daily simul (if I may say so) examination, by a class, as pregnancy proceeds; if that is what is meast as taking place in the Salle d'Accouchement, I om sutisfied that, in this country, nut even the most depraved class

of fomales would submit to it.

Sir, I have great pleasure in subscribing myself

A Pupil.

#### PRIZES TO DN. MACKINTOSH'S PUPILS.

The following gentlemen, who attended Dr. Mackintosh's lectures in Edinburgh during the course of last year, received Drises.

Mr. Dancan Grant, of Inverness, two prizes

Dr. Mackintosh considers it better to ness, the different modes and stages of par-turition on machinery. If he or his pupil. His plan is also a good one, of giving some

#### A LECTURE

Λ¥

RUPTURE OF THE UTERUS:

DELIVERED BY

Win. CAMPBELL, M.D.

Follow of the Royal College of Surgeons, Lecturer on the Practice of Physic and Alidwifery, &c. Edinburgh.

GENTLE WEN.

I come now to consider an important set of cases, those io which the uterus is ruptured during parturition, an accident which almost always involves the life of the foctus, und otost generolly, also, that of the parent. These cases confer a greater degree of renuonsibility on the practitioner than what arises from the Casarian operation itself; for by it, when early resorted to, the futus must very generally be saved; and of late years, it would seem by the periodical preas; that nu the Continent, in most instancea, the life of the mother has also been pre-

From the indifference with which that illiberal and iotolerant junto, the College of l'hysicians of London, on well as some other physiciana and mechanics of the profeasion, have affected to treat, not only midwifery, but those even who practise the art, I would not be surprised if, amuog my suditors, there might be some who, in imitation of a late calebrated professor, in a corthern university, may throk the art so fools ur illiterate old women; or who, like Sir Aothooy Oyater, of recent atultiloquence, think, that the practice of it by men should altogether be relinquished, oo the of the formidable nature of auch accideota, distinguish men whose future lives are to her fifth pregnancy, bad her uterus ruptured

he consecrated to the easen of humanity, and that you will not aoffer the babbling of fools to influence your better reason; or the dictotes of envy and malice to guide your actions. I thick I hear aomn onn say, thot auch cases are of rare occurrence! Yea. truly, because the sympathy of relatives for the decrased is often an insuperable borrier to dissection, and the grave can tell no tales! But allowing that accidents of this nature do not happen above once in 2000 laboura, or once in the whole course of a long and extensive practice, might not this solitary instance, if mismanaged, he followed by the loss of practice, and lasting disgrace to the medical attendant; or, if the efforts of the practitioner were crowned with auccess, what soluce would it not afford to a circle of relations sod friends?

Although this accident must have occasionally happened from a very remote pnriod, yet we do not find any observations in the writings of the ancients which would lead us to infer that it was known to them. Allencasia, in his chapter de Extractione Fatus mortui, certainly relates a case, where, after the death, and retention of the foctua in the abdomun, the womoo ogain cooceived, and, after a considerable interval, feetal bonea, and a considerable quantity of mattor, were discharged at the umbilious. Albucasis does not uppear to have been aware of oll the circumstances of this case, though, as you will soon be better able to underatund, it was probably an example of the accident under consideration. French accouchenrs of the 15th century, however, the merit is due of having unlightened the profession on this subject; and, since that period, the accident has been simple, that the atudy of it is fit only for frequently recognised by practitioners of other countries.

Laceration of the uterua has been met with in the early months of pregnancy, oftener, however, in the latter months, but score of immorality. But, in nonsideration more frequently still during parturition, from the commencement of pterine dilataand that their victims constitute the most tion until the last moment of the expulsion Interesting portion of the enamunity, I trust of the forus. In the Guette de Sente, for you will study this department of your pro- March 1924, a case is recorded, where a semion with that integrity which should women, cent. 33, in the fourth month of

No. 267.

to have happened.

Malformation and narrowness of the pelsuffered severe external injuries, yet the factua from tolence, userus was not iscerated. One of the most! As to rupture of the uterns from the inextraordinury I hove read of, is detailed in judicious application of instruments, this the 12th vol., Lond. Med. Chirurg, Trans., may very possibly arise when a practitioner where a woman, in the last mouth of preg-persists in the introduction of forceps into down a long steirgase three times, yet she rudely treated, that a person who saw her west on to the full term, and was delivered soon after in a public institution, said that of a stout lieing child. By adducing these they had made minced ment of her manufacture of lacera-possibility of the uterns being lacerated by tion of the uterns is violent action of the squeened between a curringe and a wall, action of the uterus becomes praternatural, In the same volume of that work, and in that of the abdominal muscles is excited

from a fit of passion, and anhaequent vio-lent exertion; she died of hemorrhaga four-there are cuses related, in which the abdu-teen hours after the accident was supposed mins and uterine parietes were turn by tho horns of outrageous auimals.

If you will call to rememberance the ohvis, contraction of the vagina from callus servations which were offered at an early or cicatriz, and enlargement of the cranium period of the course, in speaking of the from disease or overgrowth, are the causes structure and condition of the growid uterus, which usually predispose to this accident. you will readily understand haw this organ. The exciting causes are not as numerous as excepts undurt, where females have been then were at one time supposed to be; extended to severe injury. During the whole traordinary motion of the fectus, external of preguoocy the uterus is not tense, but violence, the injudicious unof instruments, sppears quite relaced, which, with its plasand violent nterine action, hace been men- tic structure, enables it to yield when viotioned. In regard to the first of the latter class lent pressure is exerted upon the obdomen, of causes, I sm not acquainted with any case, whereby it is less liable to injury than if it either from the literature of the profession, were in n start of cumplete distention. The or from any other source, in which rapture uterus and figure are still further protected of the uterus could be ascribed to the strug-externally by the abdominal parieties; and, gles of the fosts; and as to the second, alimetrially, by the counter-pressure of the though I know of second examples, both incubrances of the orum and liquor omnii, from my own and from the practice of which latter is nearly incompressable, oud others, where woman, near the full time, therefore admirably calculated to defend the

nancy, was run over hy a stago coach, to a pelvis, where the britt is scarcely capawhich accident she fell a cictim in twenty clous enough to receive eeen the fiend. I minutes. In a quarter of an hour after life am happy to say, however, that I know of was extinct, the abdominal cavity was open- only one instance of the kind, which oced to save the forus. It was then discover- curred nine or ten years ago, and that, too, ed, that although the liver had been rent under circumstances so unwarrantable and through the centre by the crush of the Giagraceful, that it would almost be desirwheals of the coach, yet that the uterus was able to see, in print, the name of the rosh uninjured by the accident. On the 54th of practitioner. The circumstances were the April, 1822, I was called to a woman who, following: — An experienced accounters while in the last month of pregancy, re-was requested to attend a poor woman in cefeed from her husband so seeere a kick labour, whose pelvis was ascertaised to spon the centre of the indomes, as to cause too narrow to actain the transit of a living a separation of shout one-third of the pla- fectus. He retired from the hed side to centa from the uterus, and consequent death make arrangements for using the perforator of the futus. On the third day after this and erotchet. While thus engaged, another injury, the woman died of inflammation of practitioner called, who, sees ceremonic, prothe abdomeo, and, on dissection, we could received to upply foreeps; and, after having net discover the slightest lesion of the heen once or twice foiled, he at last socuterus. In the summer of 1820, a young creded in extracting a still born forms, gentleman, at that timm attending my lec-whose head was so much crushed, that nue tarres, delivered a woman, who, between eye was aqueezed out of its nocket, and the tha beginning of the eighth and termination mother encapsed with a zent is the cervis of the sioth month of pregnancy, tumbled uteri, ragins, and perineum. She was an

external injuries, but merely, that the oc- organ itself, which may be induced, first, cident rarely happens from this cause. In by premature rupture of the membransa; the 49th col. of the Dict. des Scien. Med., and, accordly, by disproportion between the p. 255, there is a case related where a firtus and the peleis, i. e. the futus may be woman, in the seventh munth of gestation, large, and the pelvis below the natural had the uterus ruptured, from lineing been standard, ar actually deformed. When the

by coasent, whereby the accident is hurried jruptured when its action has been neither on. You can easily understand how either severe nor protracted; secondly, that when of these causes leads to this injury. When the cranium fills the hrlm, there will be no the membranes of the ovum are prematurely great hemorrhage; and thirdly, that unless burst, the liquor amuli escapes, and therefore the laceration be in the body of the uterus, the firtal head comes into immediate contact with the uterus, which, as it is now pressed between two bodies firmer than itself, must somer or later givn way where to me by a Gautleman who saw the patient this pressure is most exerted, or where the uterus is weskest.

Whea parturition has been much protween the head and an exostosia, or the and there was an exostosia on one of the brim of a contracted pelvia, inflammation pelvic bones. Labour had been suffered to and ulceration of the peritoneal auriace of continue for many hours; the patient died the uterus may ensue, and terminate in rup- undelivered, and without an attempt to ex-ture of this organ. When the necident hap- tract the futua; and, on dissection, several pens from violent and long-continued ac- senta had been found in the uterus—an ex-tion of the uterus, such cases have been tensive one in its body, through which the

just discussed. On the 21st of Nov., 1824, uterus.

1 was requested, by my friend Mr. Scott, Tho last case of which I am to give the fingers could reach. Dr. Duncan, was differently situated. jum, obligingly visated the patient, when the haboured under very furmidable symptoms, such as black romition, &e., but she rant fellows of the London College of Physikianaety recovered. The foregoing case science, say to these two eases? Would taughtime—first, that the uterus may be they withdraw their ungenerous opposition

its action will not cease entirely.

The next case I am to speak of is one of which the particulars were communicated when she was in articulo mortit, and who afterwards witnessed the dissection of the When parturition has been much pro- loody. In this, as in the case last narrated, tracted, and the uterus long pressed be- the head of the lortus was hydrocephalic, term must lead to an idea that the uterus truded among the intentines. This rough may be injured without cause, it abould be aketeh, which I traced with the pen, the day on which the Gentleman who communications. Aly own experience in this accident is cated the case to ma witnessed the dissection, and has been sequired where lacetion, will usured you some idea of the difficultion prose from the cause which I have rent lacerations, and their situation in the

of Broughton, to see a patient he was then you an outline, is one which occurred on attending; she was thirty-six years of age, the 14th of January last, in the bands of the mother of several children, and had suf- the pupils of a contemporary teacher. It ferred little in her furmer eunfinements, was the woman's third confinement; she ller labour, on this occasion, commenced was about thirty-three hours in labour, and about eight or nine at night; merine ac-died undelivered, without any one hut mere tion was moderate, and auddenly, between atudents seeing her, and, consequently, one and two, her bearing-duwn efforts all without an attempt to extract the focus, most entirely ceased. I saw her ut three although, from the accounts I received, she in the morning, and found her with a sapid, must have lived for nine hours almost after indistroct pulse, an anxious appearance of the accident. I knew nothing of the case countenance, excruciating pain in the abdo- until the friends came to my Dispensary to men, on the least pressure, and a slight request that I would come to open the body, coming of blood per regimen. In this can: Dr. knox and Mr. Lizars, with pupils hedition, Mr. Scott and myself thought it in-longing to onch of ux, were present. The perative on na to deliver the woman imme-jexmination of the hody, which was condistrly. Though the head bad not entered mucted by Mr. Lizars, was most interesting, the hrim of the pelvia, a lengthened pair of The rent was very extensive, situated in the forceps were applied in a few minutes, but! fore part of the body of the uterus, and perthe head, after a cautious trial with the mitted almost the whole of the body of a instrument for about half an hour, could not pretty large mule fectua to pass through it; be brought down, and at last it slipped, the fundua uteri was well contracted. The The perforator was then pushed through head was firmly fixed in the brim of a nar-the craninas, when a considerable quantity row pelvis. The casts which I now exhibit nf fluid escaped, which led us to a know- to you were, at different stages of the dis-ledge of the true nature of the case: the accion, taken by Mr. Lizsra from the body futua was imagediately brought along, and of this poor warmen. The position of the an extensive breach was discovered in the firstus was exactly the same as that repreposterior part of the certic uters, extending sented in the beautiful plate published by appearing into the body of the uterus, as far the uniable Deuman in 1815, but the reut

to this branch of the art of healing being ble to my pupils. I am, thrrefore, bound to placed upon the same footing with physic, believe, whether the article containing the or any of the other departments, and ac-terior of the control of the control of the control of the management of knowledge that it was full time the legisla-the Journal was neder the management of pel candidates for pehlic favor to provo, by bands of the respectable individuals who at examination before competent judges, that they were worthy of being trusted with the must have escaped their notice in the burry lives of their fellow treatures, in situations of publication, or that they would never of all others the most responsible? If u otherwise have been inserted. man is transported bayond seas for the whole uwarded against men who, in their sober lead to rupture of this argan. I can easily judgment, suffer their fellow erestures to believe this, but I have no knowledge of die without an attempt to render proper assistence. You are not always, however, to expect to the latter passage, nowever, a must one serve, that Dr. Duncan, junior, whin, until these precursors, for the accident has hap the last year or two, wear-dutor of the Edis-bergh Medical and Surgical Journal, and long in labour, but where even oursine see whose opinions justly have great weight tion was not remarkably strong, as in the with the profession, always in any conver- case in which Mr. Scott and myself were sation which I have had with him, ettongly concerned. We can speak with the greater impressed on me the necessity of affording confidence of the concomitant symptoms, or as many opportunities of practice as possible those which denote the presence of the more prominent parts.

nion may be delivered when the patient circumstances, there are lew, if ony, praclass been early and acientificolly rested tical errors that can more includy stain efter the accelent, when uterium action is the classacter of the mexical attendant, present, though but in n trivial degree, and he regard to the treatment, when symptonic control of the tion of intestine, and the total escupe of these remedies have use been successful,

accident. Whenever it happens, a feeling the focus into the abdominal cavity, where is conveyed to the muthur of something having given way within her; so obvious, indeed, is this sensation, that to some invaolecen to the patient; but whence, more
atances, not only the sufferer, but the medifrequeoily, it is discharged by extensive cal ottendant even, have been said to have abscesses, which evacuate their contents, at heard a noise when the nterus was lace- different points, through the abdominal parated; the woman experiances expreciating riotes, per regimes or rectum. Of such cases pain to the injured part; and if the leaion; yow will find some published, by several of be in the body of the utrus, the pains will our own countrymeo, in the Edinburgh Madicases, but if in the cervix, labour will con-cal Connectary, Edinburgh Medical Essays, tione in a very partial degree; blood ouxes and in a very i creating pamphlet, pubper organism to profuse or limited quantity, lished in 1810, on Retroversio Uteri, by according to the proximity of the reot to Dr. Merriman, of London. Similar cases the placents, and the extent to which the baye also been recorded by Austruc, Barbrim of the pelvia is occupied by the head; tholinus, Littra, and others. Death, from excapt when the cranium is wedged, the pro-tile protroning of a fold of intention into the soutation receden; the countenance is pale, uterus, has been less frequent. One fatal solitation recodes; the cumulenance is pale, laterus, has been less frequent. One fatal anaisus, and displays a peculiarity of sapect case has been reloted by the distinguished which no one who has once witnessed it, Baudelocque; and a mast extraordinary one, can mistake in u futura case; a vomiting of in which the patient recovered, by Dr. distriction of the colored fluid follows, with convulsions of M. Reever, in Dublin, in a very useful little and ayocope, which, when the hemorrhage work published by that gentleman in 1815. Is profuse, soon proves destructive to life. When the Peritoneal cast of the uterus is the uterus ruptured naring severe lobour, turn, the blood flows; int, the abdoman and torn, the blood flows into the abdomen, and which continued thirty hours, and nearly very little per nazimam, and, as slreedy no four fent of intentine protunded into the titcel, the extrume fotusion will also be twenty agains, and sloughed off on the 6th day limited, when the heed is lixed in the bries. If you place the band upon the abdomen, the patient vaided all the forces through the patient will complete of great tender—the breach in the uterus, per regimen. At ness; and when the firtua has been forced the conclusion of that period they took in among thu intentines, you will be oble to their natural course; eighteen months af-trace distinctly its limbs, not all its other terwards the woman conceived, and bas ore promine of parts.

Our proguosis, in every case of this kind, of a small female child. This last case must be guarded, and more especially if proves what may be occomplished by so much time have been suffered to elapse beserve practitioner, while it must, at the fore proper ossistance has been unfovied to some time, convince you of the propriety the putient. Profuse discharges of blood of effecting the delivery of your putient, per regularm, the escape of the fectus from the however nofavourable may be the condition uterius into the abdumical covity, the total in which you and her, for it is impossible cessation of utering action, indicating the in foretri the advantages which may arise lareration to be in the body of the events, to the parent from the extraction of the protresson of a partion of intestine into the firths. You should strain every nerve to uteres, black vociting, convulsions, and prevent a patient dying undelivered, for it syncope, should be viewed in the most un-creates a great upriar among the attendfavourable light. A mure involumble opi auts, and others of the sex; and, under most

when the pulse is little affected. In some toms are evalved which would lead you to iustances, the patient sinks in two or three; apprehend rupture of the uteras, the actionbours niver the accident, while there are of this organ most be mederated, in orde, other cases in which they have been known that the bood may be more progressively to live for several weeks. When the case monided to the polytic, or that an interval of terminates favourably, recovery is generally, ease may be precured, to enable the pracattended by a lingering convalencence. The littimer to odupt such measures as the case fatal event may be ascribed to a variety of may require. This object you should re-consecute as hemorrhage, inflammotion of deavour to obtain by bleeding the patient to the peritonous from la-cration, or from approaching syncepe, and be exhibiting from the estation of blood, or begoer small, into the BD to 120 drops of the teach upli, accordsac; protrusion and atrangulation of a por-ling to the vig. ar of the sufficier. When

that you dread the bursting of a blood-vessel. When rupture has actually hap-pened, let it ever be impressed on your minds, that nothing but early dollvery can save the patient; and how this is to be effected, must now be determined. Should the uterna be incorated during the version of the futus, the delivery, by this method, must be persevered in. The same practice must also be pursued when the accident happens before the es uteri is sufficiently expended to permit the use of forceps, provided the aperture is dilatable, and open to auch extent, as to justify a practitioner in proceeding to introduce the haud. When the preference.

instance where the nterine dilatation is adequate, and where the head presents, whetanaion of the rent is inevitable,

socident. As Dr. Hunter's putient lived for marvellous for belief. upwards of three weeks after her delivery,

try the effects of intimidation, which, from to her own improduce—and as there are its powerful influence over the uterus, may also several cases recorded, where the futus prove a valuable agent in diminishing the continued in the abdominal cavity for many violence of its action. You may call out years with comparatively little inconvenience to the patient, who enjoyed good health; got rid of the retained feetus hy suppuration, and ultimately recovered; or who, while the extra-uterine fetus was still retained, conceived several times-it has heen recommended when the fortus has been ejected by the nterns into the cavity of the abdomen, to leave matters to nature. As to the practice of extracting the focus by the natural passage when extra-uterine, I regret to say that it has been so unsuccessful, as completely to discourage us from attempting it, since every woman, in whom it was followed, whether late or early after the nocident, has died. If there he auy the uterus is injured while the head is example recorded, where the fretus was exwedged in the pelvia, whether from dia- tracted from among the viscera of the abdoproportion, exostosis, or a tumour, the permen with nithmate success to the parent, I forstor must be used; but when the brim is strongly auspect that the rent was not in the aufficiently capacious to permit the head to body, but in the cervix of the uterus, or pass, the short or long forceps must have upper part of the vagina, for these perts are not codowed with so much contractility as It is my firm impression, that in every the hody of the uterus, nor is laceration of them at oll so dangerous to the patient. Professor James Hamilton of medicine and ther above or below the brim, that forceps, midwifery in this Ciniversity, relates among long or short, should be used, in preference his Select Cases, published in 1795, one, to turning, as, by this last method, an ex- io which he says that he removed a focus from among the abdominal viscers, and that When the fictus completely pames from the mother recovered. Now, I know that the nteripe into the abdominal eavity, two some weak-headed people are inclined to be modes of relief have been resorted to : first, a little scaptical regarding this case, because to accomplish the delivery by the natural all others of the kind have been fatal; but passage; and, secondly, by the section of this merely proves that every practitioner the abdomiual parietes, or gastrotomy, as it is not equally dexterous; and if the fietus is termed. Let us now consider which of were by any chance to hurst into the urmary these merito the preference. Io regard to bludder, what would hister the professor the first, it is proper to atste, that volcas from extracting it per unsheam, he means of the accident has been attended by profuse Sir Astley Cooper a forceps? (A laugh!) To be morrhage, the uterus, and consequently loc, such a cone would not appear half so tho rent, except it he in the cervix, will, in extraordinary as another which the proa few hours, contract an greatly, that the feasor is accustomed to relate, where a practitioner can neither introduce the hand woman, in the latter months of pregnancy, through the es times, nor the laceration, amported for a formight, the trifling less of without some degree of force, and conse- a large chemher-pot full of blood daily, and quent extension of the latter opening, at last died. Secondly, although the furua There are several well-authenticated cases, when ejected among the abdominal viacera where the firtua; at the lapse of a consider has been, at some future period, successfully sole period even, had been brought through discharged from the living body by abscess, the breach into the uterus, and extracted per yet this fortunate termination would not raginam. It ours of these, in which the late justify us in leaving such a case to nature, colebrated Dr. W. Hunter was concarned, since a far greater number of patients so the fector had been allowed to remain among circumstacoed, have amk under the most the abdominal viscera for three days before painful and protracted anferings. And, it was withdrawn. Mr. Goldion, in his lastly, in regard to those individuals who; pamphlet on this subject, relutes a case we are informed, conceived during the sa-where the focus was not removed from the tention of the fecus, your own good sense abdomen for twenty-four hours after the must teach you, that such cases are far too

Controtomy, the second mode of relief, and then, as it was approach, fell a victim from its near resemblance to the Calcarian

operation, is a formidable expedient; yet the nerus, I would recommend that, after it would seem that many women who submitted to it have had a complete recovery, the band should be introduced material to the performed at the lapse of properly contrasted.

Finally, as in a faw females who recovered. rated. The first wall-suthenticated case in from rupture of the nterus, the like secident which it was successful, is to be found in has recurred in their succeeding labour; it the third volume of the Journ. de Med. for 1768; the fostus was still born. You will nd in the second volume of the Pathol. Chirurg., the case of a woman who had been viduals, to prevent the action of the uterus twice successfully operated on ; the second being viulantly anited. This I consulve time, the futue coutinned to live for half an hour after its extraction from among the sinon been successfully followed by Dr. viscera. In the second volume of the Douglas, and other geetlemen; but if the Quarterly Journal of Foreign Med., there is a case in which the operation proved suc- fore we are called, or the pelvis narrow, cessful to the pareet, although it had not this practice cannot be adopted. been performed for twelve bours after the accident. And, ie the first Number of the Edinb. Joure, of Med. Science, p. 118, there is a fith operation, by which both mother ond child were saved. From the result of gastrotomy in these five cases, or at least operations, when the axtrection of the factes from among the abdomical viscers. has not been attempted immediately after the accident, the preference must certainly be given to the section of the abdomical parietes; and the same practice must be adopted, when the forms is ejected among the intestioes, before the uterios aperture is sufficiently dilated to receive the operais sufficiently dilated to receive the hand of siderable quantity of blood, or liquer amaii, course of reading it will be clearly seen,) domee, gastrotomy, by offerding an outlet those of Drs. Gall aed Spurzheim. to these matters, will be attended with fur- I feel completely convinced, the ther advantages to the patient. Once more tiral part of the substance of the brain is let me remied you that when this operating unly subservient to the medulary part, inis thought necessary, it must be perfuriced with nu little delay as possible.

portion of intentine indicates itself into the part of the brain, and evan nervous system, utarus, and where this orgen has contracted and is which their effects become perfectly so much that it cannot receive the band to developed; hence it is the medulary part reduce the intestice, Pigrai, the friend and of the brain to which my observations refer, favourite pupil of Ambrose Pare, recom- and which possesses all the distinguishing mended gustrotomy; and I think his recom- living properties peculiar to the brain, as mendation must be acted on, for I see no living brain. other way by which, in such ruges, the object ] of the practitioner can be attained. These, however, are desperate cases; and, generally, wa may not be sware of the nature of the patient's complaint during life. Baedelocque relates a case, which, much to his credit, be tioes not believe hisoself, where one of his equatrymen, three days after the accident, introduced his hand, armed with a bistoury, into the uterus, enlarged the reut, and reduced the letestice. But if any part of this (without the cerebrum,) and we take away atstement be correct, the leceration must the judgment; this is a fact fully astablished have been in the vagina, and not is stere, by M. Floureus and Professor Relands, be-

#### ON THE

ORGANIC MATERIALITY OF THE MIND:

The Immateriality of the Soul, and the Nonidentity of the Two.

By G. D. DERMOTT, Esq.

has been effused into the carity of the ah- that my sectiments do not at all tally with

I feel completely convinced, that the cornamuch as the former is the sest of birth to certaie qualities, which afterwards become Where, after the removal of the fortus, a diffused or circolated through the medullary

I know that there are certain masses or portions of the bruie, individually possessing their peculiar properties or fanctions; thus there is one particular portion of the brain which is the region of perception, another the region of thought, another for memory, and seother for judgment; for, we take away the cerebrum, and we take away at once the perception, thought, and memory; we take away the corebellum, To prevent strangulation of the intestine by cause these actions (mental, as they are so

ganic function of the stomach to digest; for, by taking away the latter, we take away the function of digestion, and we alould simply produce this effect, if we could do it wirhout producing injury to the nervous or vascular brain is invigorated, i. e. its functions, systems, or the system at large, by breaking or mental powers are quickened; if the the harmony which must be naturally exist-velocity of the circulation be increased

It is in vain to state, that what I have now ventured to affirm is untrue, upon the strength of an assumption founded upon ignorance and prejudice, and frequently madeties so totally different from inarganic marter, that our ideas as to the nature of the former, must not be ot all fashioned by those as to the nature of the latter ; hence, what is demonstration to a physiologist, cannut be conceived to be clear demonstration to a the nature of physiology: for instance, who in their different portions, as living parts. would suppose a priori, judging merely But to take up the argument on free canal to be one of the chief means of makthe organic function of any other viscus. It was derange the atomoch, the lungs may be ment, in the same viscout. The same may be sympathetically affected by the influence of said of thought, which is the immediate her har various if we have the her was t the par vagum; if we derange the lungs, the stomach may be reversely affected; if we lessen the nervous energy of the system, for reasons I shall hereafter show.

monly called,) are nothing class than the lall the mimal functions are correspondently organic functions of these several parts of debilitated; and if we unnaturally axeite the brain, as it is the peculiar living or or- the sanguineous system, the animal functions are correspondently deranged. I need not say how much these effects are seen in the brain; now, by exciting the circulation in the brain, the nervous energy of the ing between the functions of the different to a greater degree, then come, or pura-visors to constitute a period body. incciunical pressure of the diluted results un the substance of the beain, or the affusion of serum: on the contrary, if the natoral strength of the circulation is matethat the meotal properties are totally diffe-rent from the known properties, and all necessary consequence, the energy of the established ideas of matter. For our ideas nervous system, the arteries of the brain, are founded upon our knowledge of dead or along with all the other viscers, become vaorganie matter, to which, and theology, the proportionally weakened; the mind be-divines, and every sensible man not connected with our profession, should confine tween the functions of the different parts of their speculations. On the contrary the the brain, probably becomes perverted; the knowledge and pursuits of the properties of thoughts falter with the rongue, may, more, organic matter, or animal life, is a know-if animal depression still goes on, inaction ledge of Itacif; organic life having proper-supercenes, and the brain, as a component part of the animal system, becomes inactiva, and syncupe is ancoroded by death: the mind is gane-gone with the power of di-gestion-with the power of chylificationwith the power of aanguification-with the power of respiration, &c., because the divine, unless that divine has an elaborate proximate cause was itself the arganic acand an unnecessary degree of insight into tion of the brain, and properties isherent

But to take up the argument on fresh from the properties of deal matter, that it grounds, it is undoubtedly the peculiar could be the peculiar living property of the nerves to feet, i. s. a stomach to carry on the inconupreheasible property of organic matter; and by the different property of organic matter or an arrangement of the property of organic matter; and by the different property of the canal to be one of the chief means of mak- parts of the body, every part is possessed ing blood; for the arteries to be firing tabes, with mensation, and carries on its just and for these living tubes to be circulating a actions, and by which peculiar, living, mateliving fluid, to be producing equally incom- rial property existing in the nerves, all secprehensible effects on every part of the sations and impressions are conveyed from body; and again, for the nerves to be pos-the different parts of the body to the brain, asseed with peculiar sensibilities and living this (which is a property of metter it must sensed with peculiar sensibilities and living this (which is a property of matter it must powers, so besutifully shown by Hell and be understood) produces perception of the Magendie; and again, fur the brain to be sensation—it excites the action of percepconcessing the organic functions, which have tion in some part of the brain; now this possessing the organic concession, where near serion of perception must be un detion of hitherto been invariably denominated mental. If further proof were wanting, than the living matter, to be produced by the sensition actual abstraction of the criticia portions of thus conveyed to the brain by the nervea, the brain at a the identity of function of it. they must be both nuterial, because certain parts of the humu, I might only ob- material and apritual things are so diffeserve, that the cerabral, or mental functions, rent and incompatible, that one would not are, by every person, seen to be as inti- be the direct effect of the other, or the mately associated with the system at large two principles could not be so existing cotemporally, and in a corval state of develop-

<sup>\*</sup> I call it nervous energy, or influence,

facts to support my doctrine. In the most perfect animals, where the senses are the estanding between them and certain medullary portions in the lower part of the engineum: and so that there is a medullary mass of the beam corresponding to, and the medullary part of the nerves) an indiponding in size, so as to be commensurate in its development with the understanding, and with the necessities for these senses thus numerous and perfect. This is the the brain will be necessarily fewer; in a ratio to these defects, the intellectual or mantal part of the brain, as it may be bearing a parity with the senses, and the necessities of the sound. In minute still lower, we may have a very imperfect system of nerves, and a correspondingly imperfect brain surreunding the top of the assephagua, at large, and its less necessitous condition. still lower, we have a symptom of this essence existing in a modified state, in cluse association with the organization of the scusitive plant. But to review the statement that I have just made, for the purpose of showing that all these animals have, more or less, a mind.-The training of the dog, the breaking in of the borse, and the laugh-

sequence of perception, and, therefore, not shie feats of the elephant, are the education immaterial; and the same may be said of spless animals, and no system of education memory, of judgment, and of all other members of perations, the sequences of the last; a mind to work upon, or in which that is to be inculcated. A man strikes a horse, he to comparative asstomy, there I have very feels the pain produced by the impression of the whip on his back, that impression is facility to support my doctries. In the most conveyed from the part, through the median conveyed from the part of the heart of the heart of the heart of the part of the heart of the part of als, where the senses are the of the nerves, to the brain; the impresmost numerous and perfect, we have nerves sion begots perception, perception excites thought, thought excites memory; he resollects what he has been taught-the whin excites; his judgment then teaches him to direct an impulse, through the madium of continuous with (through the medium of the moving nerves, to the voluntary mescles, for the purpose of quickening his pace. vidual sense; and we have the intellectual borse knews his way to his master's stable; part, or the higher part of the brain, corresthis is by dint of memory, er, what is the same thing, by his aducation. But I will sak any philosopher or divine, can this cleplant, this horse, this dog-nay, we will say, a spider, a lizard, a saske, ur a cockle, state of man, whose brain and mind are most be possessed with an immortal soul; and if perfect. As we look through the inferior so, (for we have undeniable proofs that all become less perfect or less numerous; here with man, —forsooth, by parity of resthe corresponding parts of the brain are less sooning, if we consider God just, which developed, or as the senses become fewer, he certainly is,—these abanda in the health of the brain sed a future state; but such an economy would be an unmerciful extrapagance in the Crestor, and would be derogatory to all the termed, will he less in size, because there attributes of the Deity, as well as the digare fewer agents, or fewer senses, to excite nity of man, who is asserted to be " ofter his own the sensitive mass into action, and its image." As such a principle as a soul is unoperations are proportionately more limited, deniably acknowledged-is it not, I would say, an ebaurdity to suppose, that the lastmentioned passage in scripture refers to any thing else! If a spiritual principle does axist, it must be totally different from matter, and incompatible with matter, in a certain sease; is the form of a large gauglion, but this i. a. ergmic matter could not have its opera-is only commissioner with the comparative tions fully developed coresporelly with those non-complexity is the frame of the sound of the immeterial principle, the soul, in the same frame, or we should necessarily know If we go still lower, we find the sensitive or more of the exact properties of the soul, or nervous essence pervading the polypus, like the nature of spiritual things. As long as so many granules or spots; usy, if we go organic life continues, so long, I maintain, the soul must remain dormant; but, on the other hand, as zoon as the life of the body ceases, so soon the soul enters into a state of development, or into a state of setosl (I may say sensible) existence; because as we are taught, it is intended for a spiritual world; material and spiritual things cannot be existing in a state of intimate association, because they must be as different in natura as two extremes can possibly be; and, consequently, their state of sensible coexistence would be incompatible, and their

<sup>·</sup> For there is no reason whiy the term mind may not be applied to the functional uporations of the brain, taking them as n class of operations to distinguish them from the operations of digestion, obylineation, &c.

<sup>·</sup> For memory is only the accumulation of past thoughts, or past ideas.

union of function an impossibility; we the commands held out by the doctrines of know nothing of the spiritual world; let divises and philosophers say what they performed these duties, will feel an inward please, we only gather, and nover shell distained, from the knowledge, than that the works of astures are wonderful, and certied on by a consection of cause and effect, and that there irriess, equal in virtue to most of the restord that the rest of his religion, that he has a restorated and the same of the same of the same of the rest of the restorated that there irriess, equal in virtue to most of the restorated that there is the same of the restorated that there is the restorated that there is the same of the restorated that there is the restorated there is the restorated that there is the restorated that the restorated there is the restorated that the restorated there is the restorated that the restorated that there is the restorated that the restorated that there is the restorated that there is the restorated that the restorated tha most elaborate composition of our language, in consequence of their supposed immors-which refers to matter, should never be lity. attempted to be used to express the natura of apiritual things, because we have egither language nor ideas so to do.

education, and without which there would as to what is right and what is wrong; be neither conscience or judgment; or, which inward monitor is only the produc-that is, a knowledge of knowing what is tion of an secummulation of knowledge deing right, or what is doing wrong. For or known facts and doctrines, or entirely instance, suppose a man brought up in a the effect of aducation; in fine, canacience hardwords state, and in a distant country, is knowledge—keowledge is cunacience, and supposing it were in accordance with the political and religious laws of their altogether from the very nument of his sometry, that a mun, to prove himself velicity, that had a commenciation with olient and virtuous, (for virtue, according to the motions of barbarians, consists of brutal to be brought up and fed abstractedly from courage,) should of necessity perpetuate the world,—that man would have no more a certain number of murders, and should be knowledge, no more language, so more is possession of the heads of his victims, as conscience, than a beast : he would natu-

must be a great and almighty first cause, or, them; or he would, perhaps, he regarded in other words, an omnipotent erestor,—a in an immoral point of view by his fellow-God. Man gathers his religion from other countrymen, more especially if he had not sources than the natural ck ation—the Biblo acted with his wouted hiswesty when coerand revelation, for faith is declared by our tair opportunities offered; he would fael established church, to be the "foundation of degraded, restless, undappy; or, more destablished church, to be the "foundation of degraded, restless, undappy; or, more deour religion;" if the Bible is true—If revels- cidedly speaking, his conscience (fashioned tion is true, as is acknowledged—if these by his barbarous birth and education,) are sent by the Almighty as our sources for would condemn him till be had fulfilled religious information, and sameans on which those duties. But, on the other band, wo, we see to place implicit dependence, it heed in a civilised and Christian nation, would be both unjust and irrational to seak have our ideas of right and wrong-our out for sinister evidence, with the view jndgment—that is to say, our constitues of supporting the Imagined deficiences of isshinned altogether by the train of think-the former; in short, although it is for ing our minds have been subject to in the man's good to believe in the existence of a course of this religious Christian velucation, future, spiritual world, and it would be —we take the doctrines of our religion as a future, spiritual world, and it would be —we take the doctrines of eur reagion as a daring folly in a person to deny it, because scale—as a means of judging between right he caunot comprehend its astura, and lm—and wrong—of determining the duties that pious, as well as ignorant, is the extreme, to comparative merit which each man has for only knows the extinence of such a thing surpulnually subtering to the principles upon the atrength of the testissony of which have been taught him for the repusarity to the principles which is the principles are plure, butters know nothing accurately tation of his character, and the comparative of the principles are plured to the plured as to the meters of a future state, nor have tive demerits also of others. He condemn we say conception whatever as to the us- a man for murder; but supposing a people ture of spirits, nor can say human language existing possessed with such a religion as convay to the mind any just idea as to the one first alluded to—they would condemn their nature, or as to the properties with a man for perpetrating xo murder, and both which they may be endowed, because our might be considered, (belonging to these language is not calculated for a spiritual two very different nations,) ender these dis-existence, but is appropriated precisely and fevent circumsusses of birth and education, solely to express our ideas of enter around singuity guilty; both hulght feel equally on-us in this material world; and, therefore, I demned in their minds, and both might have hold, as spirit and matter are so totally differ entailed upon them, by the sentence of the rent, that even the wideat extrames, or the laws of the two nations, a great punishment,

I only wish to provo, by the abovementioned supposition, that conscience is totally a relative term, a nensibility of the We do every thing from breeding end mind, an impulse dictatory to the mind, trophics to testify his having consummated rally, but unconsciously, possess all the powers of a man, but which powers had not been brought into actios: " it is education that forms the mind," or, what is nearly the

same thing, calls it into sotion.

There is one more observation I would make, before I close this paper, as to the constitutional or original capacity of men to uttain different degrees of knowledge and mental excellence. I maintain, that all Mechel's Archiv. for 1827, there is a descripmen's brains are not born slike, any more tion of bronchial vessels which have been thes their hands, their fact, or other organs; discovered in the factus of hirds and mam-i.e. as there are "constitutional peculiari-mails. We give a detailed account of this tice" in men, apeaking of their bodies in a discovery, which will be the more interestgeneral manuer, so there are functional pe- ing, as, in many respects, it confirms the general manuer, so there are functional peouliarities of perticular parts;—one man's
stomach may naturally digest better than
another's; one man's liver may produce a
greater secretion of hile than another's—
one man's kidney may secrete o greater
quantity of water than another's; one man's
mant, goes through the type of these formantings which form the anatomical characmantings which form the anatomical characsirculation may be naturally quicker than mations which form the anatomical characanother'e; some men's nervous sensibility ter of the lower salmals. may be more seute than other's ;-sud some

mind. Thus, I believe that Sir Isaac Newton might have had originally, previous to his receiving any degree of education, a ao ignorant clown who follows the plough. I helleve siso, that different degrees of intellect arn observed is all classes, from the highest rank in society down to the lowest.

## FOREIGN DEPARTMENT.

ON RECOCKIAL VESSELS IN THE POSTUR OF MENMELIA AND BIRDS.

In Oken's lais for 1827 and 1828, and in

men's (for I believe that they are but one the iscubated egg, divides into three Malpighi first observed, that the aorta in men's (for I believe that they are the bare the factuated egg, divides but into the living principle under different modifica-branches, which afterwards units again, and tinns,) corebral sensibility is greater than that of others. In other wards—the pow was confirmed by Bojanus and Pander, era of the mind, (the brain), are greater; Rathke, of Dantsie, and Professor Planchke, one man, where the animal functions are of Iena, discovered, that from the third to earried on constitutionally alow, shall, per- the seventh day of incubation, on each haps, asturally have a dull percent in, and side of the neck three fissures are visible, haps, asturally have a dull percepted, is, and side of the neck three fissures are vimine, a slow success on of thoughts, indicated by which lead into the casolingua, and thus a slowner of summal action, his thoughts crity, or scarcely equalling them; another man shall naturally have his functions carried un with a much greater celerity—he the subject of a rapid succession of thoughts, radinent of the lawer jaw, and the lowest has the considered as broachial arches, and it is the subject of a rapid succession of thoughts, radinent of the lawer jaw, and the lowest was numerous, and much more viscotists of the subject of a rapid succession of thoughts, radinent of the lawer jaw, and the lowest was numerous, and much more viscotists of the subject of a rapid succession of thoughts, radinent of the lawer jaw, and the lowest was numerous. the subject of a rapid ancreasion of thoughts, radiment of the lawer jaw, and the lowest much more numerees, and much more vigotime from the observations of MM. Huachka and case: in fact, the hrain shall carry on its functions with twice the vigarr, which shall formed by Malpighi, the norts sends a open to the mind a boundless imagery, and which may be accompanied by the foest and most effective figures af speech. I helieve, then, that although all men's inches, minds an methals of thinking in the formed by Malpighi, the norts sends a formed by Malpighi, the norts sends a formed by the former are altogether air vessels going from the norts. On the 4th day, the highest bronchial artery divides into two branches, minds an methals of thinking in the future carotid, one actoriorly, which is the future carotid. index, or methods of thinking, are fushioned one asteriorly, which is the future carotid, by eduration, and communication with people around them; yet there are difference axising as to the natural puwers of the third bronchial vessel. This and rences axising as to the natural puwers of the third bronchial artery also anastomose. and the union of all thren with those of the other side, form the trusk of the norts deaceudens. No other ramifications seem to mind more adapted for the prosecutius of take place from the bronchial vessels. On his elaborate philosophical researches, thus the 5th and 6th day the broneblal spertures begin to centract, sud, at the same time. the vessels undergo some very important chasges. The third bronchial artery of the left side, which from the beginsing was the amalicat of all, disappears: that of the right aide remains, but ceases to sunstomose with the middle broughisl artery, and becomes the future right pulmonary artery, the left being formed by the middle broachial fissures has disappeared.

chial artery of the left side. The middle results are visible on each side, which any vessel of the right side loses its connexion with all the vessels, except with the sorts descendens, and thus forms the arcus sorte. The highest bronchial arterien exces to communicate with the middle branches, and become the future innominate. During this ment of the third day, the fourth bronchia metamorphosis, the trunk of the aprix assent a sich is very assell at the sense time tha metamorphosis, the trunk of the north assen- arch is very small, at the same time the dens is gradually shortened; the left mid- fissures between the urches become very die and right third bronchial arteries thus distinct; that above the highest bronchial approach more and more to each other, and, farch in the exit of the cenoulogue. The lastly, having united completely, form the mentus unditorios externes is formed on the truck of the pulmonary merry, the innami- oth and 6th days, and has no communication nate (originally the highest bronchial arte- with any of the fisances. During the 3d ries) also approach gradually, till they at and this days, the bronchial spertures enlarge last become branches of the areas aorta, more and more; the highest vascular section formerly the right middle bronchial unters, from which at this time the carotid has Thus, according to these discoveries, the urisen, begins to disappear, and is lastly. whole arterial metamorphosis corresponds obliterated entirely, and the caretid is supexactly with that visible in several umphi-iplied with blood from the next bronchist bla, especially in the Batrachii. The ob- vessels. After the complete disappearance servations on the incubated egg were fol- of the highest srch, a fifth is formed under lowed up by the examination of the fattal the fourth. The second bronchial aperture pig at a very early period, and the fisaures begins also to decrease, and is, on the fifth at the side of the neck were distinctly seen, day, closed by the increased deposition of as from the similarity which obtains be-tween the arterial arrangement of the prin-cipal arteries io birds and mammalin, might the firth duy, the other fiveres become olso have been anticipated. The only difference gradually filled up by organized natter, and, seems to exist with regard to situation, ss, at the same time, a very remarkable meta-in birds, the norta descendens lies on the morphosis takes place in the heart and the in birds, the north descenders has on the morphous takes pince in the heart and the right side of the avoidagus, said in name hilbus sorts. In the former, which, until malis on the left; in the latter, the middle this period, was simple early, the septum left broochial artery will consequently re-is forming, by means of which the blood is present that of the right side in birds, more and more divided; in this nanner as Tbe docus arteriosus is mamuslis, is the double current of blood begins to take place, remains of the snashnowing between the fill at last, instead of the single vessel. middle and third branchial arteries of the which existed hitherts, two separate canala left side; in hirds, it is the same on the are formed, which represent the norts and right side. The accessory ductus arteriosus: the trunk of the pulmonary artery; at the in birds, is, originally, the anastomosis of same time the bronchist fissures are closed the broughist trunk behind the ce-oplagus, the vascular stelles are shortened, and After the 7th day, every trace of the bron- gradually retract into the thoracic cavity, chial besures has disappeared. After the complete obliteration of the two In Meckel's Archiv. of 1827, Professor highest bronchial vessels on the fifth day, Baer, of Kenigeberg, makes some very inte-three vascular arches are left on each resting remarks on the bronchial vessels in side. The blood, the current of which the forms of birds and meramaha. At the earliest periods, co bounchial tripered in the following manner—from apertures are found in the human feetus; the right eavity of the heart it passes they do not appear before the fifth or into the lowest branched viewed of each taight week. At this time there are three does not to the model entry of the left fagures which lead into the modelagues, and side; the blood of the left cavity goes into which cannot be his overed externally; the highest bronchial vessel of each side, they become, however, very distinct, if the lateral portion or the need, viz., that part of the bowest branchial array of the left add the which cavers a med the offers is interesting and the libral which cavers a med the offers, is intedup and of the right cavity is carried into the lowest drawn towards the head. They are also, very partity of the right, and the middle unterpy well seen, if the grander, us is opened. It of the left side, the latter of which was oriseems, even, as if there were fire spertures, ginally the fourth. This direction of the but not at the same time. Now it has been traly observed, elothes; the nipples were well formed and that mon puzzled are half persended; and,

terior part of the alveolar process, and with indalent; the quantity of blood discharged swelling of the guma; after an incision in the latter, the pain diminished; no pus was could not be aqueered nut af the mannes, found; but within a few days, three moiar the pains in which were almost intolerable, tasth were protested; and two months after and, whenever the discharge of the blood wards, another appeared. Since that time | ceased, or the weather changed, Increased Menatruation, which had always regularly appeared, having now, for the first time, CREE OF GALACTORDHOTA AND ANOMALOUS filled to do so, vielent congrections in the head chamber of the book towards the above the book towards the book towards the above the book towards the was very ensy, and there was an abondant humnrrhages, the patient always very secretion of milk. Two months after de-rapidly recovers, and her general health

BY FOOT LAMENESS IN HOUSES.

In the Sporting Magazine for August After she had weaned it, n real galacturrhen last, there oppeared a long article on foot begun; the broasts continually secreted lameness, by Nimrod, its thief contributor. milk, which was abuedantly discharged by whose opinions on such a subject are sup-day and night. Her general health did not posed to be highly valued by necrtain class seem to be affected, and the meases con-in his readers, because he is runsidered in tinued regular. In this state she remained understand the crimer of fear-hunding, and, of for six years, having, in order to get rid of course, all that in any way appertuns to it, her burden, constantly suckled neveral in. The veterinary profession will be willieg to fants. A practitioner, in whom she epplied how to this mighty hooter's skill as a snortsat this period, bled her very freely from the man, but when he comes forward to pro-arma and feet; the flux of the milk was nomice on the causes of foot tameness, or almost immediately arrested; but, in its lay dawn dogmas respecting shocing, he atesd, blood began to be discharged from becomes a poscher, smemable to tha laws of the breasts, with violent pains extending to criticism, and must be treated as he would the shoulder and acck, and increasing if the treat an unqualified person sporting on his

of aboring, ho is led into the wildest reason-When Dr. Jacobson, who relates the ing, appears to be without principles, and, case, saw the patient, she looked very to a heap of assertions, mystifies the mat-

tion to take rather high ground, having paid for work, and has "never seen a solitary particular attention" to this branch of instance of contraction occasioning lame-grounding," meaning, I suppose, "foot cas." "Assee, mules, and poniss," ha lantoness." He wisely adopts also the discussers, "bear me out here, for they are legical styla, which gives a writter who purparents and abservers, "bear me out here, for they are assoling, a convenient of pourse of versioning that the state of the that ha does not know a sign his ground whenever he rambles into good "out from none that is contracted, at difficultie.

be the basis of my reasoning.

the natural form of the foot, but not once in

netting this saids, if the opinions of this would never take place, if the foot were not writer are arroneous, his expariance and prevented from relieving itself in its natural gratuitous knowledge will give them undus way of expansion, by the vile fixed shoe, influence; while, on the further on, he states " is not they be coslly valuable, a few commants will the general cause of foot lamaness." Great do them no lajuey.

Nimrod begins by annouacing his intenNimrod seams to prefer a contracted foot
tion to take rather high ground, having paid
for work, and has "never seen a solitary
particular ettention" to this branch of instance of contraction constants. least it is avident by his comparison of the l'age 273, "Why should I be deprived uf feet uf these infarior animals, asses sod range x/s), "ray should be deprive on just it these inserts', initials, saces not vanity, that choicest gift of heaven? We mules, which are hard, upright, and sacture all subject to apeculative errors, and, rady narrow, with that of the nuble horses, I am not without my share; but wide spreading and elastic by nature, as here I shall speak the powerful and practically confirmed by artificial means, that he call language of experience, and facts shall in wholly ignorest of its true form. The veterinary profession must be at a low abb, Paga 274, "Na horse evac was, or evar when a writer, without evan the rudiments will be lamed, from merely wearing an ill- of foot knawledge, can set up to decide on constructed above." " Bad shoring will alter its diseases.

With such alender information to reat on, a bnudred times will it of itself produce he does right to samune high ground; pra-lumeness." Here we see the folly of those tansions are nothing, unless maintained ill-defined and optional terms, good and had with confidence. Thus ha tella his imagi-showing. The fact is, that as contraction pary inquirer, A, " I mean to imply this, and immooran ensue in ensuequence of oonyou shall keep your horse five years without
fining the elastic foot in a fixed trom abou, it shows, and doing nothing but entming wild
matters not greatly whether this piece of in his peature; I will keep my heras ahod,
iron be rough or amooth, (i.a. good or hed;) doing weak, and in the stable, and at the for, if the nails are driven as naual, the same | end of five years, tho feet of my herse shall effects will inevitably ensue fram aither, be not only as about as those of yours, but Therefore it happens, that many geotlemen, in a firmer and better state," &c. All of great practical experience in hanses, pay which may de very well to tell a Cockney least attention to their shooing, on finding sportsman, and might lead him to believe that no cars or expense ou their part can that Nimrod has the secret. Shoeing, that avert the evil, and that some secret cause, i.e., his mode of shoeing, be also defined with the contraction of the contr which they do not understand, is operating, to be cultivating, following, and embeliable to thwest their best enduavours. Ninrod's ing Nature!! Passing over much redunebservation has no far taught him right; but dont language about feet defective from now, to what causes does be proceed to st-birth, we arrive at his opinion, that it is tribute foot lamenaus, "principally to these, the "telling pace," and not the iron damentural mai-conformation, or, rather, weak fence of a slice, that lames one helf of our manufacture of the internal particular that there is a shift of the lames of the lames of the lames. organisation of the internal parts of the horses. As this is a plausible and very organisation of the lateriat parts of the librac. As this is a plausible and very loof; inflammation and fever, produced by popular excuse, I shall take the trouble to exeitement in high feed, and hard riding or provide the explanation for it. That homse driving; concussion from heating the ground in fast work have the west feet, is a concust the coad and at grass; irregular and unprepared for work; improped position in reason, because they are generally light the limb, occasioning an unaven tread, and, made, well bred horses, and, as a necessary above all, the pace, — it is the pace that kills. "I accompaniment, have lavariably highly Amidst all three plausible excuses, not one is least in feet, which and fee from the contrast-Amidst all these plausible excuses, not one plastic feet, which suffee from the contractof which he can explain, the true reason, ing tendency of the shoe and nails in a fac the unnatural confinement of the common greater degree than the source horses em-abos, is completely avarlooked. I aball is ployed is allow work. Nimarod, and such quire whather we are justified in imputing lamperfinial observers, looking only at the diseases which nover occur to horses lu their fact, ascribe mischief to the pase they go at, state of nature, to seatured med-conformation, which is, in truth, the cesuit of their more week organization, or improper position of the delicate organization. There are many limb, due. As to "communicate from heat-blood horses that do but hittle work, and are ing the ground on the road and at grass," it yet ruined as speedily as those that do, and,

on the contrary, we find many of course breed that go a fast pace, the mail cart horses, for instance, yet are rarely lame in the fact; in fine, the difference in suffering will be found dependent on this rule of com-parative classicity. Therefore I care not what pace the horse goes, let him be properly shod in expansion shoes, and his fact will not contract at any work, or in any place that Nimrod can put him, provided the foot is uninjured when they are first applied.

Nimrod considers a perfect foot " as one of the finest apcoimens ( the plastic art; his recipe for a good foot is curious and concise: " it should be made of firm materials, chosen?

hnt expressed in off-hand and aportsman. This, and this slone, can give a man a right like phrase, taking little pains to concest to speak positively on such a subject, and a his ignorance of these subjects, on which he capacity for doing it without making blunto pass judgment. It is the husiness of all patent expranse shoes of Mr. Clark;" it must men who write with fluency on a subject they do not understand, to level all distinct specially it is a some ground for so they do not understand, to level all distinct specially it is a supposed that he has some ground for so they do not understand, to level all distinct specially it is a supposed to the state of the supposed to do it by many proceed to erect the superstructure of their though atrongly pressed to do it by many among the ruios.

lameness?

that so long as we have an inflexible unyielding anhatance affixed to a flexible elastic foot, so long shall we have lame horses, and Mr. Bracy Clark does not stand mions here.

" A. Why, then, has not the ingennity of man found out a remedy for the evil, by inventing clastic shoes, giving way to the ex-

tension of the foot?

various patent expansion shoes of Mr. Bracy . Clark, and others?

" A. What is become of them?

" B. Did I not tell you that the systems and system-mongers were all gone to pot together? Expansion shoes have been tried, and not found to answer; therefore it is fair to conclude, that mere concussion is not the root of the evil. Furthermore, " never having tried them, I can give no opinion of the effect of what are called expansion shoes ! "

" Never having tried them." It is anflicient, most mighty hunter I without this admission; that you have asserted more than you know, is manifest in every line. You read the funeral service with much any froid over all the systems, but whatever may have becase: "It anonic he made of him materials, lee systems, but whatever may have because and able to resist discase." This, however, fallen others, the expansions sheer of Mr. Bracy can only he proved by experience." Then Clark, greatly improved, but not altered in of what value in this advice to choose a good principle, is used more axtensively than cont of firm materials, and able to resist discover; and without heing at any paios to case, (that is the contracting tendency of prove that principle right, I openly challengs the common abos.) and give no rule by any person who doubts its truth and still which this good foot is to be known or lity, to contravene them. For the practical proof, let him make fair trial (not upon dis-In speaking of expansion shore, the ideas cased feet only) of the effects of this system, of this writer are most crude and ill-digested, and be guided in his judgment by the result. assumes, nevertheless, an unhounded right; ders. When Nimrod tells us of the " various own opinions, with the materials they find who saw the value of the invention. Abova twenty years ugo, he secured the patent For instance the following: " that there right of a certain kind of removable defence is no general system to be pursued in abor- for horse's feet to be taken off or night, or iog, is heat proved by the well-known fact, in the atable, and for a share to which he that all system-mongers and their systems was offered considerable auma, h.c. never have gone to pot together, and we now attempted publicly to promulgate it. Inhear no more of them." Further on the ideed he abserves, p. 35 of the Stereogle, dialogue continues. "I used many of them on the road with con-" A. But in it not generally supposed that siderable satisfaction, but thought them, on concussion, increased by the resistance of an the whole, too complex to recommend for iron shoe, in the general cause of foot- general use." This also was before his discovery of the structure of the foot, upon "B. I should soon hewilder you and my- which is founded the present system of ex-celf, (that is to may, he can neither disprove passion shoeing, and for this, I vepeat, he mor explain it.) were I to enter fully into useer took out even a cavest to justify the this subject. Mr. Bracy Clark has told us, atstement of " various patents" imputed to him by Aimrnd.

Annther passage, and I have done with

this part of the subject :-" I very well remember the noise that was made about Mr. Bracy Clark's jointed shoe, which was to preserve horses' feet to the latest periods of their lives; on tha principle, a just one truly, of importing to the shoe the same degree of elasticity that the " B. What! have you never heard of the foot itself possesses. This was to have formed the basis for the repose of the profession, but the dream was of short duration."

This style will never do, Nimrod. Mr. Coleman must quietly bear the surcusm

<sup>\*</sup> Query; ought not the whole body to be formed on the same principles?

pose to your pretended post-mortem observations on the expansion shee. The hope expressed, at the conclusion of Mr. B. Clark's work on the foot, that the principle he had there explained respecting might form a basis for the repose of the (alsoeing) art," had no direct reference to the expansion alos (Nimrod has copied the phrase from a misquotation); but, in either case, it is literally fulfilled; the French and coetinental veterinary colleges" have adopted his nomenclature and exposition of the foot; these pricciples are admitted and practised in Russin, end no where denied but in England, which is

With the frog-pressore system, which comes next under " the hauter's ken, observes rather more cereusony, bringing various proofs of its fair triul and universal failure, which are wholly dispensed with in his previous summary judgment on the expanaion shoe. The agency of the shoe in producing foot-lameness, Nimiod has, in great measure, denied; and goes near to assert, that contraction of the fout is heneficial; it is not fair, therefore, to quit this erticle without examining some of the arguments he brings forward tu eccount for it. The chief of these appears to be, p. 286. that nature has, in many instances, given the enimal "badly constructed limbs," or " twisted forelega," but it is a fault " not always visible," end so uncertain e criteriou tu trust to, that until the ruin of the horse nothing can be known, " en it is possible that, despita of the twist in his forelega, the tread may be even, and thus his feet bave been preserved." This is on a par with his previous saniest advice to choose a good foot, but giving no rule tu do it by : it satually amounts to nothing; for the present, therefore, I shall attribute foot-lameness, be the forelegs twisted or atraight,

No. 267.

...

that you pass on his frog-pressure system, to mischievous art, and exculpate Nature, because, I believe, he caenot enswer it; Such assertions are excellent loop-holes for but I have strong proofs of vitality to op- ignorance; but, in default of all these, rather than admit the real evil of contraction, he has adopted that famous end conclesive decision of the ancient farriers to wit :-- that " when diseases of the feat cannot be traced to any specific cause, they are fairly at-tributable to ailment of the whole system dropping into the legs! !"

As I before ated, Nimrod, like most men who have tried macy plans, all baving the same common principle of fettering the foot, and, eunsequently, the same had effect, is isclined to ettribute but little of foot lameness to aboeing. After recounting variare admitted and practised in Russin, end ous other imaginary causes, "the twisted no where denied but in Eugland, which is legs, the telling pace, the high keep, &c. &c., a ferther proof that a prophet is not without hosour, save in his own cuuntry. More- the bind-fnot, which is, he says, " more ueover, as a slight accessory fact, it may be farourably shod;" sed yet it is not npon observed that I am personally engaged in record that a lorse was ever groggy, or shoeing horses on the expansion principle, foundered in a hind-foot. "Now, I think, shoeing horses of the expansion principle; if foundered in a hind-foot. "Now, I think, am well supported by the public, end do in one will dispute these facts: first, be not even despair of making Nimrod e complete the system. At present I am well is no means, Nimrod; they differ as much, pleased with him admissions, p. 280, "that he mever tried capansion shoes;" and, and for the same, or e similar resumm, 289, "that the principle of their application because their purposes are very different, inter-" this is smooth, and have form the I Australiand demanates on a slone show 289, "that the principle of their application, because their purposes are very different, is just;" this is enough, and many form the Anatumical demonstration can alone show basis of a hetter understanding on both this properly; however, it is very easy to ace, in a trotting horse, that the fore-feet perform the more arduous part of hearing the chief weight, and receiving the shock of the enimal, while the hinder ones fulfil the simple office of projecting the body forward. The former ere found naturally flexible, spreading, and highly clastic, the latter more upright end concave, much less elastic end emaller, so that eny man accustomed to handle the hoof, ought readily to know them spart in the dark, and the argument would disgrees env veterioarien. I shall orguo no further with a man whose knowledge of these things is so shallow, as to lead bim to assert, that two organs so different, and performing such opposite functions, as the fore end hind foot of the horse, are fac similes of each other. He challenges ony one to dispute it, cailing it a fact, and using it to support a bottomless theory of his own. Could Nimrod suppose that Veterinary Surgeona, we whom he enrols in. a late unmber emong the " curses of horsefirsh," would allow bim, a mere sportsman, to intrude oe our department without reproof? or did be imagice that the same language which passes current no sporting sub-jects, would earry him through when treating of mattern relating to our profession? Ou practical points, it is more than likely that his remarks moy be worth hearing, and he should have confined himself to these,

#### THE LANCET.

London, Saturday, October 11, 1820.

WE are sincerely desirous of witnessing, and, se far os our efforte can have such a tendoucy, of pramoting, the presperity of the Medical School in the Loodon University, and it is because we are sincere well-wishers to that establishment, that we feel it right to call attention to a tirade, directed by ane of Its Prafessurs, partly, us we are given to understand, against nurselves and the great body of medical reformers, and portly against a distinguished member of the profession, who has rendered himself ohnoxiaus to the corrupt few, by his disinterested and ealightened efforts ta restore the independence and respectability of medical practitioners. We stated, on a former occasion, that Dr. Conolly, the Professor of the nature and treatment of diseases, as he somewhat inaccurately styles himself, was an nutried man; oud we trust that we shall out be called upon, in justice to ! the University as well as to the public, to state, that he has been tried, and faund wanting. Certain it is, that he has commenced agreed by many matters of great interest, most insuspiciously. Instead of symiding, as Somo of you may, perhaps, be persuaded, the introduction of topica extended to ex- constitution. On the propriety of these cite party feeling, he has seized the very changes it would be unbecaming in me to offer ony opinion, in this place. But let me first apportunity of manifesting his individual opinians, if not of gratifying his percalmly, and ant to give way to say feeling sonal resentments, on the question of me-dical reform,—thereby committing, as far as the public, of which that profession forms a in him lay, the interests of the University, and exposing the new establishment to the be influenced by any, who, on the just ill-will of a large majority of the medical ground that old establishments need necesprofession. We would willingly persuade in the destructions, would really engage you in the destruction of what is useful as well ourselves that the attack on medical re- as venerable. Hear the opinions of the old formers, which Professor Coxolly had as well as of the young; compare one with the taste to foist into his introductory fur the present, to nibers, the care of Lecture, was not dictated by a more unchanged demanding time, which yes have worthy motivn then the gratification of his nat to sperc; experience, which you connuity, or the desire of propagating his own opinions without reference to the interests valuable hours, and neglect your greenest

of the University; but we are bound to state a fact of which we were not aware, when we formerly alluded to this gentletlemsn,-namely, that he was once the editor of a medical journal, and that he madeatly usoribed his failure, in that capecity, to the ignorant sod unjust preference evinced by the profession and the public for THE LANCEY.

Professor Conumy piques himself, it should seem, un the composition of his intraductary Lecture,-for he has thought it good enough to print, -ond we shall, thereinre, transfer to our pages, sud make a few abservations, in passing, an the peroration which contains the tirede in questino. The Professor will probably marvel at aur intrepidity; or, as his piety and his vanity seem to go hand in kaod, he may, peradventura, weep at the ubdureev of men who are nat only nomoved by the perusal of his masterly philippic, but who are ready to give it a circulation which it would never, except through the medium of this Journal, have ahtained.

"You cummence your studies," says the say man of camman tact and discretion wauld i before your studies are completed, to tuke a have avoided, in the outset of his career, their object certain changes in the medical but a desire to do good to, and to protect, the part.

" Beware how you allow your passioos to

opportunities, io endeavonring to effect what condoct, let your first inquiry be opnormably your anniors can effect,—hoers which ing the character of those who are most acyon two never recal, and upportunities (two is it, and who are to be your associates, which will never present themselves again; Ask yourselves if they be truly homes menhut will be looked back upon, if lost, with pain and regret as long as you live."

Oo this part of the Professor's address, we have but faw observations to make. is not true that the medical profession is in an agitated state; on the contrary, we muintain that the members of pur profesaion enjoy oll the traoquillity which belongs to a conscinuaness of their atrength, and to a conviction that they will soon be amaocipated from the tyraeny by which they have bean so long oppressed and degraded. Dr. ChnoLLy talks of the medical constitution. and of the vanerable fabric which the friends of medical reform seek to destroy, as if the College Chorter, ubtained by the Surgeona' Company in the relge of his late Majesty, were as accient as Megna Charta. But if it were as ancient as Dr. CONOLLY approses it to be, a Professor of the London University should have known that it is the ntility, end not the antiquity of an establishment, which constitutes its title to nur respect. The Doctor's remarks would have been far more uppropriately uttered in a Collega lecture-room, where the Prefeator receives a premium for the perfunctory discharge of his duty, thao in the theatre of an ioatitution, whese avowed object it is to get rid of oll absurditles which are tolcreted, merely because they have long existed. But the opinions of Dr. Coxozar, us an iedividual, are of little importance; and what wa mainly object to in the indiscretion of entering at all upon topica calculated te provoke augry feelings, and entirely unconnected with the subject on which he was called upon, in his official capacity, to address the atudeuts. He has himself sel nowledged the indecency of discussing such topies in that place, and the reader will see from the following peasage, how far he stands self-convicted of this iedeceocy :-" And, Gantlemen, above all things, when you are urged to any particular line of

tive in it, and who are to be your associates. Ask yourselves if they be truly honest men. If they are not, have nothing to do with them in any cause, for they will corrupt the heat. In all mountries pretending to civilisation and morality, people havn long been convinced that the end, however laudable, dues not justify unbuly massa. It may be your duty to endeavour to reform, but only if you can reformby benourable efforts. An ancient edifice may require repair, and repair might conduce to its safety; but if the four skilful workmen who along could undertake this experiment of preservation, be surrounded by a passionate and unstrupulous multitude, their wise efforts will be overborne, and no good end effected. If you forget these truths, and become committed to the cause of injedlcious, or selfish, or recklass, men, be assured you will find, even in your own profession, a apirit which will not tolerate you; and by the public sense of this coentry, you will be epposed and defeated in avery step of your proceedings.

This is the passage, we suppose, which is aimed at opracives, and the medical reformers generally. How far Dr. Conoult may auceead as a " professor of the nature of diseases," we are rather at a loss to coniectura, because wa confess that we do not exactly know what it is " to profess the nature of diseases, but the perusal of the foregoing, and other portions of his Introductory Lecture, bas astisfied us that the Professor is. at least, a master of that branch of rhatorie. which has been uptly denominated tweddle. The Professor, as our readers most have observad, cannot divest himself of his revareuca for antiquity, or of his notion that the College Charter is as old as the bills. The " ancient edifice" we take to be the College Charter, or, perhaps, what the Professor calla " the medical constitution;" the " few akilful workmee" are evidently the council, or surgical oligarchy, in Lincoln's Inn Fields. and " the passionate and unscrupulous mui-

A man may profess the science, or branch of science, which has for its objects the nature and treatment of diseases, but to talk or write of profession the sadare of diseases, is, with all submission to so profound a rhetorician, to talk or write nonagase.

other words, the great body of the medical coorse, appropriate, bowever cheap we may profession. Of a truth, we feel at a loss bold the Professor's praise; and we are, whether most to admire the justness and therefore, constrained to believe that the liberality of the Professor's sentiments, or whole passage was simed, as it was gencthe richness ced becuty of the allegory in rally understood to be simed, at an indiviwhich his sentiments are veiled. Hitherto, dual whose character is far beyond the reach the Doctor's remarks appear to be simed of the Professor's calumoy, and whose tarather at the great body of medical reform. lents even the Professor's eulogy cannot ers, " the passionate and unacrupulous mul- depreciate. titode," than at any particular individual; but his setire becomes more pointed towards and we troat, not for his sake, but for the the close of his harangue, and the followlog sake of the establishment to which he betemperate and judicious effusion is, we un- loogs, that so injudicious and indecent au derstand, levelled et that most obcoxious, effusion of weakness and venom as that because most upright, independent, and no- with which he disgusted his hearers at the compromisiog reformer, Mr. Lawnenca.

> Observations on Diseases in which a Residence on the Coast is most beneficial. By WIL-LIAM HARWOON, M. D. London, Colburn, 1828, pp. 326.

DR. HARWOOD has selected a subject preline ourselves, Gentlemen, that we dn live eminently calculated to excite attection in this our "sea-girt lale;" for we believe thern is scarcely a country in the world which, like Eogland, presents the example of the greut mass of its ichabitanta annually migrating to the sea-coast; performing a pilgrimage, as it were, at the ahrine of The vituperative part of the above pas- Neptune. Sea air has, lodged, from time sage we should have been perfectly willing, immemorial, been regarded in this country estimotion, os we do, the value of the l'ro- almost as a pousces for all the numerous lis fessor's consure, to take to ourselves; but to which firsh is heir; and yet we venture qualities," the " high codowments," " the to the sea coast, has been pursued, even by medical men, rather from a kind of pre- | southern and western coasts, has also been scriptive right, than from reflection upon the circumstances, the co-operation of which is necessary to enance benefit. In saving this, we would not be thought to underrate the advantages, and certainly not the pleasures, of a temporary sojourn on the coast, doomed as we are throughout a great portion of the year, to inhale the smoky and murky sir of the metropolis -air which, as our medical poet beautifully expresses it, " reeks back from a thousand lungs"-we fully appreciate the invigorating breeze of the ocean, and acknowledge its animating influence. The question, bowever, now before us is, whether in noy, and in what, cases of disease, a reaidence upon the coast is beneficial? To the investigation of this aubject. Dr. Harwood's book is professedly directed.

After some general observations on the varied oature, or "medical peculiarities," of our coasts, the author proceeds to treat of the causes which affect the temperature of coast situations, and more especially that of the seuthern coust of Eogland, which be considers as the mest eligible, " not less from the advootage it derives, in common with all others, from the influence of the seo, then from its lotitude, and other peculiarities."

Dr. Ilarwood ragards it as so established foct, that the ses, having imbibed a large portion of coloric from the aun's rays, hos the power of equalising the temperature of the air in its vicinity, from the wellknown property which best possesses, of equally diffusion itself through cootiguous hodies. Hence, he argues, arises the difference found to exist between the tempe rature of coasts and that of the interior of estensive continents, although placed in the same latitude.

In respect to the temperature of the southern and western shores, our author hazarda the following opinion :

thought to be infinenced by the agency of the stream of water which flows towards Enrope, from the Gulf of Mexico, occasioned by a material difference between the level of the gulf and that of the Atlantic Ocean."

Again :-

"It is also very probable, that an additional elevation of temperature on our coasts, moy more frequently be influenced by the current issuing on the Bay of Biacsy, which is thought to be dependent on a simi lor penning up of its waters, and is stated to flow generally north-west by west."

These preliminaries aettled, the Doctor proceeds " particularly to notice the vicinity of Hustings." There is nothing like leather, said the honest currier—there is no place like Hastings, saya Dr. Harwood. It is adapted either for a sommer or winter residence. In the former case you may live upon bills, " two or three hundred feet shove the level of the sea, visited by the prevailing breezes;" and, io the latter case, there are numerous habitations, below the cliffs, " most effectually cheltered, at all acasona, from the more piercing wiods." So says the resident physician of Hastings; but in Dr. Good's Study of Medicine, where treating of phthisis, we find the following oppeaing (and perhaps we moy say posing) remarks :-

" The topography of a situation about to be chosen, is of equal importance; for if it be atrongly marked by lofty cliffs or mountoins, the oir will seldom circulate freely, but rush in currents in some ports, and be obstructed and become stagnant in othera, Such is the state of HASTINGS, on the Sussex coast of our own country. The shore is akirted by two coormous cliffs of saodsione, that rise between two and three hondred feet in perpeodicular height. The old town is built in a deep ravice opening towards the north-east, that lies between them and the new town immediately under the cliffs, fronting south and west; and hence, while the air is rushing in a perpe-" The increased temperature of our tual current through the former, it becomes

ter."-Vol. iii. p. 307.

The author next makes some judicious observations upon the effects of sea air, and then enters into a consideration of bathing. and its effects on the constitution. In respect to cold hathing, we ment with the subjoined remarks, which especially merit inqualizing the circulation throughout the attention.

" I think I may venture to observe, that, whiln much of thin beneficial action induced by the warm bath on the ayatem, is primary, and machinically dependent on the agentthat of the cold is secondary, and dependent a circumatance which, in the practical treet-ment of disease, in of the highest importanen ; for it is obvious that the latter demanda a certain degree of power in the avatem to effect its completion.

" Too many instances are, however, preacoted to our notice, in which, from the the cutiele, and rendering persions the weakened and impaired state of the animal pores, (the cuticle, which is o mere intenpowers, this eannot be attained; in such sible shield to the true skin, and perforated

an impression with which it is unable to skio,) it has the healthful tendency to re-contend, the blood being determined in more every chatasle which imposes the due wardly, and it being long hefore the beart performance of the superficial secreting and arteries recover sufficient energy to organs, whether of sensible fluids or insen-propel it back into the extreme vessels on sible exhalation; while, on the circulation, the autface; hence arise continued shiver- its lumediate operation is like that of the ings, and an unpleasant sensation of cold; re-action occasioned by the cold hath; somethe countenance appears pallid, while any moning into the extreme vessels on the internal organ affected by disease, espessurface, a free and equable distribution of cially if that disease be of an inflammatory their fluid," nature, is unfavourably influenced by this derangement in the eirculation.

"That a certain degren of energy in the eisculation is necessary, to derive due ailvaotage from sea-barbing, though less is required by it than the cold bath of fresh water-a fact of great importance-is no iem obvious from its prejudicial influence when too frequently had treourse to by debilitated persons, in whom it may be really

indicated.

We have long been convinced that coldbathing is 100 indiscriminately recommended and adopted. As the author justly observes, power in the system, and this power is sel-On the subject of warm-bathing, there is man will read them with advantage." much misspprehension prevalent : from an

stagment, beated, and affective, in the lat- | entirely-mistaken notion, the warm bitle is almost universally looked upon as a relazant. Dr. Harwood has so well uxpressed himself in accordance with our opinions, that wn cannot do better than transcribe his remarks.

> i I may observe of the warm see bath, that while it is capable of invigorating, by entire frame, its action is no less that of a soothing stimulus to the servous system, producing, by its naternal operation, that kind of influence which is derived from the more grateful aromatics, or mild cordials; when token internally.
> " But it has this very decided advantage

more on the energies of the system itself; over the latter, that the slight exhibitration it produces, is not succeeded by that ilepression which is usually induced by other classes of atimuli; its action being less powerful, and the impressions it pruduces

more general and permanent.

#### QUERY: DLASGGW INFIRMARY?

#### To the Editor of THE LANCET.

Sin,-You will perhaps allow me, through the medium of your Journal, to inquire of your readers, and the profession at large, what they would think of the following case, if it occorred in a huspital, end of the following treatment, if adopted in such a case, by a hospital surgeon A:
We will suppose then, (for I go no far-

other of the femals nurses of a royal infirmary, (and there are royal infirmence slike in Dubliu, Edinburgh, Aberdeen, and G. Asoow)-wo will, I say, suppose that some one of the female nurses, (let it he No. 1, 2, 3, or 4, if you like; or, perhaps, we may as well say No. 5,) hy some accident falls in auch a mouner as to injure the right hip joint, and give rise to a considerable degree of inflammatory action in that part. will next approse her confined to hed for the space of three days, without consulting either of the surgeons; but that, at the end of that time, a certain surgeon physician, ward, among others, in which this nafortuleft her. Imagine him sending her once more to bed, but not till after he less the second time made e great and heroic ettempt (with the smistance of his pulleys, and some four and twenty men of strength,) to give the poor unfortunate, relief. Suppose him next, (ofter a few doys more have ises,) to have useembled, onder the name of a consultation," a mighty cohort of the P.S.—A few learned and the wise. Picture to yourself Co. in my next. the wretched patient once more (i.e. for the Mird time) brought out, and stretched upon a bed on the floor, with the drewl impleplements of our art spread around her, and in momentary four of a renewal of all her

former sufferings, by having these imple-ments most barbarously employed.

Fancy, now, that you see the several members of this very imposing consultation, in regular enccession, take up their rules of admeasurement, and ascertain most accurately the length, and breadth, and dapth. and circumference, of every point of met-tar, which may go to assist in the compo-sition of their patient, from her nevel downwards, even unto the points of her toce; fansy all this, I say, to be ot length got through; and, if it will not tire, just imagine the whole to be once more repeated. ther than supposition,) that some one or This too heieg, " in the fulness of time," brought to an end, you must behold, or rather think you behold, this mighty company retiring to one side of the room; and being there aurrounded by something less than half a score of clerks, (all starving for lack of knowledge, aranding with wide-stretched eyes, and gaping mouths, and their " long ears pricked forward," upparently determined to see, and hear, and swallow, every thing that is intended for them, and to much more as may chonce to drop from the lips of the learned and the true.

Just suppose yourself sitting in eexious expectation, during the time this precious whn may chance at the timu to be one of the host is standing " in council solemn and devisiting aurgeons, and in attendance on that liberation deep," to decide un the nature of the case before them, and the treatment nate nuise lies, is consulted. We will still which ought to be pursued. Fancy yourself go on to suppose that this certain Doctor, quietly hoping for a treat, in seeing the pulater all due inquiry and examination, pro- leve presently employed, and tell me what nounces this inflammation of the hip joint must be your suspise and astunishment, to be e" dislocation of the head of the feetor; when, the Council heing dissolved, you ere into the former a ovale," and accordingly uses enally informed that its members are unthe pulleys, for the purpose of reducing this certain whether there " now he, or ever have aupposed dislocation, without auceess. We been, any dislocation?!!" What, let us easl, will, in the next place, suppose the patientre must the public, as well as the pupils, thick turned to bed, and, of the expiration of a few of such a surgeou? And allow me to indays, again dragged into the operating the. quire, if nuch be a suitable man to fill the etre, to have the reduction of this imaginary attuotion of a hospital surgeon, where he has dialocotion effected. Conceive the surgeon, not only the education of his pupils to direct atill foiled, and then fancy him retiring for and complete, but the health, and happi-e while, (during which time his petient is ness, and life, perhaps of hundreds, nades left in the theatre), to commit Sir Astley his peculiar and immediate eare? And tell Cooper on dislocetium, and returning, in the me, ought not this kind of treatment rather course of a few minutes, as wise as when he to have been expected is those times, when our profession was considered as a " mystery, " than to take place in the present day, whee it is looked upon us " an art," and as " e science ?"

I eet, Sir, Your obedient servant. THOMAS CASTER.

P.S.-A few words to Messrs. Wood and

## ST. BARTHOLOMEW'S HOSPITAL.

CASE OF A LABOR UNMANAGRABLY TUMOUR UN THE SCAPULA.

pearance, though not of strong constitution, patient, he cannot think it is bono. Its re-

thought he had sustsiced no serious injury, the idea of operating, and, for a time, took little or no notice of Sept. 17. The patient thinks his general what had passed. The first time his atten-health is better now than it ever was, and of the scapuls. The glands in the neck, charged incurable. on both sides, and left sxills, are rolarged; those in the neck to about the size of nilhert; those in the sails, not to case of nilhert; those in the sails, not to case of the sails and to case of the sails and the sails so great an extent. Mr. Karle got Meaars. FAULL, WITH DEPRESSION OF BINE.-Vincent and Stanley (Mr. Lawrence was not in towo) to examine the tumour with patient's general health.

increased onlargement, to attempt the removal of the tumour, but wishes Mr. Lawreces to see it first. Mr. Lawrence is of opinion, that the growth proceeds either immediately from the scapula, or, that it is in very close contact with it. Notwithatsuding its firm consistency, from its rapid THOMAS SELLWOOD, must. 35, of short production, general appearance, and the atsture, ruddy cumplesion, and bealthy ap-otherwise sound constitutional health of the was admitted into Magdalen Ward, under moval would be n operation no one ought the care of Mr. Earle, on the 31st of July, to be ambitious to perform; and, therefore, 1828.

The patient stated that he had been to defer the use of the knife, at all events, coachman to Lady Stapletoo, near Henley, until Mr. Earle's return. He looks upon the and that about fifteen months ago be was case as one likely to terminate unfavorably, crushed against a well by a horse. He Mr. Skey, in compliance, has relinquished

tion was drawn again to it, was by the de-that it has daily improved since he came to tection of a swelling of about the size of a the heapital. No remedies have been rapullet's egg, projecting from the inferior ongle sorted to, except attention to the general of the left scapula, and which be concluded health. The tumour is, ut least, one third must have been forming for some time be- larger than when first seen here. There is fore he perceived it. It gave him no pain, now, occasionally, felt an sching pain in it, but increased rapidly in aise; and from the The covering integuments are greatly inincoovenieuce arising from its bulk, he was, eressed in vascularity. In the most dependat length, under the necessity of opplying ingpart of the enlargement, there is a slight for professional advice. He was put noder fluctuation felt, as if there was a small porthe care of Dr. Tuckwell, of Claford, who, tion of fluid contained in a cyst. Mr. Earle after paying attention to the state of the had presed an acupuncture needle into its patient for some time, was induced to state, substance, before he left town. His opinion as his opinion,—"I think this tumour would now is, that if cut into, the tumour would be better away, but I do not like to remove probably present a mixed medulary and it." Sellwood was then sent to town with acirchous appearance. From its increased a recommendation to get under the care of enlargement, the unfavourable appearance Mr. Earle. The tumour is now as large as of the covering integuments, the state of tha the lead of a full-grown feetus, rather oval- patient's chest, and the condition of the shaped, perfectly smooth, and when grasped, glands, he thinks the disease malignant; (which may be done forcibly, without occa-ulso, that as the operation of removal would stooing soy pain whatever,) feels as hard as he an extremely mainful one, and from which bone. 29. The wounds are nearly healed,

PUPLISHAL ANYTHISM-OPERATION OF TWO ING THE TEMORIE ARIPHY.

Thomas lligby, metat. 2h, a musculer ond besithy-looking young man, was admitted into Neaman's Ward, on the 14th of August, under the core of the " seeinr Surgeon.

He atated, that about two wreks back, in wheeling a barrow louded with clay along some planks, his foot slipped uff, and his herl was suddenly placed upon the ground, and he felt something give way in his ham, or, to use his awa expression, he beard It " crick." He was immediately seized with sonveyed to the Hospital, where, on exami- afterwards, he felt a small imp in his ham, rected to it, by ite being attenued with a mere effect of that jeslousy for which pardistinct throbbing sensetion. This ewelling don me, Sir-I em coneciuse of daily giving so rapidly increased in a few deys, as to completely inespacitate him from walking. In this state he applied to the Hospital: when admitted, the ansurismol tumour was considerably larger than a pullet's egg, end completely occupied the poplitral apace. The patient seid, that it had incressed rapidly within the last ten daye. Its pulsation was strong. Pressure upon the ertery at the grain completely rectrained the pulantion, and the tumour then became almost abliterated. He was ordered to keep his hed. Some mild aperients were administered, and he was bled to 18 ouoces. The operation was perfurosed on the 26th Aug. There were two nerves closely in contact with the artery, where it was taken up. The nervu upon the inside of the artery was eeternal to the ebeath, and that upon the outer side of the ortery was within the sheath. After the operation, the patient was placed in hed, a flannel stocking was put upon the leg, and it was faid upon pilluws, elightly flexed. In a few hours the temperature had increased; the patient was free from pain, and only felt a little tingling ecusation in the integnments of the leg.

27. He pussed a good night. The atocking was removed. There was no pulsation

in the tumour.

30. The limb is now of the came tempe raturn as the opposite. The tumnur redressed to-day for the first time; the upper part has firmly adhered.

Sept. ti. Since the last report be has been rapidly improving : the wound has healed at every point, excepting where the lighture is placed. The tumour has considerably diminished.

29. The lighture come eway lest Tuesday week, being 35 days after the operation. The would has everywhere healed; the tumour ie less than half its original eise.

WEST MINSTER BEAPITAL &. WESTERN BOS-

To J. G. Guthrie, Esq., Surgeon, 2. Berkeley Street, Piccadilly.

Siz,-Although I have been repeetedly informed, within the last few weeks, that you have taken every opportunity of speeking diarespectfully of the Western Hospital moraover, that you have actuelly etaied, " it should not be recognised by the College of Surgeoue;" I touk no notice of such College of Surgeous.

and his attention was more particularly di- lilliberality, not only considering it as the ample seuse, end as the production of the littleness of mind of a private individuel; bot deeming the cource from which nuch conduct could proceed, beneath my notice. Hut now that I understand you have become a public officer, I feel it my doty publicly to inform you, that I do not consider auch observations at all becoming one who has been, on entering his new office, sware to impartiality; one who ie only a funior surgron to an hospitals that contains only about eeventy bada; one who, to abtain that very eppointment, had to solicit my vote.

I em, Sir, your obedient servent,

W. W. SLEIGH. 25, Upper Seymour Street, Portman-

IRREGULAR ATTENDANCE OF THE CURGIONS

Squere, October 2, 1828.

AT THE BOROUGU HOSPITALS. To the Editor of THE LANCET.

Sin .- As you have inveriably evinced a laudable readiness to publish, in your Jourusl, any communication esleulated to adrance the interests of the medical pupil. I sm induced to request the insertion of the

In consequence of the appearance, in last week's Lancer, of Mr. Earle's proposal to make his visit at Bartholomew's Hospital at 8 A.M., for the purpose of enabling the pupil to abserve the practice of each surgeon, many of the Borough students, perceiving the advantages of anoli n regulation, are exceedingly desirous that a similar one should be adapted at one or both of the Borough Hospitals. Such a regulation eppears particularly suited to the Borongh linspitals, es the visits are made usually on the same day, and at the same hoor, at each; so that the privilege of attending the prectice of both, does not exist in reality; vet the surgeons never fail to annunce this fallacious privilege in their advertisements.

The adoption of such a regulation wouldnut only he an ect of justice to the pupils, but would be one of greet personal convenience to the surgeon.

Should this intimution of the feelings of a great number of the pupils meet with proper ettention, you will cujoy the gratifiestion of having promoted in this Inctauce, as

## A LECTURE

ON

# MUSCULAR ACTION,

DELIVERED DE

#### MR. SHELDRAKE.

As all the diseases, distortions, or defects, which it is now propused to cure, to correct, or to alleviate, are believed to originate in a derangement of the natural muscular action; and as it is now proposed to remedy those defects, by restoring that action to its ustural course; it is proper to begin by en-deavouring, at least, to discover what musculsi sction is.

It is a remurkable fact, that there is not a living being in whose body the most wouderful actions are not continually going on, " pulpable to feeling as to sight;" yet none bave taken the trouble to ascertain what they are, very setions, do not seem to know that they exist; and the learned, whose province it is presumed to be, have made no rational iuvestigation on the subject, at least none that I have been able to discover. This being he excused for attempting to examine it : image of death. certain, that if I produce no information myself, I shall afford an opportunity to some who may be better qualified to correct me, and to produce that information which I may not be able to communicate.

Muscular action, if it can be arranged in

a manner similar to that in which Nature has arranged the muscles by which its effects are produced, may be placed in two divisions, first, muscles, whose action is luvoluntary; and, second, muscles whose sctions are subject to the will of the animal in whose body they exist.

Of the first, the chief are the mus-No. 268.

depend upon their containing within themselves the principlea of action, which in them are equal and opposite to each other. These muscles are thrown into action the instant the heart begins to live; they grow with its growth, and strengthen with its strength, so long as the unimal of which they form a part continues in health; their action diminishes in regularity as health decreases, and finally ceases with the extinction of life. What the wonderful power is, by which these effects are produced will, in all probability, never be known by any living being; at all events it is not intended, in this investigation, to enter into the in-

----

quiry.

There are four conditions or states of derstand, and, so far as it may be done, to explain:

First, the state of absolute rest; as when a person lies down in a horizontal position to sleep, or to remain in any other state of positive inactivity. When the muscles are in this state, every voluntary action ceases, or how their visible effects are produced, and nothing goes on but the circulation of Those whose lives are supported by these the blood, and such other functions as are in erasary to continue life in the body. If, when a man lies in a sound sleep, you raise his hand, or any other member, the instant you let it out of your hand, it falls as if it were lifeless. It a man who is fast usleep the case, it remains one important subject could, without disturbing him, he raised and for investigation that is still untouched. As set upright upon his feet, the instant you it lies directly in my way, in that course let him go, he would fall to the ground as if which I have pursued, I shall, perhaps, he were dead. Sleep is, indeed, the perfect

The second state of muscular action, is what I shall venture to call positive muscuisr action, of which I will give this one example. When the anchor-smith raises his . hammer, whirls it round his head till it has acquired its full power, and then strikes it upon the hot iron with all his force, ha is in positive action. The experience of every one will enable him to recollect many examples of the same condition of the muscles. The third condition of the musels is that which exists while the muscles are passing from the state of action to a state of rest, or vice weres; it is the most fugitive or cles of the heart; their sections seem to verestile of any, and can only be perceived

time of their progress from the state of ac-

tion to the state of rest.

The fourth condition or stote of the museles I shall venture to call auspeoded, or regulated, muscular tension or oction; alnotice of it; it has falled to my lot to be the first to uffer it to notice, sad attempt to explain its properties; ? trust that, if in so doing I should full into some errors, I shall be excused, from the novelty of the subject, eod if any oon will suggest a more appropriate title for that condition of the living muscles, which I shall endeavour to describe, I shall willingly withdraw that which I have given, to aubatitute a hetter in ita

if a strong man grasps soy thing firmly in his hand, all the muscles of his arm bewauld become quite relaxed, and the object out inconvenience.
that had been held would fall to the ground. This principle is certainly something that action dependa.

himself. This is, of course, a fable; but. · like most of the Grecian fables, it was made to explais, enigmatically, a fact. The Grecians knew more of the action of muscles, iu all the exercises in which they passed their lives, than has been known by any people who have existed since their days; and their invention of this story of Mila, praves they knew that this principle, which I have called regulated muscular tension, was either itself muscular strength, or one of the principal causes of it.

in the action of any muscles, during the brief within our nwn knowledge. If we were to take a strong young man, of given size and weight,-a feeble old man, whose size and weight should be the same, -and a statue, or even a dead and stiff corpse, whose size and weight were equal to those of the though it is the most important of all the others,—and place these different objects conditions in which living muscles exist, no quite erect in the asme position, then push writer that I know of, has taken the least the dead figure with as little force as will derange the equilibrium to which it in placed, and it will full to the ground; a gentle push will throw down the feeble old man ; but it will require great exertion to overthrow the very strong mao. Why are these things so? What is this principle, which, acting upon matter, countersets the immutable laws of gravity ! It is not, itself, mutter, for it has no weight. If a man were weighed, immediately killed by sufficestion, and weighed again, he would be found to weigh more, after he was dead, than he did when he was sive; yet it is a mething come very firm while he holds it fast, but he that is abstracted from the living body when esonot hold it so long; if he uttempted to death takes place: for it is a well-known do so, some of the muscular fibres would fact, that, if a weight is suspended to one relax, others would follow, a tremulous mo- or mors dead muscles, that weight would tion would oppear io the arm: that motion teur those muscles in pieces, which, when would increase till, in the end, the nuncles they were alive, would have borne it with-

If the man who held it was determined to connects the mind with the body, at the maiotain his grasp as long as possible, he smoe time that it exists independent of would grasp it again when he found his hand with r, when under proviler circumstances; giving way; this action would be frequently for example, when some parts of a hody be-repeated, each time weaker than that which come diseased, or dersoged by many accipreceded it, till, at last, the hand would dema, the mind cannot exert its influence quite lase its power of holding the abject, to bring these parts into action, however and it would full to the ground. It is quite desirous the person may be to do so. It is impossible that any murcles should main but, itself, life, for life often exists in parts tain themselves in any one action for any of a hody for many years, without the suflength of time, without varying its antilica- forer having the least power to bring those tion, so os to renew their strength: this is parts into action, although he may have the first principle upon which all muscular the strongest desire to do so; but the most extraordinary of all the proofs that this janu-It is recorded of the Crotonian athlete, caple is something distinct from mind ood Mile, that so great was his strength, that from matter, is that which was mentioned he would stand upon a metal shield which by Juhn Huoter. He said, "That when had been plentifully covered with grease, muscles had, to all appearance, lost di their with anch firmness, that he successfully power of voluntary action, he had often resisted the efforts that were made by restored that power, by forcing them, for a several atrong men to push or to pull leogth of time, to act by sarous of an savisthim from the station on which he had fixed aut, in the name way that they would act if they had their natural power." This very extraordinary fact was mentioned by Mr. lluster, as having been proved many times within his own knowledge; and the impression his information made upon my mind first led me into these investigations, and has produced important proofs of its success, which must put an end to all doubts of the rashity of the fact, as well as of its importance.

Having estublished the reality of regulated muscular teosion, as so shatract prin-We may bring this subject still more ciple, it will be proper to mantion some

ho atanda prepared at the starting-post, and it is sometimes necessary, and always adlooking earnestly for the aigual, which, be- viaable, that, when young people are eming givou, he dashes off lustantly, and does ployed in exercises that are intended to importose a moment till he arrives at the goal, prove their health, or produce soy other No has placed himself in a proper position; sproific effect, they should be superintended his muscles ware so far braced up, and kept by amne one who is, from actual knowledge, in the proper state for action, that, upon competent to tesch and advise them what receiving the aigned, he had only to dart his to du, and what to evoid, will into them, -if I mey be allowed to use the expression,—to set off without loss of not the onse. The son of a labouring artian time, and proceed till he had errived at the follows the same occupation as his father: eod of his course. The practice which had by degrees he becomes sequeinted with the qualified this man for his race, had tsught tools and practices of his father, grows up him to know the exact state lu which every in the use of them, sequires his babits, and muscle should be kept, that it might be io- becomes possessed, at last, of all the peatantly used to the best selvantage.

Second. Two wreathern engage in a contest; they stand up to, and grasp, each can at and, act to drive aparrows from the other; all their muscles are kept in that corn, then to ottend the horses at plough; stain of tension that I have endeavoured to he at last follows the plough, and becumes describe; they attempt, by elmost imper- a ploughness himself, with all the same pecutible degrees to feelesch other satrength, cultivities that attend the other individuals till one, finding his opportunity, by a violent of his class. sod unexpected exertion, given his opponent

laxative powder, which he got last night; | cient proofs, that the peculiar distortions of fuels better.

22. Bowels have been kept open by geutle laxatives; sleeps well at night; appetite improved; no reture of the paroxyma. Discharged, to attend as an out-patient.

Re-admitted on the 24th October. States that he was seized with a severe paroxyam this morning at aix o'clock. At ten he presented himself at the hospital io the hot stage, sufferiog much from headach, pain in the back, and hurried respiration. Pulse 130, full and stroog; bowels regular; toogue foul.

26. Had an attack this morning at five ; at ten A.M. be was still in the hot stage,

29. The paroxysm came on between two and three o'clock this morning; at ten he was but it was turned upwards in a very restill in the cold fit; he complained of pain in the head and loius; the tremours were that induced his parents to consult me. not the need and rous, the transmission and the mutter in the need and rous, the transmission of clearly saw pulse 64, weak and oppressed; heat under that it was a case of this kind, and advised the tongue 95°; in the hand 72°. A veio the parents to wait a short time to see what was now opened, and he was quite relieved course the foot would take. After the expension of the parents of the pare before aix concess were abstracted, end the piration of a few days, it was perceived that tremours coased when twelve ono coes were; the defect diminished; the cause of this taken, which occupied three minutes of elteration was, that as the child was heelthy, time. The thermometer was now again placed under the tongue, and the heat found to be 90°; to the hand 7°°. There had have no annihisation of heat nor had any the north occupied and brought and begund to the property of the continually upon been no epplication of heat, nor had any warm drink been given. There wes uslight them into action so favourably that their moisture over the surface. Upon being increasing energy overcame the defect in asked if he felt weaker since the bleeding, he replied, that he was " not aware of feel-

ing weaker."
30. Was quite comfortable after the bleeding yesterday, so much so, that he dresaed himself and sat up all the afternoon, and ate n good dinner. Slept well; howelopen; tengue clean; pulse 64, and of good atrength, thinks that he feels rather weaker than he did vesterday afternoon, but says

he has oo complemet.

Nov. 1. Has had no resure of the paroxyam. Saya he feels quite comfortable ; uppetite good ; bowels regular ; sleeps hetter at night than he has done for several mouths.

4. Continues to improve to health. Has had no return of the disease, and was discharged the hospital in the course of a week, cured.

ON CONCENITAL DISTORTIONS OF THE PEET.

By Mn. Surlungar.

To the Editor of THE LANCET.

Sta .- I have already advanced an opiion, and, I trust, established it by aufi-

the feet of children which take place before the birth, and when the feet are turned iowards, may certainly be enred, in a reasonable time, if they are properly attended to. I shall now proceed to show that what may be called the opposite kied of case, where the feet are turned outwards, although the defect is not so striking to the unin-formed observer, and indeed is often unob-served until it is much increased and becumes more troublesome to the sufferer, than the opposite defect, the so called varus.

Case 1 .- A gentleman's child was shown te me acco after ita birth; there was ne visible defect io the form of its right foot, markable manner, which created so alarm the gastroenemeii muscles, and brought the foot ; so that, at the eod of three months, there was oo circumstance remaiolog which coold show that the foot had ever been defective. I was so employed to this family that I had opportunities of seeing this child grow up to maturity, and knowing that no deficiency ever appeared in this foot during his after-life.

Case 2.-Another gentleman's child was soon niterwards shown to me, who was recently born with one of his feet uoder similar circumstances. The former case was tresh in my memory, end induced me to recommend that a similar course abould be pursued in this. My advice was adopted, and with equal success, for, at the end of two months, it could not be discovered which of his two feet had been defective; he arrived at maturity, and pussed through life to the same atate as the former.

Casa S .- A child was born with one foot distorted, like the annexed figure which was drawo from a cost that I had taken when he was hut a few days old, at which time he was placed order my care. Some wecks afterwards, I was desired to examine his other foot, which had not been offered to my notice before; indeed the parents' attention had been so engrossed by the right foot, that they did not perceive that any thing was the matter with the other. At

the time that this foot was offered to my much relapsed, and the child was again notice there was little peculiarity in its placed under my care till it was quite wellform, but, in lifting the foot, in moved it. The two fret, in the state they were more upwards and outwards then the action when the child was placed under my care, required. As I was employed to core that are represented by the two figores that are right foot. I was desired to watch the pro- nunexed. As I was not permitted to take gress of the left, and do what I found to be any east from the feet after they were necessary. By the experience that I had cured, I cannot give any representation of in the two former cases, sod in some others, them here, and must be contented to say, of the same kind, I was induced to believe, they were quite restored to their natural that as it homework in these sets of the same kind, I was induced to believe, they were quite restored to their natural that as it homework in these sets of the left was the same of the same kind. that as it happened in those, so it might form sod powers, to which state they rehappen in this, that the action of the foot mained, as I had opportunities of seeing might realify itself; hot his did nut prove them several years afterwards. to be the case.

Contrary to what happened in the furthe left foot more and more upwards not words; the foot was fatter that is maunically included by which action the bend of the with children who are naturally innued, astragalos passed from its natural situation, and, when the child moved itself, it always and lay very much behind the tibis, which torned the foot newards, towards the outgave the general superarance of the foot side of the leg, instead of downwards having a hed much longer than usual; at and inwands, which is the usual consettle same time the foot turned outwards, and, quence of the exertines that are made if the child had been able to stand at all, it by challen who attempt to use thris feet would have atond with its inner collegence. would have stood with its inner accle upon before they are able to stand. The heel the ground. As I was not allowed to take appeared to be preternatorally long, and,

woold be permanently distorted if proper be attributed. I took a cust from the foot measures were not adopted to cure it, I at the time, and the annexed figures were made such applications as put the fact in brawn from thoseast. Figure 3 represents anfety, so far as to prevent it from become the leg when viewed from behind, and, at ing more distorted; and as the child was the same time, looking at the outside of now beginning to use its legs. I applied the leg. Figure 4, is a front view of the such handages upon both fort as would bug, and at the same time shows how much

ACCIOENTAL COLOURS.

## To the Editor of THE LANCET.

Srr,—A better explanation of aeciden-tal colours than M. Cuvier has given at pags 629 of Tue Lancer, may be found in Dr. Darwio's Zoonomio, vol. i., pages 15 to 25 Inclusive. M. Cuvier's experiments are, in reality, nearly the same as the illustrations of that eminent philosopher; and I am ioclined to think that M. Cuvier is indebted to Dr. Dsswin for his information.

" Palmam qui meruit ferat." I am, Sir, yours, very respectfully, J. BELINGFIELO.

Medical Academy, Stow Market.

#### LUNATIC PAUPERS IN THE COUNTY OF MIDDLESS X.

FROM the returns which have been made on this subject, it oppears that there are 307 male pumper lunoties in this county ; females 546; sex not mentioned 20; total 873. Of this number, 449 have been more than five years in an "unsound" atute of mind.

ON THE EXTRACTION OF PERIS.

By JOHN PALMER DE LA FONS, Log.

AT a period when almost every art has moving, attained so high a degree of perfection, it is truly surprising, and souch to be regret- be readily traced. To detach the tooth A. of tooth extracting, instead of useumning, able movement from side to side, tfrom C to abould have retrograded—that a act of dou- D, for instance,) the point E being fixed, tal instruments, under the mask of improve- which is not the case with the bulster, if the ment, should be so clummly constructed as tooth offers much resistance, the handles to be readily mistaken for o farrier's tools.

very limited, confiding in the misrepresentations of persons interested in deceiving them, are led to provide themselves with instruments to ill-contrived, and of such preposterous dimensions, that they seem best adspited for a speculative consignment to the

kingdom of Pategonia.

Few aubjects have exhausted so much time to little purpose as the attempt to no apply them in the favourite perpendicudiscover a meana of extracting teeth in a direction perpendicular to their sxis. For this purpose, a variety of contrivences have been produced, many of them very lage of ous; but all, one after snother, have aunk have been apared to the inventors of them, in the other.

had they commenced by acquiring a thornugh koowledge of the form of the teeth, of the power requisite to dotach them from their acckets, of the fragile nature of de-cayed toeth, and the structure of the siveolsr processes; then, supposing them to be sequented only with the first principles of mechanics, they must lisve perceived the abuve-mentioned project was absurd in the extreme, and one they could not have en-tertained for a moment, had they comprehended the action of that most useful and admirable contrivsoce, the key instrument. He who does not clearly understand tho opplication of this instrument, is utterly untit to operate in cases of importance.
Considerable ingroutty has been dis-

ployed in some of those contrivances that were expected to oct by placing the fulerum upon the adjoining tooth, or teeth; u method that, for very obvious reasons, cannot possibly succeed. Others sgain, possessing up talent for iovention, have contented themselves with intruducing, os a norsity, un instrument that has been in use from the remotest ages-a pair of pincers!! GREATLY improved, by being made of the most gigan-

tie and appatting dimensious.

That the use of auch an instrument is highly objectionable in all cases where the key is generally used, will be very evident, if we reflect that the teeth hold so tightly by reason of their diverging, crooked, and otherwise misshapen roots, that the most powerful and continued efforts to remove them to that way will prove unavailing ; unless, to be sure, breaking can be called re-

Un reference to lig. 1, the objections may ted, that so important an operation as that from its socket B, in giving the unovoidmust be grasped with extraordinary force, Medical men, whose experience in this or the jaws of the matrument will open on department of surgery is often unavoidably attempting to melion it in that direction; consequently the greater portion of farce an applied, is admirably calculated to wrench off the crown of the tooth, us represented by the dotted linea across the tooth at F.

If the pincers, under this form, are objectionshile, how much more an ore they for extracting the dear sapientic and others, where, the 1sw not externing aufficiently lar direction, it is necessary to curve them.

Those who pretend to operate in this manner ore so well aware of this fact, from ous; but all, one after snother, have aunk experience, that they have been frequently into oblivion at a very short date from their identical exhibiting their infullible piocers appearance—a disappointment that would with one hand, while the key was conceind

so as to set at right angles with the handles; if g. 2, a few words will be sufficient to proce consequently the aperator most ase great the decided superiority of instruments consultineal force, having, as it were, to raise arructed upon the principles of the key. so that, adicitting he has power to remove he fixed un a deceyed tooth A, preparatory the tools, it so saddenly yields, that the to its extraction from the socket B. The violence of the jerk very eften either fractures er lacesens one of the teeth in the aptures er lacesens one of th posite jaw, which the operator can no more control, than be could avoid falling, if, in pulling an immense weight, the cord ho held were suddenly, though not anexpectedly, to break.

Another insermountable objection, is the length of time required for lossening s tooth with the nincers; for, in defiance af the favaurite perpendicular action, the tooth will not stir till it has been most farcibly warked to and fra doring some time, as the cruwn would break aff sooner than it would;

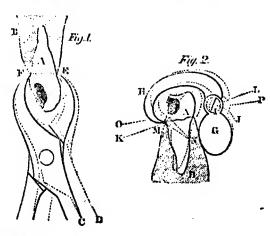

sagacinusly opposed.

breaking.

The preceding observations will suffice to to loosen the tooth. shew the impolicy of attempting important operations with the pincers, or any other only ones that can be applied to stemps means by which it is proposed to lay hold having nu apper portion to lay hold of the tooth between two cutting edges.

With the assistance of the drawing, 11, George Street, Hanover Square.

a considerable weight at the end af a lever ; The bolster and claw, G II, are represented datted carve J, and pulls the claw II in the directioe of the line K L, along which the tooth, having na direct support, is pulled by the claw on one side, (as shown by the dotted lines,) and tilts an the part N at the socket as a fulcrum; this being apposite the holster, the poll varying from the direction K L to OP; this widens the socket and gradually detaches the tooth, first from the side M, under the claw, while the ex-cellent position of the belster causing a fulcram N so low down the socket; the npyield to a dead pull; and thus it receives her portion of tooth becomes a powerful the very lateral action as atrengly and so lever to move and detach the buttam, beginning first at une side, and stretching the Lastly, the pincers cannut he used with a socket, so us to make ruom fur it the easier chance of success where the crown of the ta slip out; thus the parts are easily and tooth is much decayed; for, in the effort gradually looseeed, but in quick succession, to loosen it, the pinch requisite to prevent thereby avoiding oil that violence of tug and the instrument from slipping, would be shock that must attend perpendicular exunavoidably greater than the remaining traction, as it is erroneously celled. The substance of the tooth would allow without quantity of tilt is here greatly exaggerated to make it visible, much less being aufficient

## THE LANCET.

London, Saturday, October 18, 1828.

Tue public attention has recently been drawn to the pretenzions of an individual who makes claim to the discovery of a specific remedy for consumption. One of our contemporaries, well known in the neighacquire a little notoriety on this occasion, to some cases of phthisis pulmonalis said to occide at ooce that he was an impostor. have been cured by the individual in question, and partly by addressing letters to the therto bailled the powers of medicine.

making claim to the discovery of a new fessed, the very best species of cridence; remedy for the cura of a disease hitherto but it is a maxim to law, we believe, that supposed incurable, and refusing to dis- when the heat evidence is not to be obclose the nature of the remedy, has either tained, the next best is admissible; and, for deceived himself, or wishes to deceive the our own parts, in the case before us, we are

individual in question may have discovered such a remedy, sud the refusal to discloss the nature of it, is not to be taken, as some of our contemporaries contend, as cooclusive evideoce of fraud. The refusal proves only that he prefers his pecuniary interests to the good of mankind; that his capidity is too strong for his benevaleore; that his charity, in abort, begins at home. If the person we allude to lav claim to boorhood of Guildhall, has endeavoured to philanthropy, as well as to the discovery of a remedy for phthisia, we should be inpartly by assailing the respectable editor of clined, without looking into the evidence the Literary Gazette, who has given publicity on which his pretensions are founded, to

Apotson has remarked, that we never John Hull and Speciator, which letters have read a book with so much pleasure, as when elicited replies. We fother entering at we know certain particulars respecting the present into the merits of this controversy; author's person, education, manners, or but there is one point which it may be well characteristic peculiarities. Pour Robertes. for the public to bear in mind, in estimating MACLION accuss to have availed himself of the probability of any alleged discovery of this hint; for, unding that noted, but the specific remedies for diseases win h have trunk-maker has over yet patrouised his hitherto baffied the resources of our art. It bicularations in the Yellow Fungus, or should be recollected, that we know of no Exercences, he has last week by way of specific remedy for any disease. Bark in prolude, we presume, to a more agreeable intermittent fever, and mercury in sephilis, wein of writing, entertained the public with have been called specifics; but bark often some granifying particulars respecting himfails to care intermittents, when wher they said, and the places at which, he tells us, he rapeutic agents are successful, and it is wanteducated. He has not only communicatnsecretained that syphilis, under all its forms, ed to the public, in the last week's Excresmay be cured in many, perhaps in must cence, the finits of his own experience and cases, without the use of mercury. Experiabserration, as no the comparative prevarience does not warrant us in coacluding, hence of drunkeuness and weaching, is the that there is any one remedy specifically English and Scotch Universities, but he applicable to the cure of any one disease. has also had the kindness to add certain in-Still such a remedy may be discovered, and teresting disclosures of his "brd maker" that, too, even for a disease which has his on these subjects. When Roderick Maclend tells the public what, he says, his ted-The probabilities always are, that a party maker told him, this is not, it must be conpublic. It is possible, however, that the disposed to place just as much reliance on

gap or hed-maker, as on the direct testimony he introduces by way of exposing the folly of the highly-gifted and verseious Scotch Dub binnelf. Our readers will scarcely and Mr. BROUGHAM, who have permitted give Roderick credit for being " so agreeabln a rattle," and we aball, therefore, unote the passage to which we alludo. After having touched upon the vice of unchastity, and stated that " whenever a multitude of young single men are gathered together, they are sure to devour, like loensts, all the frail purity (the frail purity!) of the neighbourhood, he proceeds to the vice of drupkenness:

" As to the second vice, drunkennesswe ourselves went from an English University to a Scotch one, and surely we never witnessed at the latter such long, hard. deep drinking, as we did at the former. Our old hed-maker used to tell us (and we saw enunch to know that she was not remancing) that she always came about four o'clock in the marning to see in what condition her brought-but we will not repeat the scenes which she described."

We will not bear so hardly upon Roderick, as to call upon him to name the English . which yas the scene of his youthful excesses, before he went to get dubbed at a Scotch University. He saw enough, to A Manual of the Anatomy, Physiology, and s know that the was not romancing! We take it for granted, he wishes to have it believed that he tossed off his bottle with the best of them; although, undpubtedly, the nossage does admit of another construction. and, if we were inclined to be malicious, we might infer that, when Roderick assisted at these seems of riot at an English Univeroity, he was not one of the company. Hut he will not repeat the scenes his bed-maker described to him! Admirable discretion! Esquisite application of the figure apostophesis! The quos ergo in Virgil is tume to it. It is plain that the Scutch Dub has not been at an within the last aix mouths; a circumstance English University, in whatever capacity which gives us much satisfaction, because he might have figured there, for nothing, it is indicative of an increased, and we may be inferred from the following well-|few years, has been utterly neglected. It

the harrany evidence, derived from a college imagined, and languable associate, which of Lord Dudlay, Sir James Mackintoon, the establishment in Gower Street to be called by a designation at once so recondite and abourd as an " University."

> " A sailor out of Lord Nelsun's fleet, who was one morning parading a sea-port town with his girl, called at a draggist's shop for some blue unction and red precipitate. As they were going out, the girl said to bim, ' Is this o druggist's shop?' On which Jack, pulling up his trowsers, and looking mightily wise, answered- Yes, that's the common name; but the proper name is a lapidary!' meaning a laboratory."

" Blue unction and red precipitate!" " A lapidary! meaning a laboratory!" And this is the material which, to say nothing of its decency, Mr. Baoniz takes for wit; the moterial put forth-proh puder !- by the publishers of the Edinburgh Review, to masters came home; they were generally expose, by the force of its sarcasms, and the playful felicity of its illustrations, the ignorance and bad taste of Lord Dunkey, Sir JAMES MACKINTOSH, and Mr. BOOTGRAM!

> Desenses of the Eye and its Appendages. By S. J. Strattoni, Member of the Royal College of Surgeons in London, Surgeon to the Dispensary for Diseases of the Eye, and late Senior Assistant Surgeon of the 7rd, or Dake of Albany's own Highlanders. London, Longman and Co.; J. M. Lerkie, Dublin; G. A. Williams, Cheltenbam; T. Stratford, T. H. Wheoler, and H. Deighton, Worcester. 8vo. 1828, рр. 199.

Turs to the second work on diseases of the eye, that has fallen under our notice That his furbeacance on this occasion, how- trust increasing, attention to a department ever, does not arise from excess of delicacy, of surgery, which, until within the last

tached treatises; but, -- and we record it which to hang a dissertation. To proceed, with something like a feeling of humiliation, -no British author hos yet produced a systemstic and comprehensive work on diseases of the eye. Ophthalmic affections serm, in . | physiology of the eye, and the remainder to deed, almost from time immunorial, or least a consideration of the diseases ood treatin this country, to have been regarded as ment. Of the former part, it will be suffisomething extraneous, or hot appertaining eient to remark, that it is coucise, and, at to surgery; and hence the treatment of dis- the sums time, perspicuous and accurate: cases of the eye has been abandoued to the description of the nerves supplying the quacks-woold that we could say it were eye and its appendages, is excellent. entirely rescued from their hands now! We reoders, by ottempting to demonstrate that discuses of individual parts-and tirst of the ophthalmie diseases are not without the tunion conjonctivs. He objects to the term legitimata pala of surgery-that the princi- " strumous ophthalmia," preferring to deples derived from a knowledge of anatomy, signate the disease known under that term, physiology, and pathology, ore as applica- by the name of irritable inflammation, and for ble to the organ of vision as in the treat. the following reason :--ment of disease in any other part of the! "Scrofula is so vague a denumination, eases of the hody. In truth, so varied ure the structures of the eye, that the observation certainly does hold good to a great extent: ss the component parts of the eye are analogous to those of the body generally, so ore the diseases essentially similarswayed by the same laws-their treatment regulated by the same principles. Strange enough, then, that the diseases of this organ should be detached from the study of surgery generally. Mais quels fruits pourzuit porter cette branche, étaat separée du trone? shrewdly impaires the erlebiated Loois. It is gratifying, however, to ohserve, that a knowledge of diseases of the eyo is now regarded as an essential part of a medical student's education. If he require may assurance that such knowledge is not incompatible with the highest attaioments in every other branch of surgery, we need but refer to the ketures of Mr. Lawrence.

We have run on so far, that we fear it

is true, that we have many valuable da- | Mr. Stratford's book merely as a peg on however, with our snolysis .- The work consists of about two hundred pages; of these, one-fourth is devoted to the snatomy and

After some general remarks on inflammashould but insult the understanding of our tioo, the author proceeds to treat of the

frame. There is o trite remark, which we and is so difficultly defined, that I think it would be preferable to have a more precise have somewhere met with,-that the patho- and definite term for this affection, than to logy of the eye is an epitome of oll the dis- confound it with all the various symptoms of the above-mentioned discuse."

Diseases of the lach yural gland form the next subject of consideration, and then affections of the excretory parts of the lachrymal apparatus are brought under view. The misapprehension and want of information on these subjects, which prevail generally, are truly lamentable; under the term fistula lachrymalis has been included s variety of offections totally different from each other. We scarcely need observe that if we are to attach any precise meaning to words, the term is tula is only applicable to certain rases, these in which there is un ulcerated opening (difficult to heal) in the lachrymal sae. The various discurra described by nur author are as follow :-

Contraction of the Paneta .- This, in general, is the result of chronic inflammation producing a swelling and thickening of the cellular substance around the punctum, or of the living membrano itself.

" If the defect is recent, we should attend will be suspected we have taken the title of to its exciting cause, which is generally at-

tended end kept up by an affection of the sume their natural office, while the wound palpehral margin; if this be removed, the slao soon heals, sud generally without learcomplaint generally subsidea: hat ahoald ing any organic change, or permanent imthese means fail, and the disease have lasted pediment, which may prevent the due pass considerable time, we should open the princtum with a fine point, and then intro-dace a fine probe, which should be allowed to remain for a short time. This operation should be repeated daily, the size of the probe being gradually increased until the obstruction is removed, and the panctum resumes its natural size and office."

disesse commonly occurs in old people, with quick subsidence of the disease, and rapid more or less relaxation of the lower lid, and closure of the wound. The treatment to be not unfrequently accompanied by some adopted, is the application of leeches, the eversion. It may be partially relieved by employment of cold, and the exhibition of attention to the general health, and the use purgotives. If the disease proceed to sopof mild satringent opplications.

this discuse is thus described :-

"It generally commences os a smoll, burrowing under the skin. hard, and very poinful tumour, situated at the inner angle of the eye, shout the hollow of the inchrymal bone; it is of a red colour, nearly the size and shape of a small bean, precisely similar to those evinced by inand generally attended with acute pain. flammation of the ligamentous textore of tory action may soon spread to the might the suc, sod is only to be distinguished by bouring purts: now the papille appear the uttendant conjunctival inflammation. shrunk, and the puncta are obscured : while the nostrits feel dry, and the tears fall; pression of the lachrymal passages. As the akin assumes a shining and polished appear-nace, granuliy becoming of a darker colour, while presently we may perceive in its ren-

pediment, which may prevent the due pas-sage of the tears into the nese."

Mr. Stratford expresses his opinion that the lufammation commences in the " ligamentous texture," but that it soon implicates the aurrounding tissues. It is seldom, he says, that the ulcerstive stage pro-Dilatation of the Paneta.-This form of duces a direct opening lu the sac, benee the puration, its apeedy termination must ho Inflammation of the Sac .- The progress of encouraged by warmth, and an early and free exit given to the matter, to prevent its

through Inflammation of the Mucous Memover the cheek, in consequence of the com- brane.—It is this form of disease which disease proceeds, a scross eduscon is pourred gives rise to so many unpleasant results. nut in the cellular texture around the sac, its progress is slow, often increasing impersometimes even spreading to the cyrlid; ceptibly, without rossing much pain or inquently takes place, and this is soon accom- convenience. One of the first symptoma is panied by the formation of matter which an increased accretion of mucos lodging in necurs in the cellular tissue surrounding the sac; at this stage the sac is always filled the soc, and forming a small tamuur. As with a partiers mades, secreted from the the result of continued inflammation, a lining membrane, which must always par-ticipate in the same inflammantory action; thickening of the membrane takes place, ood The swelling now quickly increasing, the gives rise to stricture of some of the

" This may happen at may part, but the while problems, pale, softeth sp. 1, marking most frequent spot where it occurs in st the the existence of matter; this, if allowed to perminotion of the sac in the dactua nosalis, hurst, soon becomes thuncer, metal it spons, or about midway down the furt itself, tuncously opens, and permits the fund parts. These passages having continued more or to escape, and the tuncor partially to; less pervious for a considerable time, gracullapse. The discharge from this opening idually become narrower, and the stricture continues a longer or shorter period; at more confinued. Now the sac is greatly test it is thick nod whitish, and should the patient he of at unthealthy liabk, it may be to come more transparent and limpid. The inution is produced, which implicating the effusion is now assa absorbed, the swelling ingamontons attracture and neighbouring begins to diminish, and the puncts may re-

the effusion of serum takes place, the skin | tered the punctum and perpendicular canal, covering the tumour assumes a dark red we should turn the probe at right angles, colour, and very soon the formation of matter occurs immediately under the integuments. The esc now, as a consequence of its distention, quickly proceeds to nicoration, permitting the escape of its contents, so that now we have the only stage of these complaints, to which the term of fistula lacbrymalia ia applicable: ita adopticu in every variety of these discuses creates great confusion, and is apt to lead to wrong ideas upon the subject.

The treatment in the first stages of this complaint must be pursued in reference to the chronic affection of the membrane. Strict attention must be paid to the general health, with the cautious use of atimulants, as ung. hyd. nit., vinum opii, Xc. A great source of mischief, and one general error in practice, which we have had abundant opportunities of witnessing, is the use of instruments under these circumstances. Permanent closure of the canal is not so frequent an occurrence as is generally imagined; if attention be paid to the means calculated to relieve the chronic inflamma. tien of the mucous membrane, and to ebange the vitiated accretion of the meihomian glands, we shall, for the most part, find that the disease may be cared without the use of instruments. But if this treatment is found to be ineffectual, we may auspect that a stricture exists, and for the treatment of this. Mr. Stratford recommends the introduction of a probe at the punctum. He gives the following directions for its use :--

" In passing the lachrymal prehe, which is a silver wire slightly bulbed at the point, and flattened at the further extremity, eften having a turn to accommodate it to the form of the brow, we should hold it tightly between the two fore fingers and the thumb, then selecting the inferior punctum; should this bo closed, we may, by instructing the point of a pin, readily dilate the orifica, so as to admit the probe. Now placing the finger upon the temporal surface of the orbicularia muscle, so as to make the ciliary margin tense, and alightly evert the lid, then holding the probe in a perpendicular direction, wa shall generally be able to enter the punctum. Sometimes, however, wo may see it apasn. dically retracted, so as te create an ebstacle to the attempt: having en-lin other parts of the body, such as the sud-

that is, in an horizontal direction, and pass It along the lateral canal, until we find it strike against the bonc, which is easily distinguished by the resistance It occasions. Now, when the point is fairly within the sac, by a greater turn of the instrument, we again clevate it, and carry it gently entwards and downwards in the course of tho nasal duct, until it touches the floor of the nustril, or auperior apongy bone. When about to enter the ad, if we do not carry it homa hefore we attempt to rise it, or if wn suffer the point to recede in that movement, we generally find that the point will catch in some membranous fold, and we shall certainly be foiled In our attempt to enter the sac: having overcome this difficulty, we shall then be generally able to accomplish the passage. Should we, however, meet with any other difficulty, we shall generally be able to pass the instrument (unless it he a confirmed stricture,) by rolling the probe hetween the finger and thumb.

If the foregoing means are found to be insufficient, and the disease is likely to run on to suppuration, the sac is to be laid open, and, after promoting the auppurativa action for a day or two, wa are to proceed in forcing the passage to the nose; by means of a strong ailver probe introduced through the wound of the sac, and carried ateadily downwards, almost in a perpendicular direction, juclining a little outwards, The nuthor expresses himself strongly in favour of the use of a tube, as practised by Dupaytren, but he thinks it preferable, after forcing the passage with the prohefirst to introduce a style, or bougie, so as te accustom the part to the presence of a foreign body, rather than at unce to mas the tube. A silver tube, he says, will equally suffice with one made of gold. We can ourselves speak with much confidence of the successful results of this mode of practice,

Having dwelt so long upon the diseases. of the lachrymal organa, we must be brief with the remainder of the volume. Tranting of inflammation of the sclerotic tunic. the author observes :-

"The causes of aclcrotic infiammation are those which can exelte a similar disease

den application of cold, when the system is represent. The author will do well also, preternstursily heated. This disease frequently accompanies, or even silerastes, with a rheumstic affection of the joints, soon be called for) to correct the numerous which leads us to conclude, that the influming typographical errors which exist. In lookmatory action is connected with this disease, a positivo which the similarity of the texture affected greatly tend to confirm."

It is, we believe, oow generally admitted, that the aderotic coat is jisble to be affected with rheumstie or arthritio disesse,-Colohieum, sod, in some instances, the quinine, are the best remedies.

The author, io treating of cataract, tokes occasion to reprobate the parauance of one kind of operation io every instance. In the following sentiment we fully secord with bin :-" The operation must be adopted to the kind and variety of cataract, rather than the eye to the operation."

Mr. Strutford, we perceive, has dedicated read. tinu, hn tells us, that he should besitute to shown to the Society. employ it. Se would ony rational proctitiooer.

To conclude .- Mr. Stratford's book is evidently the production of a practical muo, securate, and the pluns of treatment recommended highly appropriate. The studont will find it highly useful. We are sorry that we cannot extend our praise to from the over-distension of its parietes, and the plates; without the text, it would be difficult to say what they were intended to

ing through the volome, we slmost constantly fied mocus, written for muceas, ervsipelatus for eryalpelatous, vitrious for vitreous, tenea for tines, and so ou.

was usually at once relieved by thu appli- | calves of the legs, or sinapisms to the feet. cation of leaches, or general bleeding, and Under this plan of treatment, patients gethe use of the warm both. The easific nerally recovered. Every iname attack had patches appeared to have been of a chronic a certain duration to continue; a faver naturn, and could not have been the cause | could not be cut short; and from the water of death.

Mr. WALLER never alleged that they were. The large dosen of opium were not given till three days after the administration of the secule cornetum, so that the effects of the former cauld not have counteracted the efficacy of the accale. He was not called to the patient till after she had laboured under the attack for twenty-four hours The case was nat a decidedly opium one; the countenance was flushed and excited. but the pulse was this and compressible. From what he had escertained subsequently, he believed he should have applied freches, erticularly if he had seen the case earlier : were afraid of venturing on the antiphlo- mout; and felt firmly persuaded, that the gistic plan.

after the exhibition of a second dose of to be given in small quantities, the quantiopium. Dr. Blundell had seen this case, tien, however, to depend upon the effects; and agreed with the practitioner, in attric the effects being to be carefully watched. buting the beneficial result to the effect of

the bleeding.

sorted to in puerperal mania.

Mr. Wallers considered, that this question could only be answered affirmatively or lowed at one draught, with the best possible negatively upon a review of the patient's effect, and in those cases too, where, from condition in every particular case. Should the most rational prognosis, the patients there exist much vascular power and action, were vinking, and must have some under the treatment would have to be of one chall any other treatment. racter,-should there be much weakness and irritability, of the opposite.

Dr. Surannas had often heard bloodletting denounced in deticion tremens, and he thought too strong an imfination obtained in the profession, rigidly to adhere either to the use of opium, or bloodletting. On Tuesday 1429, October 11, the meet-fle had certainly often seen bloodletting in-ings of this society were re-nined, Mr. Thaproperly used in delirium tremeus. but I ad I vers, President, in the chart. The meeting he is case under his care at that moment, but well attended. marked by the ordinary symptoms, he should

found, either in the carities of the brain or between the membranes covaring it, in those who died of this malady, it was fair and rational to infer, that considerable inflammation had existed in those parts. Opium was given with a view to pracure sleep, but sleep was not required; if it were pro-cured, the patient afterwards awoke in a two-fold state of excitement. Many years ago he had made a calculation, by which ho found there was no form of mania from which so many recovered, as that of puerperal.

Dr. Ryan did not look upon delirium tremens as depending upon vascular conbest remedy was the administration of sti-A Managa knew neare very similar in muli; also, that the less description of the one under discussion, in which bleed, these was, the ardent spirit the pament had ing was resorted to, with complete success, been in the habit of drinking. #### MEDICO-CHRITRGICAL SOCIETY.

An interesting paper, by Mr. Answers, on resort to it. Blood etting and opiuto, come the accomilary off its of teins, was in part bined, had been had resourse to henceheidly, tread; in which the netter, after enumerate. The Parsim er, though labelieved it in just the different well-nothenticated cases on be irregular for him to take any part in the record, of inflammation of the views, and debate, yet having been politely requested others which had come order his own duterto express his opinion upon purrieral ma- vation, produced by woulds, and terminate min, complied. He had certainly had very just family, proceeded to slow that death considerable experience in the treatment of does not take place, as some have asserted, it, and be had outver-sally found, that when by extension of the inflammation to the heart. In had given optimally rotated discharge the inflammation to the heart. In had given optimally rotated recovery. Much which we infer that it was the authors observing might be done by the application of ject to show, that the secondary effects of leeches, cold to the head, and blisters to the pullebitis arise from the introduction of pus,

or inflammatory secretions generally, from the auriace of the veios into the circulation.

Mr. Travers observed, that, us in several cases which he had an numertuoity of exumiolog, the affected voice were filled with lymph to a greater or less extent, and consequently, as pus could not get into the system, it might, he thought, at least, be considered as negative evidence, that the introduction of pus into the system could not be considered as the cause of death. But as it appears that this, among other points, will come under the consideration of the encicty at their next meeting, we purposely I the whole hody. defer giving so account of the proceedings, until we have heard the whole of the auther's communication.

The paper excited considerable joterest.

## LECTURES

ON THE

THEORY AND PRACTICE OF MIDWIFERY.

DELIVERED AT GUY'S HOSPITAL BY

DR. BLUNDELL.

LECTURE I. Of the Gravid Uterus.

In consequence of impregnation, the genitala undergo conspicuous changes; ond when altered in this manner, they form what is denominated the gravid eterus, of

which I now proceed to treat.

The womb, in the unimpregamed condition, varies much in its size, but, on on average, it does not exceed the bulk of a small pear flattened; when, however, it is enlarged to the full size of gentation, it forms a rary bulky tumour, occupying, at least, two-thirds of the cavity of the abdomen ; its diameters from mouth to fundua, from side to aide, oud from before backwards, being, on an areruge, of twelve, nine, and air inchea respectively. The form of the gravid uterus variou somewhat in different women; but, in the main, it resembles a large egg. more rounded in some cases, more clangated in others, something, perhaps, depending on the position of the fortus.

Thus oriform uterus is placed in the cavity of the obdomen, the fundua being in front before the engiform cartilage, and the mouth lying below and behind in opposition to the middle parts of the sacrum. When the bladder is full of urine, it takes its place between the uterus and the obdominal cuverings, otherwise the womb is covered by these teguments alone in front, and the intestines, in the end of pregnancy, lie above and behind the uterus, being, by the interposition of this organ, sometimes concealed almost entirely from the view, even though the abdominal coverings have been hid open by the kalfe. When the womb fails too much forward, or to oither side, might really have recourse to the trees and

these deviations from the healthy position are denominated the obliquities, and they are, I believa, commonly arising from one of three causes—distortion of the pelvisprojection of the lumber verteb e-and laxity of the abdominal muscles; the two last are thin most common, and these may operate in combination. Bandagea, if well constructed, may be very useful here.

When the womh is in action, the tumour which it forms becomes very hard-hard, for examplo, as the easts here exhibited : but, in the middle and end of pregnancy, before the full action comas oo, the uterus may be so soft and yielding, that the head of the ferma may be clearly enough diatinguished, commonly in the inguinal region, whence we may the more readily distinguish the intumescence of pregnancy from that which arises from water, air, adeps, or a diseased growth of the viscers. If the womb contain the usual quantity of water, its surface in generally equable, and more or less globone; but, in some cases perhaps, when the quantity of the liquor amuii is amall, and the womb, thin and lax, lies loosely on the limbs of the fectua, o certain degree of inequality is produced, and I koow of one case in which on accouchenr, of no small experience, feeling the porta of the child with extraordinary distinctness, was led erroneously to infer, that the pregnuncy was extra-uteriue. All these observatious are most couly mode, when the abdominal coverings ore thin-

When the womb is enlarged from pregnancy, in the general fun do not observe anything like fluctuation; therefore, if the bladder is duly evocuated, and if there is no dropay of the peritoneum when you atrike the abdomen, no fuetuation will be perpelved. Understand, however, that under . diaeaso the liquor umnii sometimea collecta in vary large abundance, to the amount of three or four gollous for example, and, in these cases, a fluctuation may be felt distinetly, as if the womes were dropsical. This I mention to you, the rather because it le nut very common, and because if you were not aware of it, and chanced to meet with one of these fluctuating wombs, you

addomen has very suddanly occarred, that pidly than you expected, than put a han-you are first led to anspect the nature of the dage round the nation in the same man-crase; for usually, where the enlargement our that you would do if you were tapping has very suddenly occurred, it does not arise in a case of asciten; and prepare for syn-from sesties, but from preguancy; sod your cona. Gaitskell's handage would unswer diagnosia is further assisted by the aevero abdominal pair produced by the rapid stretching, and ultimately the spanus of the unerus are very much developed in gentation, yet, cular substance of the wooth. When you in reality, the preparant uteros consists established as examination of the mouth and neck sentially of the same parts as the unimpressof the uterus, you may feel to the brim of the nated, viz. the nuscular substance, and the amnii—the dilated mouth of the uterus—bladder, the uterine tumour felt in the brim of the ln the womb, at the end of pregnancy,

the swelling is not very great, you may to shows. And this in the reason why, in the ment the abdomen, give optum, and leach; latter months of pregnancy, women are liable and sometimes perhaps, with our further help, he such dangerous floodings, while, in carthe symptoms may give way, the woman lier gestation, the flordings are much less this applicable and green of nine coupling, and of cuttee are attended with months; if, on the utter hand, the quantumble has deaper. The veins which cortity of water is very copious, and the pings respond with the arteries are also very example; is of the earlier months, and the pairs pacious, and, from their great capacity, they are very severe, effectual resief may be ule are sometimes called the sinusen of the tained by tap, my the membranes at the laterus, though I may abserve, by the way, mouth of the elerus, great care being taken that this term is applied more properly to not to injure the reiviz. In ordinary cases, real ainuous curities in the substance of the

canula. It is by your learning from the water may come off by little and little, and patient that she harself helieves that she in the abdomen may sink the more gradually, pregnant, and that the enlargement of the lf the water should come away more re-

pelvia the rounded tumnur, formed by the incresting membrunes, with their accessories. lower frontim of the womb; and pushing Internally the uteras is covered throughout the investigation still further, you dis- by an extension of the more membrane, tinguish the on uteri more or less dilated, which lines the vagina: externally, the with the membranous bag filled with the womh is coated by the peritoneum, which, liquor smail. So that by these characters—however, does not like the lower part of the the membranous bag filled with the liquor surface in front, where it lies against the

pelvis—the abduminal pains after very we find that the nerves are very large, and ularming—and the intimation given by the the some is the case with the absorbents, patient berself that pregnancy is, in all pro- it be absorbents in the mainpuregnated state bability, the cause of all her myorbous—that are very small, and there is a difficulty in disease under consideration may be easily injecting them; but when the woman is in recognised. In the middle months of gesta- n state of gestation, they are very large, as tion, a woman laboured noder o great swell- 1 will show you at our subsequent meeting. ing of the abdomen, which fluctuated dis- It is, perhaps, in good measure, in chosetinetly. Dr. Haightoo was sent for, to quenic of the absorbents being large, nu-gether with a very distinguished surgeon, merous, and active, that the uterus, interwho, conceiving the case to be ascites, pro-delivery, shrinks so rapidly in its bulk. As post a calling next day to perform the operation as parturation takes place, if we exato a of taging. Dr. Huighton suggested mine the uterns, we generally had it to be that this abdominal swelling might, after all, as large as the fortal head, but in the course be a dropsy of the uterus, but no particular of a few weeks it becomes reduced to searly examination of this point was instituted on its original size, such as it was when in the that day; in the course of the night, the unimpregnated condition. Now this rapid membraces, which cuctained all this water, collapse of the uteros is, I conceive, to be burst of themseives, a flood of fluid was disenseribed to the large size and great activity charged, the abdomen rapidly collapsed, alof the absorbents, assisted by the contractino feetus issued not larger than the first joint; of the blood-vessels, and the gradual expalof the foger, the woman escaped from her stoo of much of the blood. In the unimpregparaceotesis, and did well. Here, then, is nated condition of the uterus, the blood-vesa case in which a surgeon of distinguished sels are liew and small, derived from two talent, in consequence of a hasty diagno-sources, the inferior uterine arteries, and the sis, was on the point of paneturing the spermatics; but when the patient becomes uterus; do you, therefore, he on your mand, pregnant, they are of very large size in the As to the teatment of this disease, if end of gestation, especially author prepuration I think, I should not make a large opening, laterus, which seems to be distinguished for if the opening be a mere puncture, the from the voius, and which remind one of the carnese columns of the heart. To faci-litate the return of the blood from the ute-when they immediately declared it to be rue, the veins take a direct course, but the muscular. If, therefore, we are to jodge arteries corresponding with them are ver- of the etructure of the homan uterus from micular, and it is supposed that this vermi- the spreamone to the eye, independently of cular course of the erteries is designed to other circomstances, we need not assisted diminish the impetoosity of the uterioe circumstances, the interest of the culation, and to diminish the risk of those year that the proof of the uterioe moscillarity, floodings which, nevertheless, so often take very decisive to my mind, which is, it conplace. From iospection this preparation, tracts itself like a muscle under the exciteyou may find that the arteries are sa ver- meet of a stimulus. Like the womb of animicular in the womh at the end of nine male, indeed, it is true that, during the pemonths, as in the unimprepared nterus, riod of gestation, the human nterus lies and, therefore, the vermicular course does quiet; yet this is not always the case, for it not spacer to have been designed to facili-may out prematurely, as in the case of mistate the distention of the uterus, by sllow- carriage; but when, at the eod of nine ing the vessels to drow out and change mooths, the womb begins to wake up, as it from the vermicular to the linear direction: were, from its long lettargy, we then fad for this change does not take place; besides that, like other muscles, it becomes irritation the resdy dilatation of the uterus, we ment of attimulos; the ovum cutire, first exshould have expected that, like the arteries, cites its contraction-thee the fœtus-then

to be made up of a structure essentially intu action when the womb is compty, by the muscular, on opioioo io which mony, I be-introduction of the hand of the accoucheur. lieve, acquirece, though by Blomenboch, ood Like the heart, therefore, the uteros is musothers, it is denied. That the womb is really oulor; it is, like the heart, stimulated by muscolar, I am persuaded; first, because in distention, nor is it by distension only, but the mammiferous onimals generally, we find like the heart, moreover, it is stimulated by that it is so indisputably; thus in the rub-other locitements, for other stimulus, when lift, for example, the muscularity of the 'taken into the stamach, would set upon it, would is it more coospicuous that that of more especially the erget, of which I for the loctestines; you may see the fibres merly apoke. Well then, if the womb in course ond large, and you may observe all other animals is muscular-if, egain, their motion, provided you examice them the morrularity of the human womb is deimmediately after the rubbit is killed. It veloped to the eye, when preguancy occursseems, then, that in the mammiferous ani- ond, moreover, if we find that the womb, male generally, musculer fibres here been like muscle, contracts under the incitement given to the uterus for the purpose of expelior at stimulus—I thick we have proof ecough to the fectus, and if the muscular fibres by to beer us out in the assertion, that this given in the case of coimole, why should uterus is musculor. This moscularity is of they not be given to the huose uteros also ! uo small importance; by means of it, not Why in the human uterus slove should a only does the womb expel the child sod the fibre be formed, sai generis, expressly for placents, but it moreover cootracts itself so this purpose, when, as appears from animole, as to becume secure against the risk of inso clear, that if you take a portion of the listered by the same remedies, miterus when thus developed, and show it. The thickness of the womb varies in to any sustament for demonstrator, asking different women; an excrage being from a him, at the same time, what it is, he will quarter to a third of so inch; and it is worth, and the same time, what it is, as thick when out making mention of the womb, I saked tension. Certain parts of the aterus you will

the veins would have been serpentine olso. the placents -theo an accomulation of The substance of the uterus, I couchive clotted blood; or the fibres may be brought the musculor structure is itself sufficient for version, or the larger ducharges of blood; the purposes of parturition. This argument, for, as I formerly explained to you, it is by I know, is not derisive, but the presump- the contraction of the muncular fibres of the tion is strong, for if the uteros of suionals is womb, that the mouths of the blood-remels composed of unscolar ibres, why should are closed up, so as to prevent the larger we not soppose that the human uterus is an discharger of blood in ordinary cases. The slao! Frustes per place. Again, that the womb heing musculor, is, of course, ubnox-human uterus is musculor, appears when it ious to the same diverses as the other music developed from pregnancy; and this is eless of the boar, and may, perhaps, he re-

raply, without hesitation, that it is manufar, your observation that it is as thick when This experiment I once made myself: take splanged from gestation, as when in the imleg a portion of the impregnated uterus, prepared state which is a proof that the Tahowed it to Mr. Grean and Mr. Key, thoses of the wond does not arise, like escellent judges on this point, and, with that of the human bladder, from more dis-

times, on the other hand, it is unusually thin, activity, like the intestines. not thicker than brown paper for axemple. From the unusual thickness, no inconvenience arises; but if it is unusually thin, lacerations may take place, and henco you ought never to earry, your hand into the uterus, unless there he need for it. About the mouth and neek of the uterus, you will find a large number of mucous follicles, which, in pregnancy, are very upt to form a great deal of mucus, and which close up its mouth; it is this apparatus which forms the glandula nabithi, and I suspect that in carci-nome, it is this apporatus that is the original source of the malignant ulceration. opinion is deserving of attention; because, if it really be so, it is not unreasonable to hope that, in some cases of genuine malignant ulaeration, if we can but pare nway this diseased structure, we may entirely remove a disease, which would otherwise go most probably be cured. on and destroy the patient. An operation in principle of this kind, has been performed, I believe, not without its success, by Ozisuder, Dupuytren, und Lisfrane, and this operation hereafter more fully coosidered, I strongly recommend to your If the quantity of the liquor small has been consideration.

rations, illustrating and proving the assert of the uterus, of course, gives rise to a very tions which I have advanced. This, in considerable flaceidity of the abdominal cast, is a very escellent specimen of the coverings; indeed they are exceedingly aterus at the end of the nine months. You faccid, even in those cases where the uterus will observe the position of the viscera has not exceeded the ordinary size, and above or behind the uterus. The uterus is honce the propriety of the measure which I sometimes of a mure rounded, and, at others, formerly recommended to you after dea more oviform shope, a specimen of both livery—I mean the compression of a bandage, forms I bere exhibit.

In this preparation, you see the absorbents of the uterus. This belonged to the of the sudominal coverings, howaver, graducat; the womb dilsted and dried is not uslike a pieco of intestine, and the absorbents remind one of the lactesis.

Here is another preparation of the absorbeots of the human uterus, very numo-

rous and large.

Here is one that shows the muscularity of the ntcrus. A piece of berf does not exhibit a muscularity more conspicuous.

Here is another uterus inverted, its inner membrana having heen removed, so that you may see its atructure the better. You may also distinguish the orifice of the fallopian tubes.

Here is a still finer preparation of the same kind.

you may see both the wombs and the vagina abdominal coverings will be as flaccid as

sometimes find to be unusually thick; some- [distinctly moving, and with a great deal of

Here is a preparation showing the ordinury thickness of the uterus, which is from

s quarter to a third of an inch.

Hero is a preparation of the womb unusually thick throughout, nearly an inch lu its measuro from surface to aurface.

Hero is a preparation of the uterus nuusually thin, some parts of it not more than a lice in thickness. Such a womb might be easily lacerated.

Here is another preparation, where the womb is not thicker then a piece of brown paper; recollect this preparation, whenever you are introducing your hand into the nterus

And here is the os uteri, with its follicles. It is this structure which is, I suspect, the first sest of the malignant ulceration, and by the removal of which the disease might

Of the Genitals, and their condition immediately after Delivery, and during the subsequent Il'ecks.

uousually large, or if a wumsa bave pro-I shall now send you round some prepa- dured a variety of children, the contraction as in the case of sacites, so as to give to this part so agreeable support. This fisecidity ally disappears, more alowly in some, sod more rapidly in others, so that if the abdomen were exomined many months after da-livery, or even many weeks, although much laxity of the coverings might remain, you would not find them, in the general, by any means so fisceid as immediately after parturitioo. The use of the bandago tends, perlisps, to facilitate the contraction of the sbdominal teguments, and the acquisition of the natural shope, nat only immediately after delivery, but anheequeutly; and I thick it is no bad advice that is given to patients, for the first few weeks properly to support themselves with bandages, not, however, pressing upon the abdomen with Here is a specimen of the musculority of that degree of force which may give rise to the womb of the rabbit, showing, as neual in pains. That restoration of the abdomisal this animal, one very large vagion, and two coverings to their healthy tension, which uteri. It is not necessary to take away the takes place spoutaneously in most cases, uteri. It is not necessary to take away the takes place spoutaneously in most cases, peritoneum to see the muscolarity; be dues not invariably take place in all; you sides, if you examine a rabbit immediately will now and then most with a case in after its neek has been broken by thu denler, which, in a year or two after delivery, the

they were immediately after the hirth; the jan operation, however, which, as I have reason of this failure of the contraction of often said, and as these preparations provo, the muscles and the akin, I confess myself should never be performed, unless there be to be unable satisfactorily to explala.

Immediately after the expulsion of the feetus, not only is the abdoman soft, but the uterua itself may be falt to be hard and rising too soon after delivary, feel as if the uterus itself may be fait to be hard and rasing too soon ster carriary, cere in a mother round; in feel, not unlike the hord of a fastes. You must not be surprised, if that woman to the surprised, if the policy is the state of the faster delivery, that she has a tamour in the pelvia; for if she have not had a child before, she may not be sware that this tumour is bealthy; and the practition thing tumour is bealthy; and the practition thing tumour is bealthy; and the practition thing tumour is bealthy; and the practition women, were thay to get up too arrly after his a large round swelling in the region of the hladder." and one of myubatetric friends. Known to occur. After the delivery has tho bladler," said on of my whateric friends, it wown to occur. After the delivery has in the true accent of ansiety; "And I should be very much concerned if there were not," was my reply, "What could a merriced lady its original capacity; the lower part appears without her uterus!" As, however, the varians, more or less, recovers its tone, so as to approach to distinct the could a merriced lady its original capacity; the lower part appears to the could be seen to th absorbents of the uterus are numerous and tracted as it was before the delivery took eight or ten times as big.

thed. The uterus becoming inverted in another case, the practitioner, after some heatrequired exterpation, and amputated it with a pen-knife : but enough of these horrota. Pray become familiar with the characters of the womb after delivery-examino the preparation,

a peremptory need. This fiscoidity of the passages is the reason why woman, espe-cially those who have had large families, on capacious, sod as a good deal of the hulk place; the upper portion, it is true, if oth depends upon the blood with which the woman have had five or six children, alwomb is loaded, and which seems to be expelled from these vessels which contract so parts were in the virgin condition—whence the contract so the contract thoroughly ofter delivery, we find that their tendency to descrit of the womb. In thoroughly after delivery, we find that the sa tendency to descent of the womb. In womb very repidly shrinks; thus, if you ordinary cases, I think it better that the casmine the uterus even at the end of a woman should never get up at all till the fortnight after parturition, you find it is fith day, reckoning that of delivery as the greatly reduced in its siao; and if, at the fifth day, reckoning that of delivery as the greatly reduced in its siao; and if, at the fifth day, reckoning that of delivery as the greatly reduced in its siao; and if, at the fifth day, reckoning that of delivery as the greatly reduced in its siao; and if, at the fifth day, reckoning that of delivery as the foreign obsture, if a bearing downward beautiful that the bulk of it is be felt, and when the descent of the womb bulk of the womb in the ringin atate, though in a position more depressed than the hips immediately niter delivery, it is perhaps; for some six or seven weeks together, the eight or ten times as big. secident may, I auspect, be remedled: for, from the cases that have been narrated to In your morbid dissections, I wish you me, it appears, that where this discipling is to take every opportunity of examining the atrictly observed, the vagina and ligaments uterus, a practice which, you will recollect, sometions contract, and the proceduction I have frequently recommended. Some practitioners, who have seen a great field of smine the pureperal body, when the patient midwifery, have but very little knowledge dies after delivery, you will find the uterus midwifery, have but very into anowers, ties after derivery, you wan must are accounted with the polaria, purposed uterus. One case I know of, in and this in consequence of the broad ligable, the would lay forth beyond the external parts, and the practitioner mistaling it for a timuour which required removal, capital connexions being relaxed and elunited an much force upon it, that the patient ing is made above the examples in publish in the puerperal hody, granting that the parts are not become rigid, as they sometimes are, tation, determined it to be a something that that you could draw the uterus forth, so on. to bring it out from the pelvis into such position, as to allow of its ready extirpation by the knife; but this subject I recommend to your attention, for it is one ant without its interest. You will recollect, that I stated be-Immediately after delivery, there is a fore, that in the rabbit, where the connexions great deal of flarcidity in the passages of the uterus are long, I have performed this which lead to the uterus. When the child operation, and that in the living animal; 1 in passing, these passages are laid thoroughly have taken both the wombs completely open, so that you may with facility pass away, putting a ligature round the vagina your hand up into the cavity of the uterus, | previously. Of four rabbits on which I thus

it is not impossible that a similar operation, rectum; but that there really is an addition be performed in the haman body itself; and, provided it could be performed, I am not sure that, under certain farnuring circumsure that, under certain farmering circum-ginning of pregnancy; and, secondly, by atances, it might not diminish the dangers our observing when the womb is thu-of the Casarinu speration: at this subject I roughly emptind, that it still remains sight morely hint at present. In a former Lecture | nr tan times as hulky as it is in the unimtreated of it more at large. Let me mapers and a state.

Treated of it more at large. Let me mapers with the more state.

When the womb is growing, in the prorash attempts .- Experiment -- observe --

Thu apecimum I now show you, is ons of half the purperal nterns, anch as it is growth, whether from distraction or deve-immediately after delivery, when thoroughly loped atructure, is confined priocipally to contracted; imagina the other half to be the hody of the uterus, while the neck hesuperadded to this, and you may then form a notion of the size of the womh after deli-very; it is as large as the head of n fallgrown firtus.

pregnancy advances, the bulk of the womb of the uterus, and the end of the pregenlarges; at the end of the third month, it manry, issumuch that, to ascertain what is is about the size of a full-grown fixtal head; the length of the neck, and how for it is, at the end of the fifth, of the huik ut the or is not, dilated, we may form a testion of foctus without the head ; towards the close of the progress gestation has made. During the seventh month, as large as a full-grown the first five months of pregnancy, the neek, feetus; and, at the close of the minia I have said, remains undisated, being of ormunth, balky as in the casts which are dinary length—an inch nul a balf, I nean, there laid before you. Now, this great which is its original dimension: but, at the end increase of the bulk of the uterus proceeds of the aixth month, it will be found that the more alawly at the earlier, and more ra- neck has lost about one-third of this length, poly in the latter months, as a very short to roll as inot about one war reflection may satisfy you. At the end continuous the state that the tounation of the of the months and a fortnight, that is, and the end of the first laif of the period of months, it loss show the remaining third; gentation, you nid the woods is not nuch as othat in the commencement of the itebigger than the firtal head, while, during livery, if you make an examination, you the remaining period of gestation, the find the as uter immediately normal into ather four months and a tortnight, the the cavity of the womb, the cause of the nterus arose merely from distention, like fugers of the left hand, as if you were

operated, three ultimately did well. Now | the enlargement of the orlany bladder, of erhaps, If the connexions wern long, might to the sabstance of the womb, is proved, e performed in the haman body itself; and, first, hy our finding it as thick, and sometimes thicker, at the end, than at the be-

gress of pregnancy, it should be observed, the growth does not aqually affect all its parts during the first five mouths; the low enlarges but little, and remains attached to the body in the way of a nort of appendage. It is, therefore, principally thiring the last months that the growth of thu In this glass is another specimen of the ineck proceeds; not this goes on in such a womb, such as it becomes in about three manner, that, at the end of pregnancy, weeks after parturition: you will observe this urrk is forming a part of the general that it is considerably reilned in its bulk and thickness. serve the preparations.

Of the Uterus during the progress of Pregnancy. Now, in a practical way, to remember, that a soit of relation has to remember, that a soit of relation has I need scarcely abserve to you, that, as there traced between the length of the neck

in the latter period of gestation than in the ingers, may learn the length of the neck of earlier. The increase of the halk of the the worth. Sometimes—but, on the whole, uteros is to be accribed to two causes print I do not recommend this mode, for fear of cipally; one, the mere growth of the avam disturbing the avam-the tager sometimes within the utorus, which dilutes it, much may be slipped conveniently enough along in the same manuer as the urine dues the the canal, so that you just touch the meutbladder; the uther, not less interesting, branes, and, of course, taking, at the the actual addition of solid substance to same time, the measure from the mouth the uterus; there being a growth of all its to the cavity; but, for general use, the structuras, which become enlarged and do best way is to place the woman in the velaped. It was imagined by the older ordinary mature of debrery, on her left practitioners, that the culargement of the side, and then to pass up the two fore-

going to make the common navalantion, generally lodge above and behind; so that ultimately planting those fingars between if a woman have here labouring under a thu symphysia puble and the mouth of the hermia which is reducible, whether femeral womb.

This done, you carry those fingers or inguinel, the descent of the gut may he and the mouth of the uterus will give the good measure, free from it. Women, howmeanire of the neck.

vary lu utero, necording to its growth and they become pagnant with this disease, the age of geatation. During the first theu there is always a risk of atrangulation; four months, or the first four munths and a the uterus enlarging, preases the intestines fortnight, when, as abserved before, the backwards and upwards, (abserve the cast.) womb, even at largest, is scarcely bigger and, of consequence, it gradually brings the it is lodging in the cavity of the pelvis, the prifice of the sac, so that all thu syncpprincipally in the lower part, especially if tome of strangulation are produced. Casea n woman has a large pelvia. Now, when it of this kind are axceedingly rare. A man is thus ledging in the lower half below the may practice a long time before he meets hrim of the pelvis, sometimes the intestines with a single instance of them; but when are compressed, and these who are disposed produced, it is exceedingly dangerous. The to be morrhoidal affections, and to irritation atracgulation here is not occasioned by any of the bludder and bowels, may suffer a want of monin the crifice of the sac, nor is good deal of inconvenience about this time, it to be relieved by any enlargement of that from tenesous, and trement desire to pass ordice; but it is the retraction of the intestitue water. But of all the as uptoms anstruce growth the descent, the one not the least troublessme, is the feeling of bearing down, decasions all the danger. If the practitioner the worth frequently descending a little, were called to the case where the symptoms and, in some cases, even protending beyond are pressing, it would be difficult to know the external parts: though, happily, exhaus the deal with it; I really do not know trome descent is rare. These symptoms are what would be the best thing to be done; apt to occur, more capecially in the first perhaps the discharge of the liquit amui nunths, being produced by the cause I have would lower the uterns, and diminish the re-mentioned—the descent of the womb, more traction; but if the practitioner were colled or less, 1010 the cavity of this polvin; but dur- to the case early, I should conceive, that by tog the last months of pregnancy, when the of course, the sensation of hearing down is the tension, followed ultimately by the exrelieved. In this rituation, however, fur pulsion of the fietus, and the collapse of the ther inconveniences may arise; for the blad- juterus, with a reasonable loope that the disother, whenever the patient laughs beartily, I tion, and should send promptly for help. ut has any sudden abdominal movement, there is a foreible pressure on the bladder, and the prine is made to gush out; so that she has a sort of incontinence produced. Moreover, a change of the situation of the uteron gives it a bearing on the liver, and, which an ascent taken place, and this seems more or less directly, it may press on the to be somewhere about the fourth month; hiliary ducis, and give tise to jamelice, upt for at this time it is that the womb, acto occur about the aixth or seventh mouth, aconstimes not terminating till after the delivery, when the pressure has been removed, and sometimes reasing in the ninth month, when the womb approaching to its full size, the principal pressure is transferred to some other part.

The womb, when large, taking its place struction of the rectum, obstruction of the above the brine of the polvis, the intentions bladder, and a great deal of pain felt in the

unward and forward, so as to touch the prevented by the interposed womb; and body of the uterus, frequently to be felt; and thus it has happened, that women who if the vagina be ralaxed, and if this be achieve been liable to hernis, have, by a complished, the distance between the body repetition of pregnancy, been kept, in aver, sometimes labour under irreduci-The situation of the pterus is found to ble hernius of the femoral kind; and when than the head of a foll-grown fectus, we find gut to its hearing on the upper margio of discharging the riquor amnti, he would grentwomb becomes bulky, and gets its resting. ly benefit the patient ; for the effect of this place entirely above the brim of the pelvis, operation would be an immediate relief of der, when full, being interposed between case would be permaneutly and radically the surface of the hard uterus, on the one court, Patients, with hernia, ought to hand, and the abdominal coverings on the know the incipient symptoms of strangula-

It seems, then, that in the earlier months of pregnancy, the womb is helow the brim of the pelvin; and that, in the latter months, it is lying entirely above. It is elear, therefore, that there must be a certain period at quiring the bulk of the mass here exhibited to you, becomes too large to sink readily below the brim. Now, in some very rure enter, this accent of the words does not take place in the fourth menth as it nught to do, and it continues to grow rapidly in the pelvin; and the consequence of this is, oh-

strang tradit, and in the hips, shighs, back, between the unablices and the services and all the parts unastly the sent of uterine his cords, and is the sheep generalise it lies, suffering. Now this mad may be, wholly in the scubiceles cords, facili, unless, is administrate. Now, perhaps, mistike if for deed, that contraction been taken place, retrosperion, of the shere, though it is which sometimes occurs some two or three easily made out by examination; for, on days before the appulation of the factor, making your examination, you discover a large tranger fillior the polyts, with the one those of these points I shall now endershare through fillior the polyts, with the one transport to demandrate to you. and, in the first the pelvis, and to prevent a reiterated der the pasts below it rest upon the mouth of acent, the woman may be confined for a few, the womb. days to the horizontal posture, till the uterus is become too large to come down. In the general, however, in the fourth month, the merus does not, in this way, remain in BIRMINGHAM SCHOOL OF SURthe pelvis, but roses imperesptibly above the brim, probably at night, when the woman : sin ; bed, and the ascent may take place in a manfeltanychange. I here is liuwever, a peculiar tensation perceived about the fourth month, accompanied with sickness of the st-mach, accompanied with sickness of the st-mach, the consent of the lecture, the perhanance a certain perturbation of ound, and a feeling, the consent of the lecture; the perium and of enoution in the pelvis below; this is address delivered at the opening of the areally ascribed to the first movement of Selinal of Medicine and Surgery on Brimingthe child observed by the mather; but I ham this day, by Dr. R. Pearson. think it is reasonably enough suggested by Barna, that it may be produced by the sun-Barns, that it may be prosected at the deer rising of the aterus from the true to the 21, Temple Row, Oct. 29, 1678. false peivis.

As pregnoncy advances, nod as the womb! rises in the abdominal cavity, of Lourse the the discourse which I have prepared for the fundus of it gets higher and higher, and present occasion, it will be expected that I there is a certain relation of ineight between should offer a few remarks relative to the the fundus steri and the age of gestation, origin and formation of this lustituting, with which it may not be smiss that you the most superficial observer must have should acquaint yourselves. Now we find, perceived has much superior, in every re-that during the first three months the would spect, the present state of society is, to the lies very much within the brim and cavity of slate in which it was twenty or thirty years the pelvis, where the fundus may be felt, ago. In what does this soperiority consist! and it is not till the end of the foorth month, that not to the higher degree of moutal imthat the fundax is found to be riseo fairly provement throughout every walk of life't above the brim of the pelvis. At the end of that how has this pleasing change been the 5th month, the faulus is a little higher; effected ! How have the various ranks in at the terminative of the 6th month it lies a society emerged from comparative ignorance little below the umbilicus; at the cud of the and unciviliration, ioth the present degree 7th month, a little above; at the end of the of calture and reasonment! I answer, by

large tumour alling the pelvis, with the os raur to demandrate to you, and, in the aret sarga cumour among the peives, with time ost trant to demanstrate to you, sang, in the saret trans low down, that it may be percuived place, with respect to bulk, we may observe as first fouch. To reduce the nerus may here o preparation, showing the uterus of the not be difficult, when the bladder has heno size of four months, sandher of the balk of thoroughly evacuated praviously, and the fire months, and the of seven manths, and uting generally accumulated largely in fourth of time. Observing these preparathese cases. While the bladder remains tions, you have un apportunity of seeing the over distended, the rature of the womb bart of the sterm which as helore stated. over distended, the rature of the womb neck of the sterus, which, as before stated, is reodered both difficult and dangerous; oppears in the fifth month to be consected far if the uterus were, forced above the with the body as a sort of appendage. It brim, disruption of the bladder might occur, the preparation, consisting of an eight-Bewnie, therefore, of these rash attempts month uterus, the neck is somewhat diluted ; at reduction; the aufer practice areas to it is more so in the preparation approaching be that of taking a very small and flattened to more months, and at the full period of catheter, to be cautionaly instrumed into gestation, as only be seen in the preparation the bladder, after which the water only be here shown, the dilatation is thoroughly drawn away easily enough, and then the completed, the canal being destroyed altowomb may be replaced above the brito of gether, so that when the load stoke down,

# GERY AND MEDICINE.

I am, bir,

Yaur obedient serrent,

W. S. Cox, Honorary Secretary.

Gentlemen,-Before I proceed to deliver eighth month, it takes its place helf way the increased attention given to education,

er of lite-What a me e institutions have sure up there within a very few years, to which My now be added the two universities. popul may now be added the two universities. Population, it is consistent upon the agreement of the form the metropolis let us turn our ayes to amount of youing men incought up to the our large provisional towns—to Liverpool, Magichaster, and Brintol, and we shall see hourhood, must-be nearly as great as in their this apirit of the times, this aridour fort those places. The demand, therefore, for a mental improvement, has apread itself there school of medicine and surgery must be the also. Wa shall see that there also aducation, in all its branches, has been promotedthat there also the fine arts and the uneful furmed the present Institution, which has arts have been encouraged, and that in those towns, as well as in the capital of the empire, temples dedicated to science have been erected, and their portals thrown open to all who desire to enter. It would indeed have been a represch if Hirmingham had viewed with indifference all that has been going on in this way in rival towns; but Birmingbam hes, all along, been actuated by the very same spirit, omitting its excellent charitable institutions relating to education, I will instance, as; amted to the present purpose, and as forming an erain the history of this town, its public libraries, its Philosophical Institution, its Mechanics' Institution, and its two institutions for the encurragement of the fine arts, in the support of which the liberality of many of the neighbouring noblemen. We are proud, as indeed we ought to be, and gentlemen has been so conspicuously of the names of these distinguished charac-

proof th Birmingh og little, if at all in the si lation, it is obvious that the a same. Under this conviction, and in accordance with the apirit of the times, has been been hanoured with the patronage of the fullowing noblemen and gentleman:-

Marquis of Lanadowna Earl of Plymouth Earl Fitzwilliam Lail Spancer Fart of firadford har llowe Earl of Mountporris Lord Viscount Hood The Lord Hishop of the diocese The Hon. Mr. Lyttleton Sir G. Shepwith, Bart. Sir Robert Peel, Bart. Sir Eardley Wilmot, Bart. D. Stratford Dugdale, Esq., M.P. Frances Lawley, Esq., M.P.

We are proud, as indeed we ought to be, displayed. But audest all these improve- tern; men not more respected for their rank ments, there was yet wasting a achool of and titles, than for their highly-cultivated medicane and angery. This has, at length, minds, their benevolent principles, and their been established after the example of those juniform attention to public good. By their at Manchester, Liverpool, and Bristol, courtesy in the present instance, they have where the utility of such schools to youn; evinced the estimation in which they hold men brought up to the profession, has been the medical profession, and their desire in amply proved during the space of several promote its interests; and the sanction years. But it may be antisfactory to state which they have been pleased to confer on the information on this sobject, communic this school, cannot but give additional attracted by Mr. Watson, accretary of the mulusto nurexertion. Whilst speaking of Apothecaries' Company in the Committee .our patrons, I must not unit to mention how on Anatomy, appointed by the House of much our institution has been befriended Commons during the last session of Parlin by the three senior physiciana of this town, ment. " On an average," (says Mr. War. I mean Dr. Edward Johnstone, Dr. Julia son,] " during the last seven years, shout Johnstone, and Dr. Male. With their se-400 atudents have been examined annually customed liberality, these gentlemen have by the Court of Enaminers at Apothecaries' thrown open their libraries to us, and have. Hall : thuse have not all been educated in ablowed us the use of many valuable plates London, many have been in attendance at relative to the departments of quatomy and Edinburgh, some have been wholly educated botton; and Dr. John Johnstone has perat Manchester-and, of late, several English mitted the lecturer on the practice of phyatudents have received their instructions aic, in addition to his own, to avail himself from teachers in Dublin. No usuage men of his privileges with respect to the admis-come before the Court better qualified, in every about of pupils at the General Rospital, an ruspect, than those who have been our respectanced arrangement which cannot but be advantaat Munchester, where excellent lectures in groun to the school. I should now say every breach of medicine are given by compe- something concerning our resources and aptent teachers, and the Manchester Infirmery paratus. Through the penevering efforts

much is favour of it in its present state: in a manner that shall be creditable to them-bat every opportunity will be seized of mak- | selves, and baueficial to the pupils. ing additions to it; and alrendy Mr. Knowles has presented un with neveral dried specimens of medical plants; but our chief resource is in botunical plates, which hove now been brought to such a segres of per- cases of intermittent freen, in which fection, as almost to apperach a reference to living and dried specimens. In proof of this remark, we may instance the large and splendid plates in Mr. Rosco's description i the Practice of Phonic Ros. in Education of plants cultivated in the hotenic and plants cultivated in the hotenic and plants cultivated in the hotenic and the practice of Phonic Ros. in Education of Phonic Ross in Education of Phonic Ros of plants cultivated in the betanic garden of. Liverpool. Some of these plates, through the kindness of one of our patrons before mentioned, now lie on the table for your inspection, as well as other botunical plates; 20. Has been from yours a soldier. Served with which we have been farnared, through in the Mediterranean for eighteen months. the politeness of an accomplished and like-illad several attacks of intermittent, for rary lady, whose mane waste not at liberty which he was taken into hospital in one of to mention. I may add, our cabinet of Ma-1 the Ionian Islands; and since his return to teria Medica is provided with specimens of England had two different returns of the the new chemical medical preparations, by discusse. He describes his sufferings to have Mr. Morson, of Southempton-Row, London, been always very scate change each pa-I must be allowed to mentium the indvantage roxysm. is aware of the nature of the complaint, and the chest, cough, and copieus espectorstion, together with emuciation, prostrution of strength, and heavy night awests. For four or are weeks, the expectoration was bloody, and smounted, on an average, to about three gills a day. His pulse was nethan the usual antierings. His akin became | ver under 100. The sound of respiration on of a bright yellow enlour, and he was relieved the right sidn of the cheat was deficient; ed by romiting a large quantity of billious while it was puerits in many parts of the matter. The attacks still continued; they have any whore. Contrary to expectation be be-anticipated the usual time by several hours, came much betterunder the use of consider-so that the different gantlemen who went to able doses of the acctate of lead; and comthe hospital to bleed him in the cold stage, ter-irritation produced by tartar-emetle cint-were either too soon or too late, and no one mont to the auriace of the clost. When was fortunate enough to drop in in time, till his recovery was considerably advanced, Mr. Drever, one of my pupils, remained in land in order to give him the best possible the hospital all night, and he was then bled chance, he was sent on leavn to his nativn The following account place; and, when there, was seized with intermittent fever, which induced him to

ficulty. A large opening was made in a vein, the bed. From the commencement of the that the opening had not been properly made, pertoration, and complained of excessive I tied up the opposite arm and used a good coldwess, together with pain in the head, orifice in another vein, bur the hiod still chest, beily and back. Heat of the room only trickled; and as the rigories continued, 15%. Thermometer placed under the tongon very violent, I gave him nearly a wine glass. (919; held in the hand it fell to 760. Pulso ful of spirits; and in a minute or two the 75, and very weak. After the rigors had blood spouted in a large stream, and thirty continued with violence for ten or twelven ounces were quickly exacusted, when vo- minutes, a vein was opened. The first cup, unting and a tendency to avocope took place, ; which was filled in five minutes, held twelve The fremous had entirely crused, and all the ounces; by the time it was half filled, the unplement sementions. The patient express- pain had vanished from the head and chest, ed, in atrong terms, the case which had so, the cough had ceased entirely. When the suddenly been produced. In five or six mi- twelve ounces were taken he said the pain nutes after the arms were tied up, the tre- | had now left the back, and that a very warm, mours returned for a few minutes, and then pleasant sensation was gradually apreading from his back over his bowels and breast. "I visited him again at the end of six The second cup held between eight and there was a lead taken from his breast and suttons disappeared before the arm was head, and acquinful technig was left."

At two regular periods since the bleed-ing, he was conscious of feeling heavy and of interable attength. There was no sense sleeps, but had no tendency to rigor, or of sinkness, or tendency to syncape. He even to feel ould, although the weather has was notice visited in twenty minutes, and been exceedingly changeable, and for the found quite confirmable. On being asked most part cold, the wind canterly. He has if he felt weak, he replied, he did not, but had no kind of medicines but laxwives to that be did not know exactly haw he might be if he were upon his legs. In the even-ing he continued quits well, but had a little Case 17 .- Gunner Robert Young, aged heat of skin, which was found to be owing

day, no medicine was ordered.

20. Had a paroayam this morning, but it was alight, and was not attended with the and the shiverings immediately en cough, or the other severe symptoms des headach now, and giddiness. Pulse 72, again in the cold stage. 4

22. He had another paroxyam, after which the quinine was exhibited, which appeared now to have the effect of preventing a recarrence of the disease, although it had been exhibited in vain; and in much larger

doses before the bleeding.

"Where reasons for soliciting your puttonage on this occasion. ever," says The Spectator, " the learned; " coming forward as a randidate for the ever," says The Spectator, " the learned; office of Physician to take care of your lying in patients, I shall bust consult the demanding his testimonials; if he received a feelings which the Courternors at large, and vere, and has actually instructed his at- he directed towards the performance of

torney to commence an action of trever against Mr. Banconam, for the recovery of the lost testimonials.

As our readers may be curious to know something of the documents, the loss of EVERY body has heard of Dr. GRANVILLE which has driven Dr. GRANVILLE to de-

public practice I add, that I have pre-scribed for nearly 7000 rigidren during the last four years, as one of the Physicians Roared for the handkerchief that caused of the Royal Infirmary for such I hillren, and that I am a Lecturer on Midwifery at the Westminster General Dispensary-I It is, as a contemporary has observed, a humbly hope that I have shown sufficient

note, it was an even chance that it related particularly the Ladies, must caperience to the lost testimonials; if a friend called, towards the objects of their benerolence, if state, that, in doing me the honour of the object of his visit was, probably, to in- cleeting me, you would accure the services tereade for the testimenials." But this is of a married mon with a ramity, (a qualinot all. The accounters has, we understand, in importance in the chuice of a Physidistinctly announced his intention to persection-Accoucheur,) whose efforts will ever mute the objects of your institution.

I have the bocour to be, My Lords, Ladies, and Gentlemen, Your obedient humble servant

A. B. GEANVILLE, M. D. Fellow of the Royal Society, Memher of the Royal College of Physiciums, and Physician in Ordinary to His Royal Highness the Duke of Clarence.

16, Grafton Street, Berkelsy Square, March 1846.

Whether the Doctor's declaration, that he should best consult the feelings of the Ladies by observing, that, in election s married man with a family, they would securn the services of one whose afforts would be directed to the perforenance of those duties which are best calculated to promots the objects of the institution; whether, we say, this be a modest declaration, we shall leave nur reeders to determine. The passegu accurs to admit but of one interpretation. The Doctor had sirendy stated, that he had delivered upwards of ten thousand women; but this was not sufficient. The support of the Ludies was, in his estimation, to be gained, by tenderie; evidence of another qualification; and he accordingly reminds them that, as he is a married man, with a family, they should lose on time in securing the services of a parson of such rare endowments; a man who had not only delivered ten thausand women, but who was qualified, ex ri pateraftatu, to promote the objects of the isstitution. This is evidently the construction put upon the Doctor's letter, in the following ill-written, but goodhumoured, certificate of Sir Antley Cooper:-

" My dear Sir,—It gives me pleasure to add say testimony to a hoat of others, of your high qualifications for the situation you are elected) a man who so powerfully unites the science of your profession with its prestice .- Jan. 20, 1822.

ASTLEY COOPER."

those duties which are best calculated to pro- | affect, from Sir E. Home : who is, perhaps, as well qualified to certify the ability of an accoucheur as Sir A. Cooper.

> "This is to certify, that I have the high-est opinion of Dr. Granville's knowledge of every part of the duties of an Accoucheur, having studied both in this country and at l'aris, where he remained two years solely for that purpose, after finishing his advention in London.—Sackville-strest, Jan. 17, 1822. EVERAGD HOME."

The composition of this note is of a piece with that of the worthy Baronet. Evenand certifies the skill of Dr. GRAE. VILLE, because he (Sir Evreano,) had atudied in this country, and Paris, &c.

Sir Humaneev Davy, elthough he very candidly states that he san give no opinion upon the professional character of a manmidwife, is nevertheless brought in, solens wiens, to swell the triumph of Dr. GRAN-VILLE. The following is his quasi-testimoniul.

" Dr. Granville's varied talents, extensive information, and indefatigable activity, are so well know to the medical and scientine gentiemen of the metropolis, that I should conceivs say particular recommendatinn of him as unnecessary. I ranuot presume to give an opinion open his professional character: but I should suppose him peculiarly qualified, both from his education. and the nature, extent, and success of his practice, for the office of Physician to the Benevolent Institution. - 23, Grosvenor Street, Jan. 31, 1822.

H. Dava."

We take the certificate of the chemist to be fully as valuable, as fut as Dr. Granville's obstettical skill is conversed, as the tollowing testimoutal from Sir Gilegar BLANE :-

" I beg to rertify to those whom it mey roncern, that I have been intimately acquainted with Dr. Granville, of Swille How, for several years, and that I have found himto be a gentlemen highly accomplished in various branches of science, sed particularly in all that relates to his profession; to are suxmus to fill; and I shall congretulate the doctrises and practice of which, he has the Institution upon its preserving (if you paid the greatest attention, especially in the shtetrical department. - Sask ville Street, 19th Jan. 1822.

GILSEST BLANE."

There are two cartificates signed by Itofollows a certificate to the same neares Maceson; one from Mr. Broder,

and last, but not least estimable, in a johnoxions of college codes, to an ignorance question involving the reputation of an accoucheur. a certificate from Sir Richard BIRNIE, the Principal Magistrate at Bow Street.

" I take leave to certify, that Dr. A. B. GRANVILLE bes been for several years Physician-Accoucheur to the Benevolent Inatitation for delivering poor women at their nwn habitations; and I em truly state, that from his professional skill and assiduous attention, he has rendered most important service to the Institution. The Public Office, Bow Street, March 9, 1826.

R. Binnie."

So much for Dr. GRANVILLE's testimonials. We shall only add that Dr. GRANVILLE has answered his nwn insinuation, that Mr. likely to exercise a salutary influence on a Baoughan kept the testimonials in his professor. With this day of retribution pocket, lest Dr. Davis, who was alleged constantly before his eyes, he would scarouly to be a medical attendant in bia (Mr. fall into that official abliviscence which a BROUGHAM'S) family, should be deprived total exemption from responsibility is so apt Professorship by their production. > ITCH TREATED WITH CHLORIDE OF LIME. By W. JOHNSON, Esq.

# To the Editor of Tuz Laweer.

DEAB SIR,-Well knowing your promptitudo sud willingness in communicating to case called raphania, in its chronic form, the medical world any improvement in the which, in the middle of last century, was of science of medicine. I beg leave to send such frequent uccurrence, has since that you the fullowing eases of itch, (the acables time seems to have almost completely dis-of Willan,) which were speedily, safely, and permanently cared by the chlorido of lime, as prepared by Mr. Fredarick Finchem, of Blanchester. If you deem the eases worth inherention, you will much ublige mo by giving mobile the state of the man place in your highly useful periodic them.

> I am, Sir. Your obliged servant, W. JOHNSON. Uct. 6, 1878.

Elizabeth Fenly, a widow, of the parish increased, and, at taxi, were accompanied Lirabeth renty, a widow, of the param by a discharge of blood from the vagion. On of fortentill, and her sia children, all caught examination, the neck of the merus was the rank itch, (acabien papuliformin), and, found somewhat diluted. The practitioner; at the suggestion of Mr. Henry Fincham, upplied ligatures to one arm and leg as a who had several times cared the mange substitute for bleeding, which, from the juliga and horses with the obloride of time, great weakness of the patient, appeared in a ventured to give it a trial in the above-submissible, and, at the same time, sina-juamed cases, and, to my great satisfaction, being to the rare and cold impartitions to it found the disease intention to it. somissino, as d, as the same lime, as all-juamed cases, and, to my great satisfaction, plans to the arm, and cold fomentations to I found the disease instantly give way, the abdomen. By these means a transitory After the first application, the intelerable relief was obtained; thu pains abated a and characteristic stelling west off, and all little, but the discharge of fluid and grumous hlood continued. A few sights afterwards, idonu befure for some weeks, a good night's after violent pais in the belty, and during rest. It should be observed that no other the attempt to make water, a solid body medicine, either during or after the applications of the abrief and the man architecture. was capelled, which was found to be a pla-iction of the chlorida of time, was exhibited, each to it three meetles, in a healthy atste and so that the disease was cured solely by the without any sign of decomposition; it agency of that powerful liquid. The follow-umbilical chord was only as inch in leagth. ing is the modul I adopted: It belsg warm In the shood, which, at the same time, was weather, I made a bath of one part chlorida. discharged in considerable quastity, no ride, and six parts water; in this I had the

every day, and after the second application tinuance of this unnecessary unisance of of the bath, the patients felt ne more of the disease. However, as a further accurity, I directed them to go into the bath four times more, which they did; whether they would have been cured by the first two bathings, or not, I am not prepared to say. The bath was easily constructed; a common washing-tub was auflicient; I had the bath alightly warmed by heating a portion of it every day, and adding it to the whole. A better way would be to edd clean hot water, the same queetity of the eld ent every day. I am of spinion, that aponging the body diligently with the tepid chloride of lime and water in the above proportions would ower the purpose.

The effect was se decided in the above ieveterate cases of scalies, that I am icduced to indulge the hope that the eliloride of lime bath will be found hereafter a most useful, cleanly, and cheep application in all scabid, parriginous, and impetiginous erup-tions. While speaking of the valuable this truly desirable object, will be grateproperties of chloride of lime, I cannot runy and properties of chloride of lime, I cannot runy and aveid hearing testimony to lus very great and friends,

Yours, respectfelly,

A Suffense. in the proportion of sixty, seventy, or eighty parts water to one of chloride: I have found it siegularly beneficial in ulcerated sore throst, particularly where there has been much foctor, end a typhoid tendency.

All manufacturers of the chloride of lime de not make it of the same strength; but as Mr. Frederick Fineham is careful to make his of one specific and uniform atrength, if his ekloride is used, the propertions here given may inveriably he depended Bpon,

### ABUSES IN ST. BARTHOLOMEN'S.

### To the Editor of THE LANCET.

Siz .- To affect a salutary reformation in any abusive system, It is requisite to expose the disadvantages attending its continuance, and likewise to explain the remedies hest calculated to brieg about its non-existence. I beg, therefore, to be allowed, through the efficient medium of The Lancer, to submit the fellowing to the dispassionate consideration of the Barthnlomew's aurgeons oud dressers. Almost invariably, as on last Saturday, when Mr. Lawrence secured the extremities of the radial and ulnur erteries for an injery to the ferearm, many in-dividuals of the great number of assembled pupils, completely last the benefit of witnessing distinctly the process of the operation, le coesequence or the congregated bends of the " privileged few." New, sa

patients immersed for about ten minutes | ne essential utility can accrue from the conolubbing craniums, not only to the evident disadvantage of even themselves, but alan to the total and auqualified exclusion of all the other pupils who may not be so fortu-nate as to purchase the right of occupying the operating portion of the theatre, I would humbly suggest the propriety of confining to the first, and, if necessary, second hench, the dressers, merely retaining as many as shall be required for the convenience and expedition of the operation, selecting those with a little fresh chluride, throwing about in regular succession from their ewn body; thus securing to themselves their "just end lawful" prorogative, while it confers an inculculable benefit on their less fortunate fellow labourers. Nor will it he too nuch to expect, that the individuals alluded to, whose otherwise gentlemanly deportment and professional acquirements entitle them to respect, will obligingly concede lu cour-tesy and good fellowship, what sught to have been in jostice demanded as a right. The slightest progress towards the attainment of properties of chloride of lime, I cannot fully felt, and acknowledged by, Sir, for self

DELIVERED AT GUY'S HOBELTAL BY

DR. BLUNDELL.

Lacture III.

Contents of the Womb-(continued.)

Umbilical Cord .- The fictes, Gentlemen, is put into connexion with the placents, by means of what is called the umbilical cord, short, generally, in the over of animals, and longer, proportionally, in the human ovum, though its length is liable to much variety. An everage measure of this cord may be about two feet. Dr. Haighton met with a funis which was not more than sir inches long. Mr. Lloyd, e gentleman formerly associated with this class, in one instance found the cord surrounding the neck of the feetes, as meny as air times, wheece you may infer, that its length was by no means inconsideruble. Mr. Briggs, in scother case, found the chord coiled around the neck seven times; and I think a case similar to this is put on record by the celebrated French practitioner Mauriceau. I know not that any serioes inconvenience results from the extraordinary brevity of the funis, excepting, parhaps, that if you lay hold of the child, and drag it too for from the mother immediately after birth, you lneur the risk of prematurely detaching the placents by a suddee pull, and may in this way give rise to hamorrhage, not to add, that if the adhesion of the placents be firm, so as to prevent detachment, the audden effort might, perhe propriety of the rule which before pre-

mination, whether the cord be or not of the ordinary length.

If the mubilical cord is much longer than ordinary, there is always a risk, lest in the fo.m of a loop it should lie forth in the variance before birth, an secident which is prevented by its heing coiled round the seck or limbs of the child. If the cord lie forth is this manner, as already explained to you, the danger to the foctas becomes very considerable, for the vessels becoming compressed whee the head descends among the bones of the pelvis, and the circulation being is this manner arrested, at a time when respiration cannot proceed, the child dies in the uterus, suffocated. To prevent this, it was formerly recommended that a piece of apunge should be procured, and that this, together with the cord, should be pressed into the uterus, provided this may be accomplished without violence or risk of laceration; the sponge (to prevent the descent of the chord a second time) being left in the uterus, to be afterwards expelled by the pains, in conjunction with the placents.

No serves have been detected in the umhilical cord, although they have been sught for with great diligence; and I can agat, from my own observations, that this part seems to he wholly destitete of sensibility, in respect to buth the mother and the futus. No large lymphatic trunks have heen found there: there is reason to helieve that lymphatics are wanting altogether in the placeets, sed, therefore, we should not expect to find them in the funis.

ing, parhaps, that if you lay hold of the child, and drag it too far from the mother; is it is composition exceedingly simple, made in mediately after birth, you incur the risk is its composition exceedingly simple, made of prematurely detaching the placenta by a suddee pull, and may in this way give rise to hamorrhage, not to add, thet if the adhesion of the placenta be firm, so as to prevent detachment, the sudden effort might, perhaps, occasionelly invert the uterus. Hence the propriety of the rule which before prefixed, namely, that as soon as the child hamber as close as possible to the genitals of the mother, till you find by a little example.

cord is in part composed, aro, io the human ovum, three; one large umbilical velo, (wheo gin, or intermediately. And this I tho fully distended, nearly as big as the little finger,) sod two smaller arteries-the umbilicals, of which I formerly had occasion to speak. Those vessels, in geoeral, do oot take a direct, hut a more or less serpentice course, and, in some instances, they are the uterine cavity.

very moch contorted. In the cord of the An eccentric is mare, as I am loformed, the veins, like the obdominal extremity is more rare, and yet arteries, are two in number. In the funis oow sed thee even this variety is charried, of the calf, besides the blood vessels, there is snother eans! called the orachus, which leads from the bladder along the cord into a peculiar membranous receptacle, the allanteis, of which I shall hereafter speak, und which sesms to contain much of the urine of the feetal animal, lu the fuois of the puppy. we find a single settery and veio arising from the measurery inoscolation with the vessels, there passing along the umbilical cord, and ultimately branking up into a large number of capacious capillaries, which ramify, with great minuteness, over a very delicate mem-brano called the tunion crythroids.

of this knot may remind one of that of those who were lost in the ruios of the late Gordius, or of the kont scateely less note- Bruoawick Theatre. rious, kolt by the hand of Ohadieb, fated to bring to light that comprehensive code of imprecations, the contents of which his membraces; the decidua uteri, the decidua liberal master so generously showered down reflesa, the charles, and the amaien; but upon every part of his person.

The blood-vessels, of which the umbilical section is commonly capital, though it sometimes unites with the placeous at the merrather wish you to untice, because when the insertion of the cord is marginel, as in this preparation, you might be led to imegive that one hulf of the piscente had been torn eway, the other half still remaining iu,

An eccentric insertion of the cord at the the cord springing, us in this preparation shown, from the one or other side of the abdomen. The point is curious, but in o practical view It seems to be of small ulatetrie import.

Involucre.-lu the same woy as the chick is icolosed in the shell, the humao (ctus. too, la shut up in a bag, or cyst, this cyst containing the water, in which the child floats, for, in our origin, we are all of us aquatic. In general the number of the cysts corresponds with the number of fictuses. though this io not invariable, for when there Upon the umbilical cord we sometimes ore two fortuses you may have a single cyst meet with koots, and, if I may confide to only, this being common to both, and in reports received, sometimes two or three the quinton of some charvers, this commuknote may be found upon the cord at once. oity of receptorle is by no means infrequent. Mr. Rogera, an American, and a stodent There is an advantage to the futus, how-at these Hospitals, informed mo, that at ever, in having a receptuale, or an spart-New York, a case had occured where three meet ut its own, because it then becomes knots were on the fuois, and yet, nutwith-imore uccure against accidents. In twin standing those knots, nijection could be gestation, in the earlier mouths, it somethrown from one coul uf the cord to the times huppens, that the membrane, heing other without difficulty. To Dr. Hunter I tender, gives way. Now, if the fectuses are may refer you for a very plausible explona- contained in separate lags, and there is u tion of the formation of these know when single, for he has suggested, that the un-bilical cord, at birth, may perhaps form a statisting no murry, may still be carried coil round the margin of the on uteri within, to the full period of nine months. A public and that the fettus, in passing the orifice of of my own, who grew up to be much the the utarus, may, at the same time, passi finest young gentlemen of the class, during through the loop, carrying the untilical the course of his uterine life, had a very extremity of the cord along with it, in the parrow excupe of this kind. He once told way here shown, so as to form the knot at the very moment when the body passes into companion; the cyst, which at that thus the world. Observe the demonstration, formed his own nest, remained uninjured, And this explanative enables us to under- said he seems to have austuined on incoaveutand well onough how a single knot may nience; but, from one couse or other, that he formed; but then how is it that two or of his companion gave way, so that, in this three knuts are produced? how that a koot helpless combition, the puor fellow was may be found so the cord to the cordier croshed like o butterfly—parishing as tragimouths, though the fortus has oever left the cally us the viotians of Siloam; ur, if you cavity of the uterus? Really the solution prefer the more familiar comparison, like

In the earlier mooths of pregnocoy, the involuers are composed of, at least, four when the ovum is thoroughly daveloped in The origin of the cord is the navel; its the latter mooths of gestation, the memtermination is the placents, where its in- branes are three only; the decidus uteri,

reflexanot oppearing. Of these membraces, Ition have; the artery, as you may see, is of the outermost is the decidue uteri, whence extraordinary capacity. its name, because it is io contact with the womb, end receives vessels from it; the membrane which lies internally is the amnion, en organ which accretes the fluid olready mentioned-the first element of the fortus; and hetween these two membranes the chorion is interposed. In the latter somewhat thick, but it is so more especially in the earlier and middle months; being tliapased moreover to exfoliate, separoting into leaves or lamella; now the plasents of the human ovum is contained between two loaves of the tunion decidus, as my handkershief is interposed between my two hands, both of the placentar surfaces being covered by the leaves of the decidus. This being the ease, it follows, es matter of course, that the chorion and ameion must be apread out upon the inner surface of the placenta, for they both lie within the decidus, and this I will now endeavour to illustrate by preparotinos.

llere ia a preparation of a smoll portion of the placeeto, with the three mombranea in convexion; the decidus above, the emnion below, the chorion ranging intermediately. In this preparation you have a portion of the placeots, and of the edherent uterus, anspeoded by the decidus. The chodua, from which they are portially detached; and the decidua itself in distinctly separeted into two membranous lamina, between which the substance of the placeota ladges.

cord, cutering the abdomeo of the feetus interally.

Here is a preporation showing moch cootortion of the vessels of the unbilien corti, not of uncommon eccurrence.

kents of the umbilical cord, so which I before took necession to commeet,

When speaking of the placents, I ought to have observed that their number usually necords with the number of feetuses; if you have aeveral fostuaca, you heve several placentus; if a single feetus only, theo the placents is siegle; thus, with twins, there are in a way to be hereafter explained. usually two placentas; with triplets, three; and there are four or five placentas, when, however, one placenta is common to two Setuses; and you may see in this preparation two umbilies cords arising from the Same centre.

the chorion, and the omolon, the decidue gle; the matomist has practised no decep-

Decidus.-It was observed to you, awhiln ago, that the outer membrane of the ovum is the tunica decidue, called also caduca lacerabilis, and the apongy chorion, adhering externally to the uterus-loternally to the chorion ; remarkable for its high degree of months of pregnancy, the decidus oteri is vascularity; and forther deserving untico, as it derives all its blood-versels, so far as bas been ascertaided by injections, from the womb. This membrane is, it seems, genurated by the uterus itself, and is not produced from the same rudiments as the fortus, the churion, and the empion. In extra-uterine pregnuncy sometimes, though by no means universally, when the rest of the ovum is formed externally to the uterus in the neary or tube, the tunica decidue becomes organised more or less perfectly in the uterino cavity, where, in these cases, the rudiments have never been admitted; and hence we mey understand clearly enough, why it la that the deciduous vessels ere derived not from the foctus but from the utorus, they being aupplied from that atructure by which it is originally generated. If we observe the deciduo in the latter months of pregnoney, we find that it is somewhat thick end tender, and of reticulated eppearance, presenting a sort of network visible enough upon its auriace, mora ziou and omnion, you may perceive, liv, ea work visible enough upon its auriace, mora asserted, upon the inner surface of the deciwater. In the middle mouths of pregnancy the thickoess is still more remarkable; and during the first two or three months, the membrane is so thick, that it loses entirely Here is n preparation of the umbilical the membrouous appearance, end resembles e mass of flesh, as mey be percrived in the specimen which I here cirenlate. I hove already observed, that it is between the leaves of the decidus the plocents is interposed, and it is apparently the liere is n preparetion of one of those blending of these two structures which gives rise to that fleshy and mussive appearance to which I have just odverted.

The principal uses of the tunice decides are apperently two; it forms e connexion between the other parts of the ovum and uterus, and it furnishes a bed in which the atructure of the placents may be elaborated

Chories .- loterposed between the tunics as rarely happens, the wounn produces four decidus ead the annion, the true chorion or five children of a birth. Sometimes, is situated; this membrane having very few is situated; this membrane having very few and smell vessels only, particularly in the human ovem, and these being derived, not from the uterus, but from the fætus; for the tuoics decides is a part or membrase of Here is a rare specimen of a cord with the mother, but the cherien is a part or two vessels only, instead of three, the usual membrace of the fortus, indeed as much an number; the vein and artery are both sin-

hence the feetal origin of the vessels of this membrane becomes sufficiently istelligible. Ie its seosible properties, the chorion is smooth, thin, and semi-transparent, excepting during the earlier weeks of gestatioe, when it is covered over more or less completely with a fice shug, which gives it sometimes the eppearance of plush, if I muy be allowed the comperison; and this also is found to be nothing more than capillaries of the embilical veies aed artories, so that is truth it constitutou the vescular part of the placenta. This fact is proved by injectices; the iejection of the cord alla this superficial friege. It is further proved and illustrated by the chorion of the sheep, on which we fied those tassels of yea-sels formerly demonstrated, and which seem to be nothing more than the vascular shag collected istu small knots, instead of heing regularly dispersed over the whole surfucu of the membrooe.

sent round. Here is the uteros, with the three membranes annexed, the decidua, the chorion, and the amnico. You may perceive, that the amnion end chorion contain so injection, but both the decidus and uterus are full; both being supplied with vessels from

the same source.

The flocky appearance of the decidue in the earlier mosthu is demonstrated in the preparation I now exhibit; and its dispoaition to separate leto layers, and the delicato reticulations before mentioned, may be noted without difficulty.

le this preparation, which is of the humse ovum, the tunica decidua has been removed, so that the membreno on which the eye falls is the chorice-smooth, thin, and in a greet measure traosparent, as before described to you.

Here is the chorion of the sheep, with the vessels separated into knots or tassels; they are injected, and the injection was thrown into them by the ambilicul cord.

The romaining preparations show the fringe covering the charion during the earlier weeks, in some of them noiversally, in others topically; the resemblance to the very uhvious.

more importance to its welfare in the firtal the amnion, or third membrane, lying in-atate. Hence the same rediments which tereally, and heig apread out over the form the fietus form also the chinrion, and surface of thin chorion and if the placents. This membrane is remurkable throughout pregnaucy for its thinuess, decaity, and a transparency like that of gluss. That it socretes the liquor untell, there seems to be little doubt; and it is for this purpose, probably, that it is mainly intended, though in conjenction with the other two membruses, the chorion more especially, it asslats ie givieg that utrength to the ovum which is so essectial to the accurity of the child. The human munice, so far us I keew, has never been visibly injected, though the attempt has been many times made, the failure probably arising from the extreme minuteness of the vessels; but in unimals, as the cat oud dog, for example, these membranes may be jujected with facility, the injection being thrown ie by the umbilical cord. The am-nion, like the chorion, is an ietegral part of the fortus, heing formed from the same rudiments; sed we find accordingly, from our injections in brutes, that it is from the fectus I know not whether we are perfectly ac-questinted with the functions of the chorino; rived. By injecting the vessels of the uterus, but the most probable seems to be that of therefore, you cannot inject the unmiun even generating those capillaries, and ussisting, in unimula; to fill its vescular system, you therefore, most importantly in the forma- must throw the injection into the cord. A tion of the vasculus part of the placento, preparation of the emeiou l here show you; Preparations of both these orembraces, the it is very firm, and may contribute a good decidua and chorice I mean, shall now be deal to the atrength of the avam. it is very firm, and may contribute a good

Formation of the Placenta .- Ilnving said thus much respecting the three membranes of the ovum, I may now proceed to make u few resourks on the way in which the placente is supposed to be produced, e subject on which I furbore tu enlarge, when treating expressly ul this organ, us in that stage of our information the formation of the plucenta could not have been readily understood, a preliminary knowledge of the membranes being required. The placents appears to be constituted of two priocipol parts-a large asseroblage of resels, and a large assemblage of cells; and the manoer in which those two partu of the placenta are supposed to be produced, may be heat explained by means of a graphic illustration. Uoder the stimulus of impregestion, the nterns is supposed to secrete a quantity of gelationan materist, by which the inner membrane of the sterus becomes completely isvested, and this afterwards becomes the tunico decidua. As generative proceeds, the incer membrane of the uterus access to throw off into the gelatiuous decidus a considerable number of vascular tassels on the sheep's ohorion is vessels, and, indeed, this admits of proof, because, if you take an orum with the ates. rus adherent, on laying it open, and detach-Amnien.—The owner, I have observed ing the membrane, you may see the vessels ofready, is composed of three membranes; which shoot from the one surface to the

other. Again, it is further imagined, that | becomes more and more stretched, or atthose small vessels shooting into the ovum, tenusted, till at length it vaniabes com-claborate there the cellular part of the pla- pletely, or small vestiges of it alone reeenta; and this opinion, if true, (and its main, truth is highly probable,) may explain to The na why it is that the colls are io free com- flexa appear to be formed, may be best numication with the uterus during gestation, illustrated by drawing, bot for the securacy and why tho maternal blood flows through those cells so abundantly; far it is from (Dr. Hlundell explained himself by a disher substance that they are formed, and the | gram, and then proceeded). cellular portion of .be placenta is oot a pert of this first, but of its parent. But to proceed: in the asme manner as the inner membrane of the wumb thrown its vessels intu the decidus, a large number of vessels ere also thrown off into the asme membrane low the surface of the same membrane. by the chorion; and by this membrane appearently it is, that the vascular part of the placeute is formed. All this appears to be deriving nourishment from the surrounding coinc forward in the colorious of the color of the chorious that the color of the chorious that the color of the color o going forward in the gelatinous material parts, grow, and, becoming bigger, they accreted by the uterns; in the very subspace of which material, as shown by this material which was lying over their sardrawing, these cells and vessels become another membrans begins to form in this formed; and this, in the most satisfactory manner, enables us to explain why it is that the plucenna is lodged between those layers or lamellar, af the decidua, before demonstrated, for it is of this gelations material, which receives the cells and vessels into it substance, that the decidua ultimately ecosists. Thus, then, ir appears, that the human placenta, like that of the rominating snims!, consists it wo organs combined the one the cellolar, formed by the membrane, like the utermo excreseences of the ruminating animal, a porcrescences of the runinating naimal, a por-tion of the mother; the other, the vascular, a membrane called the tunies crythroides, the decidus consists.

The mode in which the decidus nteri ro-

It is said that the gelatinous material

formed by the chorinu, like the tassels of very delicate and vascular, communicating the ruminating animals-u portion of the with the mesentery by the ertery and vein, fectus, indeed, nuthing more than the romifi- slready demonstrated; what is the use of entions of the umbilical arteries and veios, this membrane, however, I am unable to Of these structures, both become formed in explain. In the ovom of the ealf we meet the substance of geletinous consistency se- with o large membraneus bag, the sluntois, ereted by the uterus, end of which afterwards as it is called, holding many pints of watertwo or three gallous when distended-and In the earlier months of pregnancy, he communicating with the bladder by means aides the decidus, choriou, sud annion, there of the uraclus before shown. In the human is yet n fourth membrane, to which, as you ovam we sometimes find a little bag, shout moy recollect, I udverted at the outset,—I as hig as a pes, and which siways lies near meen the tunica decidua reflexa. If taking the mergin of the placento, this bag con-an ovam about two manths old, you wash taking within it a little congulated mass, it and lay it in water, you may then see dis-tinctly u membrane, thick, flocky, and lace-erable—the deciduo uteri; and if you dissect this away, you uext exhibit the tunics decidus ele has not been ascertained; it seems to refloss; removing the refluxs, you find the be more analogous to the tunies crythroides choriou, and benest this the unain. Ohserre the preparation. Now it is remerkable, that if the neum he examined about
the third or fourth mouth, we find that the
reflexa is either wholly, or in a great meesure, vanished, the reason of which appears
to be that about this time the reflexa itself inhaltumesentarie preparating the amto be that about this time the reflexa itself inhaltumesentarie preparating and vani. From to to, that about this time the reflexa itself phalu-measureric mierica and voin. From ceases to grow, though the gruwth of the Professor Mayer, of Bohn, I first learnt, ovum contioues, and thus this membrane that with proper care this membrane may

he detected, not only in the earlier, bot in of the same uterus, escaping in consequence the latter months. It seems not to be much of being protected by the water of the avant.

with a fluid varying much in its quantity, ounsisting sometimes of a few ounces, and being no langer protected, might be crushed sometimes of several gallons, but, on an hy the same pressure which it before susaverage, measuring from half a pint to a piut, and this, which forms aft first element, is oulled the liquar smuli. When the liquar liquar amnit. amnii is unnaually sparing in its quantity, I knaw nat that any incanvenience arises from small nourishes the feetus; but to this that circomatance; but when there is too unining I cannot accede, and on these much of it, then you lave that dropsy of the grounds: first, where children are horn in a own of which I farmerly took occasion to perfectly healthy state, the liquor annii is treat, and which is most effectually telieved sometimes funud to be firstly secondly, the by paneturing the membranes. The office tictus, as you unverve in the glass at the which the liquor enouil discharges appears fromer of the table, saturatines consists to be very important; in the first place it merely of the lower parts of the body-the affards the fectus a yielding medium, in legs, pelvis, and parts immediately con-which it moves about with ease; for tiguous, all the rest of its structure being if the liquar annii had been wanting, we wanting, and yet those factures are naurial-should then have been fettered in our ed. Now it is clear that such manaters earliest farmatian, by the fibres of the caunat awallow and digest the liquar manii, uterus; again, facts prove that this liquor, for they have an apparatus for digesting, somehnw or other, defends us from the de- par my organ for swallowing. Again, it atractive pressure of the uteros, which, but happens now and then that the liquor aumii far the action of the water, would crush us is discharged a fortuight or three weeks se you may perceive it has done the fictus' before the high of the child; und I believe exhibited; for, in case of tains, the fictus, cases have excurred warre the ambilical which ladges in an unbroken but, remains tord has bong a birde way through the or unbort, though its companian, it the mem-steri, showing a bardy that the long was branes burst, may, at the same time, be open, and empty of the liquor, and yet the crushed by the pressure of the same aterus, thatus has been phone, and well nourished which, owing to the protection of the water, at birth, which could not have been had the inflicts no injury on the other child. Thirdly, nourishment of the child depended on the in the progress of delivery, the water, in liquar amain. So that not to push this point conjuncting with the involuers, forms a sort way further, an all these grounds, as clulof wedge, which playing in the os meri, lays over may remain in intern for a fortnight or it open, and, of course, expedites the de-three weeks after the decharge of the figure livery. You will observe, accordingly, that manif, and he nourished very well; as when there are pains, the bag is forced into healthy children may be born where the the mouth of the womb, pressing gently liquor annil is fothe; and as you may have upon the margins, and arting expansively, monstras without mouths or digestive or-like a dilator, whence the increasity of a caus, perfectly well manufact—netwithering formerly laid down—I mean, that we standing. I think, it rannot be said the should leave the disruption of the menn-liquor annil nourishes the fotus. Add to branes to nature—or, at all events, that this—that if you evaporate a table-spoonwe should take care that the mouth of the ful of the liquor, you may find, indeed, that womb be fully uponed, before we have re- it contains a little solid matter, allied to sourse to any artificial means for laying serum in its auture, but the quantity is very open the bag.

linuor smail is the protection of the fortus formed either by the amnion, the cord, or from the effect of the uterus; and this is the feetus, strictly so cathed-its skin, its best proved from the emisequence of a pre- Lininies, or some other part. Nuw, which muture discharge of the water. Here are ever of these organs produce the liquor. three features that have been crushed in this they are all parts of the fatus, and it seems manner, like thousands before them; and it shauld to suppose that the focus our he deserves especial trunck, thut, in une of nourished, and grow by means of a fluid these cases, the crushed forms was a twin, which it secretes from its own vessels. the other child, its fellaw, enclosed in a separate bag, but subjected to the pressure

His words flow the notice of other critics; thus showing from him with the regulated panetuality the superiority of the working man of the of a pendulum, and his descriptions con-laboratory, over those sciulists who concect ducted a fa tinciid. We have frequently reviews in their closets for the medical heard irm describe, geometrically, his pas- journals. But we must have done with sage from Apatheraries' Hall to his resi- this interesting personage, by pointing out dence in Towns and Street, and reduce the his high qualifications for discharging the rireunstances of a visat to one of his pa- outies assigned to him in the Richmood tients into a soutes of syllogisms. He School, while we turn our lastrument back

This school, which we described at some Blair; and that proceedy, or the doctrine of length, slung with its principal founder, verbal quantities, is the only part of Belles Mr. Jacob, comprises teachers of many of Lettres which should be consuited in conthe branches of medical science, some of
versation. Mr. Dunovan, however, is
gentleman if undoubted ability, and his
this number we must exclude Mr. Cusack; eccentric monner has been remarked coly far in every quality, except a practical because it is allied with superior qualifica- knowledge of surgery, be appears to us detious. The same devotion to descriptive fective us o teacher. Whatever success accuracy which distinguished his phruse- may attend his executions as o stage manager, ology, in completions in his compositions, he should never venture the addence side of which he has given many, on very oppo- of the curtain. Having himself the com-

mand of a respectable school of his own schools, that we fear our sight will not means, recommend bim to remain satisfied with exerting his sbility in this way, and, for the rest, indolgo in the laxuriuus privilegea and immunities of a " sleeping part-ner" in the concern. Mr. Porter, his new mairing by our preceding remarks.

opprentices, and a consummate knowledge stund as for the examination of a class of of fees and the funds, we would, by all teachers of a different character, but whom we could not find in our heart to omit, in this panegyrie on private instruction. There in, of course, in Bublin, as in all other great mudical schools, species of tutors vulgarly called "grinders," who, like gypsies, praccollaborator, might, we fear, be stretched on time their legerdemain ort without any fixed the same couch. He succeeded Mr. Jacob hubitation. Without theatres, museums, "by purchase," as the Government Gazette libraries, dissecting-rooms, or any of the other ostensive chattels of medical schools, has it, and, at losst, promised a vast deal on other ostensive chattels of medical schools, his appointment. The rumour of the surgical these wonderful men undertake, from their lectures which he was to have delivered at own exclusive resources, to perfect pupils the time is still painfully tingling in our ears, in all the arts and sciences, or what answers like the booing of a bull-freg. But bluster- precisely os well, to get them diplomas, iog of this kind generally subsides into a There is something really so hold in the monotonous calm. We cannot, at our plen-sure, command information, for it can be liven of these men, that they disarm criti-acquired by long and gradual application cinm of its terrors, oud reconcile us, by alone; nor iostantaneously transmute our their extravagance, to their imposture, dulness into talent, which is the gift of Yet, though this practice sevours so strongly natore only. It is easy to excite expects- of charitatanry, still we are unt houtle to it tion-how difficult to realize! By o little in the abstract, however grossly it is abused. artifico we may readily awaken the onriosity it is, after all, but the application of the of man; talent alone can keep this caprimost useful form of education—private inclons passion alive. Mr. Porter's representations of himself to lus private friends, made subservient to bad ends, it might have, we believe, disappointed the public, puzzle more expert casuists than we pre-His success convinces that there must be tend to be, to apport in the just quota something more than pounds and pupils to of crime which belongs to the pupil and ensure the success of a school; indeed, we the preceptor. We fear the balance of guilt suspect this joint-atock system of organising would be oftener found on the side of the didactic establishments is liable to great farmer than on that of the latter. Besides, it abuse. The natural origin of such institu- about the recollected, that it affords a retions is, that where they commence with spectable subsistence to many young men, perhaps a single individual, whose confi-dence in his own resources prompts him to, for, to be under the necessity of explaining and, in some measure, justifies so arduous a subject to others, is one of the most powan undertaking. To such training in the erful stunuli to make us amberstand it nur-open field of competition, where merit selves. Among this interesting these of meo, should rise without extraneous assistance, there is, in Dublin, one of the name of Dr. we would rather look for excellence, than to Davis, wha is a very perfect representation those hut-houses of mushroom protessors, of the singular genius to which he belongs, forced into a sickly pre-eminence by the lie has certainly attracted great attention by sheer infinence of interest and officence, the indictatigable industry and unazing in-With respect to the other arrangements of genuity of the devices displayed by him in this school, we are nothing which calls for the prosecution of his multiprious avoreance or our prince, except that by a time. He seems to have taken up the idea, aingular valuation of talent, the two elever-probably from that compounder of paraest men in the establishment, Mr. Hort and doxes, Mr. Hazlitt, that a man is estimated Mr. Alcock, have been placed at the bottom; by the world at his own price, on the supof the list. With onything like a fair per- position advanced by this writer, that all tion of those advantages which assist the men of genius have been invariably men of ascent of talent up "the steep of fame," confidence and assurance. Of this very and without which the task is always difficult and assurance, the Davis affords the cult, and sometimes latsl, we have no doubt most amusing illustrations. Though really but these two men, who are now at the young, he has contrived, by a well-designed bottom, would soon rise above their pre- costaine, sail a simulated manner, tu bury sumed apperiors. With their assful exer-all indications of youth becomet a broad-tions, and many other advantages which thus brimmed but, a cravat seemingly tied by school possesses, we have no doubt af its the vivy hopers of decreptude, a suit of success, which we have no intention of black of a designedly obsobite cut, and s look of mysterious prolundity. Meet him So much have we gazed at the private at any hour in the street, and you are sure

apporatus. Instantly he stops in the street; reads, perheps, a slip of paper, and off with him again at his toilsome career. Should you be so kind to him as to stop him fur a moment, and to broak the currect of his public meditations, he is sure to assail you with complaints of his reatlers existence and his inealculable profits; he connot, in fact, comply with oea half the demands made by the public on his professionel skill, nor is the bank able to receive os fast as he can pour ie the emoluments of his practice. prosperity are manifested with the most elaborate assidoity for the production of effect. We recullect being at a party one night in Dublio, where Dr. Davis was one the invited: he arrived, of course, fashionably late; he had not been long seated, when the coise of a carrioge rolling up to the door seemed to thresten the hoose the wheels had acoreely ceosed, when a ooxiety, "Surgeon Davis-Surgeon Dovis-Surgeon Dovis;" in a tone of trepidation still more awful, " Aldermos Apoplexy, of Turtlesoup Square, has just falles out of his standing! Christ avec us!" The how of old Ticotheus, "placed amid the tuneful choir," instantly sunk from his hand; the ladies, appalled by this usexpected intrusion of the voice of death omidst their merriment, stood motionless in the quadrille, like the fair dames of Egypt, worned of their mortality amidat their seirth, by the istroduction of a garlanded corse, while Surgeou Davis, pressing his side pocket to oscertain the presence of his instruments, rushed through the astonished multitude, apologizing to his foir hostess and her spouse for the interruption, in the well-known line of Hornee :-

" Serius out ocius, metam properamus ad unam."

He considered, that as life detected by the application of the atchese alvanced, there was a disposition to take cope to the chest. The soldier inhoused the disease, stronger than in early life. He

looked anon the average time of the protective vacaine power wearing out, to be un-der 14 or 15 years. In proportion to the perfection of the vaccination to the first inausaivisin of Larone in the period of the cessation of its protective power. The vaccine was by no means uniform in its appearance. When vaccination was first in-

the Broad Street Institution, where 1400 or 1500 had been vaccinated in the source of the last year. The greatest attention was paid to the cases there, and he felt bound to state, and had an heaitation in telling that circumstances calculated to assist and direct Society, that the principle laid down by Dr. Gregory was not supparted by facts, but would be much to the advantage of medical suffounded, and siterly incorrect. Very, very would be much to the advantage of medical suffounded, and siterly incorrect. Very, very would be much to the advantage of medical suffounded, and siterly incorrect. Very, very would be much to the advantage of medical supports. It is a such places as the longitude in Lomlon, Broad Street, took the disease again: those who did were under the age of 14, noy, of 10 years. He had knuwn patients abouring under vaccination and amallpax at the same time; athers to have smallpox, the while the indentations were perfectly distinct in the vaccioe cicoritx; and he both known nurses, who had been most dreadfully disagured in youth by smallpox, take the disease again at 50 years of age, oud the question with the profession, thus question there would be the profession, thus the disease again at 50 years of age, oud the idiesyncrasy of habit.

content to be suld by nursea, or any person as at the head of the profession. io attendonce, that after vaccination, inflamtion.

November 1, 1828.

Professor TROMSON in the Chair.

SUBBIVISION OF LABOUR IN THE PROFES-

troduced, the objection to it was, that its ency of the ambdivision of labour in our protective power would not be so perman profession. The paper had been submitted ment as inoculation with the amalipox. It to the consideration of the Committee, and was said, the protective power of the amalipox inoculation was, and would continue to lated to disturb the harmony of the Society, be as permanent at one period an ot another; gave permission to its belog read. The this pathological principle Dr. Gregory did Doctor carefully avoided adverting to the not beliave obtained with respect to vucci- divisions reade in the profession by the exnation, and he considered those who were isting chartered bodics, simply statiog, that vaccinated more safe during the first ten he considered them, as far as they went, vaccuated more as a during the first ten in considered them, as as as we were, years, than during the remainder of their for the benefit of the community. He relivas.

Mr. Bunner regretted deeply to have heard this statement from the lips of Dr. Gregory. He had had great experience at divided attention in that particular branch: Gregory. He had had great experience at idivided attention in that particular according the Broad Street Institution, where 1400 or the branch to be detenuined npon according to the Broad Street Institution, the particular according to the property of the particular according to th

fully disafgured in youth my ammipox, take time, was to be determined. Upon mine the disease again at 50 years of age, and the public, the corporate bodies, and Parliable Society, and the profession of lorge public, the corporate bodies, and Parliable Society, and the profession of lorge public, the corporate bodies, and Parliable would be of opinions, as he was, that where it happened, (and very rarely indeed it was, compared with the bulk of monkind,) that a the knowledge, ought to be double that the distribution was a strateful with the disease after which is new was, and that the addition person was attacked with the disease after which it now was, oud that the additional vaccination, in such o case it was owing to time should be taken out of the required period of apprenticeship !

Another Geatleman, who apoke on the subject, considered that great blame ettached to many practitioners, for not thoroughly satisfying themselves that vaccination was perfect and complete. They were content to a mild be made and complete. They were

Mr. Mano thought he might usefully mation had taken place, a crust had appeared, and the child had done well. This was not the way to enable persons fairly to estimate the effects and worth of vaccius. Where the velo was either cut through a rich la but found information. through, or tied, he had found inflammation very usually supervone to a fittel extent ; but he had been in the habit of applying a consic peste (constic potest) made into a stiff themen had spoken on one subject, another pasts with soft soop, for about as inch, or nu was onmmenced; one or two gentlemen inch and a hulf, along and across the vein; hoving spoken, than a third wished to make this he alluwed to remain on for about sevee hours; alough and ulceration followed; and, for a day or two, the vein did nut appear to be much affected, but, in about five ar six days, its character became completely obliterated at the spot where the caustic had been applied. In some instances pain had aupervened, but not to an extent requiring my selive treatmest.

Mr. Assort had found Mr. Mayo's plan most successful.

Mr. A. THOMSON, and the Chairman, bad never tried, in their upinion, a better course when they were at liberty to bring forward of treatment than that of puocturing the another. vein, and applying a pretty tight compress, a roller, and cold applications. They had found this generally to succeed.

Mr. Mayo alloded to cases in which it was necessory to obliterate a part of the vein altogether. He looked upon poncturing as a palliative only, the patient being liable to a varicuse state of the veins at some sobsequent period, where obliteration! was not effected, and which could not be

effected, hy paractore.

about the colock every night, and continued such information, oud why is it not used till four in the morning. He had not hall for such purposes? tima to try ony thing in this case, but he had no doubt that the same closs of remedies would be found effectual.

The Chainnan certainly considered the air of Loudon, within the time specifical by the last speaker, to be materially altered; for he believed intermittenta had been much more common within that period than for

profession, than it is for John and William | Act; in fact, they are usuaren. The fifth Rogers, druggists; C.Flood, lowyer; C. Gordon, of the Bastarda family; V. Somerset, parson; P. Mules, lawyee; L. Gidley, lawyar; G. Conry, helf-pay officer; H. Wright, probably of Charles Wright's family; H. G. Coplestone, person; and Captain Basleigh, grocer, of the vit of Honiton, holding a meeting, to support the l'rotestant Church against the mischlevous designs of the Papienes. Hoga of Rhuberb Hall, and Honiton Brunswickers !-- i'faith you are excellent company, and admirably matched. The Times is wrong, however, when he oscribes the authorship of the requisition to Mr. Bowermee, the landlord of the King's enofirmed laster of fast-days. And thus we conclude our banter.

-if it had not deceived the public, by professing what it can naver accomplish,and if it had not invested a set of individuals with powers which they have proved themselves to be incousble of properly exercising,-we should not have spoken of it terms of condemnation.

We stated in uur Nioth Volumet, that the Act was projected by avarice, supported by intrigue, and coacted by ignorance. From that statement we do not now retract one word; and if The Times would be at the pains to peruse the document, we are pernuaded that his cunviction of the unjust motives of its proposers, and the impolitic provisions of many of its risuses, will unt be less strong than our own.

The powers, however, which have been recently assomed by the Apothecaries Company, are clearly not warranted by the

clause deficas the business, or duty, of the spothecary,

"And whoresa it is the duty of every person using or exsrelsing the art and mystery of an apotheesry to prepare with exactuess and to dispense such medicines as msy be directed for the aick by any physicisn lawfully licensed to practise physic by the president and commonalty of the faculty of physic in London, or by either of the two universities of Oxford or Cambridge; therefore, for the further protection, security, and henefit of his Mojesty's enhicets, and for the better regulation of the practice of physic throughout England and Whes, he it enacted, That if any person using or exercising the art and mystery of an spotheesry shall at any time knowingly, wilfully, and contumnationally refuse to make, Mr. Bowermae, the landlord of the King s mix, compound, prepare, give, apply or Arms, who is much ton clever a man to pen administer, or any way to sell, set on sale, such trask: he is, indeed, an enemy to the put forth, or put to sale, to any person or prectices of Catholicism, because he is a persons whatever, any medicines, compound medicioes, or medicinshle compositions, or shall deliberately, or negligently, falsely, anfaithfully, fraudulently, or undaly maka, mir., compound, prepare give, apply, If the Apothecaries' Act of 1815 bad been or administer, or any way sell, set on sale, founded upon just and equitable principles, put forth, or put to sale, to any person or persons whatever, any medicines, compound medicines, or medicinable compositions, as directed by any prescription, order, or re-ceipt, signed with the initials, in his own hand-writing, of any physician so lawfolly licensed to practise physic, such person or persons an infending shall, upon complaint made within twenty one days by such phyereising,—we should not have spoken of it siciso, and upon conviction of such offence on an many occasions to such unqualified before any of his Majesty's justices of the peace, unless such offender eun show somo satisfactory reason, excuse, or justification in this behalf, forfeit for the first offence the sum of five pounds.

And, to clause tuesty, it is provided, that, "if my person, (except such as are then octually practising as such,) shall, after the said 1st day of August, 1815, act or practice as an spotheenry in say part of England or Wales, without baving obtained such certificute as oforesaid, -every person so offending shall, for every such offence, forfeit and pay the sum of twenty poucds," Here we have the business of the apothecary defined. vis. " dispensing the prescriptions of physicians, who are legally authorised to prescribe;" and, secondly, the amount of pensity which is to he inflicted on those who infrings this

# LONDON MEDICAL SOCIETY. November 3, 1828.

Dr. HASLAM, President, in the Chair.

Turs was the evening appointed for receiving the general report of the siste of the Society, and, by whom wellnow not, est egité, depuis qualque tens, par un regue directions were given contrary to any existsentiment d'irresolution et d'inquictude." What they law, that no visitors abauld he admitted grounds there may be at Paris for asserting received, and its affairs discussed. The that the medical world is in a state of agi- consequence of this was, that a number of visitors were kept waiting in another room natil half past nine o'clock, when it was ingular that a state of the profession, which, timated to them by one of the Registrar's according to the enemies of medical reform sons, that the private business having occupied the whole of the evening, the other appearance of Tun Lanceriu October 1823, upon, and that, therefore, they might

nalists, as a reason for a similar publication i dairs to the Society, seeing the visitors in Paris. The supposed ogitation of the waiting, regretted that they, having inmedical profession in this country, is, we sence, should not have been admitted into repeat it for the handredth time, a chimera, the room, and expressed their abhorrence a mere eresture of the imagination, or, ra-earned on within the walls of the institu-ther, a faction propagated by the corrupt tion. There was no report prepared for the innta, which has too long battened on the President; therefore he was under the nespoils which is has appropriated, of the cessity of calling, in ancession, upon the Freaturer, Librarian, and Secretary, for price of the weifare, the honour, and the foreign correspondence, to lay before the

night agn, in consequence of the absence of the Registrar, he baving been detained by the Council to their room, after the usual period at which the Society meeta. Ife contially agreed with the observations deprecated such conduct, and hoped that

In the course of observations from several quarters on this subject, it appeared geona are beginning to take their proper that there was a law of the Society, making atation. The treatment of the case re- it the duty of one of the Secretaries, and not flects great credit on the talent and disminutes of the former night's discussion.

pruceeded.

Mr. Callaway, one of the secretaries, observed that if this was really the duty of the secretary, he should fortbwith nnburthen himself of this situation he held in tempted to steed up as staunebly on the the Society.

The l'usament trusted, after the public notice that had been taken of this violation of order, there would be no future ground

of complaint.

the Society to detain any papers that might jection to the publication of reports of the

be read to it.

liberality for which he is an pre-eminently this point might, perhaps, have been put to distinguished, advocated the propriety of Mr. Field in another shape, and in a way in asturding, most cordistly, every upports- which it would have been impossible for him alty to the facility of publishing whatever to have withheld the fact; for we conceive transpired in the Suciety. He considered we have solid ground for ollegieg, that Mr. that thinklut reports had done, and would do, first fact insures for the juntreats of the Society on to such the reputation. promute the objects of its formation, than any Mr. Fired, too, said, that the reports ather thing that could possibly be thought must either be by members, ar visitors in-of; and, consequently, that the Society, in-troduced by them: [what a discovery'] medical press, was grently indebted to it, for held responsible for the conduct of those the part it took in their proceedings. As to who were introduced by them! the right of detaining papers after they had been read to the Society, he thought papers, lobserved, that the sceurery with which the read by authors themselves, differed very reports were made, was both a sufficient materially from those presented to, and responsibility and security to the Society read by the Secretary. In the former in sud its members. stance, in his opioion, the uspers were the literary property of the author, who had s right to make what further use of them he leased,-either to publish them, or tu lock them up in his drawer.

Mr. Cartaway adverted to a case, in which, he believed, it turned out that the publication of reports, where they were nllowed, took away the author's literary right in what was read; and, if this were really the case, he thought there would be Shaw, a tat. 03, malignant tumour, proceeden objection to permitting the reports being made. He could not but state, however, that the reports in Tue Lawerr spposted to him to be faithful and accurate in every respect.

Mr. SALMON considered the eye of the ress one of the most excellent checks over the Society it enold under any circumstances have. Putting every thing else saide, it was calculated to prevent people occupying the time of the Society in talking nonsense. If they continued to talk nonsense, they were hold up to the ridicule of the profession; and, in such cases, richly would they deserve to be bled weakly by Tux Lancar. (Loughter and applicate).
Mr. WALLER, Mr. Howell, and som

other gentlemen, warmly supported the

the latter afficer's duty being merely to take | President, and agreed with him, to the atnutes of what transpired as the discussions most extent, in the propriety of assenting to, may, of earnestly soliciting, the very advantageous assistance of the medical press.

The Registrar, and a few others, atother side of the question. They contended, might and main, for " Hole-and-Corner" work. They seemed, like sensitive plauts, airsid of being touched, as if conscious that they were unable to withstand the fair A long discussion next stose, with re-gord in the publication of the proceedings reply was made by Mr. Field, the Registrar, of the Society, and respecting the right of to the question of a member, whether the ob-Society, did not exist with respect to me The Parsinter, with that openness and weekly publication only. The question on

#### LARYNGOTUMY.

A YHUNG man, 25 years of oge, of a strong oftenave; nur nowvers were although pur-eight days after the necident, although pur-duwn his throat. He was instantly attacked gative medicine was administered. There is the was admitted, there was a projection of the apinous processes of three of the lower dorzal vertebre, nod complete poralysis of the lower estremities; accability this was, however, of little use, for pulling the thread irought on fresh attacks of coughing, oud coused a very painfol sensative amenated. The treatment adopted, the treatment adopted the treatment adopted, the treatment adopted the treatment a readily execusted. The treatment adopted, fixed in its substance. After the patient since his atny in the hospital, has been the land remoined in this state for three days, inaction of two setons in the back, and the land remoined in this of June, brought into application of the liniment of ammoois to he was, an the 19th of June, brought into his extremities. He says he is much het the hospital; of this time he was affected has extremities. In says he is much not-ter than when admitted; be can now, No-vember 3, move his legs and toes with fa-laryux, almost total loss of vuice, and very cilits. difficult deglutition. The external parts of the neek were red, bot, and swollen. During an attack of coogh, the thread had again disappeared. M. Blandiu heing uncertain at this hospital on Fridoy, the 24th ult., by whether the foreign body was in the laryax Mr. Green. The potient, a healthy-looking or in the orsophugus, put off the operation lad, st. 10, had suffered under symptoms of until the re-oppearance of the thread should stone for several years, and came from the enoble him to form a more certain diagnosis; menuwhile leeches, renesection, &c., were employed. The above symptoms continued. but without indicating much danger, till the 21st, when the threed, having been again lage size; there was considerable poin in brought up by noughing, many attempts were made to withdraw the needle by it, and twelve leethes were applied, which but in vain; in depressing the tangun with were repeated a day or two following. The tho finger, it was evident that the thread the finger, it was evident that the thread. entered the laryns on the left side of the epiglottia, and ofter a fruitless attempt to extract the nerille by meons of n curved tube, laryngotomy was resolved on. Tha awelling of the neck was so considerable, that it was impossible to find esactly the erico thyreoidean space. M. Blandin made The man who was operated on by Mr. an incision in the middle of the laryngest

opeoed. A director was carried through and tightness over the chest, after much extito aperture, and the thyreoid cartilage di-ertion, capecially in waking fast op a hill, vided on lt in its whole length; a violent, These symptoms continued until the 6th but abort attack of cough followed this March, when he had so attack of broughitis, part of the operation; when it had subsided, which he attributed to cold. His aspectors-some attempts were must to extract the time was copious, consisting of much usedle, but the extreme agination which slightly streaked with blood, and his cough followed mach introduction of the course fullowed each introduction of the forceps, came oo in violent paroxyma, which were made M. Blandio desist from them. The followed by a sense of authoration. wunted was dressed with a piece of adhesive plaster, with an opening in the middle for the coughing, a softenulsating tumour, shout passage of sir. The act of swallowing was the size of a wallut, suddenly made its apnowstanded with much least ifficulty, but the pearance behild, and extending a little fluids escaped, for the must part, through the indove the right sterno-clavicaler articular wanned. The thread had, during the ope-tioo, and covered, externolly, by the sternal rution, been involuntarily swallowed. The portion of the sterna-mastoid muscle. The next morning the needle, an inch and a tumour was greatly diminished by firm preshalf in length, was found fixed in the plaster, sure, but could not be made to dissuppear and easily extracted. From this time all entirely. the symptoms shated, and the woond slowly healed, at the end of September, a small fistulous opening, and some hostseness, still increased in force by pressure upon the remained .- Journ. Hebdomad. de Midec.

#### HOTEL DIEU.

#### CATARAPT.

In twenty-one coses of enteract, where M. Dupnyren performed kerstonyxis, the following were the results:—of the patients there were under ten, seven under fifty, and cleren where fifty years of age in eleven cases the operation was followed by immediate success: in six, the patients proceed their sight after a munit; in four was distinctly heard all over it. No nunser covered their sight after a munit; in four

# ANEURISM OF THE INNOMINATA AND CAROTID.

[Communicated by Mr. Wandnor.]

Ansurian of the Innomicate and Root of the Carotid, successfully treated by Tying the Carntid Artery.

By D. Evans, Fag. Surgeon at Belper, Derhushire.

William Hall, mint. 30, a butcher oud horse-desier, an athletic and spirited yunog man, about five fort six inches high, has been secustomed to isborhus exercise, frequeotly riding from 70 to 100 miles n day, and has always enjoyed excellent health,

Un the 10th of March, after a fit of

The pulsation of the tumour, which was synchronous with that of the heart, was right subclavian artery, and was diminished, und sometimes completely arrested, by pressure upon the right carotid, above the tuand subclavian arteries, were attouger than those of the left; but there was no spps-In twenty-one coses of enteract, where tent difference to the pulsations of the ra-

by immediato success; it say, the purpose of the recovered their sight after a munth; in four tural pulsation could be detected, by the cases unly the operation failed; in two of the mention could be detected, by the cases unly the operation failed; in two of the sterilogope, between the tumour than the tumour multipode on the heart. A loud and powerful pulsation and them amsurons, in our closing on the neart. A roun was promised cornes, and, in another, inflammation and flow was board over the tumour, unattended with any unnaus | sound,

In taking into consideration the situation of the tumour,-its sudden sppearance, after a violent paraxysm of enugling, and its soft pulsating character, together with the symptoms above coumerated,-little doubt could be entertained of its nature, and 1 coocluded that the root of the carotid artery was the seat of the disease.

Cousidering this a favourable case for the operation lately revived, and so ably advo-ented by Mr. Wardrop, I was induced to obtain the opinion of two emicent surgeons In London respecting its propriety. Both, however, disapproving of the operation, it was, therefore, determined, with the approbation of my friends, Mr. Bennet, and Mr. Brown, of Darby, that a feir trial should be made of Valsalva's plan of trent-

iog ancurisms.
The nature of the disease was fully explained to the patient, who, fortunately, was until the appearance of the following symp- a mun of strong sense and most determined foms:—About 14 months ago be was seized resolution, and, from his employment leadwith abortness of breath, troublesome cough, ing him to study the diseases of horses,

prehend the dangerous tendency of the dia-hope, case. He therefore submitted, with perfect confidence, to the proposed plan of treatment; and I cannot sufficiently admire the fortitude god cheerfulness with which ha bore tha long privation which it was nucessary to enforce, and the implicit faith which he placed in all the remedies adopted for his relief.

April 3. Ha was accordingly ordered to bed, to be bled, to the extent of eight ounces, every third day; bla diet to consist of arnall quantities of gruel, broth, and ten. Small doses of digitalis were likewise administered. This plan of treatment was couri nued natil the 13th of July. During the first mouth, there uppeared some little improvement; his pulse was frequently as low 47 in the minute, the tumour became harder, its pulsation less forcible, and more remote; from which it was supposed that coagula might be forming. The blood bituerts had accused perfectly healthy, sod it continued without diminution.

was noticed that, if the bleeding were delayed beyond the usual time, the symptoms I tion in the tonnur was stronger than it was were aggravated.

In the beginning of May, a great ulteration, for the worse, took place, which was approved to be owing to his taking a small the nature; the tumour rapidly increasing away from the arm, and assue saline medi-in the course of a few days, and becoming time administered. The blo d was much very painful upon pressure. Twenty less her were applied, without my relief. A few days afterwards a distribute supervened, the the pain ceased, and the swelling, in some breible. degree, aubaided. After this attack, his Evening. 100 process and public degree, aubaided. After this attack, his minute mour, returned. He was again bled. Blood slthough the same plan of treatment was still huffed. rigidly adhered to.

tumour remained atationary; but, from the latter date, natil the guth, he gradually got the tumour. wurso; the tumuur increased, and now rearbed as high as the critical eartile; e, and, by its pressure upon the trachen and cestphagus, partially impeded respiration and deglutition. The shirt-cullar, which, prior tenance ghastly, and covered with perspirato his illness, would button confortably, it is trucked rattle, and inability to awalcould not now be made to meet by more low. He uppeared conscious, but could than three inches; his countenance became only speak in a whisper; pulsation in the bleached; pulse more fielde; and it was tummer still forcible; the julse in the right evident that the lawering system had been radial artery accreety percentible, whilst the carried as far as it could with anfety.

was recommended, as the only remaining panied with a profuse ptypinium were accommended. It is advantages and disadvantages and considered the result of the

there was no difficulty in making him com- in the propriety of the operation, as a last

thu the morning of the 22ad of July, the day proposed for the operation, the patient been. o agitated, that the pulsation of the tumour of the heart, and the large arterica, capecially the abominal surta, was perceptible to the eye. The operation was performed in the presence of Messra, Beuart and Brown, of Derby; Mr. Ingle, of Asbby-de-la-Zouch; and Mr. Walna, of Chancery Lane, aurgeons. In consequence of the temour extending as high up the neck, there was some difficulty in getting down to the alreath of the artery, which was opened to the extent of half an inch. The artery opponed healthy, and was easily secured by a single ligature of strong ailk. Immediately after tightening the lighture, the pulsation in the different branches of the external carotid ortery ceased, except a slight fluttering in the extreme branches of the temporal. The pulsation of the tumour

23 and 24. He went on well. The pulsabefore the operation, and the pulsation of the right radial artery was observed to be more foreible than that of the left.

25. He became feverish: pulse 120, and quantity of animal food. The blood, after full; the right lip of the would swullen each bleeding, became buffed; pulse 80 in and painful. Six nunces at blood wer, taken

. Maroing-Much better, pulse 92. stronger in the right radial untery than in inflanomatory state of the tumous abuted, the left; pulsation in the tumous still very

27. Better again this morning. He was taken worse at nine u'clock in the evening. From this time until the 1st of July, the Pulse 160; delirous; anxious countenance, and sickness. No diminution in the size of

The Anothecaries' Act was an ex post facto Sign Appe a friend and infused it in 371, of lew to me, but I cherrfully complied with see a ministering one-third every quarter its enectments, because I am I should guie of an hour, without producing the least in knowledge and respectability far more than I lost in edditional expense of time and know how far it was possible to push the mousey. When every class in society is ad-ergot, I sent to soother friend, and obtained vancing, would you have the spotherary, Iss. more, the time occupied by sending, end the productive Isbourer's physician, slone making it, was not more than a quarter of stand still, or retrograde? And what keowan hour. I then gave her half of it, and, in ledge do the Apothecaries Examiners reten minutes, the other half, which, like the quire that is and useful, not to say necesrest, had no more effect upon the uterus sary, to the medical practitioner? Botany
than if the same quantity of water had is not wented in London, it is true, and perbeen given. After the administration of bars less latin than they require might do the third dose the hemmirrhage cetirely to decipher M.D.'s acrawla; but is It no-crased; the pulse, which hefore was very thing in raise the respectability of the pro-feeble, and indishibutly felt, gradually rose framion? Is it not disgracuful to every men-until it had attained its origios standard, her of a supposed learned profession, not From the farourable symptoms above-men- its possess knowledge enough of Latin to read tioned I did not feel juctimed to adopt other the quotations that frequently occur in scienmeans to deliver her, she has now every tific books, and even newspapers? So far possible chauce of going the full time of from asking too much, the Eusenburg do not utero-gentation. I have since given her 3j of ask enough; and, if they do their duty faiththe ergot occasionally, by way of experi-fully to the public and to the profession, ment, as she complained, after she had the they will, after sufficient notice, require

am yet fully satisfied we cannot keew too much of them, unless, indeed, we become mere book worms, which there is little fear in the present state of society and science.

If the Apothecaries' Company were to shridge the term of apprenticeship, they would, docutiess, do a great henefit to the rising generation of practitioners; and if they enforced the lew against chemiet's practising "over the counter," (a cubject which would itself require a long letter to do justice to,) and under various pretanecs, they would do good to the public and to the profession, fully equal to the injury that would be done to the established practitioner, by depriving bim uf part of apprenticee time and fees. Not doing this is the only thing I can see wrong in the Apothecaries' Company. But I doubt not, from what they hevo done, that they will persee their course for the benefit of the profession and the peblic, without heleg ewayad hy their assailsets; who, ie fact, like the feble of the mae and the eas, neutralise each other, one complaining that the Examinere do tou much, and another that they do too little.

It is seid, " lookers on see the best of the guere," but this rule is aut without an exception. Lookers on know not the eanflicting interests that governing bodies have to cousuit and conciliate; every perty thinks itself eggrieved, and demends exemp tion or redress; eed when due allowance is made for this fact, I doubt not the majority of practitioners will coecur with ma, in approbation of the Aputhecuriee' Company, and their Court of Exeminers.

With much gratitude for the important services you have rendered the profession and the public,

I have the honour to be, Sir,

Your canatant reader and obedient servant, R. T. WESE.

Upper York Street, Oct.25, 1828.

BATH HOSPITAL,-LITHOTOMY

To the Editor of THE LANCET.

Siz,-As the eurgeone, belonging to our infirmary, intend delivering a course of

the education of the productive labourer's geom, not a little celebrated for his supposed talent in this city, operated on a patient for I am well sewere of all Tom Pains has stons in the bladder, i. a. attaughted the written against the learned languages, and uperation, when, after cutting coll maining, introducing his fingers and forceps, &co., all is vain, the patient was returned to bed, with the stone remaining in the bladder, after being on the table one hour and a querter The next morning the patient died; and, upon post-mortem examination, it was discovered the alanden man nor sens cur into, all the polong end fundling was among the seft parts; now I beg leave to ask, Sir, in such an individual worthy to be ranked smoon Lecturers? Ought to be range surger to be used known?
O that walls could speak? what hatchery would they raises! But such is the incit in this city, which searly all the medical mee hold with this admitis surges, that every black deed is withhold from light, end from the eyes of the medical world, until an opposition spirit began to srise to cheeve their foul deeds. What is here etated, Sir, are FACTS; and such tran-sactions, I think, ought to be made known to a deleded community.

DR. BLUNDELL.

#### LECTURA IV.

Of the Circulation of the Bland in the Ovem.

Tue circulation of blood in the oram, Gentlemen, is, in its nature, complicated, and in a view to a more lucid consideration, it may be divided into two kinds—the mu-ternal, I mean, will the feetal. The maternal circulation is exceedingly simple; the blood enters the cells of the placenta by means of the ateriae arterios, said leaves them by means of the uterina veins; so that while the oven remains in the aterus, a copions tide of the maternal blood flows through those cells, and this, when the ovum is detacked, prematurely supplies the blood of those copious foodings, which we have already largely coondered. The circulation of the feetua is a good deal more complicated, but with a little attention on our parts, it may be easily enough understood; it may be divided into three parts, the greater circulation, the lesser circulation, and the circalation peculiar to the fretal state. In the circulation peculiar to the futur, the blood seming from the internal ilines by means of the umbilical arteries, is conveyed to the piacests, and diffused over its sub-senses, which it fills like a sponge, float-ing at length into the ambilical vein, by which it is transmitted to the ween pore of the liver; the in the first stage of n. The blood in the wone parts incition, be disided into three the of these three partiess, two

and thence to the right sericle of the l while the remaining or third portion p through the liver in the ord as to reach the votes cave i vens cave inferior, the right the heart; and this is the not the heart; and the merely, as we find, all the blood enters ultimately into the right surf-cle, two portions paneing into this cavity by the canalis venous, and one through the liver in the estimacy, way. When the right noticle contracts, of the three portions of blood mentioned, one passes direct birt the left arricle, through the formmen owns, and thence to the left ventricle, and the mounding and descending sorts, following the ordinary route; but the same contraction w throws one portion from the right w the left, through the foremen ovuley is slso the two other portions from the suricle to the right ventricle, in the way, to be the was afterwards out of the way, to be the was alterwards out of the was-tricle into the pulmonary artery, which, as avery anatomist known, is inserted into it. In the trunk of the pulmonary urbity, the two portions of the blood separate, ti larger passing direct into the north dono dens, by a short and capacious tube, which leads direct from the one vessel to the other; the capalia venous before demoustrated, and the blood in the polmonary arteries flow ing through the lungs into the left auricle, ventricle, accending acres, and acres desceedens, in the same manner as in the adult; and this it is which constitutes the third and most complex stage of the circulation. All the three portions of blood, therefore, ultimately reach the aceta descendros, though by different chemists, and not simultaneously; and then, which complates the fourth stage of the circulation, this blood passes along the sorts to the common and the internal lines, the point from w in the circumon pounts to the ments, the sideod in the first sting, peases from the internal illinears the voils perturent, through the umbilled, vessels, being diffused ever this vascular met of the placents; in the ac-cised stage of this engilation, this blood paness from the vana. Spitzenia, into the right auticle, in part through the cample

the same passages as in the adult; in the third stage of its circulation, the blood enters the descending north by three different routes, through the lungs, the decalis arteriosus, and the foramen ovale; and, In the last or fourth stage, this blood does to the internal illacs, from which the circuit-commesced, by the descending norts, and the common ilines.

From what has been string, it is obvious, that, in the festes, it is not, as in the adult, the whole, but a past, and, indeed, a small part only, of the blood which is transmitted brough the lungs phence the main differe between the futel and the edult cirdisting. From what has been stated, too, is ordiner, that is the first fature, the blood his bown along his north is derived. From the sides of the histor, and is propelled until by both ventiliates, the left and right, sich, in the fostel beart accordingly, are of equal thickness, and becor an important difference between the greener circulation of the adult and the fatus. I shall merely add, further, that although the placents in filed, like a means filed, like a sponge, with two kinds of blood, the maternal, a mean, and festal, yet those two sorts of blood, though most nearly and axionsively approximated, are never in setual contact with each other; the maternal blood lodges in the cells of the piecenter structure, the festal in the vessels, the two de, his the air, and the blood in thu lungs separated by membranous texture, in thickness, perhaps, not exceeding one part in a thousand of an inch. During our quatic, or formi life, the blood cannot be ventilated in the lungs; and this applains to me why it is, that a small part only is nsmitted through these organs to nourish sir substance, and to keep the vessels DECTIONS.

I now show you a preparation of the heart of the feetus, in which one of the auriles has been out away, namely, the left, in order to show you the foremen, which, so you may perceive, is wide open.

In this eveneration of the lungs and heart, rou see the pulmonery artery and descending notice, together with the canalis arterithere is a packet of bristles placed beneath the canalis arteriorus, in order to direct

It commitmes happens that, in the adult, occasion the clearre of these tennal the formism ovale remains open through life, lier to the fortal vascular apatem, a and here is an unample of this. This propa- the courses which, after hire ration was taken from a large beart; and the conversion of the fetal circul foremen ovale is so large, that you might of the adult, and these easy put your fore-finger into it; this, however, division of the funis, and this pait your fore-fieger into it; this, however, is a rure occurrance, [Dr. Blundeli sho exhibited various other

structive properations of the vonversion

venceus, and in part through the liver, by of the festal circulation late that of the

adult. j

in the fatus, the circulation is of one kind; in the soult vascular system, of another; and we will mor, if you please, proceed to consider this change, after birth is accomplished. To understand this matter right, you must remember that it is a law of the vasculer system, confirmed by various observations on its different parts, that when s sensi or aperture is no lenger of service in the circulation, it shall slove itself gradually, so as to become more or less completely glosed: thus, in the adult, if you tin a large artery, so much of the actory above and below the ligature, as is no longer serviceshie in the circulation, gradually contrasts itself, and becomes converted jato s sort of ligament, and the same holds true of the valos. Now when the feetus comes into the world, it is usual to tie the umhilical cord; and, io consequence of this ligature, the umbilies vessels, together with the smalls vecosus, become no longer of service in the sirculation, and therefore they besome closed in conformity with the law before announced. Hence wa had in the adult, that the umbilical vein is become converted into a mera ligamentous vestige, well knowe to anatomists under the name of the ligamentum rotundum of the liver. Again, when the child comes into the world, it begins to respire, and its lungs playing, the blood passes through them with very great facility; and the consequence of this is, that a large quantity of blood passing through the lungs, and a much amaller quantity flowing through the foramen ovale and canalis arteriosus, these samals first contract, and then close. explanation is at least plansible, though, perhaps, not altogether satisfactory. Now from what has been already stated, you may perceive, on a little reflection, that the pesuliar circulation of the futus depo entirely in the unistence of these most is portant channels; while they are open, the circulation remains fastal; when they are closed, it becomes that of the minit: shange proceeds apon simple hydraulic principles: when the umbilical arteries, the umbilical veins, the canalis venous, the canalis prieriosus, and the foramen ovale; and that these are no longer than tubis an spertures, which are essential to the for circulation. Those causes, therefore, which occasion the closure of these tennis page conversion of the festal circulation into lungs setting in so-speration with a principle of the rescular system had east, samely, that qual

wisceble in the transmitting of the blood, thus. By this par will contract and close themselves up in a measure, that if manner more or less complete.

Province of the Planuse.—Having or us, much in the plained to you, in our previous remarks, the and the celf my structure of the planusty and the circuis-tions which age, presceeding through it. I fortige too, may have now measured in a sublest which before may now preced to a subject which before would not key been readily comprehended, I mean, the functions which this important organ, the placents, is discharging. There is no orgae of the body, in aither state of our existence, which, during our stay is the uterus, is of more importance to our welfare, than the after birth; and its fenctions, therefore, are well worth our study, By the after-birth, I cocceive it is, that the fortus receives its aspelles of notrimeet; for I have already andeavoured to prove to you, that it cannot be moeriahed by the liquor amnii. The cells of the placeuts, as The cells of the placeuts, as fore stated, are full of the maternal blood, and the vessels are filled with the blood of the fectus; and there seems to be a communication between the cells and the vessels by means of very minute persampas-sages impervious to the letegral red blood, but transmitting the aubtler parts; and by means of those pores supposed to exist, though not to be demonstrated to the eye, the aubiter parts of the maternal blood— the serum and congulable lymph, are ab-sorbed into the remain of the fortus. In the running animal, as formerly

abown, the placebas densists of an excrea-cance, and the vessels which ramify through in the same manner as the root in the soil. These excrescences, the cotyledoos, so they may be called, accrete a fluid, io its sensible properties, like milk, and which, after the death of the spimal, may be pressed out from their structure in large quantities, not can there, I think, be a reasonable doubt that it is by the absorption and rami-fication of this lactiform fluid that the oung animal is nourished, just as the plant feet by the fluids which it absorbs from se soil. By the animal chemist, so far as I know, this secretion of the cotyledon has never been accurately analyzed; if any ola hare present designs to devote bla attenn to animal elemistry, as it is called, to this fluid, so interesting in the generation of the summeting enimal, I would invite his attention; it is very desirable that we special know whether it he of the nature of filk or shylous, or whether it constitute third homour, which has a composition

a parisk in one size forms blood for it-tion, the yelk and white of the agg, is it absorbe, dignets, and sangathes. It specimation exhibited, you may see

mage, it is, at least in gr Now; to come down upon the point us, much in the same me and the calf are absorbin the placentar colle, to be afterwards a vorted into blood by the sellon of its ve lar system.

Besides, however, monthing the fi and operating as a cort of states the placecta, too, in profession office immediately essential so it cento-polmonery, as it me equally discharged by or gills. Of the lungs, we it is their office to the hody; and this admiss a for if the nit from your h lime-water, a precipi ing of the carbonate of li ing of the carroons and pasting darived from the blood, and pasting darid gas, Now, form of carbonia acid gas. imagined that the of that of separating carbon fro blood, to the sems man after the birth; but then pered to deny that the pi rate carbon in very m wall nationed that carbon i from it in abundance, in the prequantities in which it is a charged at the lange. The bleed to octering the lungs, is of a black in that which is leaving the lungs, is a liant varmilion; and the difference in great messure, from a diff quantity of carbon, the blood, h lungs, being freed from much of the while that which enters the lengt, a larga quantities of it; but it is not a blood that is leaving and extering the to get the blood at the same time fi umbilical volu and arteries, and, in the ex periments hitherto mada, able to discover any manifest di the colour of the two; if difference of at all, it consisted in a mere sh oot to be compared with that e of the adult; and, from all this, think, venture to infer, that the leaves and enters the placents, tain carbon in quantities nearly a

Again, we are taught, wi the lungs, (but this is more di the former apinion,) that they are t biodic, ligacts, and sangeline. body, and which support the aminal to pursuing exhibited, you may not return; and wit band that, generally supported the best from the sense of the inspirent parts in the sense o hallow that the placents performs the office ration of carbon; but seems pretty syl-neually assigned to the lungs; because it dently so someth is some third office, with is to be recollected, that the child is immersed in the liquor manii, probably of the of 98 or 100 degrees; and, not losing its heat, it does not require a supply of caloric from the placents. Add to which the opifrom the placents. Add to which the opi-miss of Crawford, that the lungs are exabled to absorb heat, by previously emitng earbon. Now, as it has been observed ready, that the placents separates no car-m, or, if may, an exceedingly sparing hos, or, if may, an exceedingly sparing quantity,—provided the separation of carbon he messenary for the absorption of the at,-this is an office which the placents

It means, then, the placents is not dis-charging the two grand offices usually as-signed to the lungs; it is not separating carbon largely, and it does not absorb calorie, for the support of the animal tempera-ture; and yet it is certain this organ does erform on office immediately essential to his, and which is performed by the lungs themselves, of which you have a very sim-ple proof:—If a child comes into the world time when re-

mean the absorption of caloric, or the sepa- they do not run in a direct line; very

which, however, we are at present unaq-quainted. How I savy, by auticipation, the man who is hereigher to paccoved in its discovery !

Physiological Remarks on the Circuit Uterys;

Having said their much their respecting the sentency of the gravid merse, I shall now proceed to make a few general remarks on its physiology, not entering at large, of course, into so diffuse a subject, but merely touchieg on those points most interesting, and some of which are not without their ob-

atetric importance.

la order that my remarks may be the batter understood upon this, it may be proper, perhaps, I should commence by observing, that the uterus, in the unimpregnated women, varying in its bulk, is, on an average, shoot as large as a small pear futtened, and that it lies at the brim of the pelvis, with its fundas forward and its mouth backward, so that the one lice above and behind the symphysis pubis, and the other on the ple proof:—If a child comes into the world sacrum. Upon either side of this nterus, under the crural presentation, (lega first.) in the sides of the pelvis, the ovaries are there being a presente on the chord, at a situated, rescubling the testicles somewhat piration cannot proceed, in in their form, and hence frequently denoconsequence of the head and shoulders be-ing lodged in the uterus, in the course of a treas, in the course of a few seconds the child is in a state of dis. ing of peritoneum, and proper coverings, treas, in the course of a few minutes it which may be called the fusion proprie, an-is in deager, and, in the course of a few closing within it a cellular web, full of very minutes are to the course of a few closing within it a cellular web, full of very misutes more, it is dead; and all this, be- minute vessels, and in this cellular wab are cause the action of the piscents is pressed embedded a number of vasicles, which may pon when the lange cannot play; for, if the vary in number from ten to fifteen, or child comes into the world head first, and twenty, of unequal size, some of them being breather, you mey tie the cord, and cut as large as mustard seeds only, and some as away the placents, as indeed is the custom, large as a full-grown pre, sad more or less yet no inconvenience ensees; and hence someticuous in the ovaries of different wo-we may draw this plain inforence, that the mee. For even in those cases where there we may draw this plans marener, that he may are the three common of the placents are performing one is no reason to believe that the woman has common office, immediately earential to been sterile, you must examine with care to life. When it is performed by the placents, sen the vesicles distinctly, while in other size is not required of the lungs; end, when cause these vesicles are so extiting, that accomplished by the lungs, it is not rethey are tho perts which catch the are as quired of the piscents. And now somes on the question, What is vessels, which are denominated the grathe placesto-pulmonery office? A question, fran, are the eggs of the human species. in it is not in my power to answer. But Again: statching from the womb to the which it is not in my power to maswer. But I again: statching from the womb to the constant constant physio-lagical discovery latest there. Whetever income which are formed by the perito-lagical discovery latest there. Whetever income which over the uterus, partially in such last office is, it is objected with the principle of life; and it is very remarkable, that, though we two layers one in front and the object office is and it is very remarkable, that, though we two layers, one in front and the object of the lange, we cartainly are not. The main office is, I think, alwely experience painmany function. This statusted what are called the following thing, placemate, one is front and the object. In the status of the following is untured what are called the following them.

Stretching from the would to the exter-nal organs, is the sund called the vegins, lying on the rectum posteriorly, and the bladder and methra in front; this canal varying much la its capacity, being large in women who have borns many children, and small in virgins, but being of a form and especity evidently comformable to the make of the male organ. Observe, carefully, these

illustrative preparations.

Impregnation.—When impregnation takes place, for I now proceed to give you a short secount of it, one or more of the eggs, or griffan vesicles, becomes the subject of the conceptive actions, and supplies of nourishment are poured into it from the surrounding parts, and the eggs enlargn in their size, and they project beyond the aurface of the overy, so as to farm the mammillary process; and all around the vesicles, which are thus enlarging the orum, become more rescular than it was before. About this time the mammillary process, projecting like a nipple, is spined by the muscular fringes of the following tubes, something in the same manner as the nipple lucif is seized by the infant when at suck. The mammillary process lying in this manner in the orance of the fallopian tube, it at length breaks open by ulceration, and discharges its contents in this canal, after which the radiments, by little and little, under a sort of periataltic action, are enaveyed from the tube to the uterus, in be deposited there as in a nest,-for the uterus of the mammalia has some avalogies with the nest of a bird, This is not invariably the case, for, as a ab which, in some polated particulars, it re-sembles. Now this transfer of the rudiments from the avery to the uterus, constitutes what, in the proper acceptation of the term, may be denominated its conception, or what, in birds, we should call the laying of the egg. Dr. Huighton found, that if, is the same time, the high vescularity of the the reblift, he divided the fellopian tube surrounding overy. more than eight and forty hours after its mmunication with the male, he did not, in so deing, interrupt the process of generation; but if he divided the tube within 10, 20, or 30 hours, or even later than this, then the womb, some contending with Heigh-process of generation was interrupted, the tou, that they descend in a loose amorphous radiatents were afterwards making their state; and others, as Cralkshanks, that appearance in the wearb; and therefore he they leave the owny, and pass the tube un-fifthered; that in the rubbit the process of the the form of a mail age. Dr. lleaghten passespine, or the laying of the rag, is ac-demaphished in eight-and-forty boars, but not been recently improgramed, making his ob-

much that a large bristle gould secrecy be passed through the etilice; larger where they open near the every, for there a lerge it is not easy to give a pressue and supportion within the orifice; and immediately within the orifice, which is surrounded by within the orifice, which is surrounded by an immediately within the orifice, which is surrounded by who helices that it is of very with the called the midness dishelf, dilated into a sort of receptacle, is which the first rudiments of the fectus may perhaps ledge.

Reretching from the secret. blue sy. How young therefore, must its rudiments be when they pass in an wa-formed state through the uterine orifice of the fallopian tube, which, as this proparation proves, is secreely large enough to edmit a brietle.

I here show you the oterus, and a portion nf the vagina ameraci to it; yes may see the broad liguments stratching to the sides in the glass, and you may see the rallopian tubes, or orducts, above which is the manual ruffle, or friege, insich lays hold of

the mammillary proc

Here is a preparation of the overy; its interior is exposed, and the eggs, which are nestling there, are consplessorally observe. able.

I here show you the mammillary pro cess projecting, and in this preparati upen, its contents being escape small cavity has been formed in the or and this cavity is filled up with a yellow material brighter la some than in others, th whole constituting what is celebrated as anatomists under the appoliation of the

The reside in this preparation, after discharging its contents, is again partially filled with the yellow material; and in the preparation which follows, the closure of the eavity has been almost completed.

Il here there are two satures, two von cles are in general excited, and two late become formed; in the woman from which this was taken, there were twins, and you may observe a corpus loteum in such overy. gla egg may sometimes contain two obiohs, so a single vesicle may, in some cases, contain two fortness. The woman from wh these nvaries were taken, conceived of three children, and you may see two vosicles in one overy, and one in the other; observe, et surrounding overy.
But to proceed:—Much dispute had be

raised respecting a question of same little appoulative interest, I mean as to the form in which the rudheants come-down into

we wrate that was descend in the form of gitudinelly, as if nature intended to spread the estable opening, discharged its contents the vestele opening, discharged its contents the vestele opening, discharged its contents that the table, as an egg might do, if the lowerer, grating its existence, we have lost were freely broken. Cruikshacks, essectial to generation, for extra-sterise limitation, that the rudineous fectures may firm in the passed along into the womb in the form of order to prove this, he laid upon the tube,

Now Huighton used to observe tertly and forcibly enough, that notice did not apply distilled vinegar in her operations; and the observation was as just as it was keen; for tube in a secretion organ, as well as an were supposing the rudiments came down organ of transmission.

Into the womb without any defined abope. Here is a specimen of course the application of the vinager might be expected to congulate the setum, and to cause it to mesons something of a defined chape immediately. On the whole, therefore, I assent to the opinion of my valued relative, and believe with him that, is conception, the even comes down forn the uterus, not ecclosed in a membranous eyst, but in a loose and disougued condition's and this opinion is supported by the inference to be drawn from the amaliness of the nterius orifice of the tubes, evidently much too miante in its capacity, to allow the vesicle to pass in its oviform con-

yells, derived from the overies certain its different physicians :-

PERMINATION OF THE RETTYL IN THE MUMAY BEL.

It has very often been discussed, where a retina terminates anteriorly, and, as far as we know, the opinions of sententi

5 Das Ends der Nervenhaut im mounchi. Augu. Von Dr. Schneider, Prospet, to der Univers, su Miniches.

This contrasts very atrangely with the to this point are not yet settled. Dr. conbastic manner in which we are access. Schneider, of the University of Munich, has intely, by very accurate researches, andeavoured to determine this question. According to him, the following are the sliffeinions on the subject !-

rest opinions on the subject !-middle of the vitreous himour,....Falleplus

and Youtius

2. It terminates at the exterior margin of the processus ciliares. Macket, Simmer-ing, Wrisberg, Zinn, Handelphi, Velpota, Hanse, Joseb, Paillucci.

S. It extends to the electronic the fens, where it is inserted in the our

5. Having reached the internal margin of none of Zinn, it forms a heliard edge, from which it extends, as a very delicate mem-brane, to the margin of the form.—Bearens, brane, to the margin of the lens.—Bearens, Walter, Positinger, Hemelbook.

According to M. Schneider, it proceeds from the axternal margin of the corpus ciliare, where it was generally supposed to terminate, to the lens in the greatest cirsumference of which it ends, by a free margia, and without my firm attachment to the sula. This continuation of the retion lies between the zone of Zinn and the corpus ciliars; it appears as a very delicate, thin, medullary membrana, somewhat thickened at its internal free margin. It is covered by the pigmentum nigrum, which is must copious on the external portion, but gradually decreases anteriorly and interiorly, so that the free-margis of the retina is not nected with, the posterior surface of the covered by it. At the distance of about iris; the internal margis was free, irregu-one-eighteenth of an inch from the nircumfe-lar and indented, and pertly covared the thickness, is very white, and of a folded plastic membrace had been thrown one from attucture, in which the separate folds, from it. It was, an the whole, eary considerably 70 to 75 in number, are placed at regular thickened, and of a geletinous considerably intervals. The interval margin of this being, however, perfectly transpariest, this folded ring adheres to the capsule. Under thickening of the capsule cannot be pensistened as the misrocones the transparies of them. the microscope, the termination of these dered as the result of an inflammatory state, folds anteriorly appear as more or less co-aiform hodies placed in different directions, lag it to be formed by the accretory a

ON THE DECAMIC ALTERATIONS IN THE IN-TORIOR OF THE BYE AFTER THE RECLIS. ATION OF THE LENG.

## By Dr. W. Sönnunne.

The anther of this treatise had apportu-ulties of examining night even in which this peration had been performed. The reclinated lens was generally found immoveable on the anterior and laterior portion of the ciliary processes, at a greater or less distance from the irie; it was, amcept in our ease, without its capsule, small, and, as it seemed, absorbed, all but the herder av-cleus; of a greyish white, or yellowish brawn amber colour, and of an Irregular slape; its sise appeared to differ according to

sule.—Forreis, Haller, Lieutand, Monre, it seemed unchanged, heise sovered by the Window.

4. It is continued into the processes ulclares.

5. Having reached the enternal margin of some of Zinn, it forms a defined edge, from the office bear bad been in the continue bear bying in algotical, when the substitute of Zinn, it forms a defined edge, from more or less close contact, invariably undeprent a very poculiar alteration : the vi-treous humour, hysicid membrane, and retias, were, in these places, more or less turbid; the hysloid membrane was thickened, the retina wrinkled, and, in one inatenor, adhering to the choroid; evidently the consequences of a slight infi produced by the pressure of the lens. The capsule had, except in the one sais mentioned above, retained its natural situation, and its connexion with the sonula Zinnii; it had been lacerated in the operation in the middle or lower part, and was perfectly transparent; after having for some time been lying to very strong alcohol, it ap-peared as a yellowish ring near, but unconsee of the lens, the retina lucreaces in pupil; la one instance only, a very delicate and very similar to the nervous papille of of the capsule, and the authorquest crystall-the tought.

Tudiment of a new lens. In two capsus, the vitraous humour was very liquid; the cica-tria of the seleration could hardly be discosered. In one case of congenital cataract, where the operation had failed, the retine was found esparated from the charold by an intermediate stratum of fluid.

M. Sommering is of spinion, that the formation and nutrities of the less depend on the continual secretion and absorption of the liquor Morgagni by the capsule, b that there exists un organic connexion be-tween the two organs, and that the formstion of the lens out of the humour Morgagal, is a real crystallisation. (Such was also the opinion of Haller and of Petit; But Albinus oparon or ramer and or rent; not Albanz as we the injected vensels of the especie continued into the less, and the specie recent researches seem to confirm this observation.)
The capsule is closely consented with the some of Kinn, and, through the latter, communicates with the corona ciliaris, from which it reserves the neutrant result of the

Von W. depends not on the more or less transparent atots of the interior parts of the eye, but

the length of time which had elapsed after the operation. In two instances it was complotely theoried, and the only remaining trees of it was a slight impression in the mentic of the ciliary processes; in one or Bashacht. un dis ergan. on the irregular shape of the refracting organs. The estimates secondaria is the effect of translatic inflammation of the capsule; the lens lies although, before the ramoval sometimes even an effection takes place between the edges of the capsule, but it is hardly near the effect of exadetion from the bright yellow and preminent manees, of a use, as M. Schmidt maintained. The capsule itself is never absorbed.

ON RUNGUA MENULLARIS OF THE SYL.

This treatise contains two very interesting cases of fungaid disease, at which we a condensed report.

In a girl, neven yents ald, the fungue had been formed in the right eye, in consequence of internal ophthalmy; vision was com-plately destroyed from the beginning; the pupil was diluted and immovesble, behind it a yellow irregular spot was seen, with some gorged ressels in its centre, its enterior and inferior portion was a little promi-nest, and of a tuberculous appearance. in all other respects the sys seemed perfectly healthy. After three months the yellow spot became of a darker colour, anlarged, nodose, and beset with more varieous ves-The antirpation of the eya being abjected to, the disease followed its regular course; the eye burst, the fangus pratraded, and rapidly grew to an enormous aise; large ulcerations formed, frequent hamnyrhages ensued, &c., and the little patient died, after having suffered sinteen manths. On exemination, the glands of the neck end the perotid were found disexact; that portion of the dura meter which covers the parietel bones, as well as the greater part of the right anterior and middle lobes of the brain, had degenerated into a fungous mass; the aptic narve, the aphthal-mic branch of the afth pair, and the third pair, were also imbedded in a fungous substance. The optic nerve terminated anteriorly in a hard ligamentous intomescence, of a bulbous form. In the orbit, all the organs were transformed into one confused

The saceed case was that of a child twenty mindies of age; the fungus was in the left eje; it had likewise formed after internal ejektimien as in the foregoing case. The eye wise estipated by Dr. Donegana, about seven weeke after the first symptoms had been observed. Professor Panisas examined the eye after this aperation; it was made the eye after this aperation; it was not a considerable of the matural; the optic newlegich but harder than natural; the optic newlegich; but harder then natural; the optic newlegich; but harder then natural; the optic newlegich; but harder then natural; the optic newlegich in the lens harder than natural; the optic newlegich is not harder than natural; the optic newlegiches harder harder than natural; the optic newlegiches harder harder

the yellow spot was found to be seased in the depression is which the posterior half, of the lens lies, although, before the removal of the lens, it espected to if it were more deeply-seated. It consisted of three separate bright yellow and premisent masses, of a soft and fungous consistence. On removing the choroid, the whole of the vinyous hamor was found to consist of this yellowmas; being punctured, it emitted a bright yellow, vincous, mines fluid, which was congulated by alsohol; the optic screw was inserted toto this yellow mass; the ratics was wrishled, contracted, and appeared to pass through it to the anterior fosse, where it formed the three above-mentioned prominencies. The choroid was healthy.

Four years after the operation, the little patient was in perfect health. As for as we know, this is the only instance upon record, where the entirpation of the fungus medullaris of the eye, has not been followed by a fital termination from a relapse, or a continuation of the disease to the brain and its membranes.

CENTRAL POINT OF THE NEEVER, AND SUBER-DIVISION OF THE NEEVER, AND SUBER-QUENT RE-UNION OF THEIR ENDS.

Al. Flourens has recently endeavoured to determine the limits of the central and vital point of the nervous system. From various experiments, he infers that this point hegies at the origin of the eightle pair, and extends no forther than one-lifth or can-mixth part of en inch towards the medalla oblongets. On dividing the brein above this point it is deprived of life, but the apisal chord continues to live; on dividing the spisal chord below it, the reverse takes aliced.

balaw it, the reverse takes place.

In another memoir, M. Flourens given the result of his experiments on the division of the nerves, and the subsequent re-union was complete, and by it the merges recovered even their sensibility and influence on motion. M. Flourens being desirable on motion. M. Flourens being desirable on the sensibility and influence of heaving whether the end of them for his situation, and found that, in all the mans, complete union took place; in some of them the function of the serves was restored; in others, it remained impurfeet; but, is all, the irritation of the lower was communitated to the upper nerve, so that we can hardly doubt of the formation of real nerveus substance between the disvible ender.

Sul Funge Midofine dell'ouchio. Pavia,

OF THE APPEARANCE OF THE BLOOD OF ANIMALS UNDER DIPPRESET STATES OF STOTTEMBET.

By Mr. Bacus ap Vraus, Votorbinery Surgan; Mr. Coloman's Anistant at the Votorbary College.

Haveno stated in a former communica-tion a that the blood of the horse or and, when in perfect health, after being well fed and moderately exercised, suspined a bright rad colour; and the blood, which was thes abstracted, congulated quickly into a solid uniform mass, without may separation of the red part; and on the contrary if the same animal were apposed to a law dagree of temperature, and allowed only a small quantity of food, that the blood suder those circumstances gradually assumed a darker colour, congalated slower, and daring its congulation separated into two parts, a auperior white or straw-colour, and an ielerior dark red, thus constituting what is commonly called baffy, or intlamed blood, and that in proportion to the degree or intensity of cold, and the deprivatine from food, so the blood assumed this buffy apprerance; ned again in proportion to the increased atrength of the animal, when supplied with a due quantity of food, and placed in a more congenial temperature, that the blood recovered its original atate.

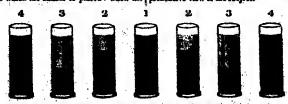

I likewise stated that the blood assumed this buffy appearance in healthy herses from drawing large quantities at short in-tervals, and also that any cause that debili-tated the system would likewise rander the blood of this appearance.

Os further investigation, and from namerous repeated experiments and observations, I have clearly ascertaised and proved, that the blood sesumes different appearances, varying secording to the circumstances en-der which the minual is placed: when the prohessive view of the subject.

animal is in perfect health, and modern excited, the colour of the blood will bee brighter, and the magnisting property be increased; but, on the continy, that in hoth, when under great (as well as disal-nished) excitement, the colour and congu-lating property will be found gradually to diminish.

Under the former circumstances both the venous and arterial blood assume a brighter colour, congulation takes place quicker, and the consistence will be found to be firmer, without any separation of the red part, and this appearance will be seen whether a small or large quantity be taken; but if the exer-tion be carried to a great excess, or if the animal breathe an impure atmosphere, or be exposed to a low degree of temperature, and at the same time not allowed food, or to be exercised, the vengus and arterial blood will then gradually appear of a darker colour, congulation will be alower and weaker, and during the congulation the red part will separate, at first in a slight de-groe; but this appearance is only to be obaereed on drawing a small quantity, but af-terwards to a much greater autest, by taking a larger portion; but in the advanced stages, and as the snimal becomes more authorised. it then gradually fails to assume the buffy appearance, from its congulating property being too far diminished.

From these facts it becomes avident; as I have previously stated, that the rensus and arterial blood assumes different appearances, varying according to the circumstances under which the unimal is placed; thus, while is health, and under moderate azeitement, its colour and congulating properry gradually increases; but, on the con-trary, both when under great as well as di-minished excitement, its solour and congulation will be gradually diminished.

The middle portion, Fig. 1, is intended are intended to represent the solouss and as separated the appearance of the blood, congulating property, diminishing those on oblines recognized into an uniform firm those on the left from diminished excitement, which is no operation, on each side, show the blood darker.

Fig. 1, on each side, show the blood darker.

Fig. 2, on each side, show the blood darker in molour than Fig. 1; and during the congulation to have separated into two parts; a

<sup>\*</sup> Lapour, Number 195, Vol. XII.

consists, which is either white or straw-celoured, and an inferior, or red part.

The two next pertient, Fig. 5, likewise sleaver and weaker, from con-taining a much ampler partient as colour, with a larger portion of the white or buffy part, commonly called an economical parties. r straw-soloured part, and a smaller of the inferior or red.

The two outside portions, Fig. 4, repre-sent the blood of n darker oniour than the last; but without any separation of the parts, owing to its work congulation.

paris, owing to its west congustation.

From this it appearantides that the remote causes which increase the colour and the bland are pure congulating property of the blood are pure sir, of a moderate temperature, good lood, and moderate exercise; but, on the contrary. those under which it diminishes are violent or long-continued exertion, severa pain, increased temperature, or any of these causes is combination with high feeding: this is very frequently to be abserved in the spring of the year, and summer months, while the thermometer is high; when it is very common to find inflammation of the lungs, eyes, and other inflammatory diseases from too great excitement of the system; again, er remote causes also render the blood in this state, by diminishing the action of the various organs of the body, as impure hir, long exposure in wat or cold, without food or exarcise;" this wn find to be the case in the natumn and winter, while the thermometer is low.

It therefore appears that whils the canees which support the functions of the different organs of the body are duly end moderately hied, the colour and congulating property of the blood gradually increase; but, on the contrary, if these causes are gradually withdraws, or earried to too great an axorse, then the colour and congulating property will gradually diminish; thus it will be found, that as the animal increases in attempth, the blood will eesquiste stronger and quicker, from containing a larger portion of animal matter; but as the animal diminishes in strength, and while under great or diminished excitement, the blood congulates slower and wesker from containing a smaller portion; its quick congulation depends on the questity of suimal matter it contains; the blood of strong subjects is always greater in weight, and congulates atronger and quither than that of weak ones; thus, as the summi increases in strength, while in health, and under moderate excitement, the blood congulates stronger and quicker from containing a larger portion of animal ing a larger portion of animal orgain, so the saimal dimier: and ogain, a nishes in strength, as while under great or

This white, or buffy part, commonly called self-congulable lymph of thris, may therefore be somidered as the base of the blood of all animals; it assumes different colours, and possesses coagulating properties, varying in animals, and in different parts of the body of the same mimal; in the strong parts it appears red, from postersing a high degree of vital power, while in the week or finer parts it appears white, from possessing a much lower degree of citality; in atrong sub-jects, and in the strong parts of the body, it congulates atrongly and quickly from containing a large portion of animal matter; benca it less received the name of fibrin from a supposed resemblance to assecular or fibrona texture; but no the contrary, in work asbects, and in the weak and fiver parts of the body, its congulation is much slower and weaker from its containing only a much amaller portion. It also assumes different appearances, varying according to the cir-cumatances under which the saimal is pieced. When in perfect health, and moderately eacited, it appears of a bright red calour, and congulates without any separation; in this state, we may consider it as possessing the highest degree of vital power; but, no the contrary, that is from too great as well as from diminiahed excitament, in consequence of its vitality being diminished, it then appears darker in colour; conguistion becomes slower and weaker, at first in a slight degree, but afterwards to s much greater natent.

I therefore deny the hypothesis of thin blood being a compound fluid, while circuiating in the living body, and of the lymph, red globules, and serum, but consider it as live unimal matter, capable of assuming either a fluid nr solid form; and that, while in the state of a fluid, it possesses a bigber dagree of vital power than when in a solid statn; that it assumes different colours, and possesses various degrees of solidity, varying in animals, and in different parts of the same animal, which depends upon the quantity of animal matter it contains previous to its possibility, or assuming the solid state. I consider its base as originally white, and that it derives its colour and congulating properties from the combination of atmospheric sir, when circulating through the lungs; this appears from the ariarial blood being always greater in weight, and one-gulating firmer and quicker this either the lymph or chyle; and I consider that its dif-ferent colours indicate its various degrees of The bleed has like wise the same up-vitality; for, in the strong parts of the same upon the horse is under the in-sence of digitalis.

sence of digitalis.

7

This appears from their assuming different colours, and peasesting congulating proper-ties, varying according to the different states of the animal. In strong and healthy horses, if destroyed while in perfect health, and under modérate excitement, the lymphatic fluid amunicaé white or atraw-solant in those parts of the lymphatic system afficiated near the of the lymphatic system affected near the circumference and centre of the circula-tion; but, on the contrary, in many of those which are destroyed when under great as well as diminished destrement, it commonly assumes the same intractor of dark venous blood in those parts of the lymphatic system; situated nearest the centre of the sirculation as the thoracic duct, and the second order of the lactenis and lymphatics. This we find from the functions of digestion being cuspended, from severe pale produced from open joints, penetures in the fest, &c., also by exposure to severe cold without food.

Royal Veterinary College, Oct. 15, 1888.

ON THE EXTRACTION OF THE TROTS.

By S. J. STEATFORE, Surgeon of Woromer

The astraction of the teeth has, by many surgeone, been considered a contamptible occupation, and unworthy the notice of a well-educated practitioner; it is, consequently, new practiced by the reguler den-tiet, or abandoned to men who have not had the benefit of a regular surgical education. I feel, however, that whetever will tend to the relief of pain should not be below the sorgeon's consideration, while the principles of the operation ought to be perfectly ouderstood, to do it with correctness and faci-lity. I believe, however, that many practitioners have ebandoned its employment, more from its difficulties, and the unsatinfactory nature of their ettempts, than from ony ideas of the disreputable feelings attach-ed to its. These difficulties, I am convinced, have originated from the want of due con-sideration of the nature of the diseased condition of the teeth, or of the variety and

store perts, it is white, from having only a ledge, which should not evines itself in the much lower degree of visality.

This leadest mid lymphetic fluids mey;
therefore; be considered to viscous blood; netwee of order, or the moio of its producneture of esties, or the made of its produc-tion, but consider the amount of disease under three hoods :--1. Simple caries; \$. Extensive caries; S. Death of the tooth,

1. Simple Cories -- Under this head I would consider that extent of discose which has exposed the lining membrane of the tooth to the degree, that we operation of the den-tiat, such as stopping, &c., could effectually relieve the pain, or stop the progress of the varies, where, indeed, we considerable portion of crown line become implicated.

S. Extensive Cories I would apply to that amount of disease which less destroyed the crowe, or all the bony part, leaving but a this shell of enamel.

S. Douth of the Touth,-Here I would be anderstood to mann, the dead etemps which have remaioed efter the crown was broken off, or destroyed, by caries; they are gonsrally level with the gum, are of a dark enlour, and cause irritation and inflammati by their presence to the neighbouring parts; they have long censed to be slive, and have now jost that firm connexion with the socket which they possessed before that vitafity was destroyed.

The auture and action of the instrumen should particularly enter into our consideration. A great variety of instruments have been recommended for the extraction of teeth i each operator has beested some new invention, to which he has meribed parti-cular excellence; but that they have not possessed the merits secribed to them, is obvious from their very limited employmeet: many are of a complicated majory-meet: many are of a complicated major, and differit of application. I am, however, convinced, that the more simple their con-struction, the more cap will be their can-ployment, and the more obvious their affects. The instruments which I have found most epplicable to the extraction of the teeth are—the forceps, the key, and the punch, the use of each of which ere indicated by the conditine, or position, of the tooth.

The forceps can be employed only in the case of simple caries, where there is a con-siderable portion of the bony material of the tooth remaining, constituting a segme of firmness which will resist the grant, of the forceps, and will not oramble under it. The forceps should be of sufficient size to afford on easy purchase to the hand, while they are made so that the inner surface of the action of the instruments they have employed; But when the action of the one is played; But when the action of the one is properly spilled to the anters of the one is at this difficulties wants; and here I cannot that the repredent the employment of the mane is but the repredent the employment of the mane is the state of the control of the test, for this resear, the exception of the test, when the employment of the test, when the control of the test, we have chosen the control of the test, and the control of the test, we mant take ears to embrack the neck; for

interal motion, also tending to the perpen-dicular; by the first we separate the adianion of the tooth to the nocket, and by the latter we draw it from its position. forceps are meet applicable to the incisors, or compidate, but, if they have a sufficient curve in their blade, they may also be employed to extract the hierapid and molecular parts. The curve of the forceps must vary with the positive position of the tooth, so that the extremity of the blade fits in a perpendicular direction to the crown of the tooth, when precisely the same movements must be used, and the extraction of the work of the apper jaw; they may, how-ever, be employed to the back teeth of the lower with nearly the same facility. I appreand, that the reason the forceps have occamonally parted is more from the make of e instrument then any fault in their applition, for when the blade la made too hellow, so that but the extremities of the blades touch the tooth at two opposite points, which are often too abarp, the grasp of the operator is liable to out the erown from the body of the tooth, instead of extracting it; but when due attention is given to their

application this can never occur.

The use of the key is demanded whea there is such outensive caries that there is it more convanient, as in the lower jaw. The manner of placing the key must de-pend upon the extent of the caries, and the position of the tooth. When we can find inner side, to form a purchase for the claw, it must be placed upon it, and the fulerum on the opposite side, so as to turn the tooth outwardly; but when a better hold is on the outside, the tooth may be turned to the outside, the tooth may be turned to-wards the inside. Sometimes the tooth, instead of being perpendicular, has a lateral

if we merely take hold of the crown, the haudie of the featrument grady and stea-forceps are hable to aligh. Having taken a dily, taking early that the blaw does not alip firm hold, we give the forceps an alternate from its hald. This acting on the fultarum will cause the claw to raise the tooth from its socket; but when the tooth has a lateral direction, if we apply the claw on the side to which it inclines, we cannot raise it in a perpendicular direction, in consequence of the inclination of the roots of the tooth, and would rather force the tooth down into the socket, if the power we employed did not break the crows from the body, while the thicker and stronger nature of the alveolary process in this instance might form some impediment to its antraction. In avery instance in which the key is used, the alveolary process must yield, in some degree, at tooth will generally follow. For the asks of particular points. The power applied to the convenience to the operator, the forceps apper part of the tooth must compress the ment, while the faogs, or roots, of the tooth will press upon the lower part on the opposite side ; heave the reason that these processes are so frequently broken. This, however, is an accident of little moment, for the alveolary processes are aute to be shootbed

as soon as the tooth is totally removed.
The employment of the punch is domanded in the extraction of old dead stamps, which, in consequence of a loss of vitality, are separated from all intimate vascular conoexion with the living apparatus, and are even commenced to be removed by absorp-tion. The manner of applying this instru-ment, is to introduce it between the stump and alveolary process, and to poise the no purchase for the forceps, or when we find latter from its socket. The best plan is, first to lauce the gum immediately abova the alveolary process, and then to pass the punch down firmly between these parts, and when we have instrumed it a sufficient distance, we must turn this handle of the punch from the perpendicular direction to a right angle, when we easily raise the touth from its position; we must be careful to place a finger on the upposite side of the tooth, guarded by some substance, so as to receive the ioatrument abould it slip; this, however, very seldom happens if proper eare has been taken to introduce it a saffidirection, especially the back teeth; in eare has been taken to introduce it a sam-that case we should always apply the fol- ciant depth before we make the turn. The crum on the side to which it inclines, and point of the punch need not be made very the slew on the opposite, for reasons which alsorp, but should be wedge shaped, so as well be presently noticed. The sociou of this casily to be insinuated between the attump instrument is that of a lever, and justly to and alveolary process. Care is particularly accomplish its action it requires to be judi-accessey not to attempt its use but in speaky applied. The falcrum should be those cases to which it is applicable; in the same to speak to act to make the speak to the same apply these it requires has little forces. But if it Sig, and must be applied to the gum, oppo-tions it requires hat little force; but if it sire to the alveolary process, while the claw is used before the tooth is dead, and applishould be of sufficient length, that it may rated from its connexious with the alveology easily reach to the opposite side of the rooth, process, we may du very considerable inits autremity being placed upon the neck, jury from the powar it will be necessary to 
canning opposite to the super part of the fall one, in our attempts to aktract it. The sucrum, and those must be kept precisely in tremity of the punch may be introduced:
a horizontal direction. We then turn the with sufficient facility on either side of the

The by-laws of the trish College of Surgnone are equelly saile, for no person can become a member of that wise corporation,

sure or appulsion, shell meet a London or Edinburgh surgeon in consultation: nay, Dr. Gratten informs me, is his remarks on the prefension in Iraland, "Net evan Sir Astley Cooper, or Mr. Abernethy, could be meet by a member of the Irish College of Surgeons in consultation," The members of the London, Edinburgh, and Paris Calleges of Surgeons, are the most numerous in Ireland, solely from the gross and ridioulous regulations of the Jrieb College, and are ashjected to this humiliation, and are excluded by Act of Parliament from being sargeone to county hospitals; the emolaments of which vary from 1 to 500% a year. By this management of the College, sided by the system of the School of Medicine, 200 outs are exiled from Dublin sunually; and, supposing, on an average, each to ex-pand 100f, a year, which is under the mark, the sum of 20,000L a year is removed from the Irish capital; a trifle, to be sure, when we consider the flourishing and opulent state of that metropolis. But a word on the exclusion of Catholic medical mon, from lungative professional appointments. They are excluded from the numerous situations ueder the government. We cannot find the names of any Catholic among the physicians, surgeous, druggists, or apotheseries, at-tached to the military and navel departments. The offices of physician-general, times, must be carried along, in the suiversurgeon-general, directors and inspectors of sel progression of improvement, and in the military hospitals, the members of the Board of health, the six professors of the school of medicins, the sine lecturers at the school of surgery of the College; the go-vernor, deputy governor, and thirteen di-rectors of the Apothecaries' Hall; the pre-femous of chemistry, natural history, mineraiogy, agriculture, botany, veterinary art, in the Royal Dahlis Society, each worth 2006, a year; the state physicians, surgeous, and spothecaries; all the medical situations connected with the Military Hospital, Plox- pleted. nix Park, and with the Royal Hospital at Kilmainham, (the Irish Chelson College,) se Femiling Hospital, the sailors' and sidiers' selicots or hospitals, the namerone ornhan schools, the Hospital for lecurables, Stevens's, Swift's, the Richmond, Jervis Street, Mercer's, Whitworth, Teibot, Welcal officer of the last, worth 2000s, a year; the Cork Street Fever Hospital, the Lock Emspital, the Custom House, Post Office, prisons, dispensaries in Dublin; filled by Protestants. In fact, it would ap- and practice which has been attended w

hit quasi master during the period. Some of pear, that the masters do not know their nurs apprentiers, when once the fee is pocketed; and three-fourths of the profusion are Cathone member of the College, on pain of canaure or a xpulsion, shell meet a London or few country dispensaries, which are worth about 30% a year each. And aven Catho-lies would be excluded from dispensation, but the anjurity of subscribers are of the excluded persuasion. But all the public emolumentary atuations are virtually closed against them. Such are the beneful effects of that iniquitous and barbarous penul sode, which makes men aliens in their native country. Happy, magnanimous, and en-lightened England! where religious worship is no longer an impediment to talent and prometion, except to Catholica.

and prometion, except to Cataotica.
In avery-nountry in Rairepo and America,
Engiand and Ireland ancepted, men of whatever religious permeasion may fill all sivil
situations. How long shall such opprebrious stigms disgrise the lowe of the most
enlightness, just, noble, and most powerful
kingdom in the world? Shall the glory of
the Rivinia constitution be alrease trapland the British constitution be always turnlahed by such a monstrous is justice? It is impos-nible. The aphere of human knowledge has wonderfully advanced during a brief and recent period; the diffusion of it among avery class of mankind, has given rise to corresponding improvements in overy art and aciesce, and has revolutionised the whole opinions of former ages; so that the reformation of anjust and oppressive possilaws, the offsprings of dark and innues univarial and rapid march of intelligence. Already have thousands of ridiculous and about enactments been efficient from our statutes; and never was there a period in which a more magnasimous and paternal mountch sweyed the sceptre, or a more consistent and independent ministry formed the council of this mighty empire, then at this time; and therefore the work of reguperation so suspiciously and energetically commenced, cannot fail to be speedily com-ESLAPERSES.

#### SYDENHAM EPIDEMIC.

# To the Editor of THE LANCET.

Sts,-Notwithstanding the number on lestey, and Lying-in ilespitals; the chief value of those predections concerning the nature, origin, and treatment of idiopathia fover, with which the medical press has reemed of lets years, it is still the duty of Office; prisons, dispensaries in Dubiu; these who have opportunities afforded them, the thirty-two county information, fever of winessing a large portion of individuals, hospitals, 300 dispensaries; county and affected by this disease, to contribute thirty prisons, lunatio saylums, are almost all tectimony, however facility to the themselves to the facility of the county of the

the happient remits. I feel that I should ill parsuing a rational mode of treatment, until discharge my duty to the Millension, if I ly. Clutterhuck directed the powers of his did not state it, as my desided conviction, great mind to the interesting subject of formed from extractive observation, that to lever; he accurately demonstrated from its the matchines work of Dr. Clutterhuck on latery, its sharpeter, the morbid appearance fover, many hundreds of individuals over the state when the first interest leves. I will reasonable through one of these who fell victims to its rater leves. I will reasonable through one of the state when the first in the state of th location round we work of Dr. Clutterback on integry, no many the matches work of Dr. Clutterback on integry, no many hundreds of individuals own their lives. I will reasonable the broaden said the second of the print, and that the man inflammatory disease occasioned by the spidemic in 1815; in one of the brain, said that shellity was the rivillage in Boddershire, ninety-six individuals of the brain, said that shellity was the rivillage in Boddershire, ninety-six individuals apparent thus real, and that it was duals full a victim to this disease. The more apparent thus real, and that it was a number of deaths which took place in the of inflammation produced a normapositing epidemic of 1821, when it may all the many intention to enter the number of the clutter of the control o its treatment consequently was more approprinte; and it comments that to the great and ap prists; and it certainly appeared to me, epidemic which occurred in Sydenhem and that to the great and aplended exertions of its vicinity, in the autumn of 1827, I saw Dr. Clutterbuck, this happy alteration was uninently owing. I am here problem may nell to what task clean many faller disting. of distant nelf to what ter with w from the metrope labours were crowned these, I counct speak. Those medical gentlemen who had dured to doubt the infallibility of these degrate which had been propounded by Dr. Cellen, and had received the heastion, and been made the text-book of the schools, had not sufficient resolution to act for themselves ; and although they were daily beholding individuals auffering severely from a disease which they might, without much impropriety, have called phrenitis, they continued to administer the most potent stimulants; and those who fortunizely survived the favor, those who fortunately survived the fayer, aggravated, as it was, by the treatment, had the doshle feitune in securing from the disease and its hindfeld remedy. When contemplating sine wast destruction which fever had produced around them, they could not but admit how atterfy inadequate their treatment was, asher in arresting the disease in its progress, in mitigating its account, or is displaining its famility; they witnessed in those who did recover, abbility of the waste simility of the displaining the similar of the waste simility of the displaining the similar of the waste simility of the displaining the similar of the waste similities of the waste similary of the waste similary of the waste similary of the similary of the waste similary of the s lity of the most appalling kind—dreadful at-tenuation, feeblesses of the limbs, sometimes desfuess, impaired vision, partial paralysis, deficient memory, and occasionally a state of complete fatuity. They could trace this disease to no organ but the brain, rium, delirium, seuses, vomiting, convulsions, spaces, themore, subsultus tendi-the head; sushing of the face, with pres-num, seems, hiscough, clearly pointing out nunce, wildness, and occasionally us the issugular distribution of nervous in-finamention of the eyes; impatience of his

cuenot evoid remarking, that during the epidemic which occurred in Sydenham as but one instance of fever baring affected more than one individual in a family this certainly appeared to me a powerful argument in favour of the opinions of Dra-Armstrong and Macultock, who maintain that eli epidemic ferrers are owing to the existence of melaria; this I could further illustrate, and prove by a relarence to the particular apota where the ferrer reged; but this task shall be the subject of smother communication, as I have many highly interesting facts to adduce on the subject. I took the greatest pains to investiga possible, the origin of the fever, and I o not discover the slightest reason to inte that in any single instance it had b propagated by contaginn. I was more induced in the able production of Dr. Marsh on Fever, were so powerful, that it would almost appear, from his statement, that every case of fever which he witnessed, he could trace it distinctly to the influence of contagion. The epidemic, some account of which am about in parrate, commenced in the beginning of October, 1827; it occurred at the same time, at the summit of Sydenham Hill, where the soil is gravelly, and in Perry Vale and Perry Hill, where the soil is clayey, and the land in a great measure undrained. The general character of the discene was that of isflammation. The those referrible to an inflammatory condi-tions referrible to an inflammatory condi-tion of it; for even when they beheld great forchead, and about the epigantic region; debility, wavering sight, west pulse, quick breathing, petrohim, viblens, eachymose, put, with some of fulness in the eyes, and they also found insomibility of the extre-mitles, pain in the forehead, timing on restlement, tossing motion, and rolling of hum, some, hiscough, clearly pointing out mesos, witheres, and cocacionally as inthe issuants distribution of nervous inflammation of the eyes; impatience of light
fluores, and the polar yet taill how he who had be ching in the point; coldrage of the extrethrough the transmels of their education, mitten; dark furred state of the tongue;
trusting to their own montal recourses, and mesos, vomiting, continuous, and great

when medical aid was not immediately line apericusts with digitalia, and restrained presented, delirium aspervened, said the dispersion of the inordinate re-action by the reiterated ease became more unusuangeable and dusplession of cold. This plan of treatment gerous. It appeared to me, that the more wholest ones might have been designated was reading, complete by apericust, rigid menting the case of this nature which came under the sub-register of the case of this nature which came under distirum, register of the case of this nature which came under the sub-register of the case of this nature which came under Schrium, great stupor, and come, the sub-states of the brain was most probably the sent of the disease; these, I also observed, white more seldom arrested in their pro-gress than those in which the symptoms gissa than those in which the symptoms illustration of which I will subjoin. I was were shore violent and alarming; and, indeed, the machicles which they occasioned, Common. I found her complaining of a were also more decided and general. Thus, sometimes, extreme debility, partial parapass, the stack of fever. It is, I conceive, quite in secondance with analogy, to suppose that is difference in the diseased atructures, occasions a difference, both in the type and neck, and had; there was emphasses; the sain was dry and tense, particularly about the hreast, of the disease; as inflammation of deafness, deep and jaterrapited sighing, of the serous membranes, will always progreat tendency to come, transfer of the disease; as inflammation of pochondria, and great irritability of the two glanduler or parenchymatous organs. Thus, mach. After one coploss bleeding, and the sminishmention of the pleurs, will produce application of a few leedbes, I found great masks more pain, fever, and excitement, advantage in blistering the sape of the throughout the system; the disease will be seek, and in the administration of calonel throughout the system; the disease will be lack, and in the administration of colored more acute, the symptoms more inteuse, incode antimony, then when the parenchymatous structure of the lang is the seat of the disease; although, fever, was one of this character; the subset of the beautiful of the sease of the lang is the seat of the disease; although, fever, was one of this character; the subset of the much dyspion, cough, and fever, and considerable danger, to the patient, if disease, and then, of course, only a palmost immediately and decisively arreated; listing treatment could be adopted; and but the progress is certainly more rapid when the serious membrane is the subject of fectual. She had been such a simulated when the serious membrane is the subject of fectual. She had been such a simulated with wine and brandy when I saw her, her the inflammation.

pression, was tight, and constricted to as queet hiscough; also become covered with issupportable degrae; the sense of hearing petechim, and died. I regret exceedingly was pretermaturally quick, and axtremely districted by the constraint of the case; but it tumeltscope; the body was intensely agi- sannot rainin from remerking, that, even taked by every pulsation, and the throbbing in this case, where the body was nearly in a of the heart was visible through the clothes; state of puridity before death, and in a the skin was het and dry, the tongue perch- from, not, by any means, well ventileted, and brown; and the entire aspect indiance of great distress. I bied her twice affected with the fever.

fatter of the breath. The urine was scanty, very conjoint during the night, I covered and the thirst continued, and insatiable, the forehead with leaches, administered samy care, I pursued the same plan of treat-

much, and invariably with the same success. In other class of this fever, I found a considerable variety in the symptoms; on illustration of which I will aubjoin. I was

with wine and brandy when I saw her, her Dr. Bretonneau, in his work on fover, pulse was quiet and stail, sink had dishas related two instances of this severe treasing headneh, noise is the ears, throbeharacter of fever, in which, after a few bing at the temples; her countenance was acute hydrocephalus took place,—strabis—seas, and was frequently in a state of delimus, dilatation of the pupil, &c.—fatal terrium; the tengue was conted with a thick mination. But, to return to an account of hown fur, there was parched blackness of the Sydenham epidemie. I was called, late the lips, and feetid sorden about the teeth; at hight, to the lady of a clergyman, who the skin was hot and dry, and the thirst inhad been indisposed a few days, but who cessant; the stools were dark-coloured, and was then most alarmingly ill. She consistency of extremely offensive; the extremition were plained of exerciating pain in the head; cold, distribute came ou, the urine and stools here eyes were infamed, and impatlost of passed involaterly, constant dell'inten, difficult for head, according to her own ax- scalt deglotition, laborious respiration, frepression, was tight, and constricted to as quent negarition, issorious respiration, fre-isospoputable decree: the asset of hearing terraching the became covered with

There also appeared to be sancthar variety, tion, the source of much annoyance and of this fever, which I cannot believe describe juritation in this disease. Of the viriage than by the narration of a case, as in the of digitalis, calomel, and antimoey, it would former instances. William Gales, of Sydenham, was seized, quite auddenly, with pain in the head, great giddiness, sed an apoplectic iesensibility; the extramities were quite cold; he lay as if stunned, sed labouring under a vicient concession of the braiu; hin atomach rejected its contents; the breathlag was stertorous; the skin was bold, and bedewed with a clausey perspirbold, and bedewed with a clammy perspir-ation; the countenance was livid, dejected, and exhibited the marks of great anxiety and distress. After bringing about re-ac-tion, by means of hot subseless abilied to the extremitias and abdomen, and the adminitration of a small quentity of atimulus, the disease was effectually subdued by bleeding copiously, lecebing bistoring purgies, and calomel and antimory.

Having enderworth to give you a faint outline of this feres, I will inform you of the treatment and result. Of 45 patients that I attended with it, 26 I bled twice, besides having had recourse to lecelies, the number of which I applied according to tha necessity of the case; 12 I bled ouce, ga-nerally copicusly; the remaining seven, beieg mild eases, recovered by purging, abatternee, and rast. Of the application of cold, as a therapeutical agout, in the more violer than of favor, there can be no question, when applied with judgment, that its influence is very considerable, and highly available, in presenting returning inflam-mation. With regard to its application, a stream of sold water poured over the head, until the fibe becomes quite palled, is the most effections: its good action can be kept up by any evaporating lotion. Inde-pendent of the great comfort the application of cold affords the patient, It is a powerful auxiliary in the subjugation of the fever, particularly when used after bleeding. Ie those eases in which the symptoms did not exhibit such violent marks of inflammation, cold suplication to the head did not appear so available ; blistering the nape of the neck, was attended with more advautage. However, bleeding is the grand, impostact remedy, on which, in severe cases, our chief relisece must be placed: it fresently destroys the fever at once; it invariably affords relief to the patient; it mitigates that distressing restlemeness which cannes so much irritative, subdues the velocity of the exculation, renders the skin ischuris, relieves headsch and deliriage, and twesfully restrains the extreme irritability the stamach; it shortens the duration of ever, produces tendency to repose, and re-No. 271,

be quite amerituous to speak; but of epium! remark concerning its utility. In every case in which I administered it, I found it. produced an aggravation of the fever, inatead of saducing tranquillity and repose. Independently of its decided and manifest action on the brain, the diminution or suppression of all the ecretions, renders its use very haundous, and its advantages very equivocal; indeed, in some cases of diarrhea, where I was compelled to employ it, in the declice of fever, it produced such great eerobral derangemant, as to oblige me te discontinue it, although with reluctance, there being no effectual aubstitute in obstinate purgieg. " Probat, ab usu bnjus re-medii (opii) diuturniore, organa chylopolesi et sanguificationi inservientia, adee debilitari posse, nt officiis suis imparia reddantur. Experimenta Alstoni onium circuitum ie vasis minimia, priesquam in majeribus, cohibere probact. Secretiones cobibet; alvum constiput.

I am fearful that I should occupy too much of your valuable Journal, if I extended my observations to any greater leegth; but I encect conclude, without conveying to you my bumble tribute of thanks, for the important sarvices rendered to the medical prefession and to the public, and to the cause of humanity, by your great and newearying exertions in the diffusion of keowledge. You ere said to be too severe ! that you would effect more good, if you were to use the rod more aparingly. This is the senseless howl of envy end prejudice. It is impossible, when the health end lives of our fellow-creatures are at atake, that investigation can be too minute, or inquiry too rigid. A siegle mistake in the trestment of disease, mey prove a fatel one. Your success is too well established, to labour under any opprehension, that those who dread your talent possess the power to prevent its exercise. The first part of the eagle's flight is the most difficult; he rises heavily from the ground, but, when once floating in middle air, he cuts the thinning atmosphere in easier course, and, with untired wing, soors upward to the beams of day. Knowledge is power; and its dissemination meat conduce to the advantage and happiness of mankind.

Again spologising for my long intrusions I have the heapur to remain

> Your obedient humble servant, THOS. ROLPH.

Sydsobam, Kent, Oct. 15, 1828.

# THE LANCET.

London, Saturday, November 15, 1828.

Unous by the repeated solicitations of numerous Correspondents, we were at some pains, e abort time back, to learn in what light the University of London would be regarded by the Universities of Scotland; and heving, in the course of our inquiry, epplied to Mr. Hoenen, the Warden, that gentleman stated, without besitation or qualification, that the Universities of Scotland would not recognise the certificates of the London University, as qualifications for the diploma, because the latter institution had no ROYAL CHARTES. This fact was communicated to the public in No. 262 of THE LANCET, and was afterwards copied, from this Journal, into a large majority of the London and country newspapers. The managers of the University of Edinburgh are evidently annoyed at the extensive diffusion of a piece of intelligence which must brand them with no small portion of disgrace, and, with a view to remove the stigms which attaches to their character, have published the following REPUTATION of the alleged calumoy :-

" A paragraph having lately appeared in several of the London and country newspapers, atating, that the University of Edio-burgh bad passed a resolution, that they would not receive the Certificates of the Medical Professors of the University of London, because it has not a Itoyal Charter, we have authority to atate, that the University of Edinburgh have not passed any such reaclution. The certificates of the Professors of the University of London, will have equal enusideration with those of any of the Lectorers at the London Hospitals. By the Statutu solennia da Doctoratus in Medicina Gradu in Academia Edinburgena, no certi-Acates of attendance on Lectures are raceived, unless these have been delivered in an University which grants the Medical Degree. But these Statuta have been in force many years. By the same Statute, four years attendance upon the Lectures in

the University, are necessary to qualify for aramination; but students from any of the great London Hospitals are allowed to graduate after three years of University study, and the same privilege will attach to the students of the University of London. We have suthority for this attacement, as far as the University of Edinburgh is concerned, and we believe that the other Universities of Scutland ere equally lacepsale of so naworthy a proceeding, as that of taking any step in opplastion to the University of London.

A first glance will convince the intelligent readar that this is a more shuffle,-a despicable quibble, and is, in fact, any thing but a refutation of our former statement. Wa said, that " the certificetes of the London University would not be received, for the diplome, by the Scotch Universities." And what is the answer? " The certificates of the Professors of the University of London, will have equal consideration with those of any of the Lecturers at the Landon Hemitals;" and further, " students from any of the great London hospitals are ellowed to graduate, after three years of University (Ediuburgh) study." We are also informed, that, "by the STATUTA, no cartificates of ottendance on lectures are received, naless these have been dalivared in an University which grants the medical degree." Hence, as medical degrees are granted at Dublio, Glasgow, Aberdeen, and St. Andrew's! certificates from these Universities are received, but not from the University of LONDON, because it meither confers medical degrees, nor has it that literary appendagea royal charter. Besidea, say the liberal Seotchmen, our statuta " bave been in force many years \* \* a and we ore incapable of taking any step in opposition to the University of London."

If the Statuta have been in force many yeers, the more imperative is the demand for their revision. The Londoo University was not established when they were first framed, consequently it could not be recognised; but surely it has a naim to aqual privileges with those of St. Andrew's and

Aherdeen! The University of Edinburgh of profits unjustly sequired, and protect will " take no stap" against that of London. This may be, for, in her present position, she presses with all her might un the infant institution, which might obtain frea dom from a single muvement.

Thu refusal of the certificates of the Londan University by the Universities of Scotland, discloses another of those saomalies in the laws respecting medical education, which are gradually coming to light by the operation of the system. Virtually, the new London School is an university; legally, it seems, it is unt an university. It has, for instance, Professors of all the medical sciences taught in the chartered colleges; but it has nu charter, and, consequently, its lectures, however excellent and instructive, cannot be received for the diploma by the schools of the North. The line of distinction attempted to be drawn and acted upon in this case is most illiberal, mischievous, and abaurd. While Professor Pattison lectured on the banks of the Clyde, the information which he communicated was deemed an indispensable sixth of the legitimate knowledge of a doctor; but it would appear, that on the banks of the Thames, he has lost all power of communicating instruction, and that knowledge which he could once convey, is now reduced to a nullity in the college calculations of his former sesociates in the University of Glangew. We are not, of course, surprised that the Edinburgh sonate have refused to make any elteration in their Statute in fevour of the new institution, for in this decision they have only acted with their accustomed consistency, in protecting their nwn interests in direct opposition to the best interests of mankind. Had they accepted the certificates of the London College, few, if suy, English atudents would in future visit Scotland, and thus their certificate monopoly would, at least, have been destroyed. The formight and illiberality of the Scottish managers may, for a while, secure to them a continuance

them from the superior advantages of theirinfant, yet powerful rival. The Univer-BITY of LONDON is established on a solid foundation : it has commenced under the beat auspices, and will flourish, although the certificates of its Professors may not be received as testimonishs of qualification for worthless Scotch diplomas.

We have reason to believe that the Council of the intended King's College have abandoned their schema of forming a Medical School. This will be a fatal blow to the sanguine hopes entertained by the medical geniuses of St. Georgu's Hespital, who have atruggled, night and day, to get the new building erected near that unpolluted fountain of " Sound Chirargical." The " eminent" put down his name for a good round num, which secured him a seet in the Council: but, with that body, a head is doomed of much greater consequence : hence he has little or an influence.

THE Committee of Governors at St. Thomas's Hospital have at length resolved, that a Surgeon and a Physician shall visit the nationts in the wards daily. How many centuries had the Hospital existed hefore even this act of justice was conceded to the poor patients! We trust that the pupils will derive benefit from the arrangement; they, for years, have been paying heavily for pramised information, which was not communicated.

A vacance has occurred, in the nince of Physician to St. George's Hospital, in consequence of the death of Dr. PRANSON.

# BIOGRAPHY.

#### CHARLES TUCKER, MIQ.

Charles Tacker, Esq. atuff-surgeon.—This duction of the ergasiline lens, siter heing gentleman had collected a rich museum of extracted, I was led to try the caperiment, antiques; which, among other curiosities, Tho result I now send you, and, should contained an ancient arrow-head, found by you deem it worthy a place in Tux Lax-Lord Byron on the plains of Marathon, and brought from Indy many heautiful pieces of scalptare of Cauova's workunnship. Of these, one was the Platean, intended by Rapoleon as a present to Maria Louiss, Caper of the complete of Japiter and Apollo, and various other elegant designs. Also, he had a nost odmira-ivision with the eye. I remain, yours, &c. gant designs. Also, he had a most odmira vision with the eye. I remain, years, &c. hie museum of was models, exhibiting a . Sir, if you please.

Mr. Lamsant resumed. If the Members lishing the proceedings of the Society, he of the Society were to be bampered in this manner; if they wern not to be permitted to bring forward whatever sobject they pleased. before the Society, touching their interest as a body, he would at once takn upon him-The RIGISTRAR (interrupting again), as a body, he would st once take upon him-Then you have an right to bring that for self the responsibility of calling a general meeting, to inquire into the necessity of The Paterorat (midressing the Regis- re-organizing the Institution. He felt there ter!. Sir, I request that you will be was a disposition, on the part of some of silent. I sholl read a low to the Society, the Council, to act over the large hody of compelling you to keep more in orders members upon an aristocratic principle, but " All Members shall pay implicit obedience which he never would submit to, for he actn the President, in the execution of his koowledged no atistocracy but an arisoffice." (Heat, hear, hear.) Mr. LAURLET. The book of laws of the TRE LANCET, had commissioned bim to state Society commenced by declaring..." The to the President and Society, that he had no principal part of our knowledge must ever inclination whatever to publish, nor would he derived from comparing our own obser- he publish, a syllable of what trasspired in votions with those of others;" and yet there the Society, unless it met with the cotire had been, as he had understood, a base at spprohation of its members. Hin, of course, tempt made to prevent the diffusion of the did not mean to be understood to say, that observations made in this Society. If the Editor would pay the slightest regard such on impression went forth to the public to the objection of any two or three, or of the feelings of the Society, none could be half dozen unrow-minded members, if such more totally destructive to its prosperity could be found in the Society, to the pul-and interests; nor could it be stigmatised lishing of the reports, cod who might wall with any reprouch too great. (Hear, hear.) feel some occurs their rouseese (loughter) He appeared that evening prepared to ad exhibited in print; hut if the unjority wish-vector and maiotain the principle of the jed for publicity, the Editor would continue liborty of the medical press. But for the jo give the reports in the faithful and contypy publication that had already gone forth of pacful manner he had done; and bo (Mr. the proceedings of the Society, the Iuntitu-tioe, le all probability, would have long, half of the Medical Press at largn, the ore now, bece wrapped in its shroud; and it Society's declaration of a perfect right to had pained him, ie no small degree, to find enter the room at any period the medical

men not being at liberty to introduce their high spon it; but he really could not find friends at the last meeting, was one greatly there was any solid shields to the bedeprecated, instances as it was any solid shields. to be deprecated, joanmuch as it was directly opposed to all existing law. The conduct of the last meeting was a sufficient reason for protracting the debote of this evening.

Mr. Procros objected to the term Mr. Lambert had used, " hole and coroer." " Hole and norner mer " imported a faction -a party, and which was not to be found in that Society. His only objection to publishing the reports was, that they had not, in all instances, been fairly reported. [ I'he speaker, however, on heing pressed, was

inecouracy.]

the Society, really believed that the notion the tenorts, just as the Society pleased, of there being an objection an the part of He (the President) thought he might now say one individual member to the reports safely declars it to be the opinion of the being fairly published, was a gratuitous as Society, that there was no objection what sumption. If it was an notice assumption, ever existing to the system of reporting. the discussion of this avroing had been

ble to any part of the Society.

(Cries of hear, hear.)

Mr. Salmon was an advocate for the liberty of the press. If a discovery, or new subject, presented itself to his mind, by which ha thought both the community and himself might be benefited, about the very first thing he abould do would be to datail it to this Society, if he beliaved the medical log. (Laoghter.)

press would lay hold of it.

was an objection on the part of the Society porting.

A MEMBER took the liberty of saying' that in thought the evening had been frit-tered away lo discussing that which was private, and in talking nonsease, by which means he had been prevented bringing forward something exceedingly interesting.

The Passurer was prepared to bear teatimony to the perfect accuracy with which the reports had been made in I'me Lancer; and he thought great credit was due to the unable to bring forward a single instance of Editor for coming forward, through Mr. Lumbert, to make the kind sud candid atoto-Dr. Williams, who felt second to no ment he had done, namely, that he was man in zeal for the hocour sod dignity of willing either to costinue or discontinuo the teports, just as the Society pleased.

the discussion of this aveolog had been Mr. Launear said, he was sure his altogether premature. He attended priced friend, Mr. Wakley, would be glad to hear, to the term a hole and corner, as application and this declaration, but that this members had rejected any thing in the cha-Mr. Wallen observed, that the amump restor of " hole and corner meo" being tion was not gratuitous, oor was it confined applied to them. Mr. Benkorne's observa-to Mr. Lambert. He unhesitatingly de- thous only demonstrated to persons of comclared, that he had witnessed objections mon istelligence, how ignorant he was of made to the poblication of the proceedings; the system of reporting, or of the manner and it was due to the Society, now that the in which editors would consent to have subject was brought openly and fully before their moterials brought to them. The meit, for its members to come forward and dical press had done more for this Suriety wipe off the reprosed, by showing, in the than any thing class passibly could have most decided manner, that so far from there done; it had made it known far ond wide; being an objection to poblishing the rac it had brought a great unmher of membera ports of its proceedings, if it were (as he to it; and, without its continuing to nofirmly believed) put to the vote whether the tire the proceedings, the majority of those members would have them published or not, members would almost entirely abandon it would be carried by at least four to one it, and he binnelf would never set his foot withle its walls.

Dr. Strwart concluded the business by an amusing suggestion. If there should be any person found dispused to object to the publishing of the reports, let the caus lie on that individual, of eatling a general meet-

Mr. Fizzu declared, he did not believe Mr. Birnaanna coold not suppose there there was any objection whatever to re-

direct contradiction to what had been stated

ing that accuracy, and also as a just remu-meration to the Registrar, As ought to be vant of the Society should be permitted to appointed to furnish the reports, and through beard the fellows of the Institution at his to the press. (Hissing, and crice of no, no.) question would be, whether such sereat Mr. Tawrron said, if the subject was to ought to be suffered to remain in office any be proceeded further, in his opinion it longer. (Hear, hear!)

Mr. Annanuar produced a patient, to abow that an union of a fracture of the neck of the thigh bons had been effected, in the most perfect manuer, by his mode of treatmeot. He could not state exactly, whether the fracture was within the capsule or out : he was inclined to think it was. It was almost impossible to detect the slightest limp when the mea walked. By the finest measurement, however, the limb could be found to be about a quarter of an inch shorter than the other. Mr. Ameabury consented that any member abould be at liberty to put some questions to him, rs-specting this case, at the next meeting, the Society's time having been now eshausted.

CONFERSION OF A REMOMETRATOR.

# To the Editor of Tun Lancer.

Str,-I have watched with considerable interest the attempts you have made to rec-tify those orrors and abuses in the medical profession, which, hefore your valuable hebdomsdary first attracted the notice of

potaries has shown how acverely your fiagellations have been felt.

But, Sir, all is cot yet accomplished; and as you have begue the good work, you must

ent flinch from completing it.

The system of electing instructors for those young mee who are to be sent forth into the world as possessing " sound chirargical," from among men whose only qualification is that of having been sparenticed to surgeons of a hospital, must be eradicated; and The Lancer must not be used with a tremuluus hand.

The world must be shown that merit, not choice of the teachets of those who are to

Convictive must be forced upon the minds of those electors, and of those who put the A Paper, by Mr. Crook, on elective franchise ioto their bands, by Gillman, the Murderet :- one by Dr. Pipe, abowing the culpability of their conduct; en Carder, and Joshua Slade, the adur- and cases are by far the best evidence which can be adduced for the purpose,

I will, therefore, give a case in point, aed you will take the sense of the public

upoe it.

At upo of the largest and most respect-Nor, 24,-Dr. Epps on Morality, consi- able of the medical classes in the metropolia, not two tuiles frem Smithfield, me of Dec. 8.—Dr. Wright,
Dec. 22.—Mr. Maugham on Hamlet.
Order of Council.—Vicitara must be ad- pupils, that "he had on mathematical head,"
mitted by personal introduction, or by and that he was "utterly unacquainted with the laws of optics," and presumed that

those whom he addressed were as " igno-| provad to be nothing more than inflammarant of them as himself."

This statement by a man who is naturally regarded by his anditors as an embryo hosital surgeon, was made with the most unblushing assurance, and appeared to be rather a boast than an apology.

Were a man of the most undoubted genlus and research to have made an admin tentifying a tythe of the indifference to any single subject, connected in the most remote dogreo with what he ought to he acquainted with, all men of any proper feeling would have been shocked at his callousnoss,

md would have pitied the weakness which could have led him into much a dilema

But, Sir, what must be the natural effect of such a brag on those to whom it was exthe more coospicuous. The lim's skin did geoms, not suffice to hide the ears of the aus.

I am, Sir,

Your most obedient servant, Efernent.

London, 25th Oct. t888.

# GLASGOW INFIRMARY.

<sup>46</sup> Док ты Кинтарі ти топ Кантаров иси ты веш та точ весу."

To the Editor of THE LANCET.

of mine, containing uo account of a sup-posed case of dislocation, which, after a ing was called by the manimous desire of very free and repeated use of the pulleys, the Glasgow augeons. By no means.

tion of the hip-joint.

Now, Sir, you must have observed that the case I gave was one which I had only ventured to suppose, and that too as occur-ring in any informary: I did not specify to what one, nor did I say if it had in reality taken place in any. What then, think you, must have been my surprise, on heiug told, (only two days after Tan Lanear had reached Glasgow) that I was charged with having acted contrary to the rules of thu Ruyal Infirmary, in reporting the case of No 5, surse, and that my application from the lofirmary had, by reason of this, been taken

into coote mplation. On belog told this terrible tole, it is scarcely necessary to add that I was in no hibited? It must lead them to think that such triding degree entertained to find, that this subjects are worse than useless as a study vile and must unpardenable of blunders,—that the attainment of them is only to be which I had quirtly omnaed myself by suplad by throwing owny time; and that if a pering to be made, (slike in any place, and man due be made a surgeon to one of the by any person; had actually here commit-chief hospitals in the world, without a teel in the Royal Informaty of Glasgow, to knowledge of the laws which govern a the lasting degree and tofuny of its llosstience with which any man, who pretends pital Surgery. And now that we are disto a liberal education, ought to be ac-causing the merita of Hospital Surgery in quainted; they, in the confloed sphere in general, I could, (were it out for raking up which they will probably move, from heing it the nakes of the dead, and causing the excluded from the possibility of cojoying wounded feelings of the hving to bleed those bonours to which the profession at snew,) tell you of tearful and of fatal helarge ought to have access, will find such morrhoges, of hadly performed and destruclarge ought to have access, will mu such morthoges, on saily performed and destructions attainments oscless and soprofitable. The tive operations, of the greatest of blunders, individual to question may try to hide and of consequent deaths; I could, in short, ignorance and assumption by an affects, reveal to you such takes of horror, said of its of the manners of the chief lecturer nurder, and of bland, as should convince in the hospital; but let him remember that hoth you and your readers, that, however, the roughness which is tolerated in a may many may fall a prey to the zushness of of undoubted talent, when assumed by one suicide, or the blood thirstiness of the whom none of those who know him regard assassin, they are but few, when compared as possessed of his office by ony other title with the number of these who yearly full than that of the election of close-minded victims to the ignurance and the careless-bigots, only makes his want of education cess, and the batchery, of bospital sur-

But to return from this digression. As 1 said, but now, my expulsion from the Infirmory was taken into contemplation; and in effect this, it was of course necessary that some efficient step abould he of oueo takeo. A meeting of medical directors of the institution was, therefore, immediately called. for the purpose of taking the matter into nerious consideration. To trauble you with the nones of those who composed this meeting, and with the individual opioions delivered on the occasion, would be ultogether useless and unnecessary. Suffice it to say, fint in this, as in most other meetings, To the Editor of THE LANCET.

SIR,—You will no doubt remember, that those who really deserve the name of honest in a late Nomber (267) of Tax Lancet, men, and those who would think it reason you were so kind as to give place to a letter if they were called by any other. It must

Nor do I believe it to have been done by | do, they will find themselves miserably disthe general wish of the medical officers then appointed, as I have siready lived by far too ufficiating in the Infirmary. Even the worthy Doctor bimself, under whose thro this ing of an ass," nr by the "babbling of a very dubious case was placed, and by whom foot." the very judicious treatment which was emplayed was prescribed, did not appear in the sffair. An doubt he was at the bottum of it, sad, perhaps, had a very active abarc, liut, to proceed. The precious characters, who proposed, I might almost say insisted mouthe. their very charitable labours proved shortlee. bave lately thought fit to take in my emarker the Boetne, loated of viewing things; cerus; I shall feel myself bound, in gratianthe same light with these gentlemanly and most honourable men, thought fit to request the for their kindness, to pay the unast unant mand most honourable men, thought fit to request here there is also allowed me, quletly and nainterruption and allowed me, quletly and nainterruption with their present day, when the term of my dressership a spired. Huw-far, then, their isbours have been crowned with success, they have a fair opportunity of judging. And I have now only to Inform them, the fit they hope to intimidate me by anything they may think fit either to say or to earnot think of localitiog Dr. Anchinelosa by thing they may think at either to say or to eannot think of iosulting Dr. Auchincian by

long, to be frightened either by the " bray-

Juhn Couper, too, of whom I have above spaken, (as one of the visiting surgeons for the coming winter,) has thought fit to give it as his vary sage upinion, that " we must through the medium of certain worthless take are not to have any literary dressers instruments, in giving still further publicity again." Now, what the man really to his own ignorance and felly, io holding meant by this wise speech of his, is, perup those who were such fools as to engage haps, somewhat doubtful. There oppears in the affair, to the just ridicale and con- to me, however, but one clear and abvinus in the affair, to the just ridicule and con- to me, however, but one clear and abvinus tempt of every sensible and reflecting man, construction of which it admits; vis., that conscious of his own ignorance and inshirty to disclurge the duties of a huspital surgeon un, the assembling of this aforementioned as he nught to do, he is soxious oot to have meeting, (in determined opposition to the any dressers under him, who being better prudent remunstrances of the gentleman to informed than himself, will be able to exwhom they applied for the purpose against pose his errors, and hald him up to deserved the proceeding,) were Juliu Couper and ridicule. Times are, in truth, come to Robert Cawsu, both of whom are come on something, when, instead of electing the to-day, as surgeons for the ensaing six most intelligent and best educated among These precious wiscacres, nu students to fill the situation of dressers, the doubt fisitered themselves that they were surgeons are compelled to search nut for the about to accomplish great things by their most ignorart, in short, for absolute fools, pretty sure of his ring me safely and suugly hility of publishing their own slame and put away. In this, however, they were disgrace. O tempora! O mores!!! It sorely disappointed; for after having coolly would, in my pointon, be much better for discussed the matter, it was decided that men of this kind, to keep out of our public nothing could be done to me, as I had noly institutions altogether; and if they feel stated those things which wees in reality connectous of their inshillty to cure the nick, true; and consequently, my axpulsion was why, for hence's sake, let them not come to entirely out of the question. There was, to kill them. It may, however, be as well for he sure, a something said about the possi- me to inform our informary surgeous, that it bility of calling me up before the managers is ant the dressers alone whom they have to of the Infirmary, and giving mas reproof '?! dresd, as I can ossure them, there are not a Plat fearing, I suppose, that a simple re- few monog their spatia, who sever having proof would not very much avail, in recall- falled, and never jutending to fill, the very ing their speature child, this proposition honourable situation of dresser, know fully was also laid saide. Finding; then, that well what is good, and what is bad, surgery, there was no chance of getting me punished and are equally as ready as any of the (formouth!) by these membs, it was proposed dressers to expose ignorance, whenever and to the surgeon, under whom I was dressing wherever it shows itself. But it is not nit the time, to dismiss me; and it was even right in me, in encreach so much in the represented to him, that he might, as a point columns of your lournal in speaking of such of daty, in take my situation from me, on a person. I will, therefore, conclude this secount of my nowarrantable and unjustifi- ambject, by informing him, that after the very shle conduct. In this attempt, however, great interest which he and Robert Cowan their very charitable labours proved shortlee, have lately thought fit to take in my cma-

comparing his practice with that of Dr. Maciachiae, I forbest entering on the task.

There have been, as you must be aware, a few cases, of a nature very nearly, if not quite, bordering on that which in diagraceful, commeelcated to you during this summer, as having occurred in our Infirmary.

I will not (lest it should injure the feeliege of any one) say under the care of which sugeon all these cases were; it is, however, het justice for me to atate, that they were all under the care of one, and that one was not Dr. Auchincioss.

It would, perhaps, be altogather ec-pardocable, to waste atther time or paper, is giving any account of Dr. Maclach-lan's attempt at clinical lectures. Of Dr. Auchineloss, however, we must speak ie a laudatory atrain. After a com laborious and increasing exertion for the good of his patients, and the interest of his pupils, be has retired, for a while, from the active duties of his office, equally esteemed and regretted by all those with whom ho was in any way connected. His anxious and unremitting attention to all the pelled to lose him.

Thua, Sir, do you see how different may bo the feelings entertained towards two iudividuals, filling exactly similar public atuatious: the one aball be doubted, distrusted, and unbeeded, on his departure; while the other shall be esteemed, confided in, and beloved by oll who are connected with him, and his loss be generally ismented. So does metit always ment with its reward,

I am, Sir,

You obedient servant.

THOMAS CARTES.

21. Collego Street, Glasgow. Nov. 1, 1828.

# PRAEMOLOGY.

# To the Editor of THE LANCEY.

S1a,-The following remarks on Phrenology, and more espacially on the so-called organ and faculty of Firmness, were written a short time since for a periodical published, during a faw weoks, ie this town; as, however, your Journal lias a very extensive cirsulation hero, and Indeed in all parts of tho country, perhaps you will favour me by printing the subjained in your columns. That you will do so I am induced to hope from the circumstance of your having already, on several occasions, admitted into the pages of The Lancer observations both for and against the doetrine of phrenology.

Birmingham, Oct. 15, 1828.

"Phrenology is a new system of philo-sophy, founded on observation and induction, and oe the ievariable laws of nuture. SPUOZUEIN.

To there be one feature by which thin patients under his care, the simost unvarying literary aspect of the present age is characsuccess of his practice, and his constant re-gard to the wants and comfurts of his pa-sense, even in the highest departments of tients, as well as the instruction and ad-reasoning and philosophy. The ingenious vancement of his pupila; his obvious desire theorem, and aniusing hypotheses, which to be understood in all his varieties of treat- atimulated the talents, and excited the litemeet; his close and happy mode of investi- rary rencour of our forefathers, are now gating disease; the value of his inductions, consigned to a well-merited oblivion; and drawn from those investigations; the solid we reflect, with a contempt only to be besia oe which all be said, and all he did, equalled by our inniference, upon the doc-were founded; the worth and frequency of trines of the universalists and nominolists— his elicical remarks; the soundness of judy—the immaterialism of Berkeley—the pre-ment which was displayed in the treatment established barmony of Leibnitz—and the of everyease under his care; and tho squaily idealism of Hume; an alchymist would be pleasing and instructive nature of his lec-tores;—have been such as to gain for him cery; and, perhaps, throughout the whole alike the confidence and esteem, as well of of herope, a single individual could not be his pupils as of his potients, and to awaken found mad enough to expect, eacept in his the sincero regret of both, ot being com- dreams, that he might discover the philosopher's atone. But, as though to dim the lustre of our ers of common sense, a sect has recently arisen, which, under the appellation of "the Phrenologists," is busily propagating absurdities derided by the wise, but from their purolty, and the resolutu quackery by which they ore accompanied. not ill-calculated to catch the ignoract and unwary. From the nature of this Journal, it will be impossible to bring forward one tithe of the objections which may be urged against phrenology; but enough, and more than enough, it is boyed, will be axhibited to show the shallowness of the reasoning by which this doctrine is supported.

Phrenology professes, by observation, to

tracs the concexioe between certain alleged davelopments of the brain, and certain mental emotions and impulses, and intellectual operations. But if it be impossible, from ed emotions of the human mind, and of deeircumataneas of ancourrollable force, to veloping the particular tests of ideas which trace this connesion, an insurmountable dif-leads to any given action, has long sluos ficulty presents Itself at the very threshold; been admitted, not only by philosophers, and although we may persevere for ever in but by the great bulk of maskind. Godconjecture, we shall not approach one step win, in his Political Justice, Book Wil, o. 6,
arearer to the proof. That this difficulty exclaims, "Who is it that, in his sober
does actually exist, a little consideration reason, will pretend to assign the motive will sufficiently demonstrato;

It is antely an objection fatal to phrenology, that any one of the various and blanded emotions by which the mind of man la liable to he agitated, may give rise to any conceivable action or train of actions. Merely from actions, therefore, it is imposaille for us to judge of the motives or emotions whence they may have aprung. The process of reasoning paraced by the phre-nologist, however, is founded upon a diffe-rent assumption. Taking it for granted that his general doctrine is correct, and that the mental affections are indicated by certain elevations of the brain, he examines a head, and finds, or imagines, or pretends, that he finds, some particular and marked development; he then makes a few superficial inquiries as to the actions of the individuals, and after assigning to these actions the mutives or emotions which he conceives the same as that of the causes of human most plausible, he forthwith, with matchless impudence, or matchless eredulity, delinnates their immutable boundaries and loca- its cause." In confirmation of the above views, let us no one particular action is significant to an instant direct our attention to a few one particular emotion, for the phrenologist of those individuals who have made the to affirm, that whenever he finds a particular greatest noise in the world, and was shall the state of the phrenologist of those individuals who have made to addit how little we know lar development of more than ordinary mag- soon be ready to admit how little we know nitude, ho also finds a particular passion in of their real motives and characters. Was eacess? The development, most certainly, Cramwell a hypocrite or an entinaisat?

Admittiog, however, for the sale of atthe above interrugatories; but surely the gument, that it is possible by a close seruman of sense will pause; "Foole rush in, tiny, to accertain the scoret springs of human conduct, it will appear, oo a reference to the list of phrenological faculties, that, in the conduct of their observations, the phrenologists themselves have fallen into the atrangest blanders. The mental apparatos with which they have furnished us, is evidently the work of their own the spinion of Helveting, and of many other; based, and not that if the Supreme Creator French philosophers of the last century, edu-of all things. Accordingly, we find that estion was all-powerful, and natural dispo-this apparatus is sometimes clums; frum its sition nothing. Here, however, they car- exams; at other times, it is inefficient from ried a dontrine, which is true in a general liascentiness. Upon a certain part of the measure, to the confines of falsehood. Dr. soull, according to the phremologists, is ni-Thomas Brown neitzes on the correct meritained a particular development, designated drom, where he says, in his Lectures on the by them the organ of firmens, and, as they Philosophy of the Human Miod. Val. ii. p. minimise, indicative of a corresponding fastly. The mere determination of the faind, evity. But had the phremologists, instead than the physical particular references. is early youth, to a particular profession or or their puerile trifling with calipers and speculative science, though it may have compasses, why attended to the workings arisen from accidental circumstances, or pa. of their own offices, nay, had they fairly reaten from accidental circumstances, or partial their own offinds; nay, had they fairly reatal persuasion only, and oot in the slight-followed out their own dectrines to their set degree from any preference or impulse legitimate axient, they must have discoverof genius at the time, is sufficient, by the ed, that such as organ could not, by possi-elements which it escone full to mingle so bility, exist, and for this plain reason, because all our complex conceptions and desires, to the corresponding faculty itself des not creat, impress for over after the intellectual cha- firmmess of cooduct (for it is no quality of racter, and to bend it, perhaps, from that the mind) can arise from m other cause opposits direction into which it would nate than the excess of our pussion, or char, of rally have turned. How much of what is passions, share some other coofficting pascommonly called genius, or at least how sino, or class of passions. The firmest of much of the secondary direction of genius, all man would consequently be be who had which marks its varieties, and gives it a but one passion to gratify, since he would specific distinctive character, depends on sterally persevers is his course without any accidents of the slightest kind, that modify mental consist, or clashing of emotions, the general tendences of suggestion by the The most vaciliating of all individuals would peculiar lirelineas which they give to certain be ha whose emotions, on all occusions, trains of thought." That the character is were precisely balanced; such an individual powerfully influenced by edocation, that would, indeed, be completely disabled from action at all. If a man were animated, in ao equal degree, by the two passions of svarice and a love of approbation, his con-duct would necessarily be highly vacillattrue character of oce of the subjects of his ing; since, according to the operation of investigation, how is he to know what por- circumstances, now the one, and then the other of these pussions, would guio a tematmees, and what portion from natural ausceptibility or capability? It will not be
would find it impossible to calculate with
decided that vanity, or the lova of approhation, for instance, if forming the groundtion, for instance, if forming the groundtion. But if one of these emotions were

vent to his justicus hate of Cassie, as he is restrained by no feeling of love towards him, for the consideration of Messrs. Vincent he calaims, with savage firmages, " Had in a survence should have the effect of in a may live as he has hairs, my great extracting from them citical lectures, I revenge had stomach for them all." Bet trust this will have the additional advanvent to his justicus bate of Cassie, as he is ; when he meditates the murder of his belaved wife, of her " in whom he had garnered up his hopes," his soul is torn with conflicting omotions, end he ceclaims, every word marking judecision, " But than lago old lego, the pity of it, the pity of it, lage!" And even wime he et last dantroys her, it is because his jealousy, e stranga compound of various simple passions, triumpha over the atrong auggestions of love; but still his vacillation is apparent in every word and ection. " ils would not near that whiter skin of here thee snow, and smooth as monamental alabaster;" eed " he kissed her, ere he killed her, killing himself to die upon e kias.

From the chove observations, all exprejudiced minds, it is hoped, will be ready to admit that the evidency in fevour of the phrenological doctrines is, from the very nature of things, deplotably inselficient, and that the metaphysics of this woold be actence are taken up on the most superficial exemination, and have no reference to the

principles of our sommon patiers.

CLINICAL LECTURES AT ST. SARTEGLOMET'S.

To the Editor of I'm LANCET.

Stn,-Of ell the various modes of conveying information to the pupil, there is vertamly none which ranks so deservedly high, as that of giving clinical lectures; this practice has been partially adopted by Mr. Earle, at St. Bertholomew's Hospital, bet, I em sorry to inform you, not to the equal eccommodation of all the classes, since the hour chosen on the Friday evening, is that on which the surgical lecteres have been delivared at this achool for tha last three years : Mr. E. has had this circumstance duly explained to him by one of my felluw pupils, sed was klud enough to give it consideration, but, as stated in one of his ashsequent lectures, without any possible chance of removing the evil, from the fact of every other hour in the week being occupied. Now if Mr. E. would conducted to consult soms evening with the assembled pupils on this subject, I think there would not be mech difficulty is fixing on some other hoer, duite as coeveniest to the different clauses, eed also to himself, as that on which he from many of the pupils.—En. L.] now lectures."

Phare count be much harm in pro-day, Thursd posing for consideration, Monday or Wed-seven, r. s.,

tage of equaing them to take into consideration, the convanience of all the clames, so that if they are oblignd to lose the valuable lectures of Mr. Earla, they may not elso lose those of Mesers, Lawrence and Vincent.

Hoping you will give admission to this letter, I remain, Sir.

Your obedient servant, AN ALBORDOATE STREET PUPIL 59, Alderngate Street. Mov. 3, 1828.

THEFTS IN THE DISSECTING-BOOM OF ST. BARTHOLOMOW'S HOSPITAL!

# To the Editor of Tue LANCET.

Sin,-I can no longer refrain from expusing, through the medium of your spirited Journal, the infamous and dishonest practices which are now become so frequent at this Hespital. Would you believe, Sir, that men aspiring to the appellation of gen-tlemen, can so far diagraca themselves, as to rob their fellow stadents of dissecting instruments, praparations, or whetever may chanco to lay is their way; sech, however, is an every-day occurrence, notwithstanding the efforts of the Demonstrator to discover the thieves. An application of your useful instrument will, however, I trust, induce those individuals to reform, especially if their names he mada pohiic, which will not be so difficult as they may imagine, as atrong and well-founded suspicious are entertained.

Amidst the numerous abeses which you have corrected, to the greet and leating beneat of the whole profession, I trust this will not be thought unworthy of your equice.

I have the honour to remain, Sir, Your most obedient servant, A STUDENT.

St. Barthelomew's Hospital, Nov. 8, 1828.

[A Hos Street afficer, will, we fear, be the only effected remedy for the evils complained of in the chove letter. Communi-cations of a similar nature have reached us

## SIRMIFGUAM TOWN INFIRMARY.

# To the Editor of THE LANCET.

Sra,-Knawing your readmens at all times to some forward on the behalf of the aggrisved medical pupil, and to aradicate, if possible; thu " hole-and-corner " workings which are too frequently found in public in stitutions, I trust you will, on this occasion, give publicity to the following facts in the pages of your praiseworthy Journal, which has doubtless tended greatly towards bringing the profession to its present improved state. I need scarcely add, that a little of your antiphlogistic treatment would be of infinite service to the Miratin ham Tour Informary. You must first know, Sir, we have six surgeons and a house apomecas; to this institution. From the great number of patients admitted, it would ive field for the cultivation of puthology, were it not for the secret manner in which the post-mortem examinations are conducted, arising, in some degree, from the neglect of duty in the surgenns, but princi-pally from the ARXIOUS DESIGN OF the HOTER APOTHECABY to gain medical information, or what is still mure probable, (as I am creditably informed,) a series of "marbid spicinina." I ought, however, to state, in justice to Mr. Cox and Mr. Baynham, (twn of the surgeons,) that they suamine their own patients in the presence of their own pupils, and I have occasionally witnessed, with a great deal of pleasure, the former invite many other pupils; but the other surgeons, in gratitude in the house spothecary for frequently attending to their out patients, allow him the sole privilegs of examining their deceased, thus leaving it entirely at his uption, whether or not the pupils shall be present. I would ask, Mr. Editor, are they present? No! for they are never informed at what knor the examinations will take place. The impropriety of this proceeding must be evident, when it is known, that the pupils pay premiums counderably increased, from the expectation of deriving greater advan-tages from this valuable institution. I would earneatly recommend the aurgeons not in leave the post-mortem examinations in the "apicimin" collector, but conduct them themselves, in a more liberal manner, i. e., in the presence of all the Infirmary papile; and, above all, not to forget giving them that necessary information, which certainly they have a right to expect. At present, I am sorry in any, "Ndoon the Suese," though by early noticing this, you may, perhaps, cause that apredy reform which is so ardently wished for by Your obedient acresnt.

AAufiros.

LECTURA V

Formation.

Ir we examine the uterus of o rabbit immediately after the process of conception is completed, -that is, at the and of the eight-and-forty hours, - we can scarcely discover there any traces of the radiments but if we wait for a few hours longer, and examine again, we shall then, according to llaighton, detect portions of the radimental matter lying on the surface of the womh, and which, in their number, are found genetally to currespond with the number of Grindau veniclea which have giren way in the ovaries. Pausing for a few hours longer, and then, in another rabbit, making further examination, we now perceive that these little portions of matter have begun tn model themselves into something of an ovifirm abane : each oviform molecule conalating of its swn parts; the one a membrane, a little smicle; the other, the material which this reside, or little membrase, contains. Generation advancing, it is found, aveo from observations in the human ovum. that the contents of this delicate eval are erpainting themselves into at least two parts more; the one constating of a lymphy water, which niterwards prores to be the liquer amnii, and which, at this time, is very small in quantity, not exceeding a few drope; the other composed of an opaque corpuscula not higger than o mustard send, and which, by means of a very slender filemeet, afterwards constituting the churd, as put into connection with the eyat which contains it. Thus, then, it appears, that exist in all their perfection, and we have

very early ingestation within the first three or four weeks after intercourse, perhaps within the first two, all the essential parts of the overs are generated; the embryo, the membranea, the liquor amnii, and the chord.

Generation proceeding, the diminutive corpnection of which I was apeaking, enlarges considerably in its dimensions, and essumes a shape not dissimilar to that of a cheese-maggot. For it is remarkable, that, to the first stage of our existence, we bear no little resemblance to this contemptible grub. Leaving this image, however, to adrence towards a likeness oil-illustrious, in the course of n few days, or, rather, of m few hours, afterwards, we begin to form the eyes. These organs, if I may judge from preparations, make their appearance, laterally, at the upper part of the most depending portion of the embryo, on either side, in the form of light-brown specks; and I suppose that, about the same time that the eyes are produced, the other internal parts, an the brain, the viscers of the thorax, and abdomen, are elaborated too; neither legal nor arms being, at this time, perceivable. Formation still proceeding, the entire curpuscule of the embryo becomes separated into two parts-the head, I mean, and trunk, which are afterwards retained in connection with each other by means of a abort and rather alender structure, which afterwards composes the neck,-that fair column, the seat of dignity and grace, on which the bu-man head is erected. About this time it is, when the neck is forming, that the legs and arms begin to make their appearance in the form of budy, which husge on from the trunk, and in the further progress of generation, these budding arms and legs become clongated, and, an long time afterwards, the fingers and toes aprout forth, the embryo, soon after these small members are completed, becoming thoroughly clubotated and accomplished in all its other parts. While this formation of the embryo is proceeding, the involucia, of an much importance to our welfare while in the uteins, are becoming organised also; and, by the time that the embryo is completely elahorated, the involuers will be found to their essential atructure are very early con- even in a corpuscule amali as thine ! structed, first needed during firtal life, and,

foot rival, was alarmed by the feroeioos variously occupied, poid no ottention to the seroam of the parrot, and scanopered off in observations on which the discovery was to a great fright. Dates afferwards proved that she was in the first days of her gestation, and she aubsequently produced a good observations. many kittens; all of them were well formed, What! a small bady like the innon to act with the exception of this one, which has, as upon the buge mass of waters in the ocean? we most allow, a head in form very much rewe most allow, a head in form very much re- Lunatic! What I the great goddens of the sembling that of the bird by which abe was Ephesians—the celestial archeress, whose scared. Mr. Maurice Workman is my vou-elier for these facts; in all that is essential our heroes—whose miracles and oracles have they are, na my part, fairly stated. The astonished her votaries, and who even now headily formation of the other fetuses de-steels down to the mysterious retrest of serres especial soties; but, say what we will, latmos!—What! do you dare to assert that the coincidence is well worth recording. Particular facts of this kind I forbest to more than a huge globe of matter, the series maltiply, though the task is easy. As these coincidences are occasional only, and pertapa I can easily believe might be the spirit which rore; of course they do not demonstrate mimsted the opponents of these documensome state of the course they come the community at an immerce the oppourant at the communities, of facts, it appear that the enheidence hetween the impression on the total of the clausuring, the most shore—the ocean marked, and not unfrequent, then, in say the termed—the most after the carbon definition of the facts are well rolled—the reasons changed—the earth marked, and not unfrequent, then, in say the termed—the most off ranks vanished from marked, and not unrequent, care, in say the termed—the most of rains vanished from the establish a very carloos, the scene, and, by its mere intinsic dunsfoct in animal generatios, and their general bility, without effort, the truth privalled at bearing is to show that the two occurrences last. Our preposessions are not the criterian in relation with each other, as cause from firmth, improbability and incompating and effect. I would that the affirmative of bility may result, not from impossibility, this could be proved; we should then be in but from our ignorance of the requisite exnospession of one of the priociples of forma- planotory knowledge. All this is clear in tion. Hat then it may be asked, how can speculation, but, somehow or other, it is these thiogs be?—and how, it might once to be forgotten in practice. Doubt—oblave been said, con it be that the moon serve—infer—atil doubt, and bring the ahruld act on the waters? If, like many truth to the test of the most rigorous re-of our forefathers, we had no outlon of the moiortion. Thuth never yet shouned the bolk of our satellite; if, like them too, we light; how can she ! it is her element .-were ignorant of the principle of gravitation; But to return from thin digression: Pray if we lad no idea that matter was capable give to the profession, with rigid accoracy of attracting matter, even at remater and and well attested, facts relating to this in-placetary distances, such an action, in such portant subject. Always, where it can be a state of ignorance, must oppear incredic known, state the age of the gestation, the ble, yet, when once the necessary knowledge : obsence or presence of the feeling of burror, is communicated, the mutual attraction of and cotanenos constriction, and endeavour, the two masses of matter becomes, to a cer-tain extent, intelligible enough. Observe personal observation and inquity of the wo-here the progress of this wonderful disco-ion herself. Monstrates the progress of all formation under the eggshell. I here show

# Duration of the formative process.

With respect to the duration of the forble connexion of the two, io the way of mative process, it is well worth your notice; cause and effect, was afterwards inferred that although it is not clearly ascertoined, from the fixity of this relation. At length there seems to be no doubt that it is in all the large mass of the long lody was say, cases short. The human fictor, of such comgented and demonstrated, and the mutual plicated organization seems to be conformed attraction of matter was returned by experim the course of five or six weeks, at to the st. riments and calcolations addressed to the and the greater part of its structure is, seems or reason; and thus the doctrine, most probably, perfected in a sauch shorter which at first rough have been deemed a wild period; birds, many of there, form in the hypothesis, was not only proved but cans, course of a few days; the maggets of in-prehended. And while all this was doing, series, to the course of a few hours. There some, in the first stage of the inquiry being is nothing in the whole formative process these delicate textures -that all this elaborate and finished atructure of whiele our hodies are composed, should be formed, if, indred, thuy are really formed in generation, in the compass of same five or aix weeks, is almost beyond wonder. Now, that the foethe North of England; hut I forbear to completely and really organised. intrude, by replacing them into the myste-

which astonishes me more than the amazing in different ages through the door of life, rapidity and amazing facility with which it blake all allowance for the infinite divisible. rapidity and amount meeting with which it is accomplished; it is wonderful, indeed, to lity of matter—give due weight to the resuppose that the human atructure should be collection, that the power of the Crustor formed at all in procrention; but that all is boundless-reasember the miouteness, scarcely conceivable, of the corpuscule of the animaleuls-still, the more we refert on this doctrioe, (evolution, as it is called,) the more incredible it appears. On a point like this, in the present state of our knowledge, with respect of facts, it is, perhaps, tus is thus early perfected, in the first weeks impossible that we should obtain m absolute of geogration 1 mean, must, I think, appear conviction, yet I schnowledge I feel, in my autisfactorily enough by the preparations own mind, a persuasion almost amounting to which I have sent you round. I know conviction that in generation, there is a for-from my own observations, made with tole- mation of parts which had previously no rubly accurate data, that a firtus of three existence, and that in this process we have months, independently of its lower limbs, is not, as Swammerdam and Haller and others as long as my foreinger; and therefore it is have supposed, merely a davelopment and ant unreasonable to conclude, that a factor collargement of organs which existed before, which is not so hig as the least joiot of my but which, by causes already mentioned, little finger, cannot exceed the age of fire wern concented from our night. Uf your or six wreka. It was asserted by llippo- structures and mine, it seems to mo not vrates, that the formation of boys is acc. improbable that no parts existed some hun-complished in thirty days, and that of girls dred years ago; nor does it, lown, appear in forty, so opinion of which I have met to me impossible, that within that compass with some traces in the popular sayiogs of of time all the parts of our body have been

rica of the Bona Dea. The opinious of Hip : living parts do possess an organizing power; pocrates are, many of them, grounded on whence that power arises, I do not pretend that experimental observation which forms to explain; but its existence, like that of the proper bottom of human knuwledgn; the lunar influence on the ocean, is not the and, without giving to this notion more than less certain, because, in our ignorance, wn a rery "seedemic faith," I think that it is; casonot tell in what it consists. Those who grounded upon certain observations, of which muss themselsca with the gay and mity like revords are now lost.

mythology of antiquity, must all have read Of Epigenssis and Ecolation.—By physio-, the rale of the Lyrnscau hydra; in physiology logists it has often been disputed, whether this story is, is some measure, realised, and in generation there is real formation, or the stag renews its horus, and the lubster whether these atructures are merely dero-lits claws; the lizard can reproduce its eye, loped in the process, the various organa soil the annil its head, and this repented; being already in existence before conceptor if the second head be remuved by a dextion is effected, though concealed from ob-terous head, a third will sometimes aprout servation by their amullaeas, their trans- up in its place : nor must we forget a fact, parency, and their involution in each other, an which, however, I do not lay equal stress, fluny physiologists have maintained, that I mean, that in the generation of all insects, in generation there is a real organisation, the mag; ot is converted into the fly. Now one part being formed auccessively upon in all these cases, it is very evident that the another, by a process of epigenesis, as it is living body, from whatever cause, really called; but Swaumerdam, Haller, and Spal-does posees a power of urcanising parts, laurani, seem to have maintained, that all which had no existence booke. I know, living beings were formed in little at the with respect to the butterfly and the catar-crection, and that they were merely enterpolite, it has been urged by the very labo-larged and developed in generative, but, mous and able Swammerdam, that the parts being possessed of organisation, before con- of the butterfly are custained under the akin ception is begun, there awarms of lucusts, of the emerpillar, at least about that time possible, as well as actual, were all, ac- when it is about to become curverted into cording to these speculators, enclosed to chrysalis; but setting saids for the present the usury of the first purent; and of the the proof of furmative power raken from the shouls of fulles—and of the flights of birds—transformation of insects, its existence is, I and of the innumerable multitudes, possible think, evident enough in the other cases and actual, of which our race is composed, which have bean stated, that of the seal;—all, according to this opinion, are coeval, especially; for, I preume, no goorous and old as the creation, though passing untaginist will renture to maintain, without proof, that a small has a rapository of heads | the more our wonder increases. And of

removed by the physiologist.

The existence, then, of a forming power. scems, from these facts, to be sufficiently and the mole which results from these connexious, is an animal of mixed structure. that this hybrid-organisation was in existence in the genitals, male or female, before the generative actions were excited, we reuter, impregnating with the male of one aperica the female of another aperies of the tobacco, obtained hybrids male and female, and then further, by mores of the same. obtain other hybrids of both sexes, anproximating still more nearly to the male formity with the make of the female.

up towards demonstration, that after the secomplished. union of the two parts of the genitala, this power is brought into high and extensive quently represented,-an operation essenoperation.

to supply the place of those which may be all men, the minute avatomist, well acquainted with those delicate, elaborate, and uccomplished atructures, of which the body is composed, must feel the greatest obvious; nor is proof wanting to show, that difficulty in persuading himself, that they this power is exerted in generation. For, are all really formed within the body of ant to weary you with the enumeration of the female parent in the rompass of a facta leas decisive, the day, as I have been few works. Let it be recollected, howassured, may prove prolifio with the sow, the ever, that the mystery may lie entirely in fax with the dog, and the horse with the ass. Our ignorance, and not in the nature of the The last fact is acknowledged and familiar, process itself. Remember, that the action of the moon on the ocean, so incomprehensible to those who are uninstructed, mar, to Now, nuless we suppose (and how wildly) those who possess even a moderate share of the necessary explanatory knowledge, he made, in many points, intelligible enough. Were you to tell a savage that you could must, I think, presume, as Haller, indeed, unrigate the sir, that you could explode the has udmitted, that in generation such a solid granite-that you could shut up the degree of forming power is exerted, that lightning in a buttle-that you can il, in the structure, originally simple, is made to twenty four hours, multiply copies of this assume a double and mixed character. Kell writing to the new root to be a twenty four root to be a twenty four roots as a full alike a root or large and a place of the same all alike a root or large and a place of the same all alike a root or large and a place of the same all alikes a root or large and a place of the same alike a root or large and a place of the same alike a root or large and a place of the same alike a root or large and a place of the same alike a root or large and a place of the same alike a root or large and a root of the same alike a root of the same alike and a root of the same alike a root of the same and a root of the same alike a root of the same ali and their excellencies; if he were a man of plain sense, his first resource would be to disbelieve you, or, if convinced of your remale, impregnated a female hybrid, so as to racity, he would then, most probably, atin bute in vau a superhuman power, for such miracles and prodigies must, in his ignoattracture, and at length, by repeating his rance, appear to execut the measure of operations upon three principles, he pro- mortal power-Beor ris-the gods are come duced, at last, hybrids in structure so exactly down mong men. Rager Bacon was a con-resembling the species of the male, that the jurer, Columbus was a divinity, and poor botanist himself might scarcely discover the Dr. Fauston had sold himself in the devil, difference; and there seems to be but little if you will give car to the savage ignorance doubt, that the whole process might be re- of semi-barbarians; but let him suspend his versed, so as to bring down gradually the faith a little, let him learn as he may, in plants of the male species to an exact con- the course of a few bours, the general principles and agents with which you operate, Here, theu, is an exertion of the forming and he finds, after all, that you are that power, high and extensive, diffusing its in- such a being as himself—the operation was fluence over every part of the new atruc- wunderful and toysterious, simply because ture-and what more need be proved? for the agents were not known. And thus, if we allow that in living bodies a plastic after all, it may be, may, it probably is, hi power is exerted, which may form the horns, generation. Simple in the means, magnifithe claws, the eyes, nay, even larger parts, cent in the results, such is the character of as the head itself, and this repeatedly; and those which we may call the greater operaif we allow that in generation this formation ations of the Author of Nature; and I can is really exerted on every part of structure, jessily perausde myself, that this stapendous why need we look further to understand how operation, this grand, this glorious a hiere-it is that new organisations are produced? ment of the living body, by which creation Frustra per plura. Here you have a power, jeujoya, as it were, a sempiternal youth, and whatever its nature, adequate for the pur- friend with renewed vigour under death the poses of formation; for that which will destroyer, may, after all, he simple and of produce the horns, the claws, the eyes, the casy accomplishment and that out wonder head, may form also, an doubt, the ruber reposes, not on the nature of the process, but parts of the living system; and is mule rather an our ignorance of some few and generation, you have a proof which comes simple means by which the great result is That generation really may not be as fra-

tially unintelligible, -is, I think, rendered As in the contemplation of the divinity, less improbable by various considerations; however, so here, the more we reflect for, in the first place, generation is an act

most aimple; by the polypus and the ane- pography, of electricity, of serial naviga-mone, no less than by the most cumplex tion, and the explosive powders, it depends atructuren of the creation; a consideration upon some simple principles, which the huwhich is surely worth our reflection, though man mind mny, perhaps, hereafter compre-I certainly abould not think of laying on it head. We have imitated many other of my principal stress. Again, lat us reflect on the natural operations, may we then hope tha immeasureable shundance in which to imitate this, even in the humblest manmany living germa are generated. The hu- mar? But I forbear, leat you should take it man species, it is true, is produced, as it into your hands that I expect to realisa the were, painfully, and in small number; but extravagant fietino of the novelist, and to it in not so with many very curious and bring from the stage Frankenstein, to not his complicated organizations. A sturgeon may, part in the acence a real life, at a single apavening, poor forth shown a millifere is a specimen of the transfer of the transfer of the transfer or the transfer of the transfer of the transfer or the transfer o lion and a half of eggs. Does this seem to indicate that generation is a work of effort? Here is a mosatrous chick, the rather initiation is a work of effort? Seresting, because it is formed under the 1 nm isformed, that the seeds of the filix egg-shell. may amount to many myrisda in each flower. Here is a monater of very rare occur-loses this, again, sensi to indicate that for rence. We meet, in life, with many who multitudinous and innumerable ahundance, a npecimen of this I here show you. that, were thay to be perfected, air, earth, sea could not contain them, is it reason that monstrosity is early formation; as able to conclude, that, in this matem of induced we cloud expect it to be, that is, things, formation is complex and psinful? before epigenesis; is other words, the for-When the world is choked with books, we matire process is completed. This consi-msy be pretty certain, that to form their deration renders tha reported effects of characters is rasy; and, areing this innu- mental impressions less credible; it is, inmerable multitude of germs we may, I think, deed, difficult to conceive of their opernsafely reat assured, that, had their formn- tion, after the formation has once been pertion been one of effort, their number would focted; and yet, I think, the impressions have been diminished; and, by means of have been made on the mind later, after parental instincts, and other means, greater formation must be supposed to have been security would have been obtained for the effected, in most recorded cases of this perfecting those few germs which the living kind. body had, with much labour, produced.

Them is yet a third argument, which, I think, strongthens my thesis, the simplieity and ease of generation; and that is taken from the grent rapidity with which the living atructures are formed. The human atzucture itself, perhaps, of all others, the most clahorata in all its essentials, is perfunted in the brief space of a few weeks. Of birds there are many; and I may give the common fon l, as nu instance of which, the principal structures become organized sequenes of ague, affected with a swelling in the compans of a few days. And, as to in the left hypochondriuo, which, after over the eggs laid by insects, as, for lastance, exertion, and several excemes io diet, contuc common large blue fly, I have myself aiderably increased in size, and became very known them to become living in the course painful. Dr. Glicans, of Tarent, whom this of n few bours afterwards; so that, without patient coundted, found a well-marked ease rising higher luto the regions of siry and of aplentis, for which he employed large giddy speculation, when I reflect on the hlerding, leeches, purgntives, and tartsgroup specusion, when I reject on the interdisk, feeches, purgitives, and tartisaministicity of nome of these structures by rised antimony. In spita of these menus, which generation is accomplished; when I the tension and tenderness sugmented; heconsider in what nhundance Nature, in the some genera of living structures, is productioned in the bads and thus seeds; when, lastly, I in the patient was very often taken with alivering the bads and thus exceeds; when, lastly, I in followed by burning heat, &c. Under the complete the work of the seed of the se that compose them are formed and deve- soften, especially at its lower part; the para-loped,—I cannot help persuading myself also somewhat subsided, and all the symp-

which may be purformed by attructures the difficult; but that, like the marvels of ty-

Mr. Dous usz read a paper upon the subthe patient had had some shivering, and ject of messles and scatistins, the object of was teverish; the pupils remained dilated, which was to have elicited from the Society, even in the atroagest light. On the next the best characteristics by which the two

discusses might be distinguished, that the jessed state of the throat. He wished to many fatal orrors which had been committing from Dr. Copland, how it was that trd, from the onn having been mistaken for the four must violent poisons so often found the other, might not be repeated, and to have the best plan of treatment loid down. He had, in the course of his practice, (having trented, and acen treated, hundreds of cases of these diseases,) witnessed junumerable futal ermra from this causa. As far as be spoke of the trestment, he recommended nne, called the untiphiocosrie! (Laughter.) This word having been repeated several times by the author, created considerable mansement throughout the Society.

Dr. Somenville would have been glad to know whether the outhor, in his very extensive practice, had given his attention to the application of cold lotions in acarlutina, and, if he had, what the effect was; also, what was the greetest diminu-ushered in with pulmonic aymptoms, and tion of temperature he had seen follow the this pressing was restrict the disease with mactice. The Doctor had abserved it follow almost to a frightful extent.

Dr. Mr. Ligan looked upon the eruptions on the skin os highly important, as well as slea, was almost invariably prevented. When the condition of the tongue, in firming a child, in a family of many more children, correct diagnosis in these maladics. In was seised with scarlatios, which was conscarlatina, the eruption appeared usually on lagious, (and the throat always became more scarlatina, the eruption appeared usually on: regious, (and the throat always became more the second or third day, ond, in messles, agreed a state of the disease having been in measles, was generally populary, and horse-shoe almped,—never many of the family, he bled freely; and, in this way, eruptions rouning into one another in clushed almost invariably prevented the pre-ters,—which is the case in scarlatina, gress of the entagion. He never hesitated in measles, the temperature of the body applying blisters, even where the eruption was blacked than in a three cash claims at the six. rose bigher than in any other condition, - | was full on the skin. much more so than in scariatins. He was averse to blistering, and agreed with the ceedingly. He had often seen blisters reuntroblogistic plan.

Dr. Guanous observed, that scarlating have caused him to make up his mind, neanmetimes preceded, sometimes followed, yet, whilst he existed to could a historia cordially agreed; and he beliaved that scarcondition of the throat. Hence the dropay that frequently followed this disease, but did not follow messles, where the er ption nl the skin was much more irritating. The quasarca, he believed, gross from un inereased action, and over-irritable condition, of the ressels, then which no condition of dropsy was mare under the control of medicine; for, in by far the greater number of cases, patients recovered. From this he concluded, thore was no connection between a diseased state of the skin and dropsy, but that the latter was cummeted with a dis-

in the human system, always attacked the throat,—namely, that of lues, smallpox, scarlatina, and messles?

Dr. CheLAND could not think Dr. Gregory in errnest, in putting such a question to him, if he had any expectation of its being answered. Such an interrogatory rejuired consideration, and he (1)r. Cop was not willing to commit himself. Dr. Gregory would have to follow Nature, in tracing many effects from given causes, and there learn. (Laughter.)

Dr. WEBSTER apoke repeatedly, but slwsys so insudibly, that he was unintelli-

Mr. Jawar, believed measles always to bu his practice was, to attack the disease with depletion generally, and, in most cases, the application of blisters. By this plan, the consumption, which often followed mea-

Mr. Nonru deprocated this practice ngsorted to, where the eruption was on the skin, but always with such effect as to and sometimes accompanied, smallpox. The such eases, lie could not bring himself to that there was a sometimes accompanied, smallpox. The such eases, lie could not bring himself to that there where that there was a connection, or aympathy, almost always death, must follow the apthat there was a constraint parts of the threat parts of the hody, and the threat, with which he the endition siluded to. The most prominent distinguishing features hetween menlatins had its rudimental seat in the throat, sles and scattatins were, that, in searlet and that the affection of the skin was merely lever, there is an efforescent appearance a symptom, or consequence, of the diseased over the body generally, yet parts of it remain without the uppearance; whereas, in measles, generally, the body presented speeks, and which never ran into an efflorescent state : these specks were never seen in scarlatina. He, with the majority of the Society, ogreed in the propriety of adopting the antiphlogistic plan.

# SKETCHES

OF THE

SURGICAL PROFESSION IN IRELAND.

No. XXY.

OPENING OF THE MEOSTAL ABSSIDE IN nraLix.

THAT portion of the medical year neually devoted in Dublia to Introductory lectures, turminates with this day. Though marked by few circumstances ilemanding especial observation, except that the number of our pupils, and the sacrtions of our professors, promise a perpetuity of that prosperous change in the affairs of our school annuunced by us last season; still wn deem even these few particulars of too much importance to deserving of record.

he proceeds to business without any refeat the close of so many years, by so respect-

abin an assembly in the scane of his early gloty, may have, in no small dagree, contributed to the manifestation of this buuyancy of demeanour, and atimulated his feelings to a more than ordinary display of their strength. ladeed, wa could evidently perceive, on his untrance, that his look assumed the axpression of that humid or lachrymal radiance of the nyn described by Homer, with which a parent is wont to ment an absent and injured child; and that his Hessian boots, in which Mr. Kirby always delivers his introductory lectures, by the volubility of their movements, seemed intent with the determination of treading in triumph over the authors of his peraccution. Nor were we deceived; Mr. Kirby having comn prepared tu proclaim the defeat of his upponents, and in paint out the present flourishing condition of his school. He accordingly indulged largely in that humble but proud attain of eloquence, uniting the pathos uf complaint with the definee of oration, which a man, who is ennacious of having pass over without commemoration. For our been injured, and is assured of victory, is so provincial dulness and insignificance, we likely to employ in an outograph of his own hold, should not deprive on of the right of outlois. At the ouset of his labours, as he making the most of our littleness: while, to journel, and dark conspiracy, originating if the great luminaries of the seat of science the jentousy of the College of Surgeons, was and of empire, it may not be uninteresting to formed to put him down; but, Antarus-like, see haw we contrive to be stupid and common place, in this distant part of the redm, quered his enteries in despite of all their as fulliver was amused with the serious efforts to put him down. Corporate hostivicities of the inhabitants of Lilliput, tility, however, was not the only give name We shall present, for their philosophic rause which he had to complain; he subsecreation, such features of last fortoight's quently became the victim of private pluncreation, such features of last fortoight's quently became the victim of private plun-proceedings as we can conveniently con- der, and had the mortification of seeing the dense within the accustomed limits of one fruits of his anatomical industry conferring of these papers, and as appear to us most colehrity on an individual to whom they slid not justly belong. The first to teach Mr. Kirby, as you must be aware, from anatonoy on the French system in Dublin, occasional illustrations of bis character in with many improvements of his own, note-Tue Lancar, is always first in the field; takers were employed by a person who was for like time and tide, he waits for no man, aslamed of attending his lectures, and the Justly relying on his own fertile resources, information thus surreptitionally obtained, was aubsequently published (there is no usu reace to the rival attractions of other thea- in mincing the matter, hy Mr. Harrison, rence to the revea accessions of other three in infinency the matter, by M. Hartson, tree simultaneously opened with his own. Professor to the College of Surgeons, in his the M. aday, the id of November, therefore, being the eighteenth anniversary of the call three is the hardship undoubtlebrated school of Peter Street, he presented himself before a numerous additory, is of a most releating disposition, and that, proof, apparently, of the success and longitude. gevity of this offspring of his talent and seemed more than repaid for the robbery gerity of this maying on its sories and secure in the control of t winter campaign, a greater elasticity of aubstance of his discuurso, and embellished, motion, or a more redundant flow of unimal as they were, in his best style of eloquence, spirits, Perhaps, too, the grateful reflection contributed in the obvious gratification of excited by seeing binself thus surrounded his audistive.

While Mr. Kirby was thus, like all lumi-

Surgeons, to whom, by an arrangement annually see compounded by mediocrity of among the professors of that institution, talent, and flavoured with those common aniong the professors of that institution, talent, and flavoured with those common the duty of delivering the first lecture essences of wit, deprived of their aroms by was assigned this season. Mr. Hartlson, frequent use, and supplied by a smattering wn confers, astonished us, as much as filterature from lying on its surface. With Mr. Kirby smused. The delivery of his just enough of invention to arrive at earilecture was one of the most extraordinary feats of memory, we ever happened to witten the control of the most extraordinary feats of memory, we ever happened to witten case. He epoks for about as hour and produce medloys of ideas and diction, numerandian, ar my other compass, to give his product medloys of ideas and diction, which, if composition were to be valued, numerandian, ar my other compass, to give his product medloys of ideas and diction, which, if composition were to be valued, numerandian, are my other compass, to give a product medloys of ideas and measier, for control of the whole discours was reputated with the job Newton, and the wit of Sir Roger de The whole discourse was repeated with the of Newton, and the wit of Sir Roger de precision of a barrel organ; not a look, Coverly—the discoveries of Sir Humphry greature, nr intonation of the voice, during Davy, and the humour of My Uucle Toby, this monderful effort, indicating the slightest justle each other fur precedence in these lapse or labour of the menary, each ward, unustand combinations of the style of senting we are sure, having here uttered precisely meat with the matter of science. Mr. in the same order it was written and com- flurrison's discourse was a masterpiece of nitted by rote. Had Mr. Harrison, we eloquence, if these models of mixed com-thunght, lived in the days of the good old position be assumed as the standards of shings of Celie Irriand, when events were joratory. With the borrowed wings of phi-preserved by tradition, he would certainly losophy he source, but the moment be laid have been worth his weight of gold as a saide his pinions, be was finundering on the "Schenssie," or living Listory in the royal carth again, and plentifully heatrewed his halls of Tara or Kinhora. Genealogies from puths with thuse figurative forms of speech, Alilesius, to the most distent ramifications which bore much the same relation to tho Militains, to the most distinct financiations, which nore much are some reason to most of this rayal anck; descriptions of battles incuments of genius as the tarnished flawers from the heisting of that awful rigual of of a milliner's window to the fresh prolitish warfare the "Crantara," or burned dilettions of an April moraing. He had branch dipped in blood, to the destruction probabily been reading, some time ago, the of an entire apri; and the glories of the introduction to the labrary of Useful Know-chare, from the first blast of the bugle to ledge, by Mr. Brougham, on the Pleasures the denth-yell of the wid-dog over the of Science; and inagined that while the dying stag, would have flowed in sa an impression of that curious paper was float-interretted narrative, even to the minutest ing in his mind, he was really composing particulars, from the lips of this Irish Tera. summething as good for the College of Surnorz, for the amusement of the I.alla Rookis; geons. It was centanly pitched on the and Abhallalis of the wigwam pulnees of same key, but wo need searcely add:— Irrland. Had the poems of Oasian, indeed, been transmitted in un through so retentive " Nam neque thords sonom reddit, quem n channel, the challenge of Dr. Johason to Macpherson, would have been a piece ni down-right impertinence; for, conveyed down through so faithful a chronicler, the uid of printing or writing would have been For, in this coincidence, the similitude an absolute superfluity. In the matter, as lended. In justice, however, to Mr. Harriwell as in the delivery of Mr. Harrison's non, we climid, perhaps, as a counterpoise lecture, a surprising power of recollection to our own criticism, observe that his lecwas manifested. To us, it appeared to have ture was most numerously attended, listened heen all derived from without-nothing to with respectful attention, applauled in from within. In our cars it sounded as the several passages, and, with many, has confused erho of multifutious injurcessons raised his character still bigher as a fluent made by extensive reading, without being talker, than it had been even before. Of cariched by one idea iledneed from original the tendency of the medical politics adinspiration. Like the paredy of the muck | ranced in the conclusion of his lecture, we ing binl, giving all the variations of the would not have apace to consider the danger sviery, but without its sweetmes or spirit; and erroneousness, if the relation in which

ERINENSIS.

1)ublie, Nov. 8th, 1828.

RICHMOND SCHOOL, DURLIN,-NR. CAR-MICHALL.

# Te the Editor of THE LANCET.

Sin,-I have just read, in the last Number of The Laster, a letter signed " Lennoz, which has given me much concern. I am sorry that your most useful and excellent parindical should have been made the velde ele of auch gross and injurious misreprescutations as those that letter contains. The impurial end independent character of your publication gives me the assurance, that you will take an early opportunity of Inserting the statement I have to offer in disgroof of them.

It has been well remarked by a celebrated writer, that to him who (like i.ennox) round, he cells on the resident pupil, who knows his company, it is not hard to be writes the prescriptions, to state should the sarcastic in a mask; and that he who wears medicines furmerly ordered in each case; it, may, like Jack the Giunt-Killer, in his and, by these means, together with the excust of darkness, do much mischief with callent practical remaths he is accustomed

to heaven, now grubbing out wonders from the day." It might fairly be concluded, the one, end next souring among the pro- from this atstement, that Mr. Carmicharl digies of the other. In one of those flights had omitted to visit the hospital on the to the stars, towards the conclusion of his Mondaya and Wednesdays of the last year lecture, we could not help contrasting his nearly that times, as we are plainly told, he position in the filmement, searching for the seldow visits it on those days. Now, Sir, sublime, with that of Professor Alciphron, what is the state of the fact? From the lat described by Mr. Moore, lu his Epicureun, of November, 1827, to the 1st of Novemwhile suspended by the brezen ring from her, 1828, Mr. Carmichael was absent from the sky, and buffetted about by all the agents the hospital, on the days mentioned, eleven f clemental strife.

times ; and, to my keowledge, on either four tiff the other introductory lecturers, the or five (and 1 believe all) of those occapresent, that they were all dresard in well- which the surgeons ester their names at cut black-coats, and acquitted themselves each visit, and which, as It lies every mornleg on the table of the extern room, where the pupils assemble, may be inspected by any one who wishes to test the truth of my essertion. It is notorious, that It is to Mr. Carmichael, the pupils of the Richmond Hospital are ledebied for the original establishment of regular attendance on the part of the surgeons. When Mr. Beltna acts for Mr. Carmichael, it is, usually, to assist in examining the extern peticals. He never goes round the words, except when Mr. Carmichael's visit in prevented by illuear, M1. Belton is a member of the College of Surgeons; he acted for some years on ro-sident pepil, or house surgeon, in the Richmond Hospital, and Is well quelified, in the uplnion, I will venture to asy, of every one but Lennox, to discherge the duties occusionally required of him.

Imbroendently of the more regular clinical lectures given by Mr. Cermichael, he is ie the habit of statiog to the class, the disgoes round his wards, particularly when atrangers are present. Its dors not, it is true, cause to be written on a label the treatment he has sampted, but, as he goes

to make at the bed-side of the patient, school may be considered, as is commonly to make at the bed-side in the patient, school may be considered, as is commonly affords all requisite information. If sur-supposed, to be a fair index to its success, geons of rank and experience are infadvant the Rielmond School has been gaining tage to an institution, it cannot be expected ground, nat only steadily, hat repidly. As they will aspend as much time an infinite regards past seasons, this is matter of fact, as their yaunger brethren, who have more known to all who know may have feel their parts of the seasons.

vidual to take the same views is his lee. Richmond School, which, he said, "had tures that he has taken in his writings. I exceeded his most sanguine expectations." did not mean to meddle with Lenuars opineer at all; but I cannot help saying, with been induced, by the advantages afforded to the same at all; but I cannot help saying, with the same at all; but I cannot help saying, with the same at all; but I cannot help saying, with the same at all; but I cannot help saying, with the same at all the same a respect to what he tells us of Mr. Carmi- them by the School and House of Industry, chacl, as a lecturer,—in the first place, that, to cuter themselves as pupils fur the ensuin my awn opinion, and of many much ing acasoo.

more competent indees, bis lectures, in 80 snuch for the "undeniable facts" of particular on stricture and venereal dis Leugox. Of his misrepresentations, but tures.

The fellowing circumstances, relation to probated. He must be the changes in the Richmond School, may possibly he secrets to Lennox; but I cau assure you they are notarious among the ather pupils, and that I have myself repeatedly heard them openly arowed by several of the Professors. Mr. Carmieliael has parted with bis share in the school to Dr. Macdonostl, lass demoustrains of the school; but has conseuted to allow his name tu remain amongst the surgical lecturers, as be will admit the class to his clinical lactures on venercal diseases,-the best, and perhaps only lectures, hy which the various local and constitutional appearances and symptoms can be made known to the pupils. Mr. Ceranchael expects no reward whatever for the instruction thus afforded them; and the writer of this letter has often where to be excelled; and, when he posses to be consciented in the avere given conserved it to be established, he would conserved it to be established, he would conserve to becture. Air. Carnichael's extention, in the quaint, hat strong language, of his time:—" lisk hole ze any nut hereafter," Had I wist —same uncomely sentence and constituted that he could be proceeded if a wyse man's mouth." imposed upon himself, as neither character uar money could be his incentive.

The last of Lenuox's facts I have to notice, is that in which he alleges, that the Dullin, Nov. 6, 1828. Richmond School is losing ground. If the increasing number of pupils attending the

leisure.

school; and I have no daubt, judging from
The assertion that Mr. Carmichasl, in present appearances, that it will have to
lecturing, teads long quatatians from his boast a larger class this winter than it has
works, is absolutely groundless. He merely yet had. Leunnz has perhaps had the saopened are of these, for also jumpase of exhibiting the delineations of venaroal cutshibiting the delineations of venaroal cutsheaving Mr. Adams, is his excellent introneons eruptions. It is natural for any indi- ductory lecture, exult in the success of the

cases, are first-rate; and, secondly, that two views can be taken. They are either the critic has cut the throat of his nwn cri- wilful and wicked standers, or he belii ved ticiam, by the well-merited preise he has them to be true. If the former be the just bestuwed on Mr. Carmichael a clinical less view, the coodact of Lennox odmits of na pulliation, and cannot he too atrongly re-

by Mr. Looke't but shell it be a sesinat that great p who was labouring to onlighten and amelia-rate minkind? We really must not cramp who was lab observations open authors and their works They should be liable to exiticism, to exposure, and even to ridicule, if their compoaltions he ridiculous.

Now if sidicule to justifiable, where it is employed to expose the true character of a literary composition, and to guide the public opinion in metters of literary taste, by how mach more is it justifiable, where its object and teedency are to motest the bealth a lives of the community.

Ar the conclusion of the Introductory Lecture delivered by Mr. Coleman, at the Rnyal Veterinary College, in the course of which the Professor had exherted the put to be different in their attendance of the demonstrations, a pupil inquired, how he could derive any benefit from demonstrations where there was no demonstrator? The Professor replied, that Mr. Sewell was the demonstrator; but, on its being stated that Mr. Sewell had disevoyed holding the office specified to him, and on some further questions being put by the same popil, with a view to accertain whether any competent and regular demonstrator was likely to be appointed, the Professor declared, that he would answer no more questions; that he considered the pupil, who had endeavoured to elicit information from him, beneath his notice; and that if the pupil was discution hed, and persisted in catechising him, he (the Professor) should take measures to expel him. This, as Sir John Brute says in the play, might be a very good answer at cross-purposes, but it scene e whimpical snewer to be given by a man in Professor Coleman's attention. A pupil pays his twenty guiness, and when he inquires how, (seeing that there is no demonstrator at the sidous? Who would have bought the works College,) he is to obtain an equivalent for

him, if he is dissettated, he shall take men, and man. Editors are, no doubt, peculiarly sures to expel him ! Sir John Brute's treat- exposed to the chances of imposition; but ment is, in point of hardship, a case in in proportion to their liability to be depoint with the treatment of the pupils at ceived, and to the necessity of reposing the Veterinary College. "A man comes confidence in the good faith of their correcto my house," save Sir John, " onto my pondents, is the baseness of sudeavouring most, lice with my wife, dishonours my to poleon the channels of public latellis family, and when I ask for a civil account gence. We cannot picture to curselves a of all this, Sir, says he, I weer a sword." more despicable miscresut, then the mon We can hardly suppose Mr. Coleman's who is capable of fabricating a piece of incoarse and menacing reply to his pupil's talligence for one Journal, and before the inquiry to here been seriously intended; link is dry with which be has perpetrated but if the Explosion meant to be jocone, we his fraud, composing for another Journal a may apply to him what Darnau said of communication, complaining of the felic-Jeremy Collier, se there is respection much hood to which his owe infamy has given horse-play in his rolllary !"

his money in instruction, the Professor tells in the ordinary transactions between mon birth.

We had some reason to doubt the genumerous of the case detailed, in the letter from Glasgow, signed "Maxwell C. Calder," in our 271st Number, p. 191; but as the letter also contained matter calculated to throw light on the disgraceful system pursued at the Glasgow Infirmary, which we know, from other sources, to be surrect, we gave insertion to the communiention. Subsequent information has confirmed one anspicious, and satisfied us that Tunopon the publicity which has been the purpose of throwing doubt on other cases, the London Medical Society, the author of reflecting discredit on the finetionaries of the week before us is well known to the the Institution is question, which have ap- profession as the inventor of an ingraious which has been fully retablished. The presumption that an greater degree of fraud Musiciosa John Hell, in treating of fracture

Observations on the Nature and Treatment of Fractures of the Upper Third of the Thigh Rone, and of Fratieres of tong standing; showing that Fractures of the Nack of the Femue, and others which occur in the upper Third of this Hone, admit of being united, so as to restore the natural powers of the Limb. without Deformity or Lameners, &c. &c. By JOHPH AMESSURY, Esq. London. T. and G. Underwood; 1028. 8ve. pp. 3t3.

the one was fabricated, and fabricated for given in this Journal to the proceedings of peared in this Journal, and the accuracy of apparatus for the treatment of fractures of shifts to which the Scotch supportors of a of the machinery in question. If Mr. or turpitude need be guarded against, than of the fewer, says, that " the subject is of itself a study," that is in " of all denotes in the most difficult of ours," and that "the machine is not yet invested by sphiols a freetured thigh home one ha puriosity secured."

It will be perceived from the title of the book, that the author limits himself to a consideration of firsteness of the upper third of the thigh bone, which he arranged under this following hends:—frectures of the recluster major, and frantures just below the trochauter minor: Bot Mr. Ameabury, at the same time that he allows the propriety of dividing fractures of the neck of the thigh into two kinds,—those which are situated within the cepsule, and those which are naternal,—contends that each of the kinds advantageously edmits of e subdivisioo. He says,—

"Those fractures which occur entirely within the synavial capsale, might be divided toto fractures witious any caneiderable baceration of the close cavetings of the acch at the bone, and into fractures accompanied with excitants accountant to the capsule might also be divided into two kinds, one of which is accompanied with little or un laceration of the investing soft parts, and the other with great laceration, or complete division at them."

Fractures at this part may also be complete or iocomplete; and these, egain, may be transverse, oblique, ar comminoted. The complete fractors of the thigh-bone, if transverse, is usually situated against the head of the bone; and if oblique, its most fraquent direction is downwards and outwards.

The subject of fracture of the carvin femoria being so highly important,—one, indeed, on which so much execution has been devoned during the last few years,—we shall, in our analysis of the passeot work, olusely follow the subdivisions of the suther, and thus carry our readers onwards with him, throughout the whole course of his reasoning, and detail of facts.

in Frantisty of the Cerule Femorie within the Congraphs, unaccomposated by any annidemble lanpairs of the investing membranes.

Of this accident the author himself has saly, seen one instance, which occurred in a patient who died from organic disease, shortly after the accident. The symptoms of the injury he states to be very obscure; the patient may be able to exert considerable power in the limb; there is but little, or no ahortening; the foot may or may not he cested; and, lastly, we may or may not be able to elicit crepitus.

" We must depend, in a great me upon the history of the case, into which washould inquire most minutely. A great is sudden diminution of power in the limb referred principally to its up pert, and occurring immediately after the infliction of an injury, of that description which abusily produces fracture of this part, must be regarded as a sympton erable importance, T ness in the joint, and some pain experies in the soft parts in the direction of the peetiness muscle, and the tendon of the pr magnus end ilisons internus, and so io the hollow behind the trochanter. patient may be able to turn the limb inward or outward; he may be able to bend it upon the pelvis, but not without pain, and a remarkable sense of weakness in the oint. The close coverings may yield so as to allow of slight eversion and slight shorten-ing of the limb. The swelling in these ing of the limb. The availing in these accidents is not likely to be great, unless the serrounding parts are much injured by ther force, which occasions That which occurs is con the blow, or oth the fracture. fined principally to the joint. When these avantous exist, we might, I think, fairly eet the existence of a fracture; but, in order to make ourselves more certale, we should examine the limb very attentively. This should be done, however, with the utmost caolism.

The fractured ends of the hone, in this socident, being held together by the perion-turn and reflected membrane, it is obvious that these are in danger of learntion, if the limb be reaghly and incentiously mered. Bending the limb open the pelvie, bearing upon it, and extending it, are therefore measures to be avoided.

The author next proposeds to a consider-

periorisad and redocted memberne, in a follow:--direction from the truchenters to the head of the butte; and a meeted plate also, to from three quarters of an inch to as inch and where the vessels taking the same course in the interior of the Muc. "The arteries which past into the ligamentum teres are tended with great distinution of the powers so extremely minute, that, as Mr. Amenbury very chriscily observes, we cannot suppose the head of the bone, under ordinary circumstances, derives any considerable neuriclement from this source. Such being the mode in which the head and mack of the bone are nontiahed, the the pelvin, but not without great palu, when effect of a complete fracture of the nucl. within the capsule will be a division of three vesiels which enter the bone on the increased when the hint is hent upon the trochanter side of the fracture, and, conacomentie, the mutation of the pelvic portien will be, to some entent, eut off .-Hence arises the important question, how for does the diminution of the quantity of direction, but not without producing pain, portion of home, influence the reparative process? The upper end of the bone, we admit, is placed under different circumstances from a freetured end of bone in other situations, external to a capsule, bet cause, in the latter eases, blood is equally distributed through each of the ends; still wa have to consider, whether oncous union in the former, is physically impossible. The resecuing employed by one sether on this subject is perfectly just; after stating that it is a general lew for fractures to unite more or less rapidly, according to the quantity of blood that supplies the parts, and Illustrating this position by the difference in the repetative process of the young and of the old, he applies the argument to the case immediately in question.

Fracture of the Carols Femorie within the Synonial Capsule, in which the coverings of the in which the head of the bone naturally re-Bone are nearly, or quite, divided .- The symp-

ation of the mode in which the parts are | seems of this accident are much mire atres nourished both before and after the unit marked then where the boundings remain dent, and he gives a plate to illustrate the asserty; or quite; eather. The characteristic manner in which the arteries ramify in the signs, enumerated by the unther, are se-

> "The retraction of the Rink is usually a half a commonly, however, in the recent. atute of the injury, it is not more than an inch. There is eversion of the foot, atiach. of the limb; the patient, however, is still able to roll it inward, so far as to bring the fact from its everted position high enough to place the limb in that position which might be called supine, or in which the half of the great toe and the superior anterior spinous process of the Hism are in a straight lies with the long axis of the body. The patient can also bend the limb a little upon the fracture is in the sevent state. He experionces pain apposite the insertion of the pains magnes and discus internes, which is palvas, especially when it is, at the same time, adducted nod joverted. The limb might be readily drawn down to its proper length, but, as soon as the entension in discontinued, it becomes again retracted; and might be passively mared in every intend of moving in a circle, is observed to roll, as It were, upon a pivot. Crepitus may generally be felt when the limb in draws down, and theu rotated, while the licad of the bone is fixed firmly to the acetabulum, by preusing upon it with the fingers over the froot of the joint.

Mr. Ameabury is of opinion, that although eversion la most common, ao one position of the foot can be regarded so so invariable attendant on fracture of the cervia femoria. He has seen and instance in which the foot was upright, and he alludes to snother where it was inverted. In respect to the cremitus, he thinks that surgeons sometimes fail to discover it. In consequence of making an imperfect axamination, omitting to draw the limb downwards, and then to rotate it while the head of the bone is fixed in the soctabulum by means of the fingers.

We have already explained the manner ceives its supply of blood, and the effect of

We endeavoured to show that in framies." nall branches of the ligamentars teres, see the author, the vessels which year along the neck, and consequently the head of the his adversaries-he has indeed hooked the probosic of the Surgical Levisthen.

Two other causes have been mentioned by Sir A. Cooper, as tending, in a miner degree, to prevent the consolidation of the fractured ends of the bone, namely, " want of proper apposition, and the absence of continued pressure." "To which," says pur author, "might be added a fourth cause. want of rest."

The enciones had a saying, " peritus in puter," but truth, in the present case, is not so deeply hid. In the "minor causes," as them from one another. they are designated, are to be found the trun reasons for non-union. that plan of treatment has been pursued, and one common effect has been observed, namely, a ligamentous, instead of a bony sminn; the in- to the capcule." ference attempted to be drawn is that nature is at fault. Freehard of the Corsts Femorie, estarted to

the cervix within the capsule, ettended invented by Mr. Januaro, of Besiton, with inceration of the close coverings; but in addition there is generally since tumefaction of the serrounding parts, and eachymosis, which rarely occur when the fracture is entirely within the synsvial membrane. Inversion of the foot is an occarional eventum.

# Fractures of the Trechanter Major.

Those are either transvarse or oblique; ther may be complicated with fracture of the cervix femorie, and occasionally fractures of the trochemics major pass through the femur so so to divide the neck of the home and the trockenter from the sheft, these two parts naining naturally contected,

# Practices just below the Treck

The upper portion of bone in this case is accommiss abdusted and best upon the polvie, in some cases to such an extent as to form nesely e right sagle with the lower portion

Before entering upon a consideration of the treatment necessary to be pursued in the various accidents proviously detailed, Mr. Amesbury concisely investigates the merits and demorits of the mechanical means usually amployed; the short splints; the fouble inclined plane; Descult's and Boyer's spperatos. The method pursued by Sir. A. Cooper, of placing a relied willow under the knee, in cases of fracture within the expeule, is very well shown, by a diagram, to have a decided tendency to separate the broken merfaces.

We could not here give an adequate written representation of the opporatus which bir. Amesbury employs in the treatment of fracsures of the upper third of the thigh. It is enough to say, that is many respects it re- be in the hands of every surgeon, insumuch sambles the fracture had of Harrold (in use | so all must have felt the difficulty of treating at St. Bartholemew's Hospital), and that by | fractures of the upper third of the thigh bose varying the angles it is adapted to most of Time, the great test of all things, will prove the secidents we have described. Both of whether the muthods recommended by Mr. these machines are, however, in our Ameabury are effectual, and if they should opinion, for inferior to the nevolvell and so prove, a most important decidersimal has

The remainder (nearly one-third) of the volume is occupied with observations on the nature and treatment of un-united fractures. The author is desidedly of opinion that the cause of non-union is, for the most part, purely local; and in confirmation or this he states, that of fifty-six cases of ageunion which he has witnessed, only four o the patients were in a bad state of health the remaining afty-two baving been robus and vigorous. Acting upon the belief that the cause of non-union did not exist in the constitution, Mr. Amosbury conceived that by exciting the action of the parts, and producing obserption of the adventitious deposit, he should effect union.

Bot, (he saye,) how were these desirable objects to he accomplished? It occurred to me, that they could not be so well effected by any other plan as by the infinence of local pressure. Strong pressure produces inflammation; and, at the same time, absorption of the parts which ere pressed upon. Pressure I could readily produce and keep up, for an indefinite period; and, ot the same time, maintain the ports in a state of quietude, by the contrivances already in my possession. I now wanted facts only to prove or disprove the validity of my remoning.

The results fully demonstrated the correctness of the reasoning, for of seventeen cases of non-union treated by the author, he succeeded with mixteen in producing consolidation of the bone. Six of these instances of non-union were of the humarus, two of the fore-arm, four of the femur, and four of the tibie.

From the copious enelysis which we have given, our readers will, of themselves, be enabled to form an estimate of the value of Mr. Amerbury's work. It will, no doubt. thus will the sixther deservatly rank as the fell's deal proggen, of rather short sta improver of his profession, and, coasequently, in the benefactor of maskind. One word of parting advice, "more in sorrow then in anger," we must give to Mr. Amesbury. Let him svoid the concombry of affixing a string of worthless titles to his name; the best are but as "sounding briss;" but we apprehend that no possible respect can be obtained, by calling himself " Consulting Surgeon" to the Royal Union Association. It would have been better nyes to have allowed the s. s. w. a. of a former volume, to remain.

# ST. BARTHOLOMEW'S HOSPITAL.

List of Patients admitted under the Care of Mr. Earle, November 6.

Haldwin's H'ard, No. 1 .- Haury Bromley, setat. 15, severe inflammation of the right considerably swollen and inflamed, knee-joint from the blow of a cricket ball.

Nn. 6.—E. K., wtat. 33, ganorriera. Lezeres' Ward, No. 1.—T. W., wtat, 20, gonorrhers, and azeoriation of the isside of both thighe.

No. 2 .- J. B., etat. 25, chancres and

gonorrham. No. 8 .- D. S., mtat. 22, bubo in the left

No. 9.-J. M., ment, 18, extensive in-flammation and awalting of the coverings of the penis, papillary aruption over the whole body.

No. 11 .- W. C., mtal. 24, onlarged glands of the right groin.

Situati's Ward, No. 11,-Mary Fuller, setat. 30, fatulo in ano.

No. 10 .- S. S., setat. 30, sore throat, bubn, and mercarial aruption over the whole body. Elizabeth's H'ord, Nn. t .- Mary Giles, metat. 26, inflammation of the right hip-

joint from a fail, No. 13.-Sarah Wheeler, mtat. 24, iafamed bursa of the right kace.

Patimer's Ward, No. 4 .- M. R., wtat, 18; No. 5 M. M., wist. 18; No. 6 E. J., wtat. 19; No. 7,-11, P., wtat, 20; No. 9. -M. II., must SG; all with gonorthes and excoriations.

PATAL CARE OF TRYSIPELAS, AND DEATH.

John Pike, mtst. 40, was admitted ou Tuesday the 4th inst, into No. 6, Heavy the require such attendance, and either them-

been supplied in a difficult branch of aurgory; | Mr. Lawrence. The patient was the boist ler and strong, and a red to here been a hard we OF, ME WI se a hard drinker. Feeling suther unwell remared himself as an out-patie before his admission as pe bier Twelve ounces of blood were taken for arm, and he fulnted. On recovering went away; teld to return again on the following day. On Tuesday he felt worse, as was admitted. His right band present WHA PARTY an erysipelatous appearance, with a spot of the back of it, as if it had received a book be was not aware of its having austaine my axternal injury. He was ordered to b bled again to sixteen or signisen ouncis; but twelvn only were taken from him by the dresser, and twenty four leather spalled to the hand and arm. He had a dress of being bied.

5. Helf-past one n'clock, he has just been visited by Mr. Lawrence. His co tenance is somewhat wild and enzious, his mental faculties becoming impethat it is difficult to get a satisfactor er impaired, so ment from him. He says that the first convenience he felt in his hand or arm w on Sunday. The head and fore-sen are dorsum of the band seems inclined to sle to the extent of shout a half-crows The erysipelas has apresd over the of the chest and abdomas. The reducthose parts, however, has somewhat a pitlary appearance; and Mr. Lawrence not made up his mind as to its exact nature. ngue brown and contod; pulse 84 full, though compressible. He is evi in a very precurious state. Ordered to b the state of the pulse, and the opening a cins to be repeated. Twelve conces n were taken from the arm in the course of the efternoon, and a date of selection ap administered. He became delici at five glock in the evening, and so outregroup that the strait weistcost had to be pat on. At seven r.u., the dresser took, as he states, ten ounces of blood from the porel artery. This, however, did not apply the board on the patient's bod, (the unquestionably the temporal entery had been npened,) the reason assigned being, that this portion of blond was taken away by him on a visit, not efficiel." A cold Intion we

" What this means may probably puzzle with it or explain. Is it, at this Bospital, My. H. in explain. Is it, at this Hospital, not to be considered the duty of the dressers to attend the patients at any and every moment the danger of their situation may Eighth's (back) Ward, under the care of selves to adopt, or instantly to send for the

hopt applied thuring the evening and night the restum, by galvanish, an well note yelec-to the head. The disease made made parting the wire upon the decrean of the tengue, green; he sens exacellarly violent through-but no good affect has, resulted; yill of east the night; he other remedies what, over water material to, and he ded athait part mining of arress all, hillard with remain of sted to, and he died at helf-s eight on the following marning, by which some extensive cloughing both of the arm d fore-ten had taken place.

Fret-merien Egeningtion

The body was exministi by Mr. Lloyd, at last past one. The Brete was unusually large, and lad all the appearance of that of a dram lithing's; it, as well as the kidneys, was firmly adherent to the adjoining parietas and peritoneum, but the adhesions were decided-ly of a chrenie meture. There was about an ounce of finid within the periordium.
The right surisks of the heart was loaded with blood, and very faccid. There was ere bleed in the several viscors, when not into, then is usually detected after death, and the vessels throughout were much dis-tended. The aracknoid membrane of the tenore. Les transmons memanages or use beries was opeque, and a small questly of bloody fluid was observed between it and the pas meter. No pus, but à considerable quantity of yallow fluid, escaped on cutting through the integaments of the diseased arms. The superficial voice of this arm seemed more hardened than natural. He evidently, for a considerable time, had inboured under a large scrotal bernia; the mic

CASE OF MEMPIE DISTOCATION BETWEEN THE FIFTH AND SIXTH CERVICAL VERTEBOR.

James Hulford, meat, 42, a thick - not cular man, was sulmitted into l'itenira's Ward, under the care of Mr. Earle, on Monday evening. November 10, at eight a clock, with an injury to the covical verteben, consequent on a fall from a cart into the street, upon his head, while engaged in levelling the grain with which the cert was louded. A depression was felt about the fifth servical vertebra, but no fracture distinguishable. There was nomplets paralysis of the upper and lower ex-spendition, difficulty of propirction, which was performed coursely by the disphragm.

14. The tries has been drawn off with the estheter, and an enema of soft soup given, but no motion has followed. The aldomen is greetly distended with fistus. Mr. Earle has endeavoured, for a considerable period, to atmulate the intestines through

surgeon, that he may have recourse to the most active treatment the circumstances tained so much injury, as in the former in-

bread into the form of pill, given in the foresten, and repeated in the affection; but still no mation. The men died in the evening.

CARE OF PHILOCATION AND PRACTURE OF THE CERVICAL VERYERRE.

John Taylor, must, 63, was admitted at seven n clock on Tuesday evening, the 11th instant, into Powali's Ward, under the care of Mr. Earle, also with violent minry su tained to the cervical vertebras by a fall into the etreet, upon his head, from a sceffolding. lis liugered till three o'clock on Thursday morning. He likewise became tympanitie, and had great difficulty in respiring. The paralyeis here was not so complete as in the former case. Enumes were resorted to, but the bowels remained unmoved. Prinpism attended both cases throughout.

# Post-mortem Examination.

This was conducted so quietly, and, at such an answel time, that we had only as opportunity of collecting the following descrip tion of eppearances from Mr. Earle's Cit-nique, on Friday evening. The first case he considered highly interesting, inasmuch as it showed a perfect instance of simple disheation, without any fracture. The dislocation was between the fifth and nixth cervical vertebræ. The calibre of the canal was diminished to about half its extent; the medulia epinalis was much bruised, and blood diffused into its substance; the membrence of the spinel marrow were uninjused; there was a rupture of the ligamentum flavum, between the dislocated vertebre. and a small portion of cartilage, at the very top of une of the oblique processes, torn off; but Mr. Earls could not suppose this eny thing like sufficient to deprive the case of the character of e simple dislocation without fracture. Mr. Lawrence met with a similar ease last year, and Mr. Easis thought, if extension of the head had been made, and reduction effected, there might have been a chance of recovery.

In the last case, there was a complete fracture, through the articular processes, of one vertebra, and an entire dislocation, without fracture, between the sixth and avcompletely turn from between the bodies of the last. The spinel canel was not so much narrowed, nor had the epinal marrow susstance.

Ann Tilling, west. 23, a necessar from the country, was admitted, October 31, into Faith ward, inder the care of Mr. Lawrence, considering of a "healt varience along on the inside of the right leg. States that, for the list is years, she has observed a bilisted vein on the inside of the leg, and hat, for a long neighd, a small dark spat, which sobsequently became the sent of the ulcer. These never troubled her, nor occasioned any pain, till about a mounts ago, when, after a hard day's washing, as the was proceedier on stairs to bed, the derk was proceeding op stairs to hed, the derk spot burst open, and a good deal of blood followed. The hamorrhage was stopped by a gentle compress and bandage. In the course of a week slie was able to resume her usual work. In suction week, the same part opeced egain, end, in the former manner, the bleeding was arrested. In the coorse of a few days subsequently, the limb having brooms inflamed out painful, two dozen of leveles were applied, and five grains of and lipe; pulse quick, but compressible; culomet, combined with julap, were odmit the countenance pule and classmy, with platered. Salivation was produced, the lucchiperspiration. This evening the future will be uncertained, and over since, greet pain dicine has been ordered to be discontinued. bites ulcerated, and, over since, great pain has been experienced when she has been in the erect position; therefore she has been pertially confined to bed. The alcer is only about the size of the disc of a shilling; and she says shout a quar of blood, io the whole, has been discharged from it.

Ordered to be bled ad 32vj, to have a breed and water positive to the leg. a doso of house medicine, and five grains of pit. bydrarg, every night,

- Nov. 1. Three grains only of the pil. bydrarg, were given last oight, which have produced salivation; it is therefore discontioued. The leg looks better, there is less heat about it, and it is free from pain.
- 2. Her mouth is very sore; bowels open; leg much the same; complains of stiffness to the right arm, from which the blood was takeo, and, indeed, says, that she felt a slight pais is it on the very evening of the day on which vecesection was performed.
- 3. The tim, from the orifice upwards, is inflamed and painful; pulse quiet, tongue furred, and she appears to be labouring unmatoms of fever. On pressure, a small quantity of fluid has couded from the ori-ace of the vein. Sixtern ouecon of blood to be taken from the other erm; the saline mixture, with e draubm of the sulphate of posts, and half a dractim of antimonial solution, avery four bours, and a bresd-andwater politice to be applied to the inflamed

- CASE OF VARICOUS OF THE RIGHT LES, i.d. In the meeting the sent was less sent in the meeting the sent was less sent in the meeting the sent was less sent in the meeting, but it is the touch, and the is described. The bows of the courty, was admitted, October 31, into state and a set of the courty. The bows is a server to the meeting of the less sent in the state of the sent of the sent of the less of the sent of the less of the sent of the less of the sent of the less of the sent o
  - 5. Has pessed a restless night ; complaint pun man guddiness in the head, with ge-seral unessiness. There is some degree of induration ground the puncture f, the infam-mation has rather obsted; there is no in-fammation, nor any sain. In the fammetion, nor my suin, in the fore-arm; tongue foul, and leaded; pulse 140. Galomal and joint, and hydrary, a streta, to it taken; the head to be abayed, and joint lotions to be kept applied to it.
  - 7. Has had, last night severe rigours. Sixteen leaches have been soulied yourse season were seen appear to the arm to day it exhibits a reliable pully eppearance, though there is no chi-cumsorbed philegenetous known. Compains of great faistness, and sinking in the stouches; the heart free from pain; the stouches; the heart free from pain; the tongue is furred, and dry, with a brow crust on the middle, sordes of the te dicine has been ordered to be disconting and five grains of Dover's nowder to be taken immediately, and every four hours.
  - B. This morning, having passed a son fortable night, felt much better. The box ols having been rather confined in the course of the day, the common selt anoma, with ten drops of laudsoom, was administered, and was followed by green and officative dejec-tions. Towards the close of the day she has complained touch of names, but has been relieved by vomiting. She has taken some broth; complaine of o little giddinges le t isen; pulse soft, and 100; the arm seems entirely free from inflammation.
  - 9. Last night was reation. Was much fatigued this forenoon, by getting op to have the bed made. Palso 100. The mouth very dry; the edges and tip of the ton meist; she has great thirst. Comple greatly of stiffoess in the arm, and inability to move it. Repeat the Dover's powder.
  - 10. Hus passed a tolerable night. Box rather rejected. Pulse 130. Feels paid perces her shoulders. Has again had rigants Perspiration over the face, with thirstinest The arm again a little hallamed, to which tru leeches are to be applied.
  - 11. The rigours have been more frequent. The chin cool and clammy. Pulse 114. Bowels have been opcoed three or four times. Discontinue the former medicine, sad take quinine every four bours.
    - 12, In the morning she had so far rallied

that some hopes of recovery were enter-tailed, but towards night them all vanish, ed. The pulse has become extremely quick and fluttering; the brein oppressed, and am nuttering; the bruin oppressed, and she can only mayor questions with diffi-culty. The fover has assumed a typhoid type. In a state nomewhat similar to this she lingured till four colonial. lingered till four o'clock, A.z., on the 14th, when the expired.

# Economation Ton Hours after Death.

. A very small branch of the tens a found to communicate with the alcer in be leg. The median basilic vein of the a infamed, and the calibre obliterated for about an inch below, and so inch and a half above, the punctore. The orifice of the puncture open. A small quantity of matter extended underneath the fascie covering the hiseps. In the vein accom-penying the brachial artery, ebeceases hed formed in verious district. panying the eranne array, encourse new spread in various situations, from which sanded small portions of pus and blood. This condition, and the information of the vein, extend up the within an inch and a baif of the axille. The internal entrocess serve, consupanying the vein, greatly soft-Serve, secondarying the veel, greatly soil; ties, there was a therapy of meter to be check size, very varieties in its substance at the wood, which fir. K. prenounced to be the sizes of portion of the veils. The braic of a feculeot kind, and the assistant sur-healthy; a small quantity of fluid in the perionic of the first cardiam, and with the exception of alight; said, that also had observed for the first said, that also had observed for the first cardiam, and with the exception of alight; said, that also had observed for the first said, that also had observed for the first cardiam, and with the exception of alight; said, that also had observed for the first said. momention of the mucous membrane of the small interlines, no other morbid ep-pearance, either in any of the veine or any part of the subject, was detected.

It is but right to state, that no blame, whatever is to be attributed to the over. There probably is not a more coal, extentive, and intelligent dresser attending the hospital than Mr. Snowlen. The lancet used, on the octation, was per-fectly clean, and in the best condition. Mr. been come in a long stated, that the gent-toms which followed the operation must have been owing to the peculiar condition of the patient. He renembered having had a heart which he prized vary highly, in consequence of its being our of the best he aver had; he bled one lady ten times with it, without the alightest ill consequence following; and immediately otherands used it, because it was his best, to open a rein in e gentleman's wem, "pe was afterwards attacked precisely at the shows patient, and also died. He had never known a use in which inflammation followed vonesection, where the patient had re-

# GUY'S HOSPITAL

CONTINUATION OF THE " NO REBUIL" CARE.

no cickness, he is the from pais in the ab-domen, except at the lower part, which is slightly tender on pressure; pulse 82 and freeble.

15. The wound is shoughy; poultions are applied. The pulse continues feeble, the bowels are open, and there is no pain of the abdomen, but it is considerably distended with fleton. Ordered to take culomel and opium at night.

14. Pulse 104 and weak; tongue forred; bowels open; abdomen tense and tender.

13 and 16. Much the same. Celomel an opium are giveo at night ; a dose of eparient medicino occasionally, and also some "juleo of ammonia."

17. On visitiog the patient to-day with Mr. Key, we found that the tension of the abdoman had completely subsided; the pulse was 94, and feeble. On removing the poultice, there was a discharge of metter from time, last evenlog, the discharge had a starcoraceous odour.

t8. Moch the same. It is the opinion of the surgeon, that alceration of the got has taken piace at the laternal ring.

### SPECIMEN OF " NEVEY'S" SUSCESY.

Edward Evans, atot. 19 of acrefulous diathesis, was admitted into Luke's Ward on the 12th of Nov. noder the care of the junior surgeon. Upon examining him on the day after admission, we found a tumour extending from the engle of the lower jaw to e short distance behind the mast oid process, elso extending upwards behind the ramus of the jaw. There was an evident facturtion in the posterior part of the tamour, When the junior surgeon (with the usual passity of pupils who accompany him.) see the patient on the 14th, he said that it was a facty or statemators temour, and that \$55 fail was fat. But failing to con-vince the pupils against the evidence of their own senies, he pacetared the sivil-ing, when a considerable quantity of pus was everated, to the no small amanenent uf the operator. "Here is a lobe," and "there is a lobe" and "here is a lobe" and "here is a lobe," were the clinical remarks of the operator, A positive was applied to the wound. OSPEDALE SANTA MARIA NUOVA, AT FLORENCE.

The unbilical cord was divided, facility." The unminous core was any monant lies placents, removed through the vagina.) The child may without any night of life. The adgree of the wound were near brought together, and kupt in this situation by five sutures; a teor was place lower sugle, is order to premote the ev tion of purulent matter; the wound covered with lint, and a uniting band After the operation, the putient was alle round and caped from the wound and ragins, and breasts swelled and became painful, the Yist, the bandage was, for the first removed; the wound had completely a except at its lower angle, from tent was now removed. During the fullowing days, the fever sheted; the alvine ascrations became regular, the patient re-covered her appetite, notwithstanding which the low diet was continued. On the 27th, the autures were withdrawn, arguinchitons inflammation began to appear near the pub but soon disappeared again. The citatrix became more comolidated; on the 8th of Jane, the patient was able to lowe her hed ; and, on the 16th, she was discharged perfeetly cured. Reportsire gladral d'An mir, åce.

upil is much more attracted and fixed; be is obliged not only to instruct, but practi-cally to exercise himself; he thus heat sequires that intropidity, without which no surgeon ought to enter into his pris career. If there is any one who this custom of our hospital, it is the profersor whe renounter the heaver, and takes ages himself the responsibility of the spereTHE BATH UNITED HOSPITAL.

- Want's to do ? hele."-Jul. C.ne. det. II. Sc. 1.

To the Editor of Tox LANCET.

Sin,—I take up my pen to address you ith considerable healtstion and reluctance, the subject being one that I would willingly seeign into other und after able hands. It is, however, a subject, which, or the high guested of justice self, humanity, demands apposition and redress. I allude to the supportion and redress. I allude to the freetenest of out-patients at the Bath United Heapitel. Scarcely a week passes without some application being made for my poofespeed assistance to individuals, when here and automatically the horse and automatical. have endeavoured, but in vein, to obin, at the institution alluded to, that relief out, or mitigation of their ailments, which they had a right to enticipate. It would rom, that unless a case is important, i. o., of ours occurrence, the patient is generally con-signed to the case of an insuperioused youth, again whose judicions management disease commonly propes intractable; and the pa-tient, westled with figuriless journeys, often from a considerable distance, has recourse, from a emanaterable distance, has recourse, sit length, to private professional sid; the distressed spolicants usually soncluding their appeal, with deciaring that "here was made eather self their best from under them, then again copils at the haspisal." Surely this first value of things, dist ought not to be suffered to suits. Their it does mix, I assert from my own experience, and will illustrate my assertion by a few cases bastily selected from many of a similar character. I was lately called to visit a female, in the iast tage of carcicomatous disease of the uterus : se was, lu fact, so much reduced, as to exhad attended regularly at the hospital from the commencement of her complaint, yet had never been subjected to an enuminal never bled, supped, or leasted, and was, ulti-mately, diamined with the securance " that she would get better as the advanced in life." Dissection demonstrated the fitness of this subject for Oscander's operation; the uterus, although greatly unlarged, being perfectly free from unnatural adhesion to the nurrounding parts—not to speak of the post-bility of effecting a cure to the early stays of the disease, by prompt and suitable treatment, the greater number of cases termed cancerous, not being atrictly so at the com-mengement of diseased action.

I have also been required to take charge of a case of fractured clavicle, meshesof for brated as an ophthelmic surgess.—Mr. Wilfied days, treated as a brain, and sail raded son Brown operates successfully in hernia-with a attendants of the young gentlemen" in attendants at the

. Bath Hospital. And no later than yesterday, a man presented himself hefore me, hie mind is a state of deep depression, his body covered with blotches, and suffering from nocturnal pains in his benes—the result of a prorunted course of meriusy, administered by "one of the young goatlemen" for bleverhea! These sine but a few of the cases that could These are but a tow of the cases unit count is monthland. This make same, are not, considered to my experience, but that other practitioners in this wife have their share of the finite of biblish! Min-prectice and neglect, may be safely, inferred from the fact, that a disputery is on the eve of being established within a short distance of the hospital, at a matter of speculation, ground-od on these very circumstances.

With regard to the treatment of patients in the house, if the following case, which is bruited about in this and the neighbouring city, (Bristol,) be substantially correct, that clean have as little reason to congratulate themselves on their altuation, as the outpatients. It is confidently affirmed, that a young person in the bospital was lately operated on for stone, and died. A postortem examination demonstrated the atter impossibility of a stone being extracted by the specialism performed; admitting it to here been, what I am informed it was noy; a stone case, for the bladder had not been spand in the special till the instrument harding; passed on one side of that viscus. This being the necond former cuse, of a similarly unfortunate kind, that has occurred in the practice of the same operator, it has excited a powerful sensation, and has called forth some severe remarks (from a correspondent) in the Bath Journal of the 19th inst., which bitherto have been suffered to remain unanswered,

It is singular enough, and mil iciantly un fortunate, that some non-professional-half-learned smatterer, took occasion, a short time since, on the etroughb of hearing a few icetures delivered over the body of Gilham the murderer, to write an article in your Journal, arowedly for the porpose of extelling the liath Hospital surgeons, and doubtless con-ceived he rendered them additional houser, by celabratiog their cemes in connexion with what he was pleased to consider—their paralier and specific virtues, a much after the fashion of Scott, when alluding to certain places in Liddendale:

" Bilhope brace for bucks and race, And carit haugh for swine, And Tarras for the good bull-trout, If he be then in time."

Thus, according to our subgist—
Sodes's framed for saturact,
For harms Wilson Brown—
And Norman for his shift and test
In eating for the store.
But the subject is of too serious a character to admit of being presid withinfollows.
That the surgical officing of the Both Hangital possess releas and ability, there can be
no doubt; that they are sure, and, being ajuilible, there can also be no foult. They are
folikewise in ratemark private practice, parstimularly the senior surgeon. Undue hasts!
—bow many excellent surgeons have suffered -bow many excellent surgeous here suffered —now many excesses surgeous new summers, from it! a minute more for reflection!—how different, pathops, the decision! Happen the propriety of that regulation, tonesiesusly adhered to in the Bristol Hospital; a regulation which makes it important on the surgeous, pravious to performing any important operations. tion, to convene and consult with his colleagues. Ney, such of the surgeons is required to enter his spinion as to the propriety of an operation, with his reasons see entertaining such operation, in a book lage for thet purpose. What has been the result of this humane regard for the safety of the unfortunate afflicted? this powerful check on the passions, the fallibility of hu-man nature? Why, that the Bristol Mospital has sequired, and deservedly acquired, the reputable of being, in proportion to its magnitude, the best conducted institution of

the kind in Europe.

Let the governors of the Beth Hospital take a lesson in this particular from their commercial, and less elegant, but equally philanthropic neighbours. And let them, if they value the reputation, the prosperity of trattering the contraction of the prosperity of an institution constructed for the noblest of purposes, he wetchful and vigiliant over the conduct of their officers. If those gendeman be so extensively engand in privete and heratic practice, as to be unable to de-dicate that time and attention to patients, whather for the house, or out of it, which the time and the state of the which thu cases require, let them resige, and give place to athers of less splendid pretensions, but of greater practical skilly. Nathing tends more powerfully to kring a cheritable in-stitution into contempt thee insettention and neglect on the part of its servants. And if once an impression to that rifect is imbibed by the multitude, it is not in the power of the most slepsed horsegue, delivered by the most similar ministers, to restore to its former channel the stream of public bens-

In concluding these remarks on a subject of great local importance, I desire to be distinctly understood, as disclaiming ony re-A PARMUNT.

Section on private ar personal character.

testain much respect; and it would give the pain, if, the observations which I have full it to be my duty, on public grounds, to make, occasion that gentleman a m Build, Ope, 28, 1886.

DE. BLUMBLL OF EXTIRPATION OF THE UTLEVE.

To the Edite of Tun Lancer.

Sen,-The cont. in which I succession a recommendated with me excised a stermi electation, having been educated into y Journal a few weeks dee, I beg leave make known, by the same shannel, that the operation has now been performed by me operation has now mean personner of for this disease, in four different imptan-of those four uporations, one (that the given to the public,) has testidated the ably, the other three have prived. It two of lines within a few hours other round was remapped. In one of the fall obsest, examination after death was not allowed; in the other two, the bodies were carefully inspected by Mr. Green and Mr. Cellaway in one instance, and by Ms. Green and Mr. Morgan in the other. No undesigned wounds were found in the contiguous to the nterus. All the f cases were dosmed hopeless, unless help of surgery could be interposed.

I sm, Sir, your abeliant servent;

JAMES BLUMPELL

Great George St. Westminster, Nov. 6, 1618

# UNION STREET DISPRISANCE.

As we frequently publish letters from Physicians, we do not see any reason why we should out insert a jetter from one of their " Pashunta."

Sur,-I aret much given to riteing but as I heard the ather dey you wur not afeard of letting foke an there duty, wen they did ant do the rite thing, I thort I wood tell ynn a littin aboute docter Remage, who is ducter to the Union Strete Dispensary for Arstma. We ort to be there to see the doctor, at twalve in the mornin, but you may set it down for sertin, that he do not will zerely won, but keeps as wateing in the cowid: and we carnt help colling with nwr treimes; and wateing so long in the winter time is a bad thing for us; impaing you will put this in your book. I remane, yet umble barviet,

words explained, so, as in my opinion, and, in the opinion of my friends who were pre-sist on that occasion, to sufficiently apolo-glus for the expressions in question:—sed, after the breaking ap of the Meeting, upon Mr. Lambert offering me his hand, I did not hesitate to take it. Since that period, a Report of the proceedings of the Society red in Twa Lancer, concluding with a these or two imputing to Mr. Lambert changes as you ampecing to Bar. Lambert chan these which had called forth my angry faitings — leaving untold the explanation which followed. After pagening this Raport, I requested my filend Mr. Blenkarue to which man Mr. I such that the carried to it upon Mr. Lambert, for the purpose of asking that gentlemen, in the most explicit inner, whether I was at all mistaken in anoluding that a sufficient spology had been made for expressions, which the warmth of agrement might have elicited. Mr. Lambert, in the mest gentlemenly manner, secured Mr. Blenkurne, that my view of the affair was perfectly correct, and that my thing like a personal insult, or demonstration of enigonity, was also at the foreign from his

Thicking it due to my character to make this statement. I beg the favour of your in-serting this letter to the next number of your journal.

I ses Sir, yours, &c. JAMES FISLD.

Bolt Court, Nov. 17, 1828.

PEACTICE OF M. BEGUSEAIS.

To the Editor of THE LANCEY.

[TOANGLATION.]

Size,—I history read your excellent Jour-nal with great pleasage. The spiritiff can-dour and independence by which it is uni-formly distinguished, induces me to hope that you will fourt is your next Number, some remarks upon an esticle in The Law way of November 3h, p. 198, taken from the Genetic de Santé of M. Miquel, purporting to be an account of the number of deaths at the hospital of Value Orace. In this account, M. Broumsis in represented an having lost more patients than my of his colleagues;

PRACAS AT THE DONDON REDICAL SOUTHT! but after the instinuctiony manner in which Dr. Roche kitt proved. That out of twenty of Dr. Roche kitt proved. That out of twenty of Dr. Roche kitt proved. That out of twenty of Dr. Roche kitt proved. The out of twenty of Dr. Roche kitt proved. The out of twenty of Dr. Roche kitt proved. The out of twenty of Dr. Roche kitt proved. The out of twenty of Dr. Roche kitt proved. The out of the portion of comming quantumly common to be party calculations and, in this respect, they present themselves distrible worthy of the Jesuitifies school io which they have been educated. It is said that since the Jesuita have lost their assendancy in France, M. Dupan is in a state of mental elienation, M. Miquel is as moribund as his journal, and M. Bousquet is in a condition nearly as desperate as that of the reverend fathers, aince his Majorty, Charles the Tenth, has been plaused to reward the services of M. Bengasis, by nominating him so officer of the legion of honoor.

Liars the honour to be, Your obedient serveot, D. M. P.

# LECTURES

OF THE

RAVID UTERUS, AND ON THE DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT GUY'S HOSPITAL BY

DR. BLUNDELL.

#### LECTURE Vi.

Tune z are, gentlemen, two grand varieties of gasital structure, whereby impregnation is accomplished,—the hermaphrodite, and that is which the gasitals are divided into two portions, of which afther is assigned to and female. Of vegetables, most species are hermaphrodita; of animals, aexual. Yet this rule is not universal; the worm, the soail, and many of the white-blood animal class, possess, in the same individual, both the male organs and the female; and, among vegetables, the almond, the hemp, and the tobacco, are divided into sexes; the differret parts of the sexual apparatus becom-ing elaborated anonally upon different stocks. Whether generation, huwaver, be sexual

or hermaphrodissie, it well deserves remark, that Nature, almost universally, makes use of two distinct substances for her pur-poses of organization; and, in vegetables, we have the seeds and the pullen; in animain, the male secretions, and those which are lodged in the ove of the female. Why it is that the two forming substances should falsebood, may, perhaps, solve this import- crime.

No. 274.

sury, in order that degenisation may be effected, it has often been inquired by physiologists, whether it be further requiie all cases, that these two sobstances should come into contact with each other? So large a question it is difficult to answer; iedeed we never could obtain an absolute demonstration of the affirmative, unless we were to make our observations on almost all

the different species of living structure,

The over of the freg are impregnated by the male, after they have left the body of the female, while they are yet on the verge of the vagina; and Tremblay, I think it was, interposing an impervious texture,—a sort of trowner,-between the genitals of the two animals, foeed that, while the rest of the eggs were productive, those which issued from the female, while this veil was that ie which the gentials are divided into interjected, were incapable of producing; two portions, of which either is assigned to se that in this soimel, at least, of oviparous n separate latificiated; whence the species generation, imprognation is accomplished becomes divided late two bodies,—the male by an ebvious contact of the two substances. with each other.

By experiments on the rabbit, I have endeavoured to prove this same principle, lu respect to viviparoes generation; and I found, in the results of those experiments, that, io the rabbit, and, therefore, probably, in all those atructures which essentially tesemble that of the rabbit,—perhaps also to living bodies generally,—in order that a new structure may be produced, the semen and the rudiments must come into contact with each other; and to this conclusion I came, though I set out with a very different persuasion, derived from observations mude by a man, to whose axample I own au much,-my selativa, Dr. lisighton; so that it was colirely to consequences of experiments made, and not from any prejudices left on the mind by the opinions of my receilent and philosophical preceptor, that I came to the couclusion that, in the rabbit, thus be formed at first spart, sed after-cellent and philosophical preceptor, that I wards mingled, is the formation of the naw came to the conclusion that, in the rabbit, structures, I am noable to signain. Is there at least, unless the male and female submot, however, come great discovery latest assesses are actually blended togethar, a new here! Have galvanism, or electrisity, my atracturs cannot be produced. A wholesome glare is the consideration of the great De-lecuticism is one of the eyes of Philosophy; gaer? Time, the discoverer of truth and in the communion of science, doubt is no

le order that you may comprehend those Two substances being generally necess experiments made on the rabbit, it is per-

haps necessary to remark, that, in this ani- those operations,) an opening was made as mal, the vagins is extraordinary, both in its before, and the wombs and the vagies were length and capacity; so much so, indeed, pressed through the sperture, [in: Blunthate when this canal is full grown, the fore- dell illustrated his statements by diagrams] ere in form vory like the little finger, when incurvated in this ensence, and perforated from one extremity to the other; the inferior opaning into the vagina by a mouth distinct from that of the corresponding ute-rus; the superior receiving that oviduct, or follopian tube, which atretches from the womb to the overy, and forms the channel by which the two vincers are communicating with such other. The two womhs, therefora, ara, in the main, distinct organs. In-

rying the incision a little way lete the mesometry; the divided pertiens of the womb, immediately after separation, moving out of apposition, and afterwards healing is such a manner that, at the lieo of division, the canal of the uterus becams abut up, though its atructure, in all other particulars, remained hashthy enough. After this operation, some of the rabhits died with abdomi-Bal inflammation, in the way that these animala frequently do when no operation has been performed; but others, and by far the greater number, recovered completely, and admitted the male; when I observed, that on the aids where the uterus was not cut through, the corpora luces made their sppearance, and the womb became thicker, and the fortunes were formed; but, on the epperite side, where the uterus had been di-vided completely, no fortunes were formed; but corpora lutes were generated, and, not infrequently, the womb was enlarged and conlved, and became filled with water. There were clear marks of a generative effect, which proved ineffectual, because the access of the semen to the rudinants had bean intercepted.

In another set of experiments, (for it

finger may be introduced jeto it, without and the parts lying within reach; instead of much stretching, of other injury. It should, dividing the uterus, I made an incision too, be further observed, that, in connection through the vagins, about fulf an inch hewith this vagins, aba has two wombs, which low that part where it receives the two orifices of the womb. Several of the anneal died from this experiment, which is a non rougher uno then the former, owing to flarge size of the capina; nevertheless, me recovered, and were put to the male, vagion being still sufficiently capacient admit of easy intercourse; but although, ina healthy rabbit, one siegle unlon, during the heat, seldem fails to produce generation; although is some of these animals desire seemed to remain for days together, lively stead of the on utari being single, there are said inantiable, yet never in one single instance were new fortuses furmed ; curpura Wall, now, in some of the experiments lutes were generated—the womhs, as in made, I opened the abdomen, showe the extra-uterino pregnancy, were evoived extra-uterino pregnancy, were evoivedsymphysis pubis, to the axtent of about an the waters, as before, collected in the utrines, taking care, by compression, to excits run—the afforts of generation were power-tha contraction of the bladder, so that il fully made, but the mutual access of the might withdraw into the pelvia, and get semes and rudimeets was intercepted, and completely out of the way. This done, by formation was tried in vain. But it may be a little well-directed pressure I urged the objected, that sterility susues, from the ge-hand of the vagins, with its wombs, through meral injury inflicted on the genitals in thesa the opening, the parts then Juig forth upos operations, and not from the intercepted so-the downy fur of the unimal; and all this, coan of the semen lother radiances; this obwhen the operation was dexterously per- jection, however, as would be readily admit-formed, without occasioning much severe jud by those who had seen the experiments, in pain. The womb lying under the eye, I then rather specinus than sound. If the experidivided it class through, near its mouth, our- ments are dexterously conducted, much injury is not ultimately sustained; and I know. from experiments upt to be wantonly rapested, that wounds more severe may be infinited on these parts, without preducing aterility; provided the enual of the utorus la not interrupted. I once, in the rabble, divided one womb in two places, the other in three, in such manner, however, that when the parts became re-mited, the uterine esnal was renewed, and, after the very first iutercourse, the snimal produced as many as nloo feetuses, to be seen in the preparation placed upon the table. Be it remembered, too, that when the vagion was divided, the wombs were left totally untouched by the knife; and, moreover, that In both sets of oxperiments, vaglusl and uterine, the formation of the lutes, the evolution of the sterus, and the accumulation of Auids in the womb, demonstrated clearly, that the geeital system was powerfully excited, though the excitement proved almitive. Nor must we forget that, when only one uterus was divided, the other, left untouched by tho knife, suffered quite as much as rither of the wambs did under the second set of axpesimenta, in which the vagins only was divided, and yet fectures formed in this womb, seemed good to vary the circumstance of notwithstanding. Further, in two of the

voginal experiments, it so happened, that a commended, and thankfully undergone, re-nation of the divided parts was accom. These operations, however, are neither to plished, the two pertions being put into be really commended no condemned. They communication again, by means of an aper-require in the uperator many qualities. If there is large as the barrel of a crow-qualit; the follopian tubes are divided in ensure both these submids became, pregnant, and this, attribute, are made, became, pregnant, and this, to length, ought to be removed, lest the To conclude, these experiments were not divided pertions about again fall into apposingle, but multiplied; they were not represent the present and the proposition the annul becoming a neared. To conclude, these experiments were not divided pertions should again fall line apposingle, but multiplied; they were not mero interesting, but multiplied; they were not mero it has often been saked, whether the make fluid ever riseaup to the ovary, or wheteur is and though I commenced my in the two make fluid ever riseaup to the ovary, or wheteur is a contary prejudice, they left. For myasif, I inclina to think that, in generate under the full conviction, that in rabbits and the focundating fluid ment each differ in the uterus; for generation probably, in order that generate the formation of the lates, the development that may be accomplished, the semen and of the nerus, and the accumulation of the rudingents must come into contant with water in the uteriue cavities, as in the appearable that. In the Medico Chiruroical invents must each of the market. each uther. In the Medico - Chirurgical rimenta narrated, seem all of them to show, Transactions, you will find a fuller account that the rudiments may come down late tha

Transactions, you will find a fuller account of these experiments.

From these experiments we may infer, that in the radinests may come down into the that in the radinest may come down into the full cities are many infer, independently of the full excitement of the exceptions of our sex sometimes reach to the independently of the full excitement of the orangementative sections, and, therefore, that in secretions of our sex sometimes reach to the independently of the full excitement of the orangement of the orangement of the same of the summed there exists in struck dead by a kinfe when in the set of this summed those appearances presently in the summed the same of dultery, found the full formation of the future without mixture of the two substances, it is clear that in by in that part of the overay from which the rudiments have excepted. From these experiments we may also, infer, that mera absorption of the seems, from the vaginal was infer, the two and the conveyance of the seman of the lymphastics, is insufficient for the two substances, it is clear that in must occur. Perhaps the neversation of the received of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the full formation of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the full formation of the future without mixture of the two substances, it is clear that in the future without mixture of the two substances, it is clear that in the future without mixture of the two substances, it is clear that in the future without mixture of doe, a temarkably fine one of her age, was Four Impregnations, in which the bymen n great favourite with her polygamous has remained unbroken, have fallen under my band; but it oppeared, after death, that not-inotice, the diometer of the voginal crifice

and I think I know of cases in which this under these circumstances, I think there

band; but it oppeared, after death, that not onlice, the diometer of the vogical orface withintanding all these attempts, no futures on exceeding that of the smaller flager; could form—the corpora luten were "guaciand titls, too, though the organ of the male rated—the wombs were evolved—the woter, parent wos of ordioary dimension. Chamban usual, collected in the uterine eavities, bun has related the case of a French but this was ell—the access of the semen to girl, whin, on marrying, suffered so moch the vagina, and impregnation could not be pain, that also was obliged, in about n the vagina, and impregnation could not be fortinght ofterwards, to arparate from her effected. Vet it is evident that much of the bushand, and return to the maternal roof; male fluid must have been deposited in the vagina, and absorbed by the veina or the large and produced twins. When delivary lumnhatics. lymphatics.

To some women, impregnation is death; maloed unbroken, there being two small the pelvin is so contracted, that without the apertures accretely larger than a surgeon's Cessarian operation, delivery counct be ef- probe; the nrethra, however, was dilated, feeted by any artificial means. In such said readily suffered the introduction of the wamen, sterility night be insured by the figure, so that the while nature of the case division of the tubes, as formerly advised; was recolered intelligible enough. Now, nperation, though an evil and h danger, can be no doubt that only a very small quantified, however, have been prudently re-tity of the semen could have entered the atill abe was delivared of twina within the stlocts, and our original rights. Remember, first few days.

To these facts I may add those uf a second cases in which the male organ was not ceiving. And when we fall to be intimi delicate for a fuller disclosure in this theatre, I am satisfied that vary small quontities of the semen, istroduced loto the lower part of tho vagina, where there is an eptitude to become pregnent, will give rise to the new atructure.

Nor must we forget the experiments made by other physiologists, and by Spallanterial was mixed with a much larger quantity of water, about a gellon, if my memory

I am not of the opinion of those who, with seems often to metter little howwonderful atructures elaborated, if they remedied.

wors not originally designed to be used by In generation, it is not necessary that every one who is possessed of them? He-mixture should take place is the individual

vagina or uterua; and the rather, because a member, however, that society, in its preseparation took place between the partial sent form, la not, perhaps, constructed with within a fortuight after the marriaga; but a philosophical regard to oer natural innine mooths, and therefore impragnation too, that, in consequence of this funda-must have taken place in the course of the mental defect, (it may be bremediable,) acciety cannot appaint without a motual concession of a part of these rights. Rememclass, namoly, cases is which impregnation ber, too, that those are jostly stigmatised / is taking place onexpectedly, and where the with public iofamy, who, living it society, parties, guilty of incoclinence, have been refuse, in turn, to their associates those condesirous of preventing id. I know of three cessions which they are themselves reauffered to eater the vagina at all, and dated by the wholesome bullying of fanation where, nevertheless, I suppose from the who, with all their arrogaece, seem frei, ite mere deposition of the semen upon the quently to put our duties upon a wrongthet vulve, impregnation took place. I have bottom—lot prudance—let self-respect—let v knowe women astonished to find theanselves a regard to health-let a just consideration of pregnant, heing persuaded that an impreg-social duty, put n chook upon these follies. nation was impossible, uctil, to their sorrow, Awkward accidents sometimes occur to this unwelcome truth was unfolded. In a those who conceive themselves the most word, from neveral facts of this kind, too knowing. Let the disciples of the sensual school beware,

". Hie morus alienaus esto

Nil conseire tibi nulla pallescero oulpà."

If you ask ma how it is that impregnetions are accomplished, when there is a deposition on the vulva, I reply, that it is most probably by so admixture of the male sani among the reat. Spallanzani says, that fluid with the secretions of the female-for adatiag power. he has taken three graies by weight of the dilution does not destroy fecundating power, male fluid of the free, and mined it with If this glass, so tall, were filled with water, seventeen concea of water, finding, almost should sugar he thrown into the bottom of invariably, that an impregnotion of the egg it, this, oe solution, might soon be perceived was produced by so much of this exceed in the upper part of the fluid, especially if ingly weak mixture, as would adhere to the agitation occurred. So the freundating as-point of a fice needle; though, in a globule cretion may, by administre, penatrate to the so miouts, the quantity of the planto agent iomost recesses of the genitals, more espe-ment clearly have been inconceivably small. cially if the secretion of the genital surface He tells us, too, that where the mala ma- be copious. "Increase and attery results from this loftraity; the birth multiply," says the Hebrow acripture; "plant of a child is one of the best suxiliary remeters, and beget offspring," says the doctrue; dies, as it lays the passages open; and of the Magi. In speculation, a schawledge, the male fauld do but exter the vagins, it a admirers of the doctrine of autipa- let. One of the most istellectual families thing, have taken it into their hands that, in Europe access, at length, to have become there is most wonderful virtue in shattaining as tinet, in coosequeece ui so impediment to from the proper use of the aeres. Why, generation of the kind to which I here in the name of sense and reason, were the lallodad, and which, I conceive, there can be powerful impulses given? why were these little doubt that a little art would have

who is pregnant; and, therefore, it is not they have too much virtuo to make use of physiologically impossible, that a woman, it. Of all the precursors of the modern though a virgin, should be with shild. It is gentleman, the knight of old, which is the well known, with respect to some animals in the lower class especially, that one impregnation will serve for several generations; thus, to go no further than that com-mon loscet which is called the wins fratter; if a female is impreguated, she will produce young; these young will go on to produce others, without further impregnatics; this process may be repeated, notil eight or ten renerations have been produced; so that, in hese snimsls, you have proof of the very principle for which I am contending, namely, that virginity is not of necessity lost by the individual who conceives. Some years ago I was shown by Mr. Highmore, of the West, a preparation of a child, on the whole not tion with the duodanam, and was conrecord.

closed under the egg-shell of the geose, pardou for this levity. From all that is sai these facts explain pretty olearly the plie- these two aubstances must mix; that of the begotten at the same time; but while the should take place in the individual who brother formed in the usual manner, the imbears the child; so that virgin programcy pregnated ovum of his companion lay dories in net physically impossible. mant, and, without resistance, became closed up within the fraternal shdomen, as the formation commencing, the wonder and the estastrophy ensued. The boy hereme pregnant with his twin brother; his abdemen furmed the receptacle, where, as in the nest of a hird, the formatice was accomplished. New, if a child, without impregnation of the it may also form in the uterus of a virgin. defect to their part of the genital apparatus, umple of the sex, though I feel persuaded general unfounded. When the eex is more

champlen who, with his lance, defended the unsullied honour of his idol with half tho effect of this simple principle of physiology?
—Senuerent Jupiter et Mars. — To the demi-gods of an absolute superatition,-te the airy greations of the middle ages, -- paternity can ne lenger be ascribed. But this priociple of physiology may take upon itself the defensive effice of the other two; and in the womh first, and at the bosom efterwards, under the protection of science, a lady may now, it seems, nourish her sister without a blesh. Louis Quatorze presented a richly embroidered jupe to clothe an offensive atatue, which fermed a nort of aqueduct to one of the eities of the Nethervery imperfectly formed, of the size of aix lands. The image of Dumoorier, formed in or seven mostle, and which had been taken plaster, was, as report goes, very properly from the body of a boy. The boy literally, screened from the view of the sex some and without evasion, was with child, for the few days after it bad been act up in the fœtua was contained in a sac in communica- Place dea Victoires. But the conscious innocance of our country-women, hownected to the side of the cyst by a short ever, places them above such pruderies, ambilical cord. Nor did this fortus make its and I will not despair of seeing my faappearance till the boy was eight or ten vourite science henoured with a statue, years of age, or more, when, after much not robed and shaded, but in Grecian aslargement from pregnancy, and moch audity, a fit companion for the Achilles, pain and flooding, the boy died; and these with two inscriptions, the one—Te the deeases are not singular; there are others oo fender of innoceace, the grateful sax;the other -- puris cipi and Toper weaker A seed, or an egg, though faonndsted, oversow Surrow sawaharret,—mysterious may lis fer years without becoming evolved, words, which, inscribed under such a figure, A serpent may, I believe, become en- will become intelligible encogh. Mr. Knight, in one of his uxfor being more prolific than the rest.

Suckling is no certain preventive of pregindeed, the observation cas be made.

# FOREIGN DEPARTMENT.

THE HOSPITALS OF PARIS,

Up to the year 1780, the Parisian bospitala were in auch a miserable state, that when Howard visited them, he declared that he had acrer sees worse; and when t772, more than eighty thomand iodiriduals the Emperor Joseph, after having ascended perialed in the listel-Dica, merely from the Imperial throne, made a jourcey to bad management, neglect, bad air, improper Paris, he was actually so shocked at the treatment, &c.

prolific than ordinary, it is, I conceive, management of the Hotel-Dieu, that he all quarters," the French government, at last, elected a committee, containing, smoog nthers, of Daubenion, Lavolsiar, Dailly, Coulomb, and Teoon, to inquire into the nwn sinters, who all produced their hunbands reveuled the most shocking abases, of which

This hospital contained t,219 beds, of which 486 were three feet, and 738 four. cellent papers on vegetable ubysiology, tells feet four inches in breadth; the number of us, that when a herd of cown is served by patients varied from 1800 to 5000, so that the same bull, aome of the cown ore noted often not less than four, or even aix patients, for being more prolific than the rest.

were lying in one hed! The Salle Saint-Charles Saint-Autoine clone sometimes conmancy, though, in general, in the earlier tained 818 patients! The lying-in departmonths especially, the wat nurse remains ment consisted of four wards, contiguous to sterile, and, in the second or third month, those of the wounded and fever patients; gentation dries up the mids. Genitals, prog. three or four women were often lying in ment already, esmoot, so far as I know, be one said the same bed; pregnant and impregnated again, unless at a very short delivered, ill and healthy females, were ininterval; so that the deughter of Augustus discriminately crowded together. It may Comer was right in her distinction. At a be easily imagined, that very draudful very short interval, a second impregnation epidemics often manifested themselves in may be accomplished. Bitches, I am told, these wards, and the mortality in the lyingmay he accomplished. Ditchna, I am told, these wards, end the mortality in the lyingproduce pappies engendered by different in department of the Hotol-Dian, if code; and women have produced twins begotten respectively by a white and black kind, exceeds all belief. On an overage ten
parant, as the characters of the offspring died out of n hundred; but during npiclearly showed. Mr. Blackaller, of Weydemica, from ten to minuteen died unt of
bridge, has recorded one case of this kind, twenty. (The general average of deuths, in and in Smellie's translation of Buston may a lying-in-hospital, is not more thue one in be found another. I lately, in presence of claudred. The number of childres born amy able friend Mr. Waller, of Barthulo-maw Close, met with two wombs opening une out of a hundred died, and shoot 1300 by separate orifices into the vagina; and were sent to the Founding Hospital, where my distinguished colleague, Mr. Key, abownd | 100 of them died of induration of the akin, one uterns with two hodies, and Mr. John while of 3,400 children , sent from the town F. South showed ma another. Should any and the environa to the asme institution, of you bereafter meet with a superfetation, | not more than 2000 died of the same disease. for so those impregnatioes ore called, pray Of the other patients at the lifter Discu, 25 observe whether the womb be double, if, died in a buedred, a mortality which is more than double that in any hospital now existing.

It is to the seal of the shove-mentioned committee, that Paris owes the subsequent amelioration, and the present state of its hospitals. The anna formarly applied to their medanance, was increased from 1,200,000 to 9,700,000 france; the oumber of bospitals was onesiderably asgmented; to each class of patients e particular hospi-tal was appropriated; the old, infirm, and

Mamoutel proved, that from 17:37 to

incurable, were removed into the Hospices; happy results of this reform, sed especially the luntics were separated from the crimities coesiderable decrease of the mortality. nais, &c. The following tables, frawn up in the year 1825, will best serve to show the formerly observed in the Hotal-Dicu:—

between 21 and 22,000, of which more than some months, hardly producing any aymp-two-fifths occur in the hospitals. There are toms; but, at the end of this period, the between 24 and 25000 births annually, of which 5000 take place in hospitals. The fourth or fifth part of the whole number of hospital patients is contained in the flotel-Dieu, where from thirty to forty are daily admitted, and about five patients die every day .- From the Journ. des Progrés.

#### MENSTRUATION IN A CRILD NINETERN MONTHS OF ACE.

The ambject of this occurrence was, at its birth, in no respect different from other children; it soon, bowever, began to grow rapidly, so that at its ninth mouth, it was equal in size to a child of a year and a half. At this period, a small emission of blood was observed from the vagina, and the same recurred more shoudantly in the eleganth month; at the same time the breasts began to grow, and the pubes to be covered with hair. At the fourteenth month a third, and, at the nineteenth, a fourth evacuation of darkcoloured blood took pince from the vagius. At this age, the child was, in all other respects, very well formed; its height was three feet; the distance from our shoulder to the other, nine inches; the circomtereace of the thorax and of the pelvis were twenty-two inches each; the breasts and eaternal genitals were fully developed; the child had, as yet, shown an sexual desire, nor did it, with respect to its intellectori faculties, exceed other chibiren of the same age, Michel's Achie.

#### GASTROTOMY.

The annual number of deaths in I'nris is into the atomach. Here it remained for most violent vomiting came ou, and soou brought the patient into a most deogerous condition. By the advice of MM. Delech and Fages, gastrotomy was performed by M. Cayroche; the fork was enaily ax-tracted, and within twenty days the wound had completely hesled.—Happort des Travens de l'Académie Royale de Medicine da Bardeaux.

### THE DUBLIN COLLEGE OF SUR-GEONS AND ERINENSIS.

" Hos ego versicatos feci, tutit alter honores."

My re-uppearance, for the third time, in the pages of Tua LANCES, has been followed by manifestations of resentment, among a certain portion of the profession in Dublin, in which, it is to be fested a troubled conscience may have some share. The exertions, at least, of this purity to discover me, strongly partake of the embarrass-ing timidity of guilt; foolishly supposing, that if they could tear off my mask, my strength, like that of Sampson shorn of his lacks, woold instantly vanish. In their blind zenl, it may be readily imagined, they might not prova mischievous, would be calculated only to awaken a smile. If, indeed, to concest myself from their threatened hostility, at the espense of the unuffenilling, were my present object, I could A judy at Bordeaux, 22 years of age, ic. not adopt a more judicious place for its advertently let a small fork slip late the attainment than to permit these blustbroat; it was swallowed, and descended decrea to pass by in allence. Jiumbly,

however, as I think of my own labours, I | whose claims to a connession with me rested valun them sufficiently not to what that any on the simple fact of his having penned individual should be burthened with the semming-raides" puffit" in the nawspapers, credit or reproach at laiving composed these in a style which (borresco referens) as Sketches, much less that any person should said to bear a strong resemblance to mine. Sketches, much less that any person abould suffer by being considered their author. These feelings alone, independent of egotistical speculations, induce me to attempt not withstanding the little confidence usually roposed in the assertions of anonymous writers speaking of themselves) to abow he extreme folly of conjecture in matters of his kind, by its perpetual contradictions. When the first of these papers was pub-shed, rumour, from the mere scalegy of tis and topio, detected the writer of t em the person of Mr. Cross, author of the excellent Skutchan of the Medical Schools nf Paris, a calumny on that gentleman in which I certainly had the hetter part. Haviog aubsequently described acenes of which Mr. Cross, residing, I bolieve, in Norwich, could have known nothing, I had naxt tha supreme honour of finding myself and Dr. Macartney onn and the same person, in the auspicions of the day, for the unconscious benefit of whose celebrity I have beg leave, most heartily, to thank him. Well, the portrait of the Professor of Austomy, io the University of Dublin, appeared soon after; the delusion was, of course, as quickly dissipated as it was diffused; but I had the conplation of being immediately united to Mr. Kirby, an union, by the way, in which I may remark, I also felt bighly flattered. Had my labours coaced here, they might atill have retained all the autendour of Mr. Kirby's fame; but, Marpint as I was, I abould pencil a likoness of my illustrious representative, which, unfortunately, de-prived mo of the advantage of being ayounymous with the founder of Peter Struct School. l'uzaled to find a fit and proper person to identify me with, the public new launched into the licenticumens of unlimited conjecture; and, will it be believed, that the Royal College of Surgeons in Ireland

I was suon relieved from my disreputable easociation with the Apotheonry and his "puffs," to be identified with the Sub-Editor of a Popiah morning journal, who, opportunely for the gratification of the public tasts for gossip, had recently "thrown physic to the dogs" and commenced practically and commenced practically in the second secon tising without a license on the moral dissases of his native country. He did not long, however, enjoy a monopoly la my famo; a new candidate was started, in a reporter to a l'rotestant morning paper, who, I believa, was serving to the capacity of a surgeon at Sierra Leone, while I was writlng these Essaya is Dublin. This fact, when made known, threw me once more on the wide waste of aconymous asistence, from which I was, in dun time, delivered by identification with a melancholy looking pupil of Alercer's Hospital, who, having no apparont business on hand, the public should find him in employment, in the com-position of the Sketchas. Not satisfied with this adjustment of the question, the public divided on my identity, one party atreuuously maintaining (rianm teneatia amiei?) that I was really Mr. Jacob, who, by virtuo of his office as demonstrator to a rival institution of the College of Surgeons, should then be a medical Whig as he is now a Tory, as professor of that establishment; the other as arduously contending that my familiarity with Camper, Spura-heim, and Lavater, in my descriptions of professors heads, was a demonstrative proof of my being a certain pupil of the Meath llospital, who, about this time, became such a craninlogical enthusiant, that he setually combed back his hoir to reoder his forehead a more cunvenient reference for the elucidation of his favourite doctrine. My metamorphoses, hitherto strango as they supposed they saw grounds for accusing Sir were, had not yet ended; they were now Astley Cooper of the composition of the to be far surpassed, my sex (a point on Shotches, who, it was sogely whispered, which, like most men, I fult particularly woa actually jealous of the rising fame of schaitive.) being now changed by Mr. Tom that institution? This report, however Egan, accuraing to whom I had absolutely agreeable to my vanity, was, I regret, of cutered the sacred premises of the Lock as ton delicate a constitution to live long; but a "womou of the town," to wat, is his apical twas quite certain I must be somehody, ritual practice in that establishment, while and as nothing better presented of the time. surmine fixed, for awhile, the odium excited asserted that I must have the omnincience by my lucubrations on a enudidate for "letters tanimonial," who had heen rejected the habit of purchasing tumours for operation in Stevens' Hospital. This, indeed, inoplied in the satirical precept—" Facit indignatio vorsum." This inglations alliance which a lythagorean neight rejoice; but I would be in the satirical precept.—" carried in its improbability the seeds of its had still further trials to undergo. Characown dissolution; and I dow turned out to tera being now a good deal exhausted in be no less a personage than an Apotheenry, Dublin, the aphere of apeculotion was enlarged, and I had now the pleasure of find- task which I have nadertshon has also been ing myself in the person of Mr. Quain, of made the theme of condemnation; but, I transformations of character.

London, to whom report assigned the in- answer, that I have taken no liberties with ganious merit of making up these articles, public claracters, or used any pressurious out of materials transmitted by post to the for concealing myself, for whisis I am not metropolis. How long Mr. Quain may be prepared to furnish hundreds of examples allowed to enjoy a reputation of which, I at the literature of this and of overy other presume, he would be no ways subithus, age. The whole periodical literature of the I cennot say, so capricious is that spirit of present day, not to include furner times, is conjecture which has and e me, in ancera- anonymous, and made up, in a great mea-sion, Mr. Cross. Dr. Macattaey, Professor sure, of atrictares on living character. The Kirby, a rejected Cambilate, a putting talented Sketobas of the Irich Bar, Poter's Apothecary, a Popiah Editor, a Protestanti Letters to his Kinsfolk, and several other Reporter, a Green-horn of Merner's, Sir essays of the sums description, furnish al Assloy Cooper, Mr. Jacob, a Phreuclogical John de a pertiuent example of personal and Madman, Mr. Jones Quain, a Witch, n nameless composition. To the obarge that Woman of the Town; and, of course, it I have abused this right, by partiality in will be duly discovered, that in addition to any representations of professional merit, I all these I am the "terra filius" of the reply, that if I tajured any person, the iunext institution of which I may chance to strument, a free press, by which the wound give a description. #### OBSERVATIONS ON DISLOCATIONS,

# By HENRY PENNICK, M. D.

be pointed out.

hore been searly impracticable. The for that the head of the hone should return every niteupt that was made to reduce meet must also be enduced with great mobi-them; and how the reduction of the third lity; in procation and augmention of the was accomplished, except that the patient fore-arm it allows of considerable motion. extension made by the hand, is the only re-The ally instructive case that I have seen. fifth and sixth were old dislocations, from which nothing could be inferred but the difficulty of treating them; nor does extension by the hand alone, though clearly a great he aucocoded in effecting the reduction; shown by nucley, when wo inther enamine and we find Mr. Key, surgeon of (iny's Hoe- the principles which Mr. Putt has catub-

difficulty to " a band of the intercense tigament, about one-third down the fore-arm, which is violently stretched by the separation of the radios from the ulne, and retains the head of the radius on the coroneid proto notice this opinion, if it come from inferior authority; butters I conceive it to pr litional evidence to justify the execution affect on practice, by withdrawing attention their threats? If I am a member of their from the improvements, of which one art is ly, their new chorter furnishes them with susceptible, I will endearms to show that congenial instrument of revenge; and it rests on oo solid foundation; and, for this superior to himself. Among the many sound principles to be found in that rich mine of experience, his works on surgery, and which, in 1783 and 1784, when a pupil at Bar-tholomew's, I had size the satisfaction of heoring him deliver in his lectures, are the following :- In his remarks on dislocations. he says, " The ligaments of some of the joints endued with great mobility, are weak and distractile, and capable of sufficing considerable violence, without being lace-rated;" and " as it is impossible to know, Distonation of the radius forwards, ap-will any certainty, whather it (a lassration) pears to be an accident of such unfrequent has happened or not or in what part of the occurrence and diffigult management, that ligament, it cannot be admitted an a rule for the recording every case of it would seem unit conduct;" and he does not appear to interesting, and particularly if a more facile consider it a matter of great consequence, made of treatment could, at the same time, even if the ligamont should be torn.

Mr. Putt la certainly applying his obser-Until Sir Astley Cooper, and Mr. Charles | votious principally to the capsular ligament liels, proposed estumaton by the hand, in- of the shoulder joint; but this I take to be astend of hy both ratius and ulsa, as had, its stronger care; for he says, when eshees formerly practised, the reduction must tension is made, "it being much more likely mer gentleman, in his great work on Dialo-hack by the same reot in the ligament, cuttons and Fractures of the Juium, then, when such higaments moderately attrebed, 1824, has mentioned aix cases that had than when it may be supposed to lie wrinfallen noder his notice. The two first foiled kled, or to folds." The interesseous lighwas in a state of aynespe, does not clearly and therefore is not more likely to occasion appear. But the fourth case, is which the resistance than the capaniar ligaments of the arm was heat over the back of a sofa, and joints, particularly as, by extension in the extension made by the hand, lathe only re-reduction, that ligament, which was before on the stretch, will be relaxed, and cannot lie in folds : for the radius cannot be removed from it, and the arm will be a guida for returning the radius through the same reot in thu capsular ligament which it may improvement, appear to have removed all im- have produced in being dislocated. That pediment; for, aren in the fourth case, Su the interesseous ligament has just to do Anthey Cooper was " some minutes," before with any difficulty that may arise, will be

liahod; for he observes, "that all the force, | fosse, so as to allow the arm being fully in raducing a dislocated booe, nught always extended; neither can it be beet so far as to be applied to the other catremity of the to parmit the thumb to touch the aboulder. said bone, and as much as possible to that A depression la felt on the ioner side of the only. By the yielding nature of the liga- radius, where its head ought to rotate ments of the luxated joint, reduction is ac- against the knob of the external condyla of compliance; the ligameots of the other arti- the humerus. The arm, three inches above culation, which is not luxated, are yielding also, and all the force which is applied to the bone, below, or adjoining, must necessarily be lost in the articulation which is not inzated, and can be of little or no service in that which is." And he afterwards lilustrates his argument, by showing why ex- our-distension, and consequent inflammatic tending by the wrist, in dislocation of the shoulder, has failed, by observing, why, in a case of luxated on femoria at the hip joios, the strength of five or six people, divided the ancle, shell be insufficient; and that of radine forwards, similar to that which

may be ascertained; for, if the intervention mitted Samuel Payor to his inspection. of the knee joint above rendered double the repeated the experiment, by beeding the force necessary; then, as the joint of the forcers to a right angle with the homerus, corpus is composed of three articulations, it and supinating the haod. I placed a tape on follows that the resistance will increase to the arm above the head of the radius, and gametrical progression, and become nine times tied it on the inside of the arm below the ever be applied that was absolutely neces- of the radius, that bone must be more easily sary for the reduction, wheo applied in a and quickly seturned to isaproper situation, proper aituation and direction.

rofession to the following case :- Samuel refer to himself. l'ayne, aged 60 years, a fisherman of Newlyo, near Peusance, informs me that, when the same method in the following ease, a lad, he, by a fall, rejured his left elbow, which well illustrates the plan I have de-The radios must have been dislocated out- tailed. On the 19th of July last, the wife words and forwards; it has not been re- of Henry Curnow, a farmer of the parish of duced, and presents the following appear. Ludgvan, by a fall from a horse, dialocated ances:—A joint has been formed on the lier left wrist. The expal bones were costide at the external condyle of the hutthrown backwards on the radius and ulos, merus, on which the head of the radius are which were thrust forwards upon the antetates; it is most promiuout when the hand; rior nanular ligament. I bent the forearm is supinated; when the hand is pronated, it to a right ongle with the humarus, where it is less prominent, by rolling more forwards was held by on assistant; and having placed over the condyle. The entonoid process was the tape of a tourniquet on her arm, summer probably fractored; for though the signoid distely above, and partly against the carpal early of the ulms traverses in the nochles bones, I tied it gauly un the opposite side, of the lumerus, yet, when the arm is bens, I then twisted the ends round my left hand, the observance, which is enlarged, projects and with my right grasped her hand. I

and below the condyles of the humerus, is one lach less in circumference than hir right arm in the same places. About 1years aloce, io a gale of wind, he was washe out of a beat, and hung by the hand of h crippled arm, which occasioned so mu that his fingers have since been contracted.

This case, though irreducible, appears me important, because it has enabled me nacertaio by caperiment the practicabilit. between the joint of the knee and that of of a method of reducing dislocations of the four, may three, of the same assistants, shall, recommended for the reduction of dialocias the same case, prove sufficient, by being all and properly applied to the keee and car, vol. i. 1927-8. p. 260. My friend, Dr. femur coly, as I have more than once acen."

Clutterbuck, of Bridge Street, Blackfrian, ing all and properly applied to the kees and car, vol. i. 1927-5. p. 260. My friend, Dr. femur coll, as I have more than once acen." Clutterbuck, of Bridge Street, Blackfriers, Here, then, the true cames of the difficulty being at Pennanca in August last, I subgreater when the extension is made by the juner condylo of the humerus, nod twisting hand, then it would have been could the ox-bath code round my hand, I proved to his tension have been made on the distal extremity satisfaction, that this method permitted me of the radios. Here, too, we must look for the to make an extension with any degree of consequences of over-distension, which the force I might wish to employ, without dansonto mind of Mr. Pott has goarded us get of the tape slipping; he also saw and against, by directing the extrosion to be felt the head of the radius rotation on the made slowly, that time abould be slived countyle of the humerus when the bood was for the nuclea and ligmenta to relax and moved, and was convinced that by bringing give way, and that ou greater force should the force to bear immediately on the head than by any other means. In confirmation I now beg to draw the ettention of the of this, Dr. Clutterbuck has allowed ma to

I have also had an opportunity of oning further back than that of the other arm, and made the entension with both hands, and in in prevented from falling into the posterior an instant, and when I was employing very places, the tape slid down an the wrist, and oe the inside of the thigh, close to the paths woman exclaimed, "the bone is in!" dendum, un which fastening a pull may be It is evident that a dislocation of the radius fixed, which will have the same affect as ferwards may be reduced by a similar twisting the anda round the hand; and method, and with the same facility with whilst an extension is making, and as soon which I reduced this dislocation of the jas the strap can be brought to act on the wrist; compression of the muscles of the trochester of the dislocated bone, the pull humeron by a firm reller, as I described in abould he hauled in a proper direction by former paper, would here be of great which meat greatly assist in bringing the ree; and it appears to me, that "hending head of the thigh-bone to the acetabulum, a same over the back of a wofe," in Sir Pensance, Oct. 10, 1928. se, productiva of this very effect. I a ly enovinced, that far less force will rays be required to reduce a distortion, tien the force can be applied as the head of the distocuted bone, as well as on its distal extremity, than if it he applied to that exramity only, and a fortiori, than if the force e applied to a part between which and that rene.

Dr. HASLAM, President, in the Cheire

MR. AMESSORY'S CURE OF A PRACTURE OF THE NECE OF THE TRICK-SOME .- PR. HUPELHA'S ONSOCCESSFUL GESARIAN CARL

Dr. Hani are understood, that some of the Fallows had intended to here put some questions respecting the case Mr. Ameabury had introduced to the nution of the Society at the last Meeting, of a perfect cure of the certif femoria upon his principle, and if that were so, he should be happy to find

many months to some. Hospital, and put under the care of Mr.

I beg to amounce, that any geotleman, Travers. Shoridy afterwards she was seen professional, or private, who may be desti- by Mr. Anteibury, and the whole treatment tous to see this lad, at my friend during the of the case committed to hist. On the 11th propries of the oute, shall he herfaulte as of the same committed to hist. On the 11th

add, that if any gentleman were in attendsace for the purpose of reporting, he should said he should cheerfully comply with the

must have been below the carrier. He had must have been below the carrier. He had said a great deal to do with practical surface, and, fram the age of the individual, the perfect recovery, and the imp he had almind to, he was quite sure the fracture alleged to have taken place, could not have existed. He believed that no fracture of the cervix was ever cured without considerdeformity. All hn had seen, were fractures external to the capsule, and those that had united, had luveriably been attended with very considerable deformity.

Mr. Awgreeny was equally satisfied in the manner stated, by bony deposition. It of treatment, was impossible for him to state precisely, Mr. Lagan fracture was. As Mr. Salmon was so incredulous on this occasion, he hoped he would with very considerable deformity. take the trouble of visiting, and of paying special attention to the woman he had bert iven a description of, and who was under tion. his care at that moment.

upon the case, wished to advert to what had London, this fracture could not be cured taken place on a pravious evening, respect without deformity, it became the profession lng the liberty of the press. When thin sub-ject was under discussion, the President had contrivence that any gentleman might bring given it sa hain appling, that when a paper forward to accomplish the curs without de-was read to the Society, it did not belong to the Society. The consequence of this was, that the very best parts of the paper were picked out, and reported with admirable accuracy, by which means, he apprehended, the nuther was deprived of his literary right la that paper.

The President interrupted the speaker, to express his wish, that as Mr. Kingdon was bringing forward a subject which was private, and as there were medical subjects pressing upon the Society, he would abdiscussion of the night.

Mr. Krnopow, as an example to alcothers. ance for the unroses of reporting, he should said he should obserfully comply with the he well happy to give him a copy of this ones. The man introduced to the Society on the former occasion, walked without at the former occasion, walked without at the street. He would sustain two himstred weight pon his shoulders.

All, Saimon had exemised the man shart he left this Society recompand was perfectly satisfied in his mind, that the nesk of the shaigh hone had never been brokee. There of the shart protuberance below the troohandar many many there were the continued with other circumstances, assured him that the fracture such as the share been below the troohandar protuberance had the the fracture of the street such in expansion tould have been made use of, and allowed by pass in the present of the Projection of this Society. The Projection of this Society. The Projection of the Society is been so highly coloured as espression.

Mr. Kinnpon added, that it was reported in The Laucanof that day. Mr. Kingdo concluded by stating, that he could not agree with the observations made by Mr. Sulmon. Because Mr. Salmon find not met with a clear case of fracture of the cervix femoris mited by bone, secording to the treatment adopted under his notice, that was his mind, that the fracture in this instance not to be a reason why the profession were was of the cervix, and that it had besled in not to turn their attention to superior mode

Mr. Lamagar wished to know of Mr. that the fracture was within the espaule. The Calleway, how many cases, in the course of fracture was sometimes within, sometimes a year, of fractured cervix of the thigh-bona without; sometimes partly within and were treated in Guy's Hospital, and cured partly without, and the symptoms of all were without deformity, and what beds were so similar, that he thought it would be a used? He had been in the habit of ettend-difficult task for ony men to medertake to ing that Hospital for a long time, and he did state precisely in what exact situation the act remember ever having seen more than about six cases, all of which had been cured

Mr. CALLAWRY considered that Mr. Lambert had both put and asswered the quos-

Mr. LAMBIET then said, so it was ad-Mr. Krugnon, before he made any remarks | mitted, that in une of the first flospitels in bury's plan was sutitled to the most serious attention of the practitioner.

Mr. Callaway had always edmired Mr.

Amesbury's treatment; but, for his own part, he had mifurmly adopted the plan of Sir A. Cooper. He firmly believed a fracture within the capsule would not unite by hous. Sir A. Cooper had sent to many emineut teachers lu London, Dablin, Edinburgh, and many parts of the Continent for a spenimen of a fracture within the capsula, that atain from further observations upon that had united by bonn, but had never ynt which must be considered foreign to the been able to procure one. Than that emiusut practitioner, no one had ever paid more attentia to fractures about this part of the pleasure. The object of the death body I Why Mr. Amesbury's bed was not was, io any respect, that of keep reguly used, both in public and private, continued extractions of the limb, of walls others, not for him to see

r others, out for him to say. Lzayo ebjected to the position that servix could not have the fractured. convix could not have the fractures, the seas shows to the Society, because my chion had takes the first hands when the age of the publics, and these being on formity. He had seen seen seen or of the age of the patient, and these being or deformity. He had seen persons under fifty wors of age, have the meck of the thigh-bone worn of age, have the mock of the thigh-bone broken ogain and again, where it had united vithout any deformity whategyr. So certain was he, that this union depth he affected, chat's he heard of a penner meder sinty years, a ger meating with the accident, and the the was not cured without depthinity and by a union, he should conclude it has hear historied. Its alluded the beginning and the city union had then penne to fracture within the capacity and he doneside within the capacity, and he doneside within the capacity, and he doneside we the within the capuris, and he openidered the greatest credit was due to Mr. Ameabury for his industry, and the perfection to which he had brought the mode of treating this socident.

M. Suza and entirely concurred with the last speaker. The slovenly practice of the Loodon Hospitals, with respect to cases of this sort, had induced him to look for a better mode of management. He had been in the babit of keeping up autention daily, for three, or four, or five hours, after tension of the limb had subsided, and then putting an apliots, by which means he had succeeded to almost avery case he had attempted. He had no heatstion in declaring, that from the number of cases he had cured of fractures of the neck of the thigh-bone, as well as other parts of the femur, he would undertake to ours any case that might be brought to him; even where the patells was also transversely fractured, he would curs it without deformity.

M. Bricks was much surprised to have issard it suggested, that a fracture of the cerrix could not be cured without deformity; he had treated many cases, and cured them without the least, seving a slight avaraion of the toe. He had been in the habit of using a bed very similar to that of Hamild's. The price of Harold's prevented its being used, at least in some installers, and he feared that the same obstacle might aperate against the more extensive ose of Mr. Ameabury's. The apparatus he was in the habit of employing was very simple, cost only a few shillings, and could be made by any carmoter. It was a double deak; the patient ley on his back, with the thighs pressing against the one desk, and the legs heeging on the oppo-site side. There was a little door, for the purpose of remosting the soil, &c. At the bottom of the desk, there was a board tient at eleves, and has just laft his

contined entroopes of the limb, since are weight of the legs was always found sub-ficient for that purpose. There were pegs for keeping the fagt, in a proper position, and in the same limb with the thigh, when laying straight found the hodge, and there may aid abour it which the pag year atrapped, which completed the apparatus.

M. Wattan believed that the appr Mr. Blicke had alluged to, had been need; a loog time io the Borough Hospitale; been found vary often to fail. It was agreed on all hands, that Mr. Amerbury's investigations a great improvement; and for which was sotified to the gratitude of the profin sion at large.

gat this period of the avening, Mr. Loan, of Hampstead, related the particelars of a case of reptured sterus, in which the Consrian operation had been performed. leogthened discussion followed, and was newed on Monday avening last; but so it was not finally concluded, we shall withhold our report of the proceedings until next week.

CASS OF SCROTAL MESNIA, OFMEATION, AND DRATH.

Ivy Wilmor, mtat. 65, was admitted loto Colston's Ward, under the care of Mr. Vinceot, or Wednesday morning, at 8 o'clock, Novamber 19. The patient is a labourer, of small stature, with a considerable between curvatura of the spine, and was brought from twenty years past he has been, at times, the subject of hernis; that sometimes he could return it himself, at others it had to be reduced by surgeous, and that, until Monday last, he had not been troobled with any descent for the last two years. The bernia came down while he was engaged in pulling up young trees, and he has been under me dical treatment until the time of his admis sion. There is now a serotal herois arrely as large as the head of a full-grown feeting on the right side. The bowels, since the descent of the hernia, have been relieved several times. He has been put into the warm bath, bled from the arm, the taxis applied, sod a tobacco enems administered, but without effect. Ordered opening medlcins, sud a bladder of cold water to be kept

Numerical splinters penegrated the smallest, detashed as well as undeatsched the granter porting of the short, and a communicated fracture of the short, and a communicated fracture against the short and a communicated fracture against the short of t m first small and frequent, a emint under, the tonguo dry bould and dose filed with meabdoming since which mader, the tonguo dry, and rose the most and non-filled with mecua; the small nearly feeld, the throat very painful, the depletition difficult. The tou-alla and mid-induced were covered with a think white, the yellower, the volce was hours respiration; difficultimed startarous, and thick nuces was experiented; eight leach this period exposed himself to cold, the month was of a livid colour, and lined with supplies was saddinity suppressed, the push a thick albuminous mass; the totalls were tales their tay, affections of a violet colour, awollen, and of. a dark red colour. The and general debility, with distribute, came on whole attent of the largax, trackes, and the and general debility, with distribute, came on. whole extent of the laryax, tracken, and the He was twice bled by leeders applied to the larger, bronchial divisions, were covered by size was wrote here by lecthes applied to the harper broachial divisions, were covered by sedomen, but the typhoid state increased, a falsa-incendrano of a white colour, and delirium incooseded, and the foosness were gradieffly decreasing in thickness. The accompanied by issuesmus. On the 18th, happer part of the right lung was hepatised, contains a seption appeared to the backfland vary firm; the 1st long was healthy, and cheek, with difficult degitation and The mucous membrase of the stemach was hearsoness. The fever subsided a little, red, and, on the great curvature, beact with and the new cruption terminated in vesicles, granulations.—Le Clinique.

ABURES IN ST. BARTHOLOMEW'S HOSPITAL

## To the Editor of THE LANCET.

S13, ... Since I last troubled you with come observations on the abuses at St. Bartholomew's Hospital, various changes have taken place, another wioter-carepeign has commenced, new house-surgeons have been appointed, and condry dressers featailed in mur situations; thus, as there is a greater there of action, so is there as selequate proportion of abuse; should you therefore think fit to insert the occasional remarks, I shall seed you in this coorse of the winter, It will still further prove that you ere, what you have ever been, the pupil's friend.
With respent to the demonstrations et

St. liartholomew's, they have been for the last year or two, unquestionably the most inferior in London; and it would become CANOREMOUS LARYMOITIS AND RECONSTRUCTION AND REMOVED A Labourer, 17 years old, had for some the peptial veilere, to pay a little more attime been affected with a very treathleome tention to the qualifications of these where perso. "ULAR ACTION, AND ON THE CURE OF DEPORMITMES.

By Mr. SHELDRAKE.

Ir has already been sold," that the netimes of involuntary muscles begin with the first movements of unimal life, with as much uniformity as aircting will allow, till its termination. Box birth, the cries of the infant, and the su gles to use its limbs, however imperfe give some feeble indications that the pri le af consciousment is coming into action, like the instinct of animals, to obte means of supporting the life of its two body, these attempts, by degrees, increase in nnergy, and assume the apparence of a more fixed purpose, to obtain the means of supporting its own existence; its knowledge, in this respect, increases with its atreagth, till it acquires, in addition, the power of locomotion. At this interesting period, the anxiety which is natural to p rents, stimulates them to seek the best information they can obtain, to give all the perfections that can be given to their children, and in this they frequently full, sometimes by using means that were improper, but more frequently by following practices which are understood by the terms, to leave them to Nature, at a period when to leave them to Nature, at a period when the proper esertions of marke quite as necomery for their welfare, as at any subsequent period of their livea.

Much of the improper advigh that has been given upon this ashier, has been occasioned by miseasderstanding, or misrepresenting an opinion that has been attributed to John Huster; who is represented to have said, that children should ant be confined.

but should be permitted to run about in the metural may. Mr. Henter exertially mid this, but when the circumstances under which he gave that advice are considered, it will noquire a very different interpretation from that which it has received. It was a pre-Vailing opinion is the time when Mr. Hunter lived, that the persons of young females. might to made more beautiful, and more perfect than in their natural forms, by the see of captain articles of dress, and some other contrivances, which then were in geseral use, and Mr. Hunter was frequently consulted by anxious parents, to know whether stays that were made by some fushionthis stay-maker, or some of the many contrivances that were then in general use, would not materially improve the shape of the young lady whose person was under examination. I have often been present at sch ofsestations, when Mr. Hunter has uniformly given advice that was most advantageous to the patient, though it was certainly inimical to the stay-maker and the shape-mender who generally had a strong prejudice in their favour fixed in the minds of the patient's friends. After Mr. Hanter had repeatedly urged all that he thought proper, and was wearied with the pertias-city of his consultant, he has sometimes added with much good humour, " Well, lady, I have said all that I can say; we have talked nonsense enough, so give me my gniaen, and let mu gn to somebody else. This was his good-humaured way of getting rid of absurd applications, which really teaxed him; had he been induced to direct his very powerful mind more particularly to this ambject, he would have enlightened that, as he did every other, upon which he employed himself.

wanpoyer numeer. The truth is, that so far as human beings are concerned, there is no way af walking armoving about that can, with propriety, be called merely natural. The movements of the animal creation may be called natural, because they are impelled, by inatinct, to perform and repeat vertain actions during the whole course of their hyea: the beast of prey is nourished by blood, which is given by the parent, till her offspring have acquired strength and skill enough to pro-

<sup>&</sup>quot; THE LANCET, No. 268,

vide for themselves; from thenceforward have occasion to discontinue, or, they pass their lives in seeking those ani- be called, to unlearn. mals which are to become their proj

The beasts of chase, when in a wild state, carn, from instinct, that they are to be dosty yed by those beautambose prey they are to become; and therefore; these two classes of animals, during the time they exist, use oll their energies, the one in endeavouring to inflict, the other to avoid, destruction; and such being the only objects for which they seem to exist, this practices by which they accomplish those code of their exist-ence may, existly, he called network. But the situation of man is totally district is the child of smill there is scarcely a sit of the earth in which anot, agist; he they conform to his sale city it is which ry that he should be e which it is ind fill; if he is not so educated, he will de to fill that station, or asset with propriety. Hence it is, which are general among steen in a tuntions, are quite unknown so men's is different circumstances. The young, all the varieties of man, whitever saily be the degree of civilization, or of barbarism, in which they assist, ere aither sought all the practices of their pear or loarn them by mere diot of its onrows time, and in those classes of society for whose ose these observations are is but that desire in accompanies with many practices which are not well calculated to produce as happy as effect. The many sa-sional course that can be adopted and puranied to produce this effect, will be, to begin, at the earliest period practicable, after children have acquired the power of moving freely and firmly from one place to another, sh them how to use all their limbs to the best advantage upon every occasion, and to avoid all the awkward and improper habits that they are so prose to sequire, by instating the peculiarities of awkward serchildren very little, but teach it them so were our bone. This is not true; createficetaslly, that it shall never be forgotten, when persons have arrived of mature age, and not let them soquire say habit, or adopt and have their full degree of natural attempth; say practice; that they shall afterwards o very low, and, indeed, obscure motion

Bitar-As children, in the carliest per their lives, ore generally left to the mi ment of servants, these persons sho carefully watched, to see that the their duty; I shall, in another lecture. scribed very simple practices, which, carefully each by those who era cutrust with the management of children in the earliest periods of life, will prevent many of the deflects which it requires so much trouble afterwards to remove ; those dired tions may be called popular; but I shall now consider the subject in a more parfessional point of view, by explaining nature, user, and octions, of the bones, ments, and difficules, by the omedania which all outsitions are performed; all professions men acquire a know, of these part when they receive th education, I still not ceter into a form distriction of the whole, but select snell parts only as will impaire attention, because they are supported with the apolicit that is

der discussion. parts all sing human body may be arranged under two divisions: hest, those these by with parts of the body are moved with represent frames of the. As these two divisions very frequently set together, they requestly art together, they in it was my fortune to attend more early, as well in more early, as well in more early, to the organs dion then to the other division, I tended, a great desire in manifested by give shall begin are explanation, by describing to their offspring all the perfection of personal beauty which can be communifested; quinted with. The boxes, the ligaments, but that desire in accompanied with many gand the manifest, will eliverguire ettention; practices which are not well mileulated to the manifest, while it require tentering practices which are not well mileulated to the homes, because they four the solid the bonce, because they form the solid limin upon which the muscles act; the ligaments, because they restrain the bonce within these dimins to which they should be confided, is under that they may perform the functions that are required of them with the greatest advantage; and the nuscles, because they are the powers which set the whole la motion.

I shall begin with the feet. They cousist of many bones, different portions of which are joined together in a different unusuing the presentation of awaward ser-symbol are joined together in a different wants, and other inferior persons, to whose the manner from that, in which others are united-care they are often entrusted; the notion. The metalized below are jointed together, so that such babits, if acquired sarly in life, as to have agasiderable motion with respect many be easily errolesses; we frequent. By are that such habits, when acquired bouse of the trans, and the house of the phalanx is no firmly united to corresponding bouse of the trans, and the house of the early, are with great difficulty cradicated, farms are so firmly andred tagether, that it and very often not at all. The course that it is not uncommon to say they are an innovashould always be followed, is to teach young table with respect to each other, so if they

"Ne diotected io them, and I shall have the fat opportueities of showing, that position, and yet admit of motion to the full gree exists ie them a susceptibility fur property, which, till I succeeded in demotion, and get admit of motion to the full property, which, till I succeeded in demotions along its ceality, was not thought possition, and so some. The strongest and most many in their nature, and capable of sever to let the point be atrilied beyond much greater derangements in their natural sever to let the point be atrilied beyond much greater derangements in their natural property. The people, who teach what are cambinations, than the fonces of the foot only with respect to each other, and have selves upon what they likewise cell making often been, with ms. at least, more difficult of reduction to their natural instituous, and of restoration to their natural instituous, and of restoration to their natural instituous, and solve the along of those joints upon whether whose deformations is larve ob-

arerd.
In knee-joint is formed lift the condyles to femur, and of the head of the this, h roll upon each other, the bones of fatigues to the action member. teg and thigh have no direct hold upon leg and thigh have no much of the bones and sach other, but are united by very strong ligoments: this joint has but one natural mution; that is, directly forwards at back.

wards, as when we best or struighten the wards, as when we best or struighten the manner. leg. As the uses for which this joint is employed require the greatest exertions to

bulum ; it is one of the strongest joiets of thigh are, in like manner, attached to it at the human body, and it needs to be so, on one end, and so the pelvis and spino at the account of the numerous and important other. The tendons are formed of a anifunctions that it has to perform; in fact, it stance which greatly rescepibles that of the is capable of allowing the leg to be moved capable ligaments, like which it has very in every direction.

shall proceed to consider the ligaments, principal uses of the redons seem to be, which, when properly united, enable them to afford great strength is a small space, so to perfure their estaral functions. It is unite intimately with the fibres of the musinclustic, and incapable of Oxtension; but ner with the hones; thus they secure a measure, and incapable of extension; but nor with the hones; thus they scoure a member scane circumstances, be extended; the muscles must contract; for, by the from these variations of opinion much contracts must contract; for, by the from these variations of opinion much contracts a must contract; for, by the frain has arisen, and may, perlaps, a stitute all the actions of living samuals, be abated, by these setting the fact; the light performed. The tendons are without feelement is, when in its perform state, nearly intention, while they are in a healthy state, but elemin, humsel when a multiple when the come actuated a manifested of extremely in the come actuated a manifested and confident. being lujuted : when suddent's noted upon come acutely securive and poinful. with great violence; it is tern or lacerated; Voluntary muscular movements are said when acted upon with less violence it is to be performed by the olternata action of luxated or strained, and much paic with the extending and contracting power of the inflammation, is produced; when that is muscles, as directed by the will of the never recover them at all.

The use of the capaciar figurants of

detected to them, and I shall have joints is to retain the hones in their natural object of all exercise abould be to atimulate the ports to that degree of action, which can be exerted with the greatest effect, and, at the same time, with the least

The muscles, all the muscles, for examemployed require the greatest carriloss to be continually made, for a great length of the training and as its strength depends embley upon the strength of those ligaments which different bones of the foot, and, at the connect the two bones togalier, they are liable to be deranged in their velaries poalitions, on well as in their velaries poalitions, on well as in their velaries possible to be deranged in their velaries possible to the bones of the foot, and, at the time, as well as in their actions, as I shall have opportunities of showing herostate.

The hip-joint is fermed by the circular the collections of the foot, are attached to the foot, are attached by the circular together. little elasticity, or power of extension and Having said thus much of the bones, I contraction, upon ordinary occasions. The generally believed that the ligaments are cles, and to juin in the same intimate man-

fammetion has been dissipated, ligaments mover; but this cannot be all the directing are very slow to recover their natural power, because it does not account for all powers, sod, in very many cases, they the phenumena, and, indued, but for a very amuli part of them.

If I endeavour to raise, and bring towards

that they might do so with impunity : while this state of things continued, fencing with hips small sword was learned, most sedulously it, rned, and practised by nil who claimed to be him, mght respects his members of secrety; those who used it in real ection obtained safety by the practice, and those who escaped the naccessity of duing so, obtained advantages of snother sort, and that wore to them et least of equal value.

The practice of feneing with the small aword, or thu science of self-defence, as it was called, required that those who prac-tised it should have much muscular strength, and great activity; they could not acquire oscellence, or keep it when it bad been sequired, without much and constant practice; the necessary consequence of this practice was, a great fund of health, and, lt is much to he wished that either likewiss, much eleganes of manner, for alsogel of light or of darkness would wrice though it may be dangerous to ettempt gacase sed firmness, es well in the most direct memmar, without any thing circuitous or unnecessarily acquired to a great eatent hy the practice of using the small sword; though the disuse of it as a dangerous weapon has been seventageous to society in meny re- in his Medico epects, the disease of it ee an amnuement cember, 1823. has diminished the personal adventages of many. The game of billiards is likewise advantageous to the health of those who practise it, though nothing can be said in favour of its moral tendency, because it is most commonly practised in public rooms, where ineautions young men are frequently lod into unpleasant situations.

Tannis, rackets, ericket, and other games of similar tendency, are equally advantageous to the health of those who practise them, and as they are in very general use among mon of various ranks, they coed no recommendation from me.

Dencing is the only practice that deserves treated of that in a separate Lecture, it will less to interfere with any of the arrangenot be necessary to say more of it here. As ments. The design, the execution, end the exercises that have been mentioned, I for any supposed defect in the plan, taste, shall next endeavour to trace it through or composition of the piece, more of its ramifications.

I have sent this letter for insertion in the

after-DR. HARRISON TO JEMMY JOHNSTO mer-

To the Editor of THE LANCET.

So, Mr. Editor, we have Dr. James Joht" son ngain at hie dirty work." Thie con! temptible reviewer can never be at poses in himself, so long as his covious heart siekans et the prosperity of others.

The Mahametaus would persuade us that the founder of their feith was n suint from the fourth year of his aga; the angel Galricl then separated him from his fellows. end cutting oct his heart, wrung from that black drep of blood in which the imagine was contained the forms process
that he had none of it over afterwards.

out of Dr. James Johnson the fomes peccuti, neral definitions of personal grace, it will the black drop, which, rankling in his heart, scarcely be doubted, that graceful action produces such a conspicuous display in all consists in the movement of well-formed his writings. I shall nuw proceed, without persons, who execute every motion with further comment, to notice a refuted charge of this hustling dufamer, which, for want of better materials, he has again revived in the last Fasciculus of his worthless journal. order to rebut the accountion, it will be enough to reprist my own letter, and the Doctor's spology, as they were published in his Medico-Chirurgical Review for De-

> " To Dr. James Johnson (such was my nddress.)

> > Holles Street, Cavendish Square, Nov. 20, 1823.

Dear Sir,-Having secidentally rend, in your Review for September, some suimadversions upon my pieture, lately exhibited in Somerset House, I request the favour of you to publish the following statement, that your realers may be enabled to form n clear opinion upon the sobject.

I had an opportunity to confer an act of civility upon Mr. Shee, which he desired to return, by presenting me with my portrait. Uoder these circumstances, and placing the the name of accomplishment, that can be greatest confidence in his professional skill generally adopted es a means of improving and elegant accomplishments, I did not prethe health of the weaker acx; but as I have sume, first or last, to give an opinion, much I trust that I have shown the principle that even the idea of showing the picture in I have called regulated or an appended naus- Somarset House, were all Mr. Shee's; he is calar ection, is materially concerned in all therefore the gentleman to be referred to,

next number of your joornal, asticipating

See the Fascleulus for Nov. 1828.

Dear Sir, Your abedient humble servant, EDWARD HARRISON,"

" Wa emasider the above explanation as perfectly satisfactory, and are happy to flud that Dr. Harrison has experted himself completely from the charge of bad taste, which was brought against the picture alluded to."-Enirons.

Was it to have been expected, after this byls apology and full explanation, that Dr. James Johnson could have had the stery to go out of his way a second to detreet from Mr. Shee's acknowrefersion; but so it is, as the reader will perceiva, is the following extract. He observes "the Doctor (Dr. Harrison) got

lils pictura perched up in the exhibition with a long crocked spine on one side, and his intended big book of Charlataunerie on the other! This we natirised as an advertisement, and the eracked spins has proved to subsequent erooked policy." -- En-

Would it be believed that, in this abort extract, the veracious Doctor, this puttern of all perfection, has committed not less than two palpublo falseloods ! The apine is not crocked, as may be seen on examining the pleture in my drawing-room, nor has the book any title to designote the author. it might, for ought that uppears to the contrary, be intended by the accomplished artist, to represent the Passicular Iteviewer's imperithable Treatise ou Morbid Sensibility of the Stomuch and Bowels.

15r. Junes Johnson is here charged with two positive and deliberato falsities. Positive in us much us they are evident to the aight. Deliberate, because they have been rankling in his envious hosom more than five years. How can we confide in this reviewer's reports, who draws so continually upon a distempered imagination, that in writing a couple of sentenecs, he aridom units to graco them with some hallucination of bis owo? Of such persons, Locks says, " men will give their own experience the lir, rather than admit of any thing digagreeing with their tastes."

I have to observe further on the shave extract, lat., with regard to the portrait, that is the Literary Gazette of the same period, (a work which has proved too caustic for this hardened sinner,") the de-

dinasa to give it a place there, in algn, the axecution, and the emaments of my maintain the impartiality of your picture were highly commanded. Mr. Shae, and to perform an act of justice to whose refined tasts the whole merit is of course due, was said to have introduced, by these embellishments, a now and brilling oru into this department of the fine arts

2dly. In respect to my Essay on Spinal Diseases, which Dr. James Johnson has designated charlatunoerio, I may remark. that a dignified olergyman, of high and well descreed literary reputation, desired to know a few days since, who attended a certain invalid; the brother said, Dr. Harrison; the inquirer replied, I have earefully read Dr. Harrison's work an spinal discuses, and I am also well ocquainted with the brilliant discoveries of Dr. Jenner. Highly sa I estimate the merit of the latter, I really think we are quite as much indebted to Dr. Harrison, as to him. Here is the nobiassed testimony in favor of my doctrines and practice, of a scientific gentlemse, of whom i have not the smallest personal knowledge. A testimony certainly outweighing an bundred muledictions of the envious and prejudiced defamer. Should be remaio scaptical, and desire further proofs, I will furnish him with the alergyman's name, sod apply to be sufficiently emblematical of the Doctor's him myself for pormission to disclose it, if the doctor will promise to publish my state-

Before I conclude this tedious nurrntive. I have to abserve, that my academical sducation, (no advantage which Dr. James Johoson never enjoyed, notwithstanding his having hy some arrange juggle channed the surreptition titles of M. D., and licentinto of the London College of Physicians,) bids mo tell bim that it is necessary to establish the truth of every proposition, before he preaumes to draw inferences from it; and that it is still more octarious to draw inferences from premises, which the writer knows to be obviously and noteriously false.

lu regard in his officious, repeated, and unfounded attacks upon my character, I now eall upon him to prove, 1st, that the spina is crooked, (i. e. deformed,) utherwise, to recal the real and wicked conclusion, Indly, That the book in the back ground was intended by Mr. Shee, to refer to my then unpoblished work an spinul discoses. Sedly, That it is a great (or little) book of charlstennerie. 4thly, That it really contains may charlstan-

nerie, and to point it out.
Itaring disposed of these four propositions in the best manoer he cao, let bim go nn successively to the rest, ant only in this, but also in my former letter. I now toll Dr. Junes Johnson, without the smallest reser-

Junes Johnson, to expose the proceedings of s person of the name of Long, of whom the See the repeated promises made by Dr. Literary Guzetto had apoken favourably. "

vation, that his honesty, his verseity, and Sonday excepted, and at every he after respectability are all at atake. He must wards, for the admission of cases a lawreither redeem his character, from the grave gency, for the first time, without bomcharges contained io both my letters, or be mendation.

I am Sir, &c. Lowann Heanmon.

Holles Street, Nov. 18, 1928.

BOYAL UNIVERSAL INFIBMARY FOR CHIL-DRSN, WATER LOO-PSINGS ROAD.

To the Editor of The Lancer.

Six,-I beg permission, through the mediam of your widely-circulating Journal, to most excellent institution, with the hope that such publicity may remove them. The funder, in the benevolence of his heart, the principle of administering prompt medical aid to the children of the poor, would be excellent code of rules and regolations was drawn up for the government of the institufounder's zeal and application. Death has deprived the public of the services of this benevolent man; since which time, the the lufirmary, and he in readiness, or all which it is held by the indigent classes, pense to such patients as may require a sied into offect."
repetition of their medicines," and tu " see Will you believe, Mr. Editor, that, bethat the Infirmary be opened for business caess some one or two of these house vicievery day at nine o'clock in the morning, tere had the honesty to write in the book,

pured not only to see the hoper of acoru Than far for the rules; now, Mr. I. or, positived, but to hear the most vilifying eactors directed towards the worst of no a semple:—A poor woman, with his children, applied, for the first time, on Tue-With these defeasing remarks, I most wil- day, October 21, for advice for her Infant, lingly take my leave of Dr. James Johnson, eight months old. The doors were opened between eleven and twelve, and the parties, between 20 and 30, admitted into a cold damp dirty ward, with three small forms, as scats, but no fire. The honr fur the physician and surgeun to attend is from twelve to . one; and, as the house anreon did gof think well to commence his examined until it was quite certain his supplemental than the would not be there, he employed th in getting a lunch. Neither physician surgeon attended, hat the examination out menced at one, and the medicines were al dispensed shortly after four. The child's game? were lanced, and the muther obtained the nelay before the public, a statement of some of coassary medicines for her lefaut, with an order the abuses which have crept into the above to attend again on Satarday. In cousequence of the incessent bleeding, however, which took place from the gums, alse becaum alsoued, and applied again on Friday. Nu conceived, that so institution, grounded upon physician, no aurgeon; the house surgeon, as before, began ut one. The bleeding coutinned, and she applied again on Saturday ; productive of great becefit. He appealed one medical geothema in attendance. The to the public, in furtherance of his ideas, bleeding still continuing, a pon her rourn and his appeal was quickly answered by a hame, also became misorable, and interhiberal subscription, to coable him to carry mined to seek further sid in the neighboariato effect his philanthropic visws. Ac hood in which she lives, when the surgeon hood in which she lives, when the surgeon to whom she applied, found it necessary to pass a needle through the part, to stop the tion, and was carried into effect by the further loss of blood. The child died on the following Toesday!

Let mu sak, Sir, is this the prompt and efficient aid that the poor have a right to streodence of the medical gastlemen has expect? that the subscribers have been less constant. The rules, which were to expect? Are men to write after their intended to regulate the uttendance of the names," Physician to the linyal l'nivarial medicul officers of the institution, see as laftmery for Children," "Surgeon to the follow:—"A physiciso shall attend at the Royal Coiversal lofirmery for Children, Isammay every day, Sunday excepted, to and thus neglect their daty? In this "the give advice, and prescribe for such patients preservation of the jufant families of his as shall be brought to him:" and "a sar- Majesty's indigent sebjects," held out in geon shall attend every day, Sunday ex- the addreas? If the extensive practice, and cepted, to administer to such eases, in his exalted stations, of these gentlemen render department, as shall be brought in him." their sluties to the institution impractice. The house surgeon, also, is to " reside at lale, let them resign; but " the extrem in timm, to reoder assistance, as well during must not he sacrificed by neglect. Dr., the attendance of the physician and sur. Davica seems to have foreseeo that neggeon, as after they have transacted husb lect might, at some time, creep in, and Ha is likewise required, " from therefore house visiters were appointed, to foer to six o'clock in the evening, to dis pre " that the various regulations are car-

By Ropant Mrsay, Esq., Sargeon-Accoucheur, Lewes, Sumer.

"Lorsqu'on ecrit avec un desir sincere d'etre utils, on doit avoir le courage de s'esposer s la critique."

Barona entering upon the effects of a medicite, it is usual to give aume alight description of its properties. The names that this vegetable substance has been known by, are either from its form, origin, or the properties which it has been found to pos-

In France it is called ergot, bled cornu, secalia mater, bled svorte, bled farouche, seigle cornu, seigle a eperoo, or ergotiae, seigle ivre, and seigle noir; it also has been numed, by Gaspard, Bauchin, secala hauvinos; and in Germany, is known by the usme of mutter korn, or mother curt.

Spurred rye, in its mature atote, is of a releast than the locality rye, while uthers are from an inch to an inch and a half in pain heiog leogth, and of n proportionate thinkness; its form is nearly oylindrical, having its ends somewhat obtuse, at times a little point and hent, in the shape of a creaseut; and heing broken trouversely, it internally displays a greyish white aubatauce, covered closely by the coloured cortical substance, which does not separate on ebullition; whee pulverised, it is of an asken grey colour; when the grain is quite dry, it has accreely nny taste, but the powder has a nauseous, hitter, and uerid taste.

Its chemical properties, sa stated by

Vsuquelin, are-

1. A yellowish fuwu coloured matter, soloble in alcohol, exhaling a smell like that of fish oll.

- 2. A white oily unatter, of a hland taste.
  3. A violet-culoured matter, insoluble in
- alcohol.

  4. A free acid, which sppears to be of
- 4. A free acid, which appears to be of the nature of phosphoric acid.
- 5. A vegeto-animul matter, in considerable quautity, moch disposed to patrefaction, and whielt, oo distillation, furnishes e considerable quantity of thick anunoniucal oil.

f. A minute quantity of free aumonia, exhaling at the temperature of hoiling water.

Lastly, it results from this analysis, that rye, in the spurred state, ou longer cootsins any starch; that its gluten has become altered, and that it ebounds with a thick ammoniacal oil, which is never to be met with in rya when in its sound state.

Most of the cases that have on arred to me have been those where the path a suffers accounting and unprofitable pains a days before the uterus makes my efforts be expel its contents, reducing the strength of the patient, and often brings on farrile symptoms. In country practice, in paticular, the ergot must be found an invaluable medicine, when the distance prevents the accountment of the patient, and at the same time not being able to render her any massistance, where a few strong pains would accomplish the delivery.

Case 1.—Aug. 30, 1828, was sent for to Mrs. Walker, of Hormer, whom I remained with for twenty-four hours, the deling dilated then to the size only of the pence, and the pains atrong but including and, ascertaiologi it to be a face production, I gave her a scruple of the ergot powder; in teu minutes the peios became most violent and nneesting, until the child and piscenta were expelled, which was in twenty minutes from the time she took the ergot.

CARE?.—Sept. 14. Was with Mra. H., of Lewes, eight hours. The oa uteri was disheted to the sise of a shilling, and very littin pain heigo present, I gave ber half a drachm of the ergot (knowing her to be of a delicata constitution, and to have had lingering labours with all her children); in about a quarter of an hour tha pains became vary severe, and in twenty minotes the child was hore.

Case 3.—Was with Mrs. Lutman, of Barcombe, no the 17th of September, for twenty hours; the on uteri not much district; the pains strong, but inclicated. I gave here scrupte of the pulv. seed, corout, and in half an lour the child was excelled.

Cass 4.—October 20. Reussined with Mrs. Siomons, of Falmer, nine hours; tho oa uter diluted to nhont the size of a shilling, but no paina; gava her a scruple of the ergot, which I repeated in teu minutes, and in my hour the child was expelled.

CASE 5.—Bira, Morris, of this place, sent for me so the 26th October, at three o'clock, v.s.; the watera land cume away shout an bour; the cas utern being partially dilated, and no pain, I left ber. In twenty-four hunrs afterwards, being called to another boom in the same street, I revisited her, and atill finding nu pains, gave her a scruple of the cryot; the pains camo not in a quarter of an hour, and in en hour and a last time child was born dead, being the aixth dead child she has had in auccession.

This is the first still-horn child that I have met with in the numerous cases where I have used the secole cornutum. CHMOND SCHOOL, DUBLIN.

No wonder, then, at the but night, in some instances, he an useful eliaical's wrath, when his quondam master preparatory for other means. Pargatives was introduced so informally to the public were not to be omitted. Blisters almost by Filius Æsenspii, who, in truth, did not; always did harm. Brandy, ammonh, and disease the ways sentengen to the public were not to be sometimes and the disease the ways sentengen to the public were not to be sometimes and the disease the ways sentengen to such a purity was the sentengen to the public were sentengen and blisters almost a purity was the sentengen to the public were sentengen and blisters almost a purity was the sentengen to the public were sentengen and blisters almost a purity was the sentengen to the public were sentengen and blisters almost a purity was the public were sentengen and blisters almost a purity and the public were sentengen and blisters almost a publication of the public were sentengen and blisters almost a publication and the public were sentengen and the public were sentengen and the public ways and the public was a publication of the publication o describe the very gentlemently tirade my wine, were sometimes used with advan-countryman (faugh! I blush for him) inge; but, of all the remedies, option was honoured him with. Apopus: it was within the one greatly to be preferred. By the pered at the time this letter appeared, exhibition of this drug, in his upinion, the that no warm an emotion coold scarcely be expited by the friendship between the lieving it to be nearly certain, that if sound

landiei, which would, at once, account for to take blood, and then to give opium; one

of the potients he had ottended during two ! opium to be much more affectual in affordsubsection titacks, when bleeding was anneed fary. The production of sleep he
nord to be a most essential object. In
one case he had given four grains of opium
genuine delirian tremens, calling for the
combined with calonel, following that up whitwo grains every two hours, until sleep has obtained, and with the best advantage. Dr. Coates had mentioned a case, in which Dr. Coates had mentioned a case, in which liof. When optum failed to produce a be-ka had given aix grains every hour. Dr. neficial result, end also etimulants, he be-Ayra also recommended it strongly. The lieved it to be owing to the naglect of the LANCAT had likewise suported o case lately, practitioner in removing sufficiently the us occurring in one of the Boroogh hospi tols, where, after two drops of Prussic acid ministered brandy, escept in the shape of had been given, eight grains of opium were punch; and he considered stimulants, soadministered.

Mr. Hiver believed, that when the subwas under disbussion last year, the

riety of taking away blood was much ed. In cases where blood was to be abacted cortainly it never was to be depareded upon as a cure. Nor was it to be taken for granted, that patients had always an amelioration of the attack after the procuration of sleep by mium; on the contrary, it was not unfrequent, that when sirep had been obtained in this way, patients awoke worse than before the administration of the opium. Opium, huwever, was the aheet anchor. Ammonia was much hetter than brandy or spirimous liquor, if stimulonts were to hu giveo. There were conditions in which bloodletting was undoubtedly railed for, but he had seen fatal effects from large bleedings, and he looked upon dupletion as requiring the greatest procession. He had found hearfit from having the head shared, and bladders, half filled with ground icc, applied to it,

Dr. Jourstone concurred with the precaution accessary, where bleeding was thought of. Death had been much more frequent, according to his experience, where bleeding had been resorted to, than where opium had been depended upon. Death, however, would be the result of the majority of cases of delirium tremens, and, therefore, instancing death efter the exhibition of opinus, was not to be raised as a valid argument against its use. He helieved delirium tremans, as it usually occurred, not to be a atate of inflammation of the brain ; it bore the features, in a great measure, of phrenitis, but would not bear its treetment, nor be cared by the same means. In answer to u question put by Dr. Sheil, he could not state the proximate cause of the disease; but certainly the arriving cause, most generally, was the abuse of ardent spirits, and he approved of the exhibition of those medicines which were esleulated to allay irrithat of hydrophobia, where the nervous was perfectly sured.— Granje u. Wakker's system was so much excited. He had found Journal.

commended the application of leeches about the boad, and which eventually afforded recontents of the rectum. He had naver adcording to the astors of the stimuli the pa-tient had been in the habit of using, ought to be exhibited in combination with opium. Ha objected to the practice of applying cold lotions to the bead.

The PRESTRENT WOS of opinion, that If oplum were to be given, the liquor opil sedativus was the best form in which to administer It.

The discussion did not excite much laterest, nor was it kept up with spirit.

The Presiduar was Instructed to give notice, that four of the Committee having waited on the Right Honourable Robert Peel, upon the subject of ansiomy, which was before Parliament last ression, and having received a communication from that Centlaman, a meeting of the Society would be held on Friday evening, the 12th of December, at seven o'clock, for the purpose of hearing Mr. Peel'u communication conreved to the Society, and for its members to consider what future means unglit to be udopted.

#### PARTIAL ECTROPIUM AND TARSONAPHIA.

In this case the patient was affected with ectropium of the external engle, in consequence of a wound in the temporal region, attended with loss of substance. The commissure of the eyelida was distended, and had lost its angular form; the conjunctiva was much axposed, and constantly luftsmed. and the skin of the cheeks excorinted by the continual discharge of tears. Dr. Walther, of Bonn, performed the full uving operation : after having carefully extracted ull the lushes on the external side of the eyelld, be pared uff the murgins of both tard as far as they were everted, and united tham by two sutures. l'erfect coalition having taken place, the inflammation of the conjunctive tation, or inordinote excitement of the nor-yrudually disoppeured, and the patient, with your system. There was no disease, except the exception of a very alight deformity, IGNORANCE OF THE APOTRECARIES' COM-PANY.

To the Editor of THE LANCET .

Sia,-I have to complain of the withering inh uce of this body of old women, or, as you more appropriately style them, "hags" in a case in which the progress of medical science has been checked by their deleterious interference.

A friend of mine at Demerara, wishing to have my opinion on the efficacy of a terebinthinous oxudation, sent me a small quantity to make expariments with, observing, that the natives consider it to be a panaces, giving it indiscrimies toly, and with autonishing success, in almost every complaint, but more particularly in pulmonic affections, in which it is said to remore cough, and prumate especiality. torstion, by simply inhaling it several times a day. This siegular medicine has neturally arrived at the West India docks; and the Custom-House, in its igeorance of the quality of the article, posted it off to the Apotheration Continue for his pasted it. caries Company for information; where-upon the said company, le their Igoerance, returned it with a label, pronouncing it cojeput oil! bearing a heavy duty of one shilling ac ounce. Authis is far beyond the fiscal value, I am deprived of the astisfaction of testing this interesting fluid, or obliged to pay an axorbitant duty upon a large quantity, through the official incompetency of this sect.

This learned secrety took no less than a week to make the luminous discovery; and in order that I may not be charged with exaggerating the case against the Company, in my accoustion, I will briefly enumerate the opposite characteristics of the two

prodoctions.

The nee (Cajeput) is the growth of the East Judia Archipe ago, and is procured by distillation from the leaves of the mulalonic cajupute, a ahrub reaembling nur osier, or sally; the leaves are put in the instant they are gathered, and the oil comes over in the usual manuar, of a bright greek colour.

The fuld in question comes from the American continent, and is obtained from a tree of ensuderable magnitude, found in the vast forests about the Orinoca; the procass by which it is procured is simple, and consists in striking with an axe the bark, and holding a small goord, or calabash, under it, to receive the eaudetion, which is called, for went of a better name, "native laurel oil:" it is colourles, and has the peculiarity of being the lightest field hitherto known."

I am, Sir, yours, &c.

WESTMENSTER MEDICAL SOCIETY

In the Editor of Tun LAYCET.

Sin,-Having remarked in your repoll of the discussions which took place at the Westmioster Medical Society, on the 8th November, upon the subject of acarlating and measles, an erroneous statement of my observations, I beg yoe will permit me to correct it, as my silence, it appears, has been misconstrued into a tacit acquirecence in its accuracy. In the treatment of scarle-tine I am made to say, that I " bled frealy, aud, in this wuy, had almost invariably prevented the progress of the contagio Whereas my observation referred solely the inflammatory affection of the that (and which was perfectly understood every member of the Society with whole have since conversed.) and I mentioned the practice I had recently adopted, namely, " as soon as the disease could be recaynised, to apply leeches to the throat, by which means I had generally seceeded inmitigating the inflammatory symptoms of the throat, if not in prevanting them altogether." I should scarcely deem it necessary to trouble you upon the present occasinn, but for the reason above stated, as the fidelity of the reports generally ie Tha LANCET, has often excited my surprise and admiratiun.

I have the honour to remaie, Sir, Your phedient servant, Gao. Jawas. 24, Sackville Street, Nov. 31st.

BIRTERS IN MEASLES.

To the Editor of THE LANCET.

Sin,-1 beg to add my testimony to the communication of A. Matthews, Esq., Surgeou of Chelsea, in favour of early blinteriug in mensien, in Vol. 11. No. 205. p. 814, of The Lancer, having adopted the means recommended by that gentleman, and with the success which he mentions. I could relate the names and residences of the lodividuals who have bean treated after that geutleman's plan, bet it would be taking up .
too much space in your valuable Publication. Suffice it to say, I have blistered five before the eruption appeared, and the aymptoms have been scarcely worth mentioning. I therefore think it is likely to be of easential benefit to our fellow-creatures.

By inserting this, you will much oblige your constant subscriber,

GEORGE WARE, M.IL. Birmingham, Nov. 13, 1888.

Our Correspondent has faroused us with specimens of both articles, which are left at I'un Lancar Office for inspection,

THE LANCET. Salurday, December 6, 1828.

Glasgow, at the very moment when it was sed certainly not more strongly illustrative supposed to have been not only auccessful, of the ignorance of the Glasgow surgeons, but undetected, has, of sourse, covered its than those of which the accuracy had been parpetrators with diagrace and confusion; fully subfuntiated, we were not insensible aed our adversaries must perceive, by this to the advantage which we should derive the ventage ground which they have from the fraud aed folly of our adversaries, Side anoths of literary controversy, that by any course different from that which we one party should exult in the auccess of adopted to place the fabricators in so disan acknowledged fraud, and claim credit graceful a position as that in which they we have already hinted, wherein a man's with our exposure of the fraud? They are intellectual superiority, is that in which Mr. liating, and, at the same time, ledicrous -credit to themselves, if they were to live to eareer, attempted, like the pious, but pilfer" rogue," eachims that respectable character, | exactity and decorum.

ed with auapicion, yet there ware other parts of the letter containing it which, apon tha whole, removed that auspicion, and we' admit, therefore, that we were, to that tent, deceived. But although, le publishing the case in question, we believed that Our exposers of the freud committed at | we were publishing a case not less gecuice, Their most eatraordinary admissions, in the event of nur first anapicious being , as far as we know, unparalleled in confirmed. Would it have been possible, for a fabrication " well conceived and cle- are now placed, by an acknowledgment of verly executed." The only text-hook, as their own infamy, made simultaneously. deaterity in fraud is taken as a guage of his eaught in their own trap, and a more humi-Peachum procounces, that there are some spectacle was, perhaps, never yet made by dull regues who would never be hanged with men who, in the commencement of their the longast term assignable to men of soar- ing valet in Gil Blas, to palm themselves ing propensities. " without the lesst genius - that follows. Had our anspicions, as to the genninenasa though he were to live these aix months, of the case, been stronger than they really would never come in the gallows with any were-may, had we even felt satisfied that tho credit." It is in Peachum's school that our case was fabricated,—we should have been adversaries have learned to take-credit to perfectly justified in publishing it, provided themselves for the eleverness with which that, by so doing, we took the most effecthey have conscived and executed a fraud; tuel meens of demonstrating the infamy of but it is a little singular, that, while they the fabricators, and the total absence of the pique themselves upon this species of le- esslicious motives falsely and absurdly imtellectual proficiency, they should, in view- puted to us by our calumulators. Such a ing the matter under another aspect, affect case would have been analogous to that of a tone somewhat more in unison with re- auffering a party, known to have been guilty cogoised principles of morality. If, any of the crime of forgery, to complete a medithey, we had any reason to doubt the ge- tated fraud, and thereby furnish against nuineness of the communication, why insert himself the evidence which may lead to his it? We have already stated, that although conviction. We repeat, bowever, that we there were parts of the case, that afterwards shall not be deterred, by this solitary inturned out to be fabricated, which we view- stance of fraud on the part of the Scotch.

the sources of public intelligence, from gavailing ourselves, freely, and without sesp, 'on, of sech communications as may be transmitted to ea from provincial surgeous-To this source the profession is iedebted for some of the most valuable papers which have appeared in this Joureal; and it is no alight testimony in favour of the value of such sommenications, that the stroke in-STANCE is which a case entitled to no credit has appeared in our pages, is one whereie our adversaries admit and boast that they procured Its issertion by fraud und forgery. We have no wish to keep this fact out of night; on the contrary, we are now atudiously travelling over the same shall take care to invite attention to the acknowledged forgery of our opponents, the stale and ridiculous allegation, that the malice.

For some time previous to the 4th of Ochaving published the Lectures of different tained against Mr. Aszanstny, and main. tained successfully, in a court of aquity our right to publish the lectures. The fol-

miscreant, who has endeavoured to poison lowing is the statement to which we allude :---

" It can scarcely be necessary to re nied our readers of the distinction which we wave always recognised between the situation of a public teacher and that of a private our. or of the principle upon which we claimed the right of publishing the Lectures of Mr. ARRANGENT. The lectures of private teachers, which we acknowledge to be private property, we have never published, as we shall presently abow, without the comman's of the lecturers; but the lectures of public medical teachers, delivered within the walls of public hospitals, stand, as we have eniformly conteuded, upon a ustally different footleg. We maintained this polet leasly ood manfully against Mr. ABERY in a Court of Equity, end the issue or coetest was, that the injuection which that gentleman obtained against the publication of bia lectores was finally dissolved by the ground which we tred list week; and we Lord Chancellor, So much for Mr. Asea-NETHY'S lectures. Sir ASTLEY COOPER'S lectures came within the principle on which we relied in our contest with Mr. Agenwhonever we may be called upon to seawer NETHY; but Sir ASTLEY Concer canent, at any rate, he one of those who has been pleadered of his literary property, for Sir freedom of discussion, which we claim ou Antley Contan gave his express consent grounds of public expediency, is sought to the publication of his lectures. The lectures of Dr. Bluneell on Midwifery, by us for the purpose of gratifying private though delivered within the walls of Guy's flospital, we did not consider as public leotures three years ago, because, at that time, so certificates of attendance on courses of tober last, scarcely a week passed in which midwifery were required by the colleges ar we were not essailed as literary pirates, for the universities. We spolied, therefore, for permission to publish them, which was not at that time conceded. Subsequently Professora without their consent, and in de cirtificates of attendance on courses of midfince of their remonstrances. These charges wifery bave been required, and Dr. Blux-DELL has not only not withheld his consent had been made against us, at intervals, for from the publication of his lectures in this years past; sed, for years past, we treated Journal, but, as they were to go before the them with silent disdsin. But, on the 4th public, has added to their value by a revision of the proof sheets. Dr. Assernove's of October last, as our resders are, for the lectures on the Theory and Practice of Medimost part, aware, we published a atate- cine, were published in consequence of the ietimation of one of his pupils, that the lecmeet, demonstrating that, in every case lattination ut one of ints pupils, that the rec-asve one, wherein lactures have appeared Annaranoko did, however, after the appeared in this Journal, they have been published since of the first lecture, object to the pricein this Journal, they have been published ciple of publishing private lactures, in which objection we acquiesced; but having instances, ueder the immediate superintendence, of the lecterers themselves. The excepted case was that in which we main utility—and as he foued that the pupils were desirous of possessing his lestures, he afterwards consected to their publication, and schooledged their sccuracy. Mr. AtSurgery, yera published with his nonsent, boles. Verily we have most respectable sed the force aloes were revised by him. Mr. L. Financa's Lectures on the Anatomy, Physitogy, and Dissasses of the Eye, were published with his consent, and the proof-sheets were revised by him. Dr. Czurrannuca's Lectures on the Theory and Prettien of Physic were published with his consent, and the preof-sheets were slao revised by him. Dr. Spurgery's Lectures and the preof-sheets were slao revised by him. Dr. Spurgery's Lectures and the preof-sheets were slao revised by him. Dr. Spurgery's Lectures and the preof-sheets were slao revised by him. Dr. Spurgery's Lectures and the preof-sheets were published with length of days. on Phrenology, in like manner, appeared with the consent, and underwent the revision of the lecturer. The Lectures of Mr. llnanns on Chemistry, and those of Dr. Ilastan on the Intellectual Composition of Mae, were also published with the express against of the lecturers. All these facts "e had the permission and nethority

several lecturers to state, from the at which their respective courses one completed, as distinctly as we now late them; but we have hitherto disdained to rive this conclusive answer to the calumnies of our enemies, and we have now, once 'for all, odopted this coerse, in order that anch culumnica, if they be again repeated, may be as much contemued in all other quarters, sa they have been uniformly con-temned by ourselves. We may further state, that so far have we been from the imputed eccessity of eaching butten lectures by indirect or disbonourable means, that our difficulty, on the contrary, has been to deal with the numerous opplications which have been made to us for the publicative of lectures, and to appeace teachers, to whose urgent adicitations we have not deemed it expedient to yield."

Since this atutement was published, what has been the course pursued by our adversaries? Have they ventured to repeat that charge? No. Have they had the honeoty and the manliness to acknowledge its falsehood? No. But they have changed the mode of their attack. The columny which was formerly levelled at us as publishers of Lenturea, they now direct against us sa publishers of Hospital Reports, and, in the absence of materials for a tree charge, they have committed forgery to give colour to a false one. They can make, if they do not find, a basis for unfounded accusation, A forgery costs them as little as a new hearen of crystal nost the inventor of the Ptolemaie system ; and they can produce a fabrication with as much facility as the Abbe Sirves

admiration, Is of a species seldom accom-

In discussing the affairs of the medical profession, we have invariably assumed in this Journal, that the majority of that body were liberal in politica, and tolerant in religioe. Though we never antecedently cansidered the consequences of this opinion, as they might affect our interest, we find, on a retrospect of our success, that this presumption was correct. We cannot now, indeed, on reflection, imagine how the men to whom we have addressed ourselves, could have thought differently on these subjects from us; most of them having received. a similar education, and having as few motivas to decline obedience to the dictates of reason and rectitude. Uf all the sourses of discipline to which the human mind is subjected, the atudy of medicine is, perhaps, the best calculated to improve the judgment and liberalize the beart :--

" Emoltit mores, nec siult esse feros."

Unlike the other learned professions, it leaves its voteries free from the influence of prejudice, and preserves them from the sophistry of refining on truth. Untrammelled by the dogmas of the theologien, and nacorrupted by the aubtleties of the civilian, truth is the quarry which the student of medicine, with the engle-wing of freedom, pursues through Nature's vast domain. Neither the necessity of implicit belief confines the energies of his mind within an impassable circle of investigation, nor a temptation to err through the allurements of gain vitistes his uedarstending by a constant undeavour to array truth in the garb of falsehood, until the used to draw a constitution from his pigeon- distinction between both is sometimes obli-

terated by habit from his breast. The objects | scribed, has failed of producing in natural 'vim above the narrow prejudices of the furnished by the Dublin College of , hysimultitude. However the atorm of jarring cians, in the person of their President, Dr. interests which desolate the moral world, Lendrick, at n " Brunawick" meeting of may rage, in his researches, at least, there the Graduates of Trinity College, held blood; the divine harl his denunciations, and made to asy-" That his apinion has ever light the fires of persecution against a guilty been, that the repeal of the Acus for excludless honourable dety, to triumph over error, ment, would he a measure either un and lead home truth coptive in the ear of sary or deogerous: unneccessry, if it . other order of men, he learns to look flown to prove this uncharitable position, thatwith contempt on the maliciona littleness of, " He might safely say, that the great majoman in his ettempts to oppress his apecies, rity of the members of that hody nyer In the earth, he beholds but one great com- whose interests he had the honour at premon, destined, apparently, for the aubsist- scat to preside, entertained opinions similar ence of all its various productions. #### LONDON MEDICAL SOCIETY.

November 17, 1828.

Dr. HASLAM, President, in the Cheir. RUPTURE OF THE UTESUS-OPERATION OF OASTBOTOMY.

Mr. Lonu related e case, in which the operation of guatrotomy had been resorted to by Dr. Hopkins, within the last ten days. This was the cese which, on the last evening, he cansidered so importsot, so to have been nualous then to here had an opportunity of relating. The woman was pregnant with her fifth child; he, Mr. Lord, was sent for, to attendher; she had gone herfull time. When he arrived, lie found very considerable pain in the aldomen; the liquor smoil discharged, the vagins dilated, and well lubricated, but uterioe action very much aliated. He re mained with her for shout three hours; he then gave her three ordinary doses of the secsle cornutum. Uterine action was induced to a small degree. By a vaginal ex amination, he felt the aculp tenne and puffy. The ection of the uterus having contioued for about on hour and a half, he cudesvoured to bring awey the head with the vectia, but failed; at length, he was induced to consider the head was hydrocephalic. Dr. Stephenson was sent for to the case, in coujunction with Mr. Jacob; and, at one time, they thought the best mode of proceeding would be to ley open the heed; bot, from sation of the uterine paies, and the sinking state into which the woman superred to be getting, induced them to suspect a rupture of the nterus, and to send for Dr. Hopkins. Dr. Hopkins, on his arrival, agreed that the

plaster, compress, and handage; and apches, to prevent peritonitis. A small quantity of nourishing diet was given; the patient ex-pressed herself greatly relieved, and passed a good night,—but diad on the following nfternoon.

Oo exemination, after death, there was enagulable lymph on the adges of the wound; very little peritonitis had taken place; and there was e rupture of the uterus, abun-dantly large to edmit of the escape of the child. The head of the futua was immensely large, and no excellent drawing of it was submitted to the iospection of the Society. The diameter, from chiu to occipat. aured nine inches and three quart cumference, from chin to occiput, inches; from the upper part of the ... the enterior fontanelle, eight inches.

Mr. Wallen wished to know how soon, after the rupture hed teken place, Dr. Hopkion had men the patient! whether any on the oscape of the child into the abdomen? and whether the auggestion of Dr. Blundell had been ettended to,-thet of removing tho womb entirely !

Dr. Horsans stated, in suswer to the ebovo queries, that he auderstood those dungerona symptoma had not manifested themselves long before his arrival. The circulation he foned to be exceedingly incressed, the pulse 155, with great depression of the vital powers. The Doctor made an accurate vital powers. The Doctor made an accurate examination, by the introduction of his haod into the vagina, when he found the uterus permanently contructed; so much so, es to prevent the admission of more than too fingers; but he could feel the lacerated aurface as fur an its contracted state would onable the fingers to reoch. This cuntraction elicited some practical remarks from the Doctor, respecting the difference between this permanent rigidity, and the spasmodic action exhibited, in some cases, during parturition. The hand was carefully withdrawn from the vagios, end, un passing it over the abdomen, the focus could be distinctly felt. It was ascertained that the entire fortus had escaped from the uterus, and, consequently, there could not be a doubt as to the propriety of the Caurian operation being resorted to; although, from the exhausted and dangerous uterus had been ruptored, and that the child statu of the patient, few hopes cauld he had escaped into the abdomen. The Doctor in- entertained of her altimate recovery. Findtroduced his hand into the vagina, but, finding ing it impracticable to deliver by the the, uterns completely contracted, and that ustural canal, an enems was administered, he was unable to reach the feetus, he there-end the catheter introduced. The woman fore proposed the operation of gastrotomy, being placed on her back, in the centre of as a déraier ressort. The child was removed the bed, with the head slightly alevated, the through an opening made in the abdomen, Doctor commenced the operation, by makof seven inches and a half in length, and the ling an incision, half on inch to the right whole operation performed admirably, with- side of, and on a line with, the lines alba,

exposing the focus as he carried down that that part of the natrus found subsequently scalpel. The focus and placenta were re-liscerated; the pain had continued for three moved, and the operation completed in about months without intermission. He con-

removing the uterus, the idea was so outre, as scarcely to require a thought. There was no man more deserving the gratitude of the profession than Dr. Blundell, for the great perfection to which he had brought the science, and more purticularly abdominal sur- bealthy condition. gery; but he (Dr. Hopkins) could not imagine this to be a case in which the excision of the uterns was in any way called for; in-deed, he had no besitation in believing thet, had the operation been attempted, the pa-tient would, is all probability, have expired re its completion.

. Water sons there could be ficulty whetever removing the sterns wholly, and that it would have been much better to have done that then to have left it in an unsound state. He regretted that no answer had been given to his questions, whether any attempt to turn, hume- night, upon his fracture case, was not such distely after the accident, had been made, as he shen understood it to have been. He and what the exact time was at which Dr. | could not understand the discussion at all, Hopkins saw her.

Mr. Summer, looking at the immense size of the head, considered that it must have erected on uncommon mechanical difficulty in the partnrition; and the question mind, he wished distinctly to propound the with him was, whether the argot which the question, whether, in the upinion of the Sopractitiooer gave, had not been the imme-

diete and entire cause of the accident. ergot producing the accident; he did not think the pains produced by the exhibition tinctly known. of it, atrong enough to have ruptured the

after death, which, together with the fw- eventually hovo caused the ruptureon that pert, namely, the posterior surface, the organ oppeared completely nitered, and softened in its texture. Judging from the morbid appearance of this pert, be could not recancile his feelings to the idea that the secale coroutum had been the sole means of causing the mischief; but that the parturient efforts, unsided, would have been sufficient to produce the ropture. Indeed, he made a point of inquiring from the putient, and ascertained that she had felt a patient, and ascertained that abe had felt a Dr. Hornys had not punctured the doll and continued pein in one partien-head, which was in his possession, as lar part of the abdomen, the situation of well as the whole of the forms and the ute-

ceived, therefore, from the post-mortem apin snawer to Mr. Watter's proposition of pearances, there could not be a question but that it originated from chronic inflammati at. The feetal head, again, being partially decomposed, the integuments must have given way, before the accident could here oc-enreed, had the entire uterus bean in a

#### November 24.

THE REGISTRAR'S INCORRECT MINUTES,-CONTINUATION OF MR. LORD'S CASE OF RUPTURED UTERUS, AND DR. HOPKINS'S OPERATION OF CASTESTOMY.

AFTER the Registrar had reed the minutes

of the last meeting,

Mr. AMESUURY took an objection to He declared they were not correct; or, if they were, the discussion of the former by what appeared from the minutes.

Mr. SHIRLEY said, that, as the discussion on Mr. Lord's case, when the Society last met, had not been at all satisfactory to his ciety, the administration of the ergot of rye was not the proximate or immediate cause Mr. Lonn objected to the notion of the of the rupture of the uterus? He thought it highly important that this abould he dis-

Dr. Hors ins stated that, as far as he was uterus; he thought it more reasonable to capable of judging of the condition of the ascribe the accident to the largeness of the uterus, the whole of it appeared to ho in a head, combined with, in all probability, a healthy state, excepting the part at which vitiated state of the posterior part of the the rupture hed taken place. Here the texture was considerably altered; the sub-Dr. Horkins objected to the notion of stance was much softened, and though the ergot, aloue, producing the accident, he was not present when the ergot was adthough absent when this remedy was hed ministered, yet he thought that, had it not recuprate to. On examining the uterus been axhibited, the head of the futus would coverings of the head were so thin that, found it healthy, excepting near the larera- if the uterns had been in a healthy state tion, through which the child passed; but throughout, he thought they must have given way before it would have ruptured.

A Member wished to know whether, efter the exhibition of the ergot, there was powerful and long-continued uteriue action? Mr. Loan observed, that the action wes

remarkably moderate, and by no means so great as that which useelly took place in the expulsion of an ordinary furtus.

The I'nesident inquired of what the bulk

of the head was composed ?

great importance, as well with respect to him that he had used it lu that case in regard to Mr. Lord's conduct in the man which he (Mr. Waller) had over been regard to Mr. Lord's conduct in the man angument of the case. He was inclined to pupils the ebsolute necessity of not haveonault the feelings of this young practitioner, and to state, the the impression on The Prixslower ebserved that, is this his mind was, that the exhibition of the ergot did no harm. He abatsiced from saying ony thing upon the question, whether, in the present instance, the ergot was called for or not, only feeling inclined to think that it had doue no harm.

Mr. Wallen observed that, if truth were to be suppressed, and the feelings of indivi-courted inquiry. At the same time deals only to be consulted by the Society, complained bitterly of being pelted on all such a Society would not be worth attend-sides, hefore sed behind, with so many ing. Mr. Lord should know, that any quea- | questions. tions that were put, or observations that were made, could not be intended to inplicate him personally, but only with a view to the advancement of science. Mr. view to the advancement of science. Mr. was necessary that some parteristic action Lord had stated that the head was hydroce-should be present when the ergot was given, phalic, and that it had not proceeded heyond the hrim. If he had made up his mind that the heed was in this state, would it not have been infinitely better to have punctured it with a sharp instrument? It had been said, that the ergot had nothing to do with the rupture of the uterus: this might he, but if ony part of the womh was in a morbid state, and inclined to hurst, the administration of the ergot was unquestionably calculated to increase that disposition. At the former discussion he had isquired, ing it till the on uteri had no far dilated, and but tu which he had not been able to get anawers, and therefore he put his questions again, whether, immediately after the rupture of the uteros was detected, eny attempt was made in turn, and how long subsequently it was before Dr. Hopkina saw the cose !

Mr. Lonn viewed the case candidly and impartially, end, if any error had been committed, he abould willingly have confessed rice action came on, prupulsive and conti- and had ever since cootiened to du so. She nued, but not violent.

rus. Some part of the contents of the Mr. Wallen certainly did understand lead, however, had lately escaped, and Mr. Lord to say, that he had ascertained which was finid. He thought there must the head to be hydrocephalic; but orders have been a gallon of finid contained within upon this latter statement, of Mr. Lord, he head. Dr. Williams coesidered the case of have resorted to the ergot. It seamed to

Society, there was a great disposition to doubt; and, as that was the ground of all sound philosophy, he heped Mr. Lord would excuse it, and answer, as distinctly as possible, the questions the different members were pleased to put.

Mr. Long was anaious to do so,

Mr. LAMBERT inquired whether the palua were totally absent when the ergot was od-ministered? As far us he had learned, it as it had not the power of creating paln.

Dr. Hopkins, before this question was anawered, desired to be informed whether, if Mr. Waller had been attending a patient who had had anveral favourable parturitions, and found the og uteri dilated, the vagina lubricated,—supplising the head was of the ordinary dimensions, feeling the head, but fieding it could not descend,-be would not have had recourse to the ergot?

Mr. WALLER would never think of givlabour had so far advanced, as that he could not only make out the presentation, but the situation. He should consider himself acting highly culpably, if he were to act upon any uther rule; insamuch as the head might be lying transversely, and his conduct might be attended with the most serious mischief. In the case which Dr. Horston

had put, he should wait, and do nothing. Dr. Blick doubted oltogether the effect it; but, upon his honour, he believed there of the ergot; indeed, he could by his hand but one one. He had waited three hours, on his heart, and say it had office whatfrum first seeing the patient, hefure he begau to edminister the ergot, during which attend a hady, under very peculiar circumtime no uterice action had taken place. The istances. She had had five children in the
os uteri was dilated, and the vagina well course of eight yeers. Symptoms of pregof uters was distent and the vagina were course or eight years. Symptoms of preg-lubricuted. In passing the fuger, to felt inner had again proceeded, frout the be-the scelp corrugated; the finger passed tea-dily and easily never the parient hone, and or 5th of August, she had violent theory nothing more could be discriminate. This pains. She was nick and comited, and lost he considered favourable for the use of the a considerable quantity of blood. On the ergot. Ito gave it, and it was not till three 19th of the same month, the membraces or four hours after the exhibition, that ute- broke; ahe then began to decrease is size, had removed from the vagina a small piece

(Laughter.) She had aubsequently dia- occurred to Stamford Street, only the other charged coagula and livid sobatanees, something like pieces of liver. He believed he should astonish the Society by saying what had passed and travelled through the uterus, Dr. Walanman had bed great caperience and that the shild had entirely escaped into in midwifery. He agreed with the obserthe abdomen. He could detact no rupture whatever of the vagina. There was now a tomour oo the right elde of her abdomen, which, when touched, produced o tickling sensation. The howels had been remarkably good; also had never had eause to complain of them; sod this brought him to the question, how far the Casarian operation should, on -say occasion whatever, he performed? Eacept the tumour he had alluded to, this lady ed nu bad aymptoma whatever; and he Me, either in the abdomon or some other art, and through which the foetus would be experied.

eahibiting the ergot to be in the nature of was said. He deprecated certain modes of o decoction. He wished to know from Mr. expression, as, "I assure you upon my Lord, how long the woman, in his case, had honour," and considered them much more been in absolute labour, before the rupture applicable for a stage than a scientific soof the uterus took place, and how long the uterus was ruptured before the gastrotomy

was resorted to ?

Mr. LAMBEUT ridicoled Dr. Blick's notion of the inefficacy of the ergot, which this case not to have used the ergot. He atood alogly opposed to a host of the most thought aufficient weight had not been respectable testimony. At first he was induced to think Mr. Lord had out made ont a proper case for the administration of the ergot, but his opinion had somewhat changed. lle, however, wished to know how long parturient action had been going on, when the mechanical impediment to delivery was ascertained, and how long before the exhihition of the cornutom? It was his decided opinion that, when the physical obstruction was discovered, the hydrocephalio head should have been perforated without dolay.

. Mr. Lonn-Are we to suppose that e country practitioner la like Dr. Stop, always going about with his green bag under his arm, filled with instrumenta? (Laughter.) I live et Hampateed; I was called to the case a mile distant from my house; I cannot determine when the uterus was really roptured; the symptoma come on gradually; I had no abarp justrument with me to puncture the head; it was in the middle of the night, and it ought to be recollected, that it is exceedingly difficult at this time, in o country place, on all necessions, immediately to procure instruments, and the assistance of friends, whenever they are wanted. An instance won detailed in The LANCET, a short time ago, of a case hoppening at Worceatur, where the practitioner authenticated cases to justify the accoucheur was not at all aware of the rupture of the in following the child, and extracting it

of hone, having previously felt a pricking, juterus that had taken place. Another case day, of a rupture of the uterua, where it was not detected notil an examination was made after death.

Dr. WALBRUAN had bed great experience vatious made, that the presenting part, and the condition of that part, ought, in this case, to have been distinctly ascertained, before the ergot was resorted to. If the hydrocepholio state of the head had been sacertained, he apprehended only one course ought to have been pursued, that of per-forating; and that if perforation had been resorted to, the life of the patient would have atood a much better chance. He should have been averse to the performance cht absocasea would ultimately take of the Constion operation, under the cireumatances of this case.

Mr. Asnwatt regretted to have observed soything like a supposition, that personali-Dr. RYAN considered the heat mode of ties could be intended by coything that ciety. After giving every possible etteoheard nothing to remove him frum his first opinion, that it would have been better in given by the Society to Mr. Waller's observation, that before the situation of the head was ascertained, it might be lying unfavourable to the use of the ergot. Here the head still remained obove the brim; there were long-continued pains, aud, probahly, such as the woman had always formerly had, therefore, he should not hove considered it a case for the ergot. At tha same time, he was not prepared to any the nterus would not hove ruptored, had tha ergot not been had recourse to. He boped the detail of the circumstacces of this case would lead to a more careful administration of this medicine, and if so, that detail would be proved to have been usefully made. In bis opinioo, the ergot was a most invaloable remedy; it had often greatly quickened lobour, and restrained hemorrhage. He thought if a futua escaped ioto the obdomen, the occoucheur would not do his duty, if he allowed it to remain thera. The child might escape into it alivo, and might be extracted alive, which was a powerful argument in favour of gastrotomy.

Dr. Hopkins again observed, that the uterna had perfectly contracted by the time hu saw the ease, and the woman was in a very exhausted state; the pulse 150.

Dr. RYAN thought there were many well-

## December 1.

INCOMPRET MINUTES. - CONTINUATION OF MR. LORD'S CASE,-POINT OF CAPEU. ATOMACH OF AN EXTRAPRISHABY SITE

THE minutes of the last meeting were read. Dr. Walshnan, after taking an objection to the correctness of the Registrar's minutra of the last meeting, resumed the dis-He had met with many cases, in which a adopted by Dr. Hopkins, is the opera-bydrocephalic state of the head presented, of gastrotomy, he considered to be the forsted than to have given the ergot.

Mr. Dountabay related several cases, in the sequel of further pregnancies. When it was nace fairly ancertained that the on uteri condition of the head and sucrum, the head could not pass, no doubt could be cotertained that the sooner perforation was resorted to, the greater chanco of safety there existed for the mother. A case of this nort was very anniogous to a case of atraggulated hernia. In the latter case, when it was clearly found that the hernia could not be returned, the less delay that took place before the operation was performed, the better. He produced to the Society one apecimen of ruptured uterus, in coosequence of perforation not having been resorted to in

Mr. WALLER regretted to have been under the necessity of having had to Inquire, for about the aixth time, without having obtained any answer, whether any attempt was immediately made, when the rupture took place, to bring away the child through the natural passage; out, if not, within what time afterwards, the operation to turn. or the Casarian section, was performed?

Mr. LAMBERT considered rupture of the

when accepted into the abdomen; but he had been estimated by Burne, as scour-decidedly objected to the operation being ring in the ratio of 1 to 1000; but he performed when the woman was in so ex-banated a state as that detailed by Dr. Hop.

The contract of Dr. Willan, on the Diseases

Alter. of London, it was stated that, out of 2002 labours which occurred in the practica of an eminent accombiner, there was only one instance of lacerated uterus. Reverting to Mr. Lord's case, and passing over the treatment which, in his (Mr. Lambert's) opinion, should have been adopted,-unmrly, perforation of the head, and which would, in all probability, have prevented the rupture of the utorus, who was desirous, at once, of coming to the question, sa to what were the most advisable means to be purcussion of the aubject that occupied the at- sued when such an untoward event had tention of the Society on the former night, taken plane? The practice which had been where the life of the petient could not have proper measure. Three modes of treatment been saved without perforation: many where it present themselves for consideration, as it was saved; and he had likewise med with Burns justly observes, when the nterus cases where it turned out afterwards that, it ruptured during gestation, and prior to if the operation had been resorted to, the delivery:—In leave the case to Nature, to make a would not have a saled. A land delivery:—To leave the case to Nature, to mother would not have perished. In Mr. deliver per tim naturates, or to perform gas-Lord's case, -considering the well-tormed trotomy. With respect to the first ansaure, pelvis; the calarged condition of the os mars, he would simply remark, that there was no so as to have allowed the introduction of the well-authenticated case of recovery, where vectis; the nature of the presentation,-it the feetus was allowed to remain in the would have been better practice to have per. cavity of the abdomen, the woman being at the full period of gestation. As regards this secood means, delivery per vies naturales, he Mr. Doubling related several cases, in would only repeat the language of an emi-which perforation was performed with antery out writer:—"To dilute the on uteri forri-to the mother, where, otherwise, sho could be an extract the child, is a propo-not have been delivered: as anneared from the countries of the second of the countries of the coun not have been delivered; as appeared from a stron so rest and heterday, that I know no the sequel of further pregnancies. When it one who would adopt it." The operation of was fully cilated, and that, owing to the measure, and although the experience un gustrotomy, then, was the most preferable this subject was but limited, yet, looking to the results of the few cases in which the operation had been performed, we are fully borne out in its adoption. Since the last meeting, he had referred to the nuthorities on this subject, and he found that the first case recorded, is in the 3rd volume of the Journal de Alediciue for 17ti8 : the woman hern aurvived. In the Memoirs of the French Academy was no account of a case in which the operation was twice performed by Lambron, on the same female, yet she did well ; and, leatly, in the 2nd volume of the Quarterly Journal of Foreign Medicine. a auccemful case was related, on the authority of Bernard and Latonebe. With reapret tu Dr. Byan's observations on Dr. linphina baving operated at a timo when there was much depression of vital power, he (Mr. Lambert) woold say, that the prestation is a leading characteristic throughout of rupture of any viscus; that patients dis in this condition, without any apparent effort at re-netion; and, consequently, that uterus of axtremely rare occurrence. It say delay in opening the abdomen, and

removing an oppressive cause, in his opi-| Still he was justified in making the obsernion, would have been celpuble.

Mr. WALLER, in explanation, considered that Mr. Lambert had altogether mistakan the nature of his interrogatories, netwithatanding the numerous times they had been repeated. Every person knew that, after the uterus had espelled its contents, and contracted, no hand could be introduced inte it; but there were many cases on recerd,-Dr. Bhindell had often met with them. Mr. Doubleday had met with them, ethers had met with them,-where, immedistaly on the rupture of the utarus taking place, the hand was introduced, and the child brought away by turning.

Mr. Loan conceived that no parson could have expected the rupture to have takee ece, from the mild pains the woman was an heur and a half, more or less, before the side, terminuting in the polvis, a consider-rupture took place. The accessity of per-able portion of which it filled upforation, befure the rupture took place, was not called for. There was no fair analogy to be made between a case of this sort and a man labouring nuder hernia. Had the large state of the head been foreseen, he should not have given the ergot, but would have punctured the head with a penkuife, rather than have left it until the rupture took place. The morbid condition of the pterus had not been sufficiently adverted to by the Society. 1 -: had seen a cese on that very day, in which the aterna was ruptured at the period of quickening, either by some pain of the nterna itself, or a atotion of the fatus, as the woman was descending from a stege-coach. The os uteri was soft and dilutable, but the operatice of turning was not attempted. After the excessive large state of the head was thought of, he considered that, even if delivery was secom-plished, the child sould not be saved, and the mother's condition but very little meliorated.

Mr. Kingpow was of opinion, that, considering the able and candid manner in which the author had brought forward this case, and the excellent abilities ha bad proved himself to possess, so further ques-tions ought to be put, which could be per-sonal, or painful to his feelings; the grati-tade of the Society must be due to him.

Mr. Loap should not have wished the net been that, on the former night, a gen- about that time close upoe the crifice of the

Mr. Lamant-lieving been the indiviconducted himself as Mr. Lord had done, until it arrived at the critice, where it has

vation; and he repeated, that the wesse bad been lost; inasmuch as, in all prob bility, if perforation had been resorted to, her life would have been saved,

Dr. BLICK requested that certaic parts of the Laws of the Society might be read from the Chair, which he considered would bear out his argument, that, on the furmer evenlng, at the breaking up of the Suciety, the President had no right to interrupt Dr. Hepkius in the statement he was making.

The Passinexy (interrupting) - Dr. Blick, alluw me to request that you will sit dowe, Sir, and to assura you that I shell not bear another word on the subject. (Hear, hear.) Mr. WALLER exhibited to the Society, sa a curiosity, a female atomach of cattaordinary aise. When in situ, it eatended from the natural situation down nleng the left

# GÜY'S HOSPITAL.

CONTINUATION OF THE " NO HEBRIA" CAST.

Normand has transpired worthy of notice in this case since our last report. The discherge, which was prenounced feetlent by the surgeon, has not been observed sinca the 21st.

Dec. 1. On visiting him, with Mr. Kny, we found the wound had ecerly healed. He has been taking a generous dies, and, in fact, is not much worse from the uperatioe.

## ST. BARTHOLOMEW'S HOSPITAL.

#### EXTRAVASATION OF UNINE.

STEPREN Nossie, et. Si, a meacular baker, and a hard drinker, was admitted into Colston's Ward, Sept. 12, with conaiderable inflammation and distension of the perineum ned scrotum. Was ie grentagony when brought in. States that he lies had a difficulty in voiding his urine for the last two discussion to have proceeded so far, had it years, ne account of a chancre that he had tleman ebserved that, in this case, the wo-man had been lost. until this case, the wo-contracted the crifice of the apertura, so that the atream of water has never since dual who made the observation, considered been larger then a small crow's quill, it due to Mr. Lord to assure bim, that he Upon passing a small-sized cathoter, every certainly did not meen the remark to apply uther part of the urethra appears free from personally tu him. He might, if the case contraction The urina has always seemed had fallen to his (Mr. Lambert's) lot, have to him to pass frealy along the urethra

been auddenly arrested in its progress, and often most painfully distended in the nrethra. zelt a little pain in the perineum, on making water one evening, after drinking and dancing at Bartholomew Fair; and, on axumining the part, discovered a small awelling. which bee gradually increased in size, and extended to the scrotum. This has been distended and painful fur the last two days. Mr. Stanley, who attended for Mr. Vincent, saw the ninn about an hour after ha was brought in, and entertaining no doubt about the nature of the case, made an incision, of about two inches long, in the parineum. A quantity of offensive pue and urine immediately gusbed out. The catheter was withdrawa, bot and molat flanucla ordered to he constantly applied, and calomel and julap taken, with a dose of house physic.

13. Ilas passed a reatless night, and is very feverish this morning. Skin hot; tingue dry; pulse quick. Is much relieved by the uperation. The bowels have been freely mured. The principal part of the urins flows through the wound. A small portion has escaped by the urethra.

16. Now passes the greater part of his uring by the matters, though a little than the same than

still comes through the wound, to which a poultica has been kept. During the last day or two, granulations have aprung up. The acrotum is diminished to its natural size; tongue moist, pulse neutral, and he is, in all respects, doing wall.

22. The uring finws autirely through the nrethrs. The wound is nearly closed. In consequence of some inflammatory sympt ms about the chast, the dresser has bled him to-day to 3avj. In a fortnight after, in was quite well.

In the latter part of our report from this Blospital, last week, it should have been atated, that the bone was discused for a con-siderable distance above the fracture, and that the fracture did not estend up the bone.

## HOSPICE DE PERFECTIONNEMENT.

#### ASYSTPELAS PRIEG MONOLES.

Sevanal new methods of treating erysipslas have recently bean proposed by the French anysons. M. Dupuytres has often seen an extraordinary effect from blisters; and M. Larrey kinws, in this disease nlso, as in many others, no remedy superior to the application of muxa. M. Velprau, of the Hospico da l'erfectionnement, has frequently effected a speedy cure by continual pressure, especially in such individuals where general and local blood-letting is inadmissible.

A female, 65 years old, and of a very unhealthy cunstitution, was, on the 25th of August, admitted into the Hospica; the left les was swelled, hot, very painful, and of a brown-red colour; on pressure, somn subcutaneous fluctuation was perceptible, the knee was slightly enlarged, and the syncvial capsule anmewhat distended by fluid. The disease of the leg extended rapidly to the thigh, which, within a short time, was affected in its whole length, and in such a manner as to threaten gangrene. The conatitution of the patient not admitting of bleeding, M. Valpeau ordered compression of the whole limb; the bandage was made very tight, and re-applied as soon as it be-gan to loosen. At first the pain was considerably increased, but it soon abated, and at last entirely censed; so that, within iew days, the patient was discharged, cured. About the same time an old man was ad-

mitted at the Hospice, with eryaipelaa phlegmonodea of both lega, which were much awelled, very painful, and discolured. The putient, being of a very plethoric habit, was twice bled, but the bleeding, baring no influence on the local disease, pressurn was resorted to, which pravad so effectual, that the cure was completed within aix days .- La Clinique.

#### HOTEL-DIEU.

#### PENETRATING WOUND OF THE SEULL.

A young man, who had been stabbed in the right orbit, immediately below its upper margin, was brought into the Hospital in the most complete stupor, visiou, hearing, and general sensibility, being quits astinct; the wounded eye protruded from its orbit, its vessels, and those of the eye-lids, being gorged with blood. He was freely blad from the foot, but, in the following night, had an attack of the most furious delirium. The neat day the stupor and paralysis still continged; the pulse was vary small. The patiant was again bled twice, but without any alteration in the symptoms. On the third day, the respiratory muscles began to be paralysed; his breathing became atertorous and very difficult, each iospiration being accompanied by a trembling of the whuln body. M. Dupuytren accounted for this symptom, by supposing that an entravnastinn had taken place at the base of thu skull, which suspended the function of the respirutory nerves. The patient was bled a fourth time, but the difficulty of breathing increased, and he died on the same day.

The bones of the skull baving been removed, it was found that the instrument congulated blood from the arteria curporia ing the knife along the groove of the staff. callogi .- Journ, Cener. des Hopit.

#### LITROTONY.

The aorgeons of the Hôtel-Disu, MM. Dopuytren, Breschet, and Sansun, bave recently endearoused to determine the comparativo merits of three different mathoda of lithotomy. The first adopted the transverse; the second the lateral; and the third the recto-vasical section. The four patients operated on by MM. Dupoysen and Breschet were perfectly cured; hiat in one of the two cases in which M. Sanson performed the recto-vesical operation, there remained a fistulous opening between the rectum and the bladder. in one of M. Dupuytren's patients there occurred, soon after the operation, a violent isteraal hamorrhage, which was soon discovered by the great tension of the hypogra-trium; the distinct, soft tumescence of the bladder; the frequent and fruitless dosire of making water; and by the auddon pale-ness, with intercurrent attacks of syncope; it was checked by a doseil of lint introduced into the bottom of the wound. The number of cases in which the threa methods of lithotomy were performed, are not sufficient to determine the respective value of each; but the frequency of a fistulous opening between the rectum and the bladder, after the recto-vesical operation, and the danger of wounding the semiasi vesicles, appear to be sufficient ressons for shandoning it altogether. The Annali di Medicina contain the bistory of a onse, io which there remained, after the operation, an incurable fatulous passegs between the biadder and rectum, and where the seminal vesicles were divided in such a manner, that during coitus, the semiaal fluid was discharged through the rectum. It acems, buworer, that the recto-vesical operation, which, at first, found so many partisans in Italy, is now generally relinquished there for the median section, a method also proposed by Vaceu, in his last Memoir on Lithotomy," and which, indoed, seams to have considerable advactages over it. This uperation is performed in the fullowing mannor: un locision being mudo in the rapho, extending from the external aphineter sai to the bulhus urethra, a probe-

had peactrated through the urbit into the pointed histoury is inserted into the groova abhatance of the brein, and that a piece of of the anti, the handle of which is pressed bone had been threat into the anterior lohe, towerds the pubis, so that the neck of the ngreat portion of which was found dissolved, bladder and the prostate gland present and mised with a sunsiderable quantity of themselves, and are easily dirided by possible themselves. The principal advantages of this method seem to be the following :-

1. The bladder is opened in the abortest way, and the wound admits of the greatest dilutation, being in the centre of the outlet nf the pelvis, and surrounded by soft parts

2. No large vessels, and only the minuta ramifications of the joudends are divided, and thus an occurrence is aroided, which not nefrequently led to a futui termination.

3. The koife in nimost mochanically earried into the bladder, and the parts, in question, are very easily dirided, being kept in a

state of tension.

4. The fieger being introduced ioto the bladder, the stone is very easily felt, being, by its own weight, carried towards the wound, which is at the lowest part of tho bladder.

5. The aituation of the wound best promotes the discharge of calculous fragments after the operation, and prerents sanguineous or urinous extravasation, which so uftan takes place after the lateral operation.

#### HOSPICE DE LA SALPETRIERE.

#### OSSIFIED AXTRA-UTRAINE PRETUS.

A PEMALE, who had been for several years at the Salpetriere, on account of meotal derangement, diad in her 77th year. On examining the abdomen, a small tumour was found in the pelvis, slightly adhering by some layers of cellular tissue to the mesentery, and a loop of the small intestinen; tho nterus and its appendages, as well as the other abdominal viscera, were perfectly healthy. On a closer inapection of this tumour, it was discovered to be the skeleton of a fætus, surrounded by a thin, and nearly trausperent, membrane; it had un oval form, was two ioches in its largest dismeter, and was, by a sort of indenture, divided into two unequal halves, the largest of which contained the houd, the smaller the trunk. Tho skall was fery well formed, completely ussi-fied, 12 lack in its antero-posteriar, 14 inch in its transverse, and ooo inch in its vertical diameter. The bones were regularly developed; not the slightest trace of a fontanelle could be found, and all the sutures were perfectly united. The frontal bone was much arched; the parietal bones were also very prominent, ospecially that of the

<sup>·</sup> Della Litotomia nei doe sessi; quarta memoria dei l'rof. Vaccà Berlin gheri. l'isa, 1825.

right side presented a sort of aygematic arch, united to a small on malare, which termiand lower jaw-bones were entirely wenting; the orbits were well formed; the occipital bone was a little elongated towardalts upper part; its lower portion consisted of several the trunk hy fibro-cartileginous ligaments, found, on external examination. The trank being somewhat curved unteriorly, showed the radiments of a vertebral column; the ribs, as well as the hones of the shoulder the margins of this longitudinal fractor and the elavieles, were completely confind; the vertebral column terminated below la the sacral bone, and the rudiments of the pelvis. a gelatinous fald, of a yellow colour, with-nut may distinct organisation. The cervical vertebre consisted of several pieces, of an irregular form, so that the single vertehre could not be distinguished; the dorsal vertebra were more developed, sed distinctly annular; the lumbar vertebre, as well as the secral bone, consisted of irregular pieces. The abdomen and thorax formed one cavity, at the upper portion of which the pleura was distinctly som lining the sib lower half contained a grayish-yallow adi-pocirous mass, with apparent traces of folds, representing, no doubt, the intestines. In the centre of this mass a brown addless was discovered, with a small cavity, which was continued, in a thin filament of the same colour, along the vertebral column, and which were very probably the remains of the heart and sorts. ()a the external surface of the skull, particularly on the right side, several vessels were seen running towards the median line; some intercostal vessels could also be distinguished, fresie. Génér. de Médecine.

#### SURGICAL CLINIC AT BERLIN.

## EXTENSIVE PRACTURE OF THE SKULL.

A LITTLE boy, about nine years of age, was brought into the iostitution in a state of complete lusensibility, with the blood flow-

right side; the temporal bones were placed | lng profusely from the mouth, nostrils, ear almost horizontelly, and exhibited the rudi- and eyes. A large piace of timber had fellenments of a glenoidal cavity; that of the from a considerable height, on his headand caused an extensive fracture of the skull. On examining the wound, the skin nated in a rough articular surface ; the upper above the right sar was found lacerated, and a probe introduced into this aperture, could be easily passed to the temporal re-gion of the other side. The parietal hones were considerably depressed, and a crucial separate piaces. The skull was united to incision having been made, a large fracture was found extending over them, from the at least an articular surface could not be right temporal bone to the left side of the head. The anterior part of the skull was also considerably depressed, and in it a second fracture was discovered, extending place of the sternum was occupied by a from the transverse feature antesionly over very thick fibro eartileginous mass; the the frontal bone towards the right eye; wern distant from such other about the tehral column terminated helow is tenth part of an inch, and the pulsations of ral bone, and the rudiments of the the brain could be distinctly seen between The extremities were wanting, them. At each pulsation, the blood rushed with the exception of some traces of the with great vinlance from the fracture. upper-arm. Un internal tespection of this Bleeding, cold fementations over the head, at eleton, the cavity of the shell will found and some injections of diluted vinegar, have a regular form, its parieties being one-ing been employed, the little patient retwenty-fourth of an inch is thickness; they covered his senses, and, the depressed porwere lined with the dura mater, the folds of tion of the skull having spontaneously risen, which were well developed, and contained the nes of the trephine was very properly a gelstineus fald, of a yellow colour, with dispensed with. The wounds were simply dressed with lint dipped in tepid water. After some time several portions of the fractured hones were discharged, and the dura mater began to be covered with granulations, which were gradually fermed into n solid membranous substance. At the end of three months the skild was perfectly cured. Graff's Bericht des Chirurg. Angeneral. Last.

#### INTUR SUSCEPTION SUCCESSFULLY TREATED WITH QUICKNELVER.

A EADY, 80 years of age, was suddenly seized with excruciating pain in the intes-tines, accompanied with vomiting of sterenraceous matter. M. Bellucei, who naw the patient on the fourth day of her illness, countidring it a case of intus-susception, ordered general and lacal bleeding, the warm hath, fomentations, and oleaginous sperients, but without any effect whatever. On the seventh day, a dose of three ounces afquickailver was given, which, nfter 74 hours, produced copious stools; to cousequence of which, a remission of all the symptoms took place, so that, within a short time, the patient completely recovered .-Escuia pia.

De. TUOMY.

#### To the Editor of Tun LANCET.

Sin,-I shall beg leave to call your attention to the following circumstances consected with the appointment of Dr. Tuomy to the professorable of the practice of medi-

cine io the School of physic.

Dr. Tuomy was, in the year 1817, a fellow of the College of Physicians, when the College refused to continue Dr. Whitley Stokes, S.F.T.C.D., in that professorship; it was admisted that the duty had been performed in the most exemplary manour, but that it was expedient to hold an election, in order to asonrisio his relative merits, ie order to associate his relative merits, is computions with these of eather persons who imight be enadicates. At the election Dr. Pakes was dispositively and Dr. Tuomy ap-pointed to his prefessorishy by a custion voice. I dismost therefore, see that Dr. Tuomy his any just ground for complaint because a sidem is continued, without the adoption of which, he could not have been elected. For Dr. Stokes identil slive and resident is Dublin, although he was not amongst the condidates at the late election.

ARISTIDAS DUGLINISKSIS. Nos. 20, 1828.

# INFLAMMATION OF VEINS.

## To the Editor of Tue LANCET.

SIR,-Perceiving in your Lascer of last week, (No. 273,) a case of " inflammation superveoing upon venescition, and followed by death," I was led to notice Mr. Law-rence's samerk, at the end of the article, that he had never known en instance where the patient reneward is such a case. As you passed the expression without comyou passed the expression without con-rect, I esterably onclude your without to the remerk. Allow me to diller you the following case for consideration. In the month of December, 1985, I were on the coset of Africe, in the skip measure, and had openion to abstract about sixteen ousces of blood from the master. Next morning he complained of a sense of tightness in the orm, with loncinating pains exthe hundage, I percuived the orifice in a state of supperation, with inflammation to a considerable extent. In the course of the day, erysipeles extended ever the whole of the forestm. On the third day I discarered o sinus to have formed from the orifice along the median buille, to the extent of, at least, se inch and a half. As the above case is from memory, i cannot give particulars of method of cure ; except that, by the appli-

oction of poulties, with seturine solutious, and paying particular attention to the howels, the patient recovered. He was, at the same time, mider the influence of mer-cury, which had been exhibited for an affection of the liver.

Your obedient servant J. W. MILLOR. Limehouse, Nov. 27, 1818.

SO G G SONMAND " PO MES."

Ste,-Permit me to inquire from some of your semerous, and often excellent correspondents, answers to the following eo-

1st. When a consultation is designative s patient, sed, as is frequently the case, the choice is left to the general practitioner, why does he select a " pure" to one of his own clase

2d. Why does the "pure," when so consulted, make such repeated and often sourceas a stempts to appropriate the intent, in order to introduce a friend of his own; or, order the prescription to be seet to some draggist named by himself?

3d. Why does the "pure" seek to lessen the general practitioner, in the estimation of the national and his friends he are

lesses the general practitioner, in the esti-mation of the passest and his frienda, by a rrogant or purposellines, demensors, by a want of pathematity in hosping his appoint-ments by declaring that he may be again-start for, if it should be necessary; by com-plement of the passes of practices and the first the "pures" so greatly super-rice, it has general practitioners, as to make it migrate at the part of the latter to codure this treatment above described?

3th. Is it just, to be accessary to the robbery of poor patients, who are frequently obliged to pawe their apparel is order to satisfy the rapacity of the "pure" 6th. Is it politic to advocate or recom-mend this misapplication of the money of

the patiest, who, io consequence of the sa-orifices made to obtain the better service (!) of the pure, is incorpacitated from estisfying the juster claims of the general practithe ju

The Were not the most conspicuous and classificate demandants of surgical reform, Messes. Lawrence, Tyrrel, and Key ?

6th. Is not this tricity composed of two "name" of the "worthy baronet," and an integral portion of the corrapt body, in the person of Mr. Lawrence !

9th. Are the geootel practitioners jastified in expecting any realous endeavours from these gentlemes, for smeliorating the oppressed condition of the "largest and most unofal sines?"

I remain yours, &c.

We have seen patients who have recovered from these complaints,-Es. L.

LECTURES

ID UTERUS, AND DIVERS DISEASES OF WOMEN AND CHILDREN.

DELLYSEED AT WAY S. MOSPITAL BY DR. BLUNDELL.

Lictuaz VII.

In general, l'issue said, animalé are est-ual, and ragetables hermaphrodite; bet this is not bonstant. Animal hermaphrodites usually witte, and there is double impregnation; anaila and worms are examples of thin.

The perpetuation of the species, and the preservation of the individual, being, apparently, with the great Designer, objects of first interest, all living beings appear to be formed mentally and bodily, (if I may be allowed the expr ma,) in w great anda; and bearing these two plea in mind, we may com of the wherefore of a great de atrikes the attention in the mel alinet, the dispositions, and other spalichanges which the system undergoes, both sexes, at the age of puberty, is a subject of common observation; and the illintrious Flarvey has described the metallic phosis, which changes the girlish form into the perfection of womenly grace and beauty, with a delicacy and a classic elegence, which may well doter his successors from the attempt. When regatables propagate, they form their blossoms, and appear like aniotals, in all their dignity and glory. When insects prepare for the formation of the new structures, their previous changes are truly astonishing; the annightly and onwieldy grab becomes decorated with all the coloors and the uplendours of losect elegance, and the betterfy, rising on new-formed pinions, so light and ziry, that the poet and the press purpose; these, and other accidents,

artist have winged the soul with suchwith its little heart full of guiety and glad-ness, frolice forth in search of its compasion, to perform its last effice in the economy of nature, being often destined other victims of passion, to periah all shrino. I beliace it is agreed, on all has that the transformations of the larva into the winged insect, are, throughout the whole of this class, designed merely to adorn and fit them for the formation of the new structures; and nature, with something more then a quakerly attention to solviety and de-orice, series to have taken a pleasure in righly adorning the bride tools and

Though one highly respects the working the Character of Dr. Danman, one cannot forb Human generation at certaio sesindy; in spring, summer, autumn, pr winter, once or twice in the year, or eftener, and the genitals undergo a periodical dece-liquiest for the purpose. Although, however, that the heman female has periodical aptitude may certainly he denied, yet I have sometimized blought that there is sema-thing genied is the invitage resistor, and we all know, think of the vernal months, May, perhaps, is the one which may just in the intest that the property of the blooming elements.

When the genital system is once prepared, by numerous expedients, Nature, never at a loss, accomplishes the mixture of the two substances. She entices—she impels—alte forces; io the lustance of ergetables, she employa the ministry of intermediata agents; and a shower-or a breeze-or the busy flight of insects-accommodated perhaps, without being coescious of it, with some pratty contricance, generated for this ex-

ă.

are, one way or other, furnishing our wise Mr. Hellum, of a drummer, who, when he perent with the means by which she accom- keew the heunt of a wild animal, (as the

of the evil spirit into the more sober and man above mentiocod, that he was accusbeautiful engel; while the more sober and tomed to get and keep by him, in some useful naturalist may probebly bethick him of the metamorphisms of the esterpillar into the volstile and said being to which it is indebted for its existence. It is by the touch ear, and eyes, in part, that the touch become excited among men, but principally, become excited among men, but principally, "Clarks at as goutt." A puttid carcase is, perhaps, by the syes, (hence the advantage of being short-nighted.) for the graces do not find leve hims; is well as the principles. Here had been and the level him is a maintain, too, the principles. Here and evel has a less should be the med of or one. However, they had him. In maintain, too, they had been do of oil of hodium, and nate and evel has a their indusance—writers stated.

rently armed, and the bull has his horn, and the pola-est his scent, will the viper his touth, and the scribbler his slandar. The the pola-est his acoust, will the viper his and for male manual especially, areas would touth, and the attribbler his slandar. This prova so alluring and lutoxicating as the fairer part of our species is, too, defended, he had been a species in the part of the partificially her by a different succession and distributions. Anacreon, in softened numbers, told to the world the irresistible influences of female beouty. The Indiana, I am informed, can fascinate the most poisonous serpents; and rat-catchers, in our own country, it is well known, can wheedlo these snimals on to their destruction.

plishes an object all dear to her heart—the otter, for axample,) he had a certain secret, perpetuation of her living beings. Boss by which he could, on lying near, bring tho and butterflies are sad go-betwenns.

When animals fre divided joto sekes, and muck of its ferocity, and sufficient its perhaps under hermaphroditism too, nature he hauled soid insuffice with impunity. briegs the two parts of the genital opparatus Like Daniel in the den, he seemed to pos-together by meons of impulses to which the sees a protection against brute violence: now, together by meons of impulses to which the sease protection against brute violence: now, human mind is no stragger, and the study seducing as these fellows are to animals, so of which is conselves may, I think, serve seducing our own females, if we are youthouse strange impulse; in animals called and twas this reflection which first led me is attact—impulses which drive an selmal, by pain or pleasure, upon a coerce of action, be, herefaffer; found the removal—I mean, without any regard to its end. Adam, at-the wholed of this power depends upon cording to our great poet, ruined the whole of the whole of the power depends upon a coerce, his children, for the love of ceive, contain within them the principle. A rog, says Blamenhach, will continue to impregate the over, even after removal of impregate the over, even after removal of and equally, the atter or the tiger, a principle of the sexual necessity is, in some parts of animal nature, truly astociahing; nor is it nemd that Helman muller gaterrine belli animal nature, truly astociahlug; nor in it nom fult anta Helenium muller stearrine belli week in our own race. The emanation of casm. Dieah first, and lives afterwards. In level, a course sed vehement, might it well langua Chansen, "We all love," acc., missinct an course sed vehement, might it a very great physiological truth is contained, might it is a very great physiological truth is contained. Accordingly I have learnt, respecting the of the evil spirit has the semblance of a man above mentioned, that he was accus-

of being alort-nighten, and of being alort-nighten, and find leve blind; but when they bind, they heading him. In unimals, too, they heading him. In unimals, too, they head to the head of the head head of the h there can be no doubt that daring the heet, hot by a different weapon; and some two compounded. Galen and Rabelais knew themsend years before the birth of Moore, something of this secret. But time forbids ma to salarge.

Signs of Prognancy, and means of attentioning the period when Gestation will close.

The most certain mode, gentlemen, of The mere knowing of knowing whether a women be in a state of these fellows will, I am told, he at length on gestation or not, is by waiting till the term the floor, and, with some preliminary sees- of nine months is completed, when, naless sures or other, bring all the vermin from the pregnancy be satra-uteriae, or upleas their haunts about them. I have been told by there occur some of those extraordinary and

rare prolongations which here sometimes so that, during the greater part of the been made the subject of physiological or day, they ere wall enough, but when they forenzie litigation, the uterus contain an rise, or even sit, in the morning, evert ovum, it will be expelled. It not unfre-in the hed, if I may coofide in reports, queutly happens, however, and I have met both retching and aquees are produced. In with such instances myself, that woman, asses like these, a little mucus and gastrio from variena causes, are exceedingly anxi- juice only are expelled from the stomach, ous, in the earlier, or middle, or latter and not as ill-digested obyna, this proving, months, to know whether they are so opporently, that the disease is not to be pregnant; and hence the accombant has ascribed to duppens, but rather to gastrio been led to bring together a variety of signs, irritability. If, therefore, a woman, previby which the decision of this question may ously exposed to the cause of gestation, the second of th be effected.

not a faw, may be commodicusly divided seizing her morning after morning when into three chases; of these, I meao, which she quits her bed, or even when she takes are of ordinary occurrence; of those, again, the accentary posture, there can be listle which are rare, or anomaleus; and of those, i doubt that all this is the result of gestation, natly, common indeed to all women, but and the sign becomes of no small value. Which may be secretained solely by meuns. In the earlier mouths of gestation, so great measure, from more verbal inquiry. If a patient apply to me, auxious to know whether size is a state of gestation or not, one of the first questions I propose is-have you any feeling of hearing, together with a sort of irritation about the bladder or the rectum, but more especially about the blad-der? For, is consequence of the enlargement of the uterus, and of its descent into the privis, and of that increased action approaching to the inflammatory occurring in the womb and the parts contiguous, it not unfrequently happens, in the earlier mouths, that micturition, and some little obstruction of the bladder, together with bearings, are produced.

From a variety of causes, an enlarga-ment of the tower limbs of the dropsical kind occure; in some wamen especially, this sulargement, whether of the one or both limbs, is apt to be produced in the earlier or subsequent months of gastation. If, therefore, a patient suppose herself to be in the earlier mouths of pregnancy, you ought altre cedemetons or not; and if your patient, previously in good health, has this edems of the lower limbs unexpectedly, and in considerable degree together, with the other und, indeed, as one of no small value.

It is obvious that you must not hattly conclude that a womao is pregnant, morely because alsa is attacked with vomitings and ever, women, perfectly wall before, are fied themselves that the woman was with sometimes seised with morning sickness, child. Should it be your duty, then, to exstended with retchings and vomitings; assine a woman, who not only has her res-

nor wanting the other signs, is seized sud-The indications of pregomecy, in number dealy with retchings, nauses, and vomitings,

lo the earlier mouths of gestation, say in of a careful manual examination; and, the first two or three, when the ambryo is first, we will consider those signs of more amall, as in some of the glasses on the frequent occurrence, to be ascertained, in a table, the movements of the foctus, of course, caucot ba felt, but in the middla and latter months, when the futus becomes large and stroog, its movements are readily perceived by the mother. Now, where the motions of a child are, as they frequently are throughout the whole of the preguency, obscure and infrequent, they become of small value, as an indication of pregnancy, even though the woman have had u large family, and though, judging from this symptom, she per-suades betself that she is pregnant. I know an instance of a lady, possessing more than average intelligence, the mother of twelva children, who was lad, by these abdominal movements, into an erroneous persuasion that she was pregnant again; for spasma of the abdominal muscles, and Butters of the bowels, may now and then be mistaken for the movements of n child. You ought, moreover, not to be ignerant that some woman possess the power of stimolating the setal movements, by the action of the abdominal muscles, as I am informed, so exactly, that evan an experienced accoucheur might be deceived. By women of intrigua, this piece of slight may be abused. A woman, who possessed considerable skill of this kind, formerly exhibited her taleots In this town for hire; alse was visited by aigua of gestation, you may then consider lowder, Mackensie, and some other cele-this, too, as a sign indicative of pregnancy, brated seconcheurs of the day, and, after satisfying themselves that the womb was not cularged, they; made the usual exumi-nation of the abdomen, when they all agreed, that the movement was so exactly unalagous retchings in the mornings, insenuch as to that of a forus, that no distinction could these retchings and vomitings in women, as be clearly made out; adding, that if no inin ourselves, may be produced by a variety turnal examination had been made, thay of other causes. Pregunocy occurring, how- should, judging from this only, have satissoos for supposing that she is pregnont, | distinguish between the swellings which but who finds her interest in this supposi- arise from these two causes, by ascertsining tion, be on your guard against this annulo- the time that they have been observed to These cases, bowever, are nut frequent, and, in general, it is sufficient to recollect, that when the motions of the child are somewhot obscure, but little reliance is to be placed on them as a sign of pregusney, even where women ore perfectly bonest; but where the child is very turbulent, and its motions are of consequence both frequent and violent, the sign becomes so strongly marked, and so decisive, that without looking any further, you may venture

enlargemoot of the abdomen, greater where the bollow in the hack is deep, less conspi-cuons when it is aballower—observed, howan doubt, that from u great variety of other a notion whether gentation be or not begun. as to whether the woman he pregnant or ever, bastily conclude that a woman is preg-

aubsist. In n word, mere abduminal intumescence is but an aquivocal indication of pregoancy; but, by ascertaining its age, its firmmess, its want of fluctuation, its seat in the abdominul cavity, and the form which it assumes, we may, in general, distinguish such awelling from those various morbid enlargements which ariso from air, water, fut, or the diseased growth of the viscers, or from the operation of these causes combined.

After women have suckled, you cannot, to infer that gentation is undoubtedly be-in general, jodgo a subsequent pregnancy by the breast, but where they are pregnant for When women ore pregnant, there is al- the first time, and, in general, it is then that ways, in the middle and latter months, an they are most an rious for information-from the increase of the size of the breast, from a certain fulness and tenderness, and an approach to inflammation, and, now and ever, in all when pregnant, more especially then, from a secretion, of a flaid, seroes, in the end of gestation. You are all sware, milky, or mixed character, you may form causes than prognancy, abdominal enlargoment may be produced, as as to render this pregnancy, the breasts are researkably enlargement, to the incaperienced, a very small, and whose breasts become switch or nucertain sign; from air, from fat, from three times as large, or even larger, after water, from n diseased growth of the vis-cera, an intumescence may arise, and the den enlargements, and other changes, super-appearance of pregnancy may be deceptive-veno in first pregnancy, and this after the ly produced. From the enlargement of the patient has been exposed to the cause of obdomen, however, the more expert accountenum may often form a very jost upinion pregnancy in begun. You must not, howas as wester use woman no pregnant or ever, bastily conclude that a woman is pregnant or the form of the tumour, as observed by of the breast; she may be getting very cothe eye, is uf no small importance, and I pulent after her marriage, and the breasts would advise you to acquire, from observation, a correct idea of it; nor must we parts of the body. Enlargement of this kind, forget its situation, lying in front of the source of the body. Enlargement of this kind, forget its situation, lying in front of the source of the bidy. Enlargement of this kind, and middle parts. Swellings from a property of the consultant increase of the bids, face, and limbs, and middle parts. Swellings from a point Assets of the state of the stat and middle parts. Swellings from air, being Again, you must not bustfly jufer that a very elastic, slways yield under the conti-woman is prepasot, merely become sho has nucd pressure of the hand, and may be a good deal of measuress shout the breasts; urged from one part of the abdomen to the for, if she suppect pregnancy, and is uften other, and allow the fingers to sink deep, handling the mammas, she may, in this man-upon the spine; but the intemescence of per, cause them to become irritable and tenpregnoncy is firm and unyielding. The der, as, in young females, they frequently pregnoncy is firm and unyearing. In our; as, in young senses, seey requestry intention, too, frequently gurgle when the is prome to be; nay, secretion itself may enlargement is from gas, and, though sometimes lasting for weeks together, tympunitial infer there is pregnancy, merely because is frequently fuzocious, appearing and value of there is a secretion if milk. I remember a their is a secretion if milk. I remember a their is a secretion if milk. I remember a their is a secretion for milk. I remember the company of a few hours. Woman, is this hospital, who had milk in Swellings from woter undulate more or less her breasts, out who had not had a child distinctly when strack with the hand; but, for three years, nor had she been suckling unless there be a distended bladder, or n for a length of time before; yet in this unicas there has a classacer, or m for a reagan of time serior; yet in this dropeionl womb, in preparoncy, no fucture—forman, which is examined, at the request of flow can be felt. An culargement from fut the nilears of the hospital, the milk formed is not topical, but diffuses itself over the so coplously, that when the breast was whole body; in the limba, for, and haunches, pressed, the milk coxed freely forth; and it may nore especially be detected. The yet I satisfied myself, most unequivocally, discussed and solid growth of the viscora is thut she was not with child. In the Ethioa work of much time, but the enlargement pian variety of mankind, the genitals are of pregnancy is rapid; so that we may often very active; and my friend, Dr. Chapmao,

gave me the case of a negress of Demerara, you are attending cases in town, for in-

twenty years together.

ness, pain, and same enlargement of the notice the areals, when the child is applied breasts, take place; and therefore it is obtained to the breest. The changes of the areals I viously necessary that the eccuncheur should have studied with a good deal of attaction, the rather, because it has repeatedly occur- find that they may be distinguished into red. A woman, perhaps, marries at two auditures varieties, numerically discriminated forty, and is assious to have children; and seconding to their degree. New, when the the estamenis cease, and the abdomen he elteration of the arcola rises to the highest enmes tympanitic, and the bosom is swelled point; when this part becomes broad and and nocesy, and she supposes herself to be dark, and embrowned in fullest measure, pregnant; and she eugeges her norse, and more especially when pale, before, perhaps, she cozens her negoughour, and alse receives it changes to a deep brown, so dark, that it

the breasts double their size—if the en- man has had a large family before, aven largement be knobular, and not from fat—if though the arcels be changed in fullest manthere be secretion, tenderness, pains, then ner, nn certain reliance can be placed upon the enlargement of the hreast is te he the algn; for experience abows that the looked upon as a very valuable indication of smaller changes are indecisive, and when when the waman bas suckled a large fa- bighest degree are to be attributed mily, and the breasts have been brought uperation of a fresh preguaccy, or the retn aympathise with the ceasatiun, tha indioations of the breast cannot be safely relied anomalies) if the change be in full degreeon. Some ladies remain at five-and-thirty for half a score of years or so. Time and tide wait for nn men; but, with wamen,

If you axamine the nipple in either sex. tinguished by a rosy tist, and sometimes very early in gestation. tinguissed by a rowy dut, and sometimes very carty in generalization by its being in the same colour with the cootiguous skin, but lighter, constitutes interrogate, and, upon examining the arcols, what is called the oreda, in part which, in I declared her to be pregnant; this she et come cleanged, even from the first; for when field that I knew a little more about it than

who, after her pregnancy, fermed milk fer stance, I would recommend you to take every proper opportunity of examining the Again, about the age of five-and-ferty, arenia; this you may do, no many occasions, sterility aupervenes, the catamenia ceasing without much exposure of the bosom, and, to flow, and frequently, at this period, ful moreover, you will have occasion often to guard against delusion in these cases, and both for your advantage and my own, and I she cozens her negoughcur, and ahe receives it clianges to a deep frown, so carry, cans it the gratulations of her friends; and she con-reminds one of the akin of the negro, the sults about cans and long petticoats; and she indication of the arcola nught to have great hopes it will be a boy; and she gets langbed weight, at least, in a first pregnaccy. By at for her pains;—though I must add here, this indication alone, pregnancy has been not that I thick the ridicule is a little unfeeling; infrequently detected. After than once I Th bring my observetices to a point here, if also other hand, when the sreola is changed in the above a remead the impresentation—if she it first or second degree only, its indication is the contract of the contract have been apposed to impregnation-if she the first or second degree only, its indicahave also the other signs of gestation-if tions are of little value. And when a woprognaccy; but where the enlargement is there has been pregnancy before, it is difabscure, when the patient is very corpulent; Soult to decide whether changes is the under a great deal of action; when, again, maining effect of those which have preceded. the patient is about 45, the entamenia To be abort, the meela may, now and then, being likely, to cease, and the breasts likely deceive, when you think that there is most cause to rely on it; but (allowance made for if there have been nn pregnancy before—if the eye of the abserver be experienced—if the other signs of gratation attend-the in-dications of the areols are deserving of a very confident reliance; not to add, that in you will frequently find round it n disco-lauretion of the akin, and this circular the arcolar changes alone, and they have discolauration of the skip, sometimes dis- the advantage of manifesting themselves

MUSCULAR ACTION, AND ON THE CURE OF DEPORMITIES.

By Ma. SHELDRAKE,

On what are now called Gymnastic Exercises.

It is a peculiarity, and indeed a misfor-tune, to this country, that there frequently area among us persons who produce something that they say is new, and which hope to make many by it. To realise this they likewise say is important, because they hope to make many by it. To realise this they intend to be accomplishments, they important sabject, they stop some high-sounding agmas, which, is assignt times, here, in the Latin or Greek languages, been they actually must produce, premise to do emplied to some important matters that were what they, in reality, cannot perform,known and practised in those sountries; Many young ladies, I know, have been sethe terms which have been thus adopted riously injured by accidents that have hapshey apply to their own contriences, and pened in these achools; none of them have say that these contriences are the same as acquired the accomplishments which they those of the ancient Greeks or Romans, sought to obtain, and some will, at a future which they pretend have been revised by period of their lives, be subjected to avia themselees.

Une of the most remarkable of these re- engaging in these practices, which those vivals, or ra-discoceries, which thas lately who recommended them did not foresee. been pressed into cotice, is what has been called gymnastic exercises. If they are to be believed who have endeavoured to get qualities, that it will require more time than eaght to be so amployed to enumerate. All then in one of their ewn tracts, the is absurd, and would be ridiculous, if it in one place, the writer, from the is about d, and would be ridiculous, if it in one place, the writer, from whose tract did not tend to produce, and had not really I quote, has written:—" In such cases, the form clubs, or societies, in which the practice of these axeroises shall be the general among the lower orders of mon; some gen-themen, I have been told, smuss themselves I he want of agility is a common defeot in similar pursuits, in placen that are better samong almost all clauses of people in Eng-suited in their rank in society than those land"!! gymnasis can be. To all this no ebjection can fairly be made, because, although the this declaration, cannot nasily be exceeded, practices that are followed in such places and will be answered, most effectually, by are really productive of much injury, every referring to the epinion of Belidor, an emi-one has an andoubted right to amuse him-neat French engineer, in the service of self in any way that he thinks proper; if, Louis XIV. Belidor was employed in in the practice of these exercises, he gets a most, if not all, the great military works

hernia, a broken leg, rib, or violent contu-sion, or luxation of any kind, he will have the satisfaction to reflect, that he procured it for himself, by practicing what would be of no real use to him, and in which he had no occasion to employ himself at all.

But this encouragement has not been andicient for the professors of gymnastics; they have attempted to establish schools for the instruction of young ladies, females of the superior classes of society, in the practice of these exercises; if they succeed in this, they will reduce their scholars, in point of personal accomplishments, to a level with the tumblers at Sudler's Walls, and other places of public amusement; this, I believe, of great magnitude, in consequence of their

I shall endeavour to point out these swits, and the causes that will produce them. In doing this I shall confine myself to an explathem unicersally adopted, thuy are not only lation of the facts which these professors of a recival of this gymnustics of the ancient gymnusticessy, in a triumphant manner, they Greeks and Romans, but lines, in them-intend to produce. As shey take merit to selves, the power of giring to the human themselves for these practices, which they figure every perfection of which Nature is believe to be maritorious, it will, of source, susceptible, and to the mind many perfect be understood that they actually do what tions which causet be so easily obtained in they describe; and, in what I shall say upon any other way, besides many other good this part of the subject, I shall confine myself to a true explanation of what I find writ-

heen producties, of much serious mischiel gymnast, from the acute perception of his The avowed objects those who have set these e.e. the flexibility of his joints, and supepractices in motion is, to induce persons of rior strength of his muscles, it is say to every rank is society, and of each sex, to perceive, would been greatly the advanlage.

Again :- " By the exercise we recompursuit. Some such clube have been formed mend, the joints are randered exceedingly among the lower orders of men; some gen-fasible, and the whole body active and sgile.

The impudence, as well as falsehood, of

account of them; in that account, he re- for such occupations. It is true that these labourers in equal, in effect, to the work of their pursuits; it is true that, for the short siz Frenchmen of the same class.

Again: this gympustic writer says,-"The preliminary exercise, which may be termed the initiatory exercise, in for the purpose of strengthening and rendering fleris all the different points of the body. This is what persons, unaccustualed to gymnantics, stand most in need of. We frequently meet with persons of great muscular strongth, but who, from their habits of life, are so aluggish and nuwickly, that they know not climbing, dec., are entirely new, or at least, instince as a matter of signaliumout, ofter it is, by long disease, have become extremely different. To effect the desirable object, there have been objecting, the persons who have been objects of materials for their force, of removing such defect, an object regarded as a preliminary on necessary in scurity, but it is well known that, so long. he a line, at such distances that they can of great debility. This is the new-soney havely south such other's linger with his consequence of the practices by which they extended arm. They then practice, after sequired the power of performing those leads the example of their leader, every different which made them so remarkable, and apon the example of their tenser, every warmers, this subject I shall mention muon make the penalt are capable of, eig., this subject I shall mention muon make bending slown on the tore till the knees have passed within my own knewledge, have seen a tumbling boy place his I have seen a tumbling boy place his large and call the best seen a tumbling boy place his from alonly, without my assistance from heads upon the ground, suddenly throw his the lands, holding the arm at full length, beels into the air, and place them against a and rapidly whirling it in a circle, during wall that was behind him, so that he might them to the shoulder; and various other; head downwards, and his feet taked up in

frame; it braces every muscle, ia rigorates placed there for that purpose. the courage, incredibly improves the faculty

very effectually, that those who wrote them ralied very much upon the credulity and that situation; he then gradually taturned want of knowledge in their readers, when himself tota his erect coutton. they supposed that they could believe all that was tald them about the wonderful effects that would be produced by their Communic exercises.

The truth, as it relates to these exercises, which are now called gymnastic, is, that they do not, in principle, or in any essential point of practice, differ from those practices by which the temblers, those who dence, as it has been called, upon the slack apine tagether. These ligaments are so ed times, were called posters-masters, were state, they linar all the must violent ections taught the arts which they practised. These to which mon subject themselves without arts consisted in distorting such parts of any inconvenience. All these alterations their own persons, so they close to subject must be produced before the spins could be to these practices, into such positions as it drawn into the circular form, which he one

of his sovereign, and has published on of those who were not specially educated relarly states, that the work of four English persons obtained applause and money by time they were under public observation, they showed both strength and activity which could not be displayed by those who had not had the same education; but it is likewise true, that hy constantly repeating those practices, the parties who indulys in them spinisheems debilitated, and irravacably sink into deprepit old age.

This fermination of the existence of rope descers, tuesdiers, and memorals, hen been but little, if at all known to the pobhow to court it. To many, the positions of Re, because the public natifies know were the justing should for losping, during, ours any thing about what is affered to gymnastic exercises, the pupils are ranged us they continue to lite, they exist in a state

the fists forwards, and suddenly withdrawing be said to stand upon his heads, with his motions which the teacher may deem as the air; while in this situation, he brought cessary to affectuate the desired object. his feet loner and luner upon the wall, and " Leaping ranks among the most ex- at the same time, carried his face nearer cellent of the gymnastic exercises; it to the earth, till his stone resembled an atrengthens and gives elasticity to the feet, such, and, with his mouth, he took a piece legs, knees, thighs, and indeed the whole of money from the ground, which was

I naw sputter boy stand exect, and then of measuring distances by the eye," &c. &c. gradually bend his head backwards till be The passages that are now quoted prove, passed in between his legs, and looked the appectator full in the face, while he was in

To anable themselves to perform these feats, those boys must have repastedly, and for a great length of time, attained themneives in the manner that I saw one of them do, by which they increased the contractible action of all the muscles of the back to such an axtent, that they produced much extension of all the very strong bymments which passect the different bones of the ps, as well as those who, in less enlighten- atrong, that while the hody to in its natural was quite impossible to give to the hodies case I saw, and in the other I saw in pro-

the very strong thements, which connect which Nature intended them. These lienthe bodies of the vertalism regisher, that which the aphast pracesses were, by this yout the point to which Nature has limit-most unavess? practice, finds to electric a circle, the bodies of the first bear were made to despite a circle than the chief, by an armine the thickness of the chief, by a grathe at the thickness of the whole versions, suffice and all. This necessarily implies un extent that, as we have no opportunity of seeing, one is really aswelling integrated. Moreover, there must have lines expected weighted in the remains of all the abdominal weighted, in propertion as the contracting at the capacity figureus have been unaversed of the back was increased; and, as the performers were able to plong themselves in, but people who practice used to the capacity figureus has deen also everal to the capacity figureus has been also everal to the capacity figureus has a first to which they have been unaversal to the back was increased; and, as the performers were able to plong themselves in bing, and similar energiates, as well as by the bodies of the vertabre together, that ments, when they are foreibly strained beand forcibly down, till their knees nearly tsuch the ground, and rising therefrom slowly without any assistance from the hands, and by these means giving overy capable."

which the tumblers, and other persons of the parts to recover their natural tens.

a similar description, use to instruct them. This may be called the natural state of metural action, and no no no e. The ligs gree of firstbility in the joints, which the ments are, in their awn sature, said to be writer, from whom I have quoted, piques inclustic, but here, lu reality, a limited himself upon producing; although it is evi-

creas towards the same state, which I be-idegree of classicity, which adopts show to here the boy would, in the end, strive st, their natural functions; so that, while they if he continued to use the means which I srain their natural, healthy state, and duly saw him employ; but whether he did so proportioned to the bones which they con-I have no means of knowing.

Heades producing these alterations, they be called their natural condition, and thay are must have produced so myes extension of capable of performing all the functions for

formers were able to ploce themselves in, bling, and similar exercises, as well as by and remore themselvey from, the extraor- those who teach these gymnantic exercises, dinary and unnatural attitudes in which though nous of them know the sense or the they had chose a to pisse a assumences, or, or, and the great permanence and their was muscles, without only the moetives upon the great permanence and outirely by their they give to the joints of their acholars, own personal exertions, it is certain that which, before they became acholers, were the house and acquired creat atrength, flexibility, stiff and rigid. The muscles are the power and acquired creat atrength, flexibility, stiff and rigid. The muscles are the power actions of the body are they had chosen to place themselves; by the consequence of what they do and pique action of their own muscles, without my themselves upon the great fertility which they had acquired great strength, flexibility, stiff and rigid. The muscles are the now-and activity. These are the qualities which ers by which all the actions of the body are the people who teach these symmetric exer- performed: their powers may be increased cases pique themselves upon communicating by exercise, and injured by it when earlied to their pupils; and it is also to be observed, to waccas. In the muscles, as well as in that they teach them by the very same other parts, there are certain proportions means, vis., by lending themselves a sluwly between the size and strength of the muscles, and the nace to which they should na-turally be applied. This strength may, by proper exercise, be increased to a certain extent, but, if carried beyond that, becomes different flexion of which the joints are debility, and injures the party that uses it. When a man, a lose members, and all their As the exercises of these gymnaste, parts, are in a healthy, natural state, takes and the means by which they are taught to so much exercise as produces fatigue, ha practise their feats of activity, are now lays slown to rest, and recovers hisself, identified with the exercises and means in because the possition of action plows all

pupils, it remains to show what effects are man; it continues so long as he remains in ultimately produced, and must be produced, [youth and in health, diminishes gradually as upon those who practise them. In du this lage said decay approach, when he bushy effectually, it will be necessary to inquire make into his grave. This is the state of into the structure and nees of different parts man when his life has been active, loss of the hody. Those who are sequented hody healthy, and his exertions natural; with the subject know that the bones are but the case is very different with all tun-the solid basis upon which the whole de-pends. The ligaments connect the bones tise what are called gymnastic a services: with each other, and are so proportioned to by their preparatory exercises, as they call the bones which they unite, that they allow them, they sequire a certain portion of musto each joint so much motion as is neces- cular strength; they overstretch the capsusary to what may, properly, be called its lar liguments; and thus produce that great dedently without knowing that great famili- that Delphini died a few days before, at his lity becomes mischievous debility, which ledgings in Lancaster Court, in the Strand, in will estail lasting miscary upon his selectors, the miscry-state year of the age! at a future period of their lives.

That he should have lived as long, is to be

exercises his is engaged in , but, when the muscles become weak, the joints are deprived of the extranson support they had derived from the muscles; they have lost the support they naturally ned originally bad from their own natural atmosture and atrength, and are no longer able to suppurt themselves under their natural exer-

former, nod was, in every respect, the most forms over the well on, and, at their close, emioent performer of that kind in his day, the came forward, and addressed the madi-He was the strongest mon that I have known, dience in the following speech: and, in his business, exhibited many feats " Ladies and Gentlemen, I appear be-which no other octor could then perform, fore you for the last time. #### QUACKERY IN NORTHUMBERLAND.

### To the Editor of THE LANCET.

Sta, -I have great pleasure in learning, from a late Number of your valuable Jourmal, that a surgeon, in the North Riding of Yorkshire, has takes up the subject of quackery which hes of late ettained no great ght in the north of England.

Isto not intend (at this time at least) to enter into any details of the great extent to which this unlawful aystem has been carried, but from the increasing evils which daily arise from it in this part of the country, I hope to be the means of prompting same older and more abla practitioner to take the aubject in hand. Few counties, if any, I believe, are more cursed with hone-setters, and such like, that the common accusation of questions, which, was it is merely as an absence, which, as it is merely as an absence, may be metosumently of Northumberland; and I linve with e denial, and calling upon him to prooften wondered that no one has attempted duce his evidence. I would, however, sugto put a stop to such a system before this gest that if, as he says, and I believe, the time. These empty braggarts, it is well present age is so superior to those which known, take all accidents under their care; have preceded it in acceptific and metaphyand we have many proofs, many serious sical accuracy, the time was ill chosen for proofs, that the greater part which fall under founding a delusive science, and that the their hands ore discharged with such limbs, gradual, but steady, progress of phresology, and such specimens of treotmens, that say from its discovery to the present moment, pupil who had only been aix months in the affords a fair inference that it does not de-

I now lative, considering himself due heir to his seat him down a mixture of actim. text. gr. j. pactice, having placed the word 'Surgeon' ac, pure his, to take a teaspoonful even; on his door, has commenced with all the three hours; this produced a good deal of confidence of a medical man of fifty years' names, and once or twice vomiting, with profuse ewesting. I saw him again in practitioner, and still more so to the poor the event of the evening; much the same as in the suffering individuals who fall under his core: moraing. I again took awey three pences of the man also may be said of several other blood, sed gave him palv. jalap, gr. zv. in fewers and villagas in the county. Hoping a little water; the bowels were purged the the same means may soon be employfollowing morning twice, about aix o'clock.

fession in this county,
Likes the honour to be, Sir, Yours most respectfully, A SUBGRON-APOTHECARY. Newcastle, Oct. 1, 1828.

PHREE GLOCY.

Te the Editor of THE LANCET.

Sta,-I am indused to notice the article of your Birmingham correspondent; not be-cause it contains any very new or very powerful objections to phrendiggs; but be-cause some of your readers who know nothing of the subject may be prejudiced by contradicted. Though; like a late statesman, be is not easily narwered, from the difficulty of finding the strong point of his ergument-" ne man knows where to have him. to induce your non-phrenelogical readers to neek the opinions of phrenelogists in their own works, not in those of their op-ponents, to examine for themselves, taking nothing on trust; and if they do so, we are not afraid of the result.

enfermion would be ashumed to look at serve to be classed with alchemy, and the other follies, which, as A truly save, would The medical men of Blyshe I would consign their professors to meritud contempt.

If when A says it is impossible, from eirhave so lately arrouted up among them: it is the connection between the developments well known in the county that can of these of this beam and meatal emotions, and in-(intely deceased, after having served an tellectual operations, he means that we apprenticeship to a linen-draper, com- cannot observe any physical connexion, I menced in that town, and that, during his admit that he is right, and no phrenelogist ever maintained the contrary; but if he but merely say, "show us a head, and wa will, with Dr. Brown, whose excellent lork will tell you how the weuere is likely to act he subsequently quotes, understand the cause to signify universal autocadeace; and effect neiversal unocession. I deny the impossibility, and confidently appear to the anmetous facts cluarly before the public. If "any one of the various and blended emotions by which the mind of men is liable to be agitated, may give rise to any con-ocivable action, or thin of actions," their there is us objection, not merely fatal to phresology, but us the missions of mind altogether; but how as emotion of benegateuce can give rise in merial, or one of likered to he act of kindness, migt be light for him to

nipleio. But the fishet to think I principally object in his description of the operations of the phresologiet. "Thinky it for granted," says be, "thick his gentleid decthin is cortect, and that the mouth affections are indicated by certain alcentions of the brain, "&c. Now, Sir, there corresponded a known comething of the minuter, or he does not it had not been a proposed."

If he does, he what he sware that a peculiar development he asses of his schoolfellows, induced Gall, when u bey, to examine the skells of persons of marked character, and that no organ was stated as uncertained till many cases concurred to prove, and none to controvert it. If he keew this, he has misrepresented, and if he did not, he ought not to have written upon a subject of which he was wholly ignorant. All which the phre-nologist "fade, or pretends to find," are cor-tuin alevations which, having been found in every anamined shall of persons who have been distinguished for may peculiarity of sharacter, he believes to be indicative of similar character in the individual under sume, have profited enough by observation (whether phresological or not) to form u tolerably correct notion of the chiragina of

our actions. They do not pretand from no judge between on. inspection of the head to say what events: I am, Sir, your obedient served, have brought the mind to its present state, Temple, Nov. 17.

and feel in such und such esituation. they also say, that there are natural differ-ences of talents and disposition which neither education nor circumstances can perfeetly resimilate, and that some minds taken suggestions more easily thus others; that ea shange of situation would have made Hampdon, Strafford—or Strafford, Hampdon; and that A might have set for his whole life in Newton'uchair, and in Newton'u garden, and have seen every apple fall from every tree, without having his ideas carried up to the theory of gravitation, or beyond that of e dampling.

As far as I can understand your corresordent, he has mistaken the phrenological doctrine of firmness, which may be well given in the words of Sterne :- "That quality which would have been called firmness in u good cause, and obstinacy in u bed one." It is sufficient to may, that atendiness and unimpressibility, and their absence, in persons of otherwise similar dispositions, are so common, that nearly every one may find examples, even in his own family. If A has not perceived any instances, eli that I can say is, that I am norry for him, and hope he will look again. His observations on the character of Othelio um correct enough; but the immediate elastics of Othelle towards Cassia, would be meribed by a phreudlogiet, not to firmment, but to destructiveness. Othelia acts before his has time to sool. Had he pursued his revenge half a dones years, unchanged and enmitte gated, we should say that firmaces much

Leve been a leading point in his character. What I have said, I trust, is sufficient to show that your correspondent is not entitled aramination; and he thinks it hard, when it o conclude with the very thiumphast lope, he uppeals to facts, to show that a thing is that, "from the above observations, all unpreto he meet with arguments a priori, to show judiced minds will admit the insofficiency that I consist do, and atill harder to find any of phrenulogical evidence;" and that, who attention gives to ansoupported smertions their phrenulogy be founded on a rock or the that it is me. Most of your readers, I preas for an regards his attack upon it. Should he resume his pee, I would submit to him, that a little more attention to politeness will those with whom they are in the habit of not blunt the edge of his wit, or diminish frequent intercourse; though I shall not be the weight of his arguments. Such terms as so rude as to contradict a, by affirming " shallow phrenologist," " resolute quacksno sour me w contrauct a, sy autumny ; minerow porenouejis, "resoure queka-that to him, "after very protracted obsert- 17," med the itse, do not help u good cause, vation, even u loose conception is more than and make a bad one worse. And, as to barely possible."

All phrenologist sadmit the influence of and supported alone by " resolute quacks," mixed motives, and the very nomencluture I beg him to turn to page 217 of the Num. shows that it is one of the most important ber in which his article appeared, and if, pasts of their science. All admit the is-safter having done so, he repeats his accusalisance of education in the formation of chartion of ignorance and imposture, I have un racter, and of circumstances in directing more to say of him; but the public will

LACERATION OF THE BRAIN.

#### Te the Editor of THE LANCAT.

Fulham, Nov. 9th, 1828.

The late Mr. Donn, a corpulent man, was thrown from his horse on Fulham Bridge, by an errand cart, driven futlensly against him. The horse and life ridar were preci-pitoted with great colence by the force of the shoot, and street more war shan to the wear nearest ion, in a seaso of insteasibility, and continued so for an days, when he sapired. The examination of the brain was performed. aevanteen hours after death ; the following appearances were noted.

Considerable extravarations of blood beeeath the scolp, posteriorly. (A complete tendinous origin of the complete flushes). A considerable effusion of serious between the dura mater and trachnoid (said; an

extravasation of blood between the dura mater and colvarium, upposite the posterior and lower part of the right hemisphere; a com-paratively alight extravasation of blood betwees the dara mater and akull, on the left side of the posterior lobe, opposite the autura lamdoidalis additamenta.

Oo removing the dors mater, as usiversaide by gently boiling half an ounce of the sai effusion of serom, estrayasation of blood out dried herb in a pint of water, for chout on the pia mater, covering the side of the right hemisphere, but to us considerable tion, they taka a amed wius glass full two extent; oo examining the right bemisphere, or three times a day. The extruct, which the extravaration of blond is not continued also contoins the virtues of the herb in into the substance of the brain. Plexus great perfection, is taken in the form of churchles empty; the bird ventricle full pills. It is likewise given by the Indian of water; a slight entrawasation of blood in practitioners, to cases of pulmunary contine middle division of the base, in coagula, ammption and scrofals; but of its effects in Oe removing the base from the hase, the the former malady, I cannot speak from ex-jextravastion of blood between the pia mater parience; bat, is the letter malady, I have and brain was found to be universel on the frequently witnessed its salutary meration. Dr. Fleming, late of Hengal, apeaka highly extending into the substance of the broin, of the cherratuh as a tonic medicine. The only diming down into its sulci. At the only dipping down into its sulci. At the under surface of the right hemisphere, and apposite to the external real of injury, a surface, to the extent of three inches to length, and one in breadth, was lacerated. The vossels of the piz moter full of blood. It appears that the laceration took place on the opposite side of the brain to that on which the blow was received. The encussion, therefore, must have been tremendous. The only external mark of injury wos c slight nhrasiou of the acolp un the left side of the head, near the landoi-dal auture, necessioned by the hard grevalled road on which he fell.

#### THE LANCET.

London, Saturday, December 13, 1828.

Ir is svideot that, so long as human naturo la constituted as It is, the limits between fair and unjustifiable comment on the blanders of physiciana and surgeous can never be justly estimated, or distinct prehended, by the parties who have exposed themselves to and iversion. The and an civil law of all communities stitutions declares, that no man should but by a law be a judge in likelityn das of human miture, antecedent to all civil inatitutions; almost every and feels disposed to judge throughly of his own capacity, and to regard say opinion, or act, tending to a different experience, at malicious and unjustifiate. From the earliest period at which critics began to exercise their fuoctions, down to the latest instance in which ignorance or bad taste may have been ceosured and exposed, parliags a case never yet occurred in which an author acquisaced In the justice and propriety of his fingelintion. The respect which a meo ontertaius for his own understanding, like the teoderness wherewith he regards his own flesh, may be a feeling in which no other individicipate; but he is commonly dual san po as ready to raised any dispuragement of the the Ignorance of those who audertake the ons, as to resist any unprevoked aggression care of the public health is entitled to on the other. Jurirun, says the fahle has greater protection than that of authora. alung one bag on a man's back, containing whose compositions are calculated to miahis owo infirmities, and another bag on his lead or vitiate the tasto of their readors, is chest, containing the infiguraties of other a question which has not yot been decided men. Hauce an attempt to altar the post- in a court of justice. This quention has not tion of three bags is supposed to be ustu- being judicially decided, because, hitberto, rally resented, and resisted by the party who no case, in which the ignorance of a physicarries them, as su outrage on the laws of cian or surgeon has been made the subject the saimal economy. It is an attempt to of comment in Tha Lanear, has ever been ture a man's back upon himself; au act of brought into a sourt of justice, and, before violence, which, though, if we may credit the catablishment of THE LANERT, reports s celebrated authority, the body politic once of sassa occurring in our public Hospitals meditated committing upon itself, it would were never published. Our readers are

be unjust and indecerous, supposing the begs of the fable to form part and parent of ur bedies natural, for our man to perpetrate upon another, llappily, however, .... the interests of the literary republic, there is post only all the difference in the world trees attacks upon the person and upon the understanding of an author, bot this difference has been fully recognised by our sourts of justice, which have refused, in cases of offences against the laws of good writing, to interfere with the jurisdiction of the courts critical, and have left the offenders to be judged and punished at discretion by the arbiters of literary taste. If the criticism be unfair, the legitimate sourt of appeal is the poblic.

The same observations, which up criticism on a man's literary con are equally applicable to critical sciontific pretensions. Whether by quotations and somments, that thor has written a bad book, or demo by facts and commeous, that a physician aurgeon is ignorant of his profession, crist oism is, in either case, directed against the iocapacity of the party, and tends, in either ssee, to disparage his intellectual qualifications. The comments will in both cases, of coarse, be regarded as unjustifiable, and the critics denounced as libellers by tha persons aubjected to criticiam; but whether

ewere, that we have never commented on the never directly decided on the partic errors acquiring in private practice, excapt far case of a physician, or surgeon, supwhere such arrors have been made the sub- posing himself to be too roughly handled by neither of an action at law, as in the case of a medical critic; because, hitharto, phy-STANLEY, the Hospital Surgeon, who mistook a piece of fliot, of nearly two inches in dismeter, and at the distance of more than our inch from bis patient's anting patella, for a portion of that patella? and they are aweres aleo, of the grounds upon which we have confined our criticisms to the blunders of Hospital functionaries. Now, we ask, upon what principle the physiciana and surgeons of public hospitals can be entitled to greater indulgence from medical journalists, than authors who endeavour to instruct, or entertain the public by their ecientific or literary productions are allowed by law to claim from literary journalists? Are they more eacmpt from error 1. If it can be shown that blunders are mover equimitted by these persons, then we admit that every thing in the shape of severe comment on hospitel practice must be unjustifiable, because, by the supposition. such comment must necessarily be unjust. But if, on the other hand, it be matter of motoriety that cases are frequently, aye, on medical or enrgical practice, and by how constantly, occurring, in which the bealth much the health and lives of the public are and lives of patients are destroyed by the negligence and ignorance of haspital func- in knowledge, or their literary tests, by so tionaries; if it be matter of untoriety, that much will the Physician or Surgeon, whose the election of these functionaries is fre- practice is animadverted upon, he less enquently an offair of family interest and in- titled than the author to the interference of trigue, depending, ant on the pre-eminent a court of law egainst his exitie. The iescientific attainments of the person elected, competent physician or surgeon may be but on the flat of some individual, incapa- damaised in his pocket by the criticism, ble of judgiog of such attainments, or, if and so may the incompetent author; the capable, biasaed by cousiderstions wholly physician or surgeon may have nothing but distinct from, and incounistent with, the in- his professional skill, however elender, to terests of a charitable institution ;-if qualt rely upon; and the literary powers, howfacts be notorious, and capable of proof,-in ever despicable, of the author, may be bia what respect does an incompatent hospital sols means of subsistence; but, where the functionary deserva greater indulgence at public is a gainer by the esposure of false the hands of a journalist, than an ignorant pretension, the loss of the individual exor vapid writer? or, upon what principles of posed is held by the law to be demants law or reason is he antitled to ask for greater shape injurid,—a loss entitled to no reparaimmunities? The law, as we have stated, tion-a loss which he ought to sustain.

siciona and surgeons, who have considered themselves aggrieved by the publicity given to their mishaps, have desmed it wiser to appeal to a medical than to n legal tribunal. But the analogy between criticism ou cases of mais press in surgery or medicine, and criticism on despicable literary compoaitions, seems as us to be complete, as far as the courts of him have entried the principle of demotes about formid, as applied 0 the loss sustained by authors in the letter cases; and upon groundered public espediancy, that principle might be carried still further, in the case of inthingstant surgeons and physicians. The courts of law will not protect an author, however dampified in his literary reputation, against his settle; and why? Because, if they cramped observations upon authors and their works, the publie might suffer in their pockets, and intheir literary taste, by the purchase of worthicae booke. Apply this principle to criticism of more importance than their advancement

It is perfectly clear, that if a physic an or surgeon write a book on a professional subject, he is just as liable as any other suther, to be publicly taxed with ignorance; and that however damnified by the oriticism, eye, though his fee-book may have been rendered certs blanche by the castigation, he sansot recover damages, in a court of law, of bone, and the consequent alowness with against the critic, provided the cenagre, or even the ridicule to which he may have been subjected, prine fairly out of the subjectmatter, and comput he taken to be directed against the private or many character of the hen. And a court of law mould not, in such a case, estalliste the huestion; whother the erhideline, or was not right, in his view o the medie of the work; but, if it appeared that he had not travelled out of the the pathology of the hones, it is strongly work he criticated, for the purposes of slan- impressed on our minds that there is, geneder, it would, as successful general issue, rally speaking, a want of information on directionalist for the defendant. A Treatise on the Diseases of the Bones, By BINJAMIN BILL, Fello. " he Royal College of Surgeons of Edinburgu -London, Edinburgh, Blackwood, 8vo. pp. 294. 1828.

FROM the comparatively low organization which all its sanatory, as well as morbid, processes are earried on, surgeons not having an opportunity of observing the immediate effects of remedies, have imbibed a notion that art can effect little or nothing in diseases of the osseous tissuo ;that, in fact, every thing must be left to the vis medicatrix seture. Hence, although we have many excellent systematic works on

The method of classification, which the

criticised is a published composition; in | "I. The first head includes the various the latter, the thing criticised is an opera- kinds of inflammation to which bone sud its tion publicly parformed. matades of hone.

VI. A sink head may with propriety includ. . snomeleus sffections ef bone, ... uncerning the nature of which little as yet is knewn.-1. Bleedy tumeur, or nneurism of hone.-2. Tumours dependent upon the axistence of hydetide in the substance of the osseous tissue."

Mr. Bell makes some interesting remarks on "interstitial obsorption of hone," e term which he first employed in e memoir, published in 1824, in reference to the well-known affection incidental to the neck of the thigh bone. The disease, however, Mr. Bell informs us, is not peculiar to the femur, it is not common to any period of life-in the young It is generally confined to the vertebral column-and in the middle-aged and elderly its usual seat is the cervix femoris. We regret that we have not space for the whole of the enthor's remerks on this subject, beth as regards the local peculiarities of the affection as well as its general characteristics. But, In the opinion of Mr. Bell, it is important to notice that-

"At an early period of life, or even in adult age, when, from habit, the body has been suffered to incline un the side, beyond the proper centre of gravity, the unequal pressure of one vertebra upon enether, on the side to which the tendency to inclinatien has occurred, occasions, in the first instance, a partial absorption of the intervertebral cartilages, and subsequently of the vertebrae themselves."

The various diseases enumerated in the colour? anthor's classification, are separately treated of in a brief, yet sufficiently intelligible manner, and although we de not find any thing novel as respects the pathology of the bones, yet the whole subject is so well treated, that in two hundred pages of on occave velume, there is sufficient infermation for general purposes. It is no small recommendation to this work, that, with a few exceptions, all the morbid conditions of the osscous tissue which Mr. Bell bas described, have como under his nwn observation; the diseases have been loss of motion, in paralysis?

Ventous .- 2. Osteo-sercome, nr Fungus Ha- | att fied at the hed side, and in the dissecting room. Subjoined to the treatise, is a estalogue of the preparations Illustrative of the diseases of bone, contained in the museum of the Edinburgh College of Surgeona. The description of these preparations is drawn up by Mr. Charles Ball, who was, if we mistake not, the original possessor of these "neese spicimins."

> The outhor has fallen into one egregious error, which we must take the liberty of correcting before we conclude our review. In e note, at page 1916 Sir William Blisard is designated "one of the PARRIES of SErgery." One of the exter CRANDMOTHERS would have been mearer the truth,

QUESTIONS PROPOSED TO A CANMBATE FOR THE BERSON BY M.D. AT EDINGUESE.

#### RE. GRODORY'S QUESTIENS.

WHAT is a mosele ! Are the extremities of muscles of the ame testure as the other parts ?

Why are the catremities of muscles composed of tendon?

What ere the conditions in which a muscle enists?

Do muscles always become relaxed after centraction ?

What are their diseases ! ... What is the colour of a muscle ! Is this colour essential? Whose is it derived?

When the blood is removed, what is their

Ara there say bollew muscles? Have the arteries soy muscular fibres ? What is the use of them ?. Has not the heart the power of propelling the blood?

Hew do you prove this ? Are muscular fibres discovered in the veine !

Are there ony valves in the erteries? Are there ony valves in the veins? In what part of the body is that? liew are the veine here subjected to pressure ?

What is the cause of paralysis? Does the pressure occur at any particular pert?

Is there ever any nther symptom, besides

If pressure is made on the right lobe . the

hrein, where will persiyais occur?
What is that disease called, when, besides loss of sense and motion, there is also a od? cometose state? Are paralysis end apoplexy allied to each

other ?

How do you know this?

Are there any other diseases of the muscles ?

What ere the symptoms of apilepsy? Are all the muscles of the body elways

convelsed? Are there any aymptoms denoting the approach of an apileptic fit?

Does the patient recover immediately, and all at once, from the fit?

What is the definition of rheumatism? Does the disease effect any other part beaides the muscles?

Is there eny pyrexia in this disease? Is it synocha or typhus?

What ere the causes of this disease? Are there any other causes, when cold is

not epplied? Does the pain ever remain after the py-

rexle is gone?
How does the disease termineto? Does it ever eed ie suppuration?

Does suppuration ever sfeet the muscles? Does the disease over termicete in gangrene ?

Does death over casho from this disease? What remedies would you employ?

Hes the blood, when drawn, any peculiarity in this disease ?

What is the huffy coat ?

What is the cause of this separation? Hoes the blood, in such circumstances,

congulate faster or slower than usual? What time, in general, does the blood

teko to sosgulate? Is it ever longer?

What other remedies would you use? What disphoretics would you use?

What do you mean by the pulvis opiatest?

What does this powder costsin besides oplum and ipocacuan? What are the proportions of the ingre-

dients ie e acrupie?

In what dose would you give it? What incoevenlence sumblimes arises fro

it ?-does it ever affect the stomach? Are there any had consequences over left af ter the disease is cured ?

#### Dr. Hong's Quaties,

What are the diseases in which the muscles are affected with spasm? Mention some of them.

What are the symptoms of tetatue? Are there any muscles particularly affected?

What muscles of the hand are chiefly effected ?

Ara the muscles of the lower jew affect-

What are the species of tain. . What is opisthotonos?

What is emprosthotonos?

Are the muscles of the ebdomen affected? Does tetanus ossur more frequently in somo countries then in others?

What randars the hody more ensceptible of the disease in these countries?

What are the ecuses of it?

Are there any other esuses ? Are there my internal causes !

Are there any sauses epplied to the bowsla?

How do you know worms are u cause ? How does tetanns terminate?

What are the remadies? How does calomal act?

Does It act in any other way? But how does it ect in general?

Has It any other mode of acting?

Does opium act in any particular way in this disease?

How does its sction differ?

In what does would you give it? Who first introduced this remedy into practice ?

is the warm or cold both most affisient? How is the cold bath to be admisistered? What would you do with your patisot efter coming out of the hath?

What would you do next?

What would be the affect of opium? Bet in what maeifast way would it relax the spasm?

#### Dr. Horn's Queries.

-coming the Monao's queries.

Ifow is lime water made ? Is it not to be atrained?

In what diseases is it used?

Is it used in any other?

In what quantity would you give it? In dyspepsie; how much?

As lime water cannot be given by itself, how would you give it?

Why should it not be given in calculus? Does it ever augment this size? How would you know this by examining

the calculus?

What medicine is chiefly now need is calculeus complaints?

If given in large quantities, what incooveniencies ariae !

What is its doss?

How woold you sxhibit it? How is magnesia supposed to act in this disease ?

#### Dr. Duncan, senior-queries.

What is the name of the disease when there is a collection of water in the thorax ? What are its chief symptoms?

What is the state of the pulse? You said the patient lies with difficulty on bis back.

Why does be breathe more easily in the orect posture?

What medicises de wonse to svacuate the water?

What remedies are used ?

What is digitalis?

In what form is it need? How much of the powder woold you give? Has digitalia any peculiar effect on the

pulse? What are the effects of an everdese?

This ficialist my first examination; it lasted out hour, and took place at Dr. Gregory's house, in April. In June, the following abort examination took place at the College in private.

#### Dr. Duncan's queries.

How many external senses are there ? . Enumerate them. Where is the sense of feeling situated ?

Ars not other parts of the body possessed of this seras in a certain degree ?

How is the sense of fashing diseased?

#### Dr. Homn's queries.

Give an example of the depreyed sense of feeling?

I now received from Dr. Menro tho

and, so the oth of July, was szamined thereon.

Fiestly, I have to defend in poblic my Insugnral Dissertation.

## WESTMINSTER MEDICAL SOCIETY.

December 6, 1828.

- ARKOTT, Esq., in the Chair.

TREATMENT OF CONCUSSION.

Me. M'ALPIN, after the Minutes were read, iotroduced the subject of concussion, with a view of taving the spinion of the Society upon the ment spinoprise treatment. As far as his swn judgment war, he was de-cidedly swerse to bleeding in the first stage, and which he thought, but for the prevailing public prejudice in its favour, would not be so frequently resorted to. He considered that re-action sught to be allowed to take place before venescetion was thought of.

Dr. Durrin observed that, during his stay at Florence, he had seen the Prefessor there treat three cases of concussion. That treatment consisted in taking away small quantities of blood, only a few conces, in the first stage, during complete collapse; under the impression that this mode of treatment seted as a stimulant to the arterisl blood. The professor considered that, following sphorism, to write a commentary in concussion, there was a congestion of

in, and the

t of taking away

vergus blood in the bleeding in small qu circulation was afterw After re-action took pi in other cases. Those feetiy well. Dr. Sam (Dr. Duffin belisved.) same plan of treatmer He had been in the F amall quantities of blc then of giving atimula.

treating the case upon ge real principles. Mr. Bus upr did not think the reason of bleeding; either in concension, compression, or apoplexy; well auderstood. He was per-sunded; that at no time will any additional supply of matter be disastred within the navity of the brain. In the cases to which he had adverted, the venous circulation was, in a great measure, put a stop to; the veins of the Brain could not empty themselves, therefore the activital blood was not admissible; hence the redness of face that frequently appeared in apoplexy. Upon removing the various blood, the brain became ationslitted by the flow of acturies blood into it, and which he conceived to be the only more of disconting the brain to action. mode of districting the brain to action.

It: M'Atrix abjected to the mode of

depletion in the first stage, as it was had recourse to in this country. It was considered nothing, here, to take away twenty or thirty cances of blood. In believed the grand point to be, to get the brain atimulated; and if the opinion of the Society was, that small blandings would do that, and was the only means, he could have no

hesitation in receiving such a decision.

The Presenter wished to know what atimuli were given, either on the continuet, or at Edinburgh, after the small bleediegs.

Dr. Durris did net say that the professor at Florence gave stimuli, but that Dr. Saunders had done so.

Dr. Swait, as far as he was capable of recollecting, believed Dr. Seunders had in-formed him, that, in treating cases of this sort, he had always taken into consideration the idiosyneracy of the patient, and the bistory of his constitution; that he had even seen gout producing epilepsy, and all the ayantoma of apoplaxy; and that, in such a case, he should not treat the patient as he should a patient under ordinary circumstances.

Dr. Appreson considered, that if this apoplectio gonty aubjent was to he treated differently to other aubjects, the case might be greatly endangered. As to

stimulants which uxuited both the heart lies, the artisi and afterno to increased action. In the enabled to go on. treatment of all teres, the symptoms were ins hied freely as first to be looked at, and the con-ten cases did per-a, of Edinburgh, applicable to the treatment of a goot, d practised the subject, ware generally and precisely those by twelva years. regard to the doctrins of incompressibility in the first stage, of the brain, too much stress had been laid upon this. Thure was the foramen and, afterwards, magnum, and the different foramina for the exit of the nervous system, into which, or partly through which, it was possible the brais might be urged by an in-creased admission of atterial, and detention of venous blood, and who could say how alight a pressure of the hrain into these foreming, might not disturb the functions of the organ?

> Mr. Buangr believed, that if an additional aupply of arterial blood was admitted, it was only in consequence of an increased rapidity of the circulation; and that if any more than the ordinary quantity of the venous blood was detained in the brain. then a proportionate quantity of arterial was prevented entering it. Here the discussion

ended.

#### EXTRACTION OF THE TESTE.

Stres the publication of Mr. Da la Fons' paper on Estraction of the Teeth, we have received a variety of communicatious on the subject; and although we are far from denming it unimportant, we have not space for all which our numerous correspondents have written. It mey, in good truth, be said of tooth-drawing as of writing-that every man has a fashion of his own.

Mr. Bedingfield of Stowmarkot, in writing tn us, says that, while he admits the general ressaning of Mr. De la Fons, on the auperiarity of the key-instrument to be earreet, yet he contends there are some cases in which the forceps are indispensable, as in the removal of the incisars. The key-iostrument, which Mr. Budingfield employs, is constructed with a kind of bridge fulcrum, se that pressure is made on the teeth adjoining that shout to be extraoted, and the injurious effects of pressure are obviated by attaching a piece of cork to the fulcrum.

wers so, it was a mode of treatment ex-tremely lishle to be misconceived. If an Bedingfield) readily allows of the siveolar process being sufficiently broken down by the tooth only, as it is drawn laterally from its socket: whereas, when the decayed tooth might be greatly endangered. As to its socket: whereas, when the decayed tooth bleeding being the means, and the only is itself made the full-rum, the numblon of means, of increasing the circulation of the common key-instrument is crushing the brein, this was a misconception. It alveolar process in one direction, while the the brein, this was a misconception. It alveolar process in one direction, while tho was well known that there were other fung of the tooth is breaking it in another:

the alveeler process is, as it were withis a vice.

Mr. T. Warner, of firencester, on the other hand months raus:—" the forceps, if secrified there, and properly applied, will remove teeth with much less present and subsequent pain than the key-instrument, by Mr. Warnor, are of different kinds-

adapted to the various teetb.

blr. Proose of Briatol says that, in the inches in length, bent almost to a right an-gle, arched and notated in the claws, so that of an inch broad, and rather more than en-it is easily passed over the crown of the linch in length; From the application of tooth without touching it: sod, when it is the scalpel to the persesua, so the axtracjaws, but tapering from the joint to the remained in the bladder. The boy was then olustic and prevent too great pressure on this report, has continued to do-well, the teeth. For the large moiar teeth, Mr. Castrolies.—Mr. Earle removed, as Prouse employs clarger and atronger pair samo day, the testicle of Thomas Wells,

ceived a communication from Mr. Knox, out of health. About a year ago ho had with a drawing of his " improved forcepa, which appears to us tu possess considerable merit.

#### ST. BARTHOLOMEW'S HOSPITAL.

List of Patients admitted under the care of Mr. Earle, Nov. 27.

Harley's Ward, No. 2 .- W. Darley, at. 16, calculus in the bladdor.

Huldwyn's H'ard, No. 6 .- John Quin, at. 36, extensive ulcoration of both lega.

No. 7 .- John Vices, #t. 30, large aloughing ulceration of the right groin.

Situell's Word, No. 2 .- Sarah Hicka, mt. 68, cancer over the radius of the left fore-

Elizabeth's Ward, No. 3 .- And Grant, set. 19, injury to the dorsal vertebra-

A few others, with slight injuries, principally to the knees, sa well as some common eases, into the Venoreal Wards.

No cases of importance were admitted on the two last " taking-in" days.

OFENATIONS-LITHUIONY AND CASTBATION.

a boy eight years of age; after meking an atories high, whilst feeding pigeons. Was

things with a common scalpel, he used Blinked's knife, which he withdraw, end introduced four times before completing the incisions. The staff was beld by Mr. cent, and some delay, in the course of the operation, was occasioned, in consequence of Mr. Vincent, from e motion of the patient, and likewise as speedily." The forceps used and perhaps too intensely observing tha course of the knife, permitting the east to alig out of the bladder, by which the opera-tor conceived he had out into the neck of it, course of many years' práctice, he has "ex. when, in fact, he had not. After the in-tracted hundreds, not to say thousands," of cisions were complated; the stone was easily teeth with a pair of forceps of about five axtracted. It was a flat lithic soid stone, fixed, "the obtuse points of the claws hold tion of the stone, four minutes and forty the tooth auticiently firm, without breaking accouds alapsed; another minute was oc-The forceps are made strong in the cupied in ascertaining that mething further handles, by which means they are readered removed to bed, and up to the writing of

of forcers, with jaws of about an inch end set. 24, to consequence of extensive acro-half in length. The patient has enlarged In addition to the above, we have re- scrofulous knee-joiots, and is, alteget the opposite testlein removed, owing to the same disease. Three arteries were taken up, and the patient removed to bed. The teaticle, which was the aire of a largo fint, when cut into after it was removed, presented, in part, a healthy appearance, from which, if the morbid parta could have been thrown, Mr. Earle thought might have retained the power of accretice, but he was induced to perform the operation, in consequence of the declining health of the patient.

Greatly to the advantage of the pupils, and, consequently, much to the credit of the operator, no one was permitted to surround him during these operations; consequently, the pupils had a distinct view of the opera-tions from all parts of the theatrs. This is sa it ought to be, and so example which it is aincorely to be boped all the surgeone

will follow.

PRACTURE OF THE BASIS COANSI, WITH -LACEBATION OF THE BRAIN.

William Hurst, setat. 22, was admitted into Colston's Ward, Nov. 17, at haif-past three r.s., with a lacerated wound of the scalp and periosteum, ovor the external angle of the left eye. A small portion of the hone was exposed, on which the com-On Saturday Mr. Earle performed the mencement of a fracture was visible. Ha operation of Lithotomy on Thomas Cooper, had fallen from the roof of a house, several insensible when brought in, and ha bleeding from the ness and mouth; winited much; pupils acted very slightly; breathing stertorous; pulse feeble, and intermittent.

B. Calonel, gr. lij.; falop, gr. x. statim. Cold eleths to the head (not shared).

Towards evening the pulse began to rise, and the dresser bled the petient to 3xvj. In ton minutes afterwands, the pulse became more feeble, and therefore the dieseer, Mr. Thornton, wrote for eight ounces of brandy, part of which was given him in small quantitles every quarter of an henr, or twenty minutes.

18. Still insensible | breathes with less sterior; pulso 130, and intermitting; pupils contracted, but they act slightly no axposure to light ; the bowels freely epen-

ed during the night. 5 about of the legs during the night, so that it became necessary to have them strapped down; iridas immoreable this morning, and the pupils much contracted; breathing changeable, being more or less atertoreus at Intervals; pulse fluttering; countenance

sinking. Mr. Vincent now ordered the head to be alisted, and cold cloths to the scalp; also, 3ziv. of blood to be taken, if the pulse would bear it. The blood was alightly buffed on some parts of its surface.

Died at half-past two on the i lowing morning.

Post-mortem Examination, at o'Clock.

Immediataly beneath the du und a considerable effusion at found a considerable effusion at the surface of the right hemisp. oerebrum, and great turgescence t sels of the pix mater of the appears and also has continued the assispants an The estimator of the first in presented strong parks of vascular excitement, and, on helog that period. The ulceration of the eyold from the skull, the posterior love in the proof. The ulceration of the eyold in the posterior love in the proof. The ulceration of the eyold in the proof of th fracture of the basis extended from the left auternal angular process of the frontal bone across the erhital plate, downwards, and scross the nella turcies, runuing hackwards the whole length of the petroon portion of internal ear; a bloody serous effusion within exercisity of the lewer third of the femora-the thece vertebrains, and, in some places, The large had been long discased, and the blood extravasted fitto the anhabance of patient encredingly reduced in atrength by the apinal marrow itself. Blood was also it. The operator made a double flap: six found extravasuted and engulated in the arteries were secured. cervical portion of the vartebral canal eaternal to the theca. The laceration of the brain was on the opposite aide to that which immediately required the blow,

GERENIC OLCERATION OF THE UPPER

Lie.

looking woman, and in the wine also daking tated and tated state, was admitted into drago Ward; October 9th, under the care of Mr., Lawrence, with extensive feul phagedcnio ulceration of the upper lip and left eback, (the left upper aye-lid destroyed by the ulceration,) and chronic conjunc-tival iudammatign of that eye. The sore on the lip has been attended with much inflammation of the neighbooring parts, and considerable pain. A small painful pimple came on her lip about three months agn, which has gradually extended into the preany venerual aymptom; is a widow; remembera her husband, some time ago, giviog her some pills for the benefit of her

health generally.

Ordered a solution of the liq. opil. medntiv., the propertion of 3ij. to 3vj. of water, to be applied to the wound by means of lint ; bread and water poultices ; pil sapon. eum opie, gr. v., omni nocte; and gr. ijas, bia in die, with easen sarap, yes, ter quo-tidia; and house physio occasionally. 17. The general health better; the sapeet

of the sere much improved, and the surrounding inflammation abating; the pain also much diminished. Omit the pills, and

centiaue the serseparilla.

26. Has been fumigating the sore for the last week, and taking the pil. sap. c. opio, gr. v. omni. pocte, agaio, continuing plac tha surseparilla. The sore is very much imreved, presenting now a clear, healthy, graoulating auriace; the gums rather tender with the fumigation. Cnotinue.

Nov. 19. Her mouth has been kept affectd hy the fumigation for about a formight, sels of the pin mater of the eppo. . ..... and she has continued the sarsaparilla all

#### OPERATIONS.

Mr. Vincent removed the left leg of Elithe temporal hone, ever the cavity of the mabeth Fletcher, etat. 23, at the superior

> Mr. Vincent took off the right leg of William Hawse, retat. 25, at the same part

of the femer. This operation was also formed in consequence of a much discussed knee, which there and the destruction of the perio seid.

· Lithstony.—Edward Darley, metat. 16, was brought on the operating table at five minutre peat one, to undergo the operation of lithotomy hy Mr. Earle. On introducing the staff, the bladder not being much distantly, the operator was guadre to atrike the atone. The luntrument was withdrawa, and three other staffs introduced; but though about half an heur was occepied by Mesars. Earle, Vincent, Lawrence, and Stanley, in trying to come in contact with the atone, they were unable to dage. Some thought the staffa were in the wrethra, some in the bladder, and some detained at the prostrate. During the whole of this period the patient was auffering great pain. Mr. Earle thee introduced the staff he had first each, havring altered its curve, end, without further difficulty, came upon the atone. At 26 minutes sed a half to two, he begon to maku the first incising, and extracted the calculus ra four minutes afterwards. After having much the incision into the bladder with Blisard's knife, he istroduced it e second time, to colorgu it. The stone was of a mulberry kind, the size of a large walnut, rather of an oval form, and extremely rough. After it was zearly brought out, the operator lest his group, and therefore the forceps wern obliged to be introduced again before it was brought ewny. Mr. Lawrence held the steff.

#### WESTMINSTER HOSPITAL.

#### STRANGULALEN CORRTAL PEDNIA.

John Prnnington Tyly, setat. 64, sa emaciated subject, admitted under the care of Mr. White, ce Monday, 17th Nevember with strangulated scretal hernia. The patient had had a reducible hernia for about a year. The Saturday previous to his edmisston, after some exertion, an additional portion of gut descended, and symptoms of atrangulation appeared. Ne application was made for medical aid uetil the next day, when the usual means of reduction were employed without success. The aurgron consulted, recommended his immediate remeval to an hospital. Another day, however, was lost, before this advice was com-plied with, and he was not admitted until ten o'clock this morning.

The hernial tumour is large, and exces-

sively sensitive. He complains of pain

the alilomen. The countenance is pulled and anxious; respiration harried and constrained t pelse small, lrregular, and frequent. No sivine evacuation has taken place for feur days, and vomiting of focal metter has twice coourred. The prelimiaury remedies having been promptly resorted to, but without success, Mr. White

sorted to, but without success, mr. v mise proceeded, with the sid of Mr. Guthrie and Mr. W. B. Lynn, to perform the eperation. The patient being little supples, with the thigh bent onto the period on a nugle of 40°, Mr. White loid hold of the scrotum, and immediately secertained the exlatence of a bydrocele. An inciden was then made about three ruches in length, in the longitudinal axis of the tumour. Several strate of condessed cellular tissue were dissected with the greatest care, and a small anc, containing about two antices of per-lucid acrum, was opened. This the ope-rator supposed to have been the sect of an old hernis, being situated exactly in front of the true sao, which was then immediately opened. The intration which presented, was of a dark port-wine colour, attidded with greecish spots, and emitting a gragrenous odour; the greatest enution was consequently necessary is reterning it into the belly, and Mr. White, with that view, made a very free division of the stricture. As strong adhesions existed round the neck of the suc, in the abdomical eavity, thu whole of the intentine was not returned, and the hydrocele not having been opened, the wound was closed in the usual munner.

The patient, during the aperation, which lasted about fiftees minutes, did not nake much demonstratioe of pain. In that time twelve onnces of port wine were administered to him. Pulse weak and irritalia. On being put iatu bed, the following dranght was given, and urdered to bu represed occanionally :-

Spir. etheris onlyh., 3ij.; Conf. prompt, 344.; M. ft. pelie.

Half an honr ofter the eperatice he died. Post-mortem Examination twenty four hours after death.

The peritoneal cont of the amall guts was injected throughout, and, in many parts, the muscular and mucous coats were affected with inflammation opposite the wound; about eighteen inches of the Beum were gaugres ous, and insulated by adhesions from the general cavity of the abdomen and pelvis. The apermetic cord was situated behind the sac, which was avery where adhe-rent to the adjacent parts.

# GLASCOW ROYAL INFIRMARY.

CARRE OF PRACTURE OF THE CRANIUM.

DONALDM INNER Was admitted (Nov. 4) with from which there issued a free discharge of arterial blood. Blood, it was stated, had with eight fragments, and the odges of the patient dying on the table, a few minutes cles, a quantity of serum. The wound of after its performance. When admitted into the Konjuda, he was quite furious, requiring the exertions of several of the was quite furious, requiring tain bim la hed; but for some time previous to bis bring brought into the operating theatre, he had been in a state of come. The body was not inspected.

On the same day, Donald M'Millan was time, with the preceding patient. From the sponding with this, a portion of hone was found detached, and irregularly depressed. A considerable quantity of blood had been lost, and the right arm, although it presented no appearance of injury, was benumbed and powerless. The patient was quite sensible, giving a encreet reply to eny question that was saked him. Respiration was unaffected; pupils natural, and pulse 75.

This man was operated on before the last, and was nearly an hour on the table. The original would was enlarged, and snother made at a right engle with the first, extending over the left parietal bone. The depressed portion was now seen, be-

remained after the circular portion had been separation removed with Hey's saw. The broken both was raised with the eleva-tor, and removed. The formeous, some efterwards pleked out of the wound a wound extending over the right eyebrow, the forceps. There was only one vessel which he had received from an iron block, tied doring the operation, and about an attached to the rigging of a vessel, fulling oo nunce of blood lost. This case also termihis head, The wound was nearly ten inches a nated fatally. A mong other unfavourable in length, and, by introducing the finger, a symptom, in a few days a furgul appeared finears could be felt in the bene. On one in the wound. Agampts were made to reside of the head, there was a party awelling strain its growth by pressure, but without of considerable chee, and, posteriorly, a se-ancess. It gradually increased, and on the cond would, balf the extent of the other, 17th November, four nr five ounces of blood were discharged from its surface. The patient died during the night of the same day. also forced from the ear. An incision was The Inagus was of the size of a hea's egg, made, over this frestated piece of hone, of a sponcy consistence, sed dark brown which was found depressed and datached, two-raches and a half-integrity, and one and it of the acoustness of the brist, protruding through an aperture in the dara mater, and extending downwards nearly to the roof of the lateral ventricles. Autorior to this,

Donald M'Queen, aged 70, was admitted into the Hospital by Dr. Couper, on the 13th November, with a fungous tumour in the right nostril. It bled profusely when touched, and a thin fortid fluid constantly exuded from its surface. The right cheek admitted with an injury of a similar neture, I was more prominent than the left; and the received In the same way, and at the same roof of the mouth corresponding with the theor of the nostril, noft and protuberant. middle of the sagitted seture, there was a The cychall was pressed furward half an wound three inches la longth, extending to inch from its sucket, and from the gum, the posterior part of the head, and, correl which was softened and spongy, there issued a slight puraleot discharge. were also loose, and in addition to the affection of the eyeball, alight ectropium of the lower eyelid had taken place, with dia-tension of the Inchrymal sac, and consequent epiphora. Vision was impaired, and cround the arbit the patient sometimes felt ervere pain, extending backwards over the scalp, generally followed by bleeding from the nose, which, he stated, always afforded him immediate relief. A few days after bis admission, the third and fourth grinders were removed, and an opening made into the natrum. Some blood lawed, but no tumour could be felt by the probe, and tepid water, tween two and three inches in length, and when lojected through the perforation, half so inch in breadth. This was broken issued freely by the nostril, bringing away a into many small pieces, some of which were quantity of inspisanted pus. The tumour in firmly fixed under the autrounding cranium, the nestril was removed with the polypus and one fragment, in particular, was found forceps, and by continuing the injection, a driven through the dura muter, penetrating large quantity of solid matter was dis-the ambutance of the brain. The trepline charged. Tepid water was afterwords dely was applied to the left of the depressed injected, and, in a more time, the distancia bane, and one angular projection, which of the lachryans see and spiphore, had, in

a great measure, subsided. Vision also they mean to jestify this departure rapidly improved. of or other

AJUTAT HTEW ABBILLA ATDICTURES. od (Oct. 26) with indurated awollings, of a dull red colour, spread ever the perineum, and reaching upwards to the enternal abdominal ring. le tho lest side of the perimenm there was a fistness epening, into which a probe could be passed to a consider-able extent, but no communication, either with the acrotum or urethra, sould he de-Above Ponpart's ligamont there was a soft fluctuating awelling, entending towards the spine of the ilium, the contents of which could, hy pressure, he made to pass through the fixulo in the perincum. The prostate gland was of natural size, but about no inch anterier to it e hard cellous stricture could be felt; the urine was voided with difficulty, and in a small stream. The patient stated, that he had been subject to atricture fer the last 25 years; and that, about five weeks before he came into the Hospital, while enerting himself, he felt a andden pain in beth his groins. His urine, when veided, abertly after this occurrence, was of a reddish colour, and, a few days afterwards, the swelling in the perinenm began; this continued to increase until it hurst, a short time previous to his edmission. The abscess in the grein was opened, and a small quantity of bloody, purulent matter evacuated. A poultics was afterwards applied to the perineum and groin, and a catheter ordered to be kept constantly is the neether. Nething worthy of notice took place fur eight er ten daya, but, en the 7th Nevember, a diacharge of florid bleed took place from the epening in the groin, and also, la smaller quactity, from that in the perineum; shout three pounds were lest before the bleeding was stopped. The pstient died on the 10th.

The abscess was situated under the common integuments, extending to the anterior spineus process of the llium, and also near to the umbilious. Near the symphysis pubis it got under the cerd, and desconded along the left side of the perineum to the anna; whon spened, its inner surface was aloughy, and found to contain n small quan-tity of purulent matter. The bladder was thickened, but the vessel from which the blood had issued could not be discovered.

The unfortunate nurse, whose case was lately published, died sheut e week ago. The inspection of the hody was privately ceeducted; and although a written request strong, and frequent; the akin hot, face Infirmary to make known the post-mortem tengue red and molat; the abdomen was appearances, no attention was paid to it. I free from pain, and there was no diarrhose,

the Liful aubterfugo, " that the nurse was a private patient." If candeur and justice he forgotten, they surely ought, for their own asken, te pay some attention to con-sistency. How much this really is attended to may sasily be astimated, from their treating a patient one day, in a public ward, pretending to explain the natura of a case to the students of which thay thomselves wern ignorest; and when that patient is dead—when an opportunity has eccurred of acting aside all doubt on the accident, and ascertaining its real nature unblushingly tell us, that she was a private patient. It is new to be presumed, that the diseased appearances of this patient are the diseased appearances of the period of the nature of the made known, however manual or instructive such information might be, or however much it might spable the students to avoid a similar energy furtherly still become also see a priode justime, as is pretended, but merely because man information at the instrument of one of the would expose the ignorance of one of the heapital aurgeona.

#### HOTEL-DIEU, AT NANTES.

DYSENTERY TERMINATING IN CANCERNS, AND PERFORATION OF THE INTESTINES.

Encephaloid Tumonr of the Liver, penetrating into the Thorax. Cicatrix in the substance of the Brain.

Jun. Heunen, setat. 53, of an athletic conatitution, and habiteally in the enjoyment of excellent health, having, for three weeks, boen affected with great debility, less of appetite, pains ie the bowels, and sanguineous diarrhon, was, on the 11th of June, eduntited iete the Hospital. At this period he complained of anoresis, violent color pains, and tenesmus; the abdolism was somewhat tympanitic, but not tendar on pressure; the tongue was red and dry; tha thirst viulont; skin dry and bet ; the pulse natural; the daily number of atoola varied from ten to twelve. He had a larga cicatriz en the right cheek, extending from the middlo of the molar hone over the aygomatic eroir, to the temporal auture; it was tha consequence of a wound which he had re-crived in the war of La Vendée. After tha repeated application of leeches to the anus. and ander the use of mucilsgineus petlons, the distribute diminished, but the fevor angmented, and delirium accoded.

On the 15th, the pulse was very full, was sont to the Visiting Surgoons of the puffed up, senjunctive injected, eyes bright, but furious dollrium. The patient hit is been twice bled, the affection of the freed and the facer subsided, but the distribute a state of the facer subsided, but the distribute appeared with lucreased violence and frequency; the stools were very fould, and sometimes passed ievaluaturily; the abdomen was sommwhat tender on pressure; six jecches were applied to it.

leechea were applied to it.

On the 21th, the caustenaces of the patient was auddenly altered, erry pale, and apprentice of the greatest anaioty; the abdonau was perfectly free from pain; the atoola ware involuntary, and had a truly gangresous smell: the axtrantice were cold; the paint outd not be felt, acc., and in the avening he axpired.

### Impactio Codaperie.

Under the olcatriz of the face the lategumants were armly adherent to the bonce and the squemous portion of the temporal bone consisted only of a very thin cosecus layer, so that, on the least pressure, the scalpel entered into the cavity of the brale. The internal serface of the right temporal bone was rough, and cocared with osseoos aed cartilaginous excreseances, to which the coverings of the brais were firmly attached. The pie mater was much injected, and contained a small quantity of serum. In the anterior and middle portion of the right hemisphere, a callular intersection was foeed, carresponding with the external wound, and going through the substance of the brain towards the lateral ventricle, from which it was separated by a very this layer of medullary substance. This intersection showed a large and compressed eyet, divided into a number of amail cells, which were filled with a seroes liquid, sed the parietes of which were of such a delicate atructors that they hurst on the alightest pressure. The medellary aubstance round this cellular latersection, and the other parts of the brain, a xhibited an mothid alteration ; the left lueg was slightly adherent to the planra, but in a healthy condition; that of the right aids was, at its leferior surface, firmly adherest to the disphragm, by means of a fibro-cartilagieona tissue, which, heelag been divided, is order to obtain access to the aponeurotic centre of the diaphragm, the latter was found perforated to a cou-aiderable exteet. The upper part of the right luog was healthy; its leferier lobe contained an axeavation of the size of an orange, which was filled by a green, putrid, and cerv fortid matter. The heart was and cery footid matter. The heart was healthy. The perfection of the disphragm was ac inch in diameter; its margins were softened, end he a condition approaching to that of encephaloid tumours. The surface that of encephaloid tumours. The surface of the licer was very rough, and otherent to the disphragm, by mases of a fibro-cartilaginous tissue, which being removed, an

ens excavation was found in the liver, communicate with the aperture in the presented, le its centre, a softened accephaloid tumour, which was enited to the tissue of the liver by menes of a very delieate cellulo-eascular teature, from which it could be easily deteched. The peritoneem and epiploon exhibited some traces of in-flammatice, and the istantices were adhereet to one annther. The mocous membrane of the atomach, duodonum, aed small intestices, was hosliby; that of the large in-testines was extensively ulcerated and gangrenous. Ie the middle of the transverse portion of the colon there was an aschar of two inches in diamater, which, ie its elrcumference, had produced a perforation. The cens cave contained a thick, dark-coloured blood, ie which some whitish mattee was found, whileh had much resemblance to the liquid contained in the cavity of the liver .- Répus Médicals.

#### HOPITAL SAINT LOUIS.

PUSTULAR VINSEXAL XRUPTION, TREATED BY THE RUBCARBOWATE OF AMBONIA.

P. M., 38 years aid, emaciated, and of a very weak constitution, observed, in the month of July, a particular cruption on his furchead; this bacing here suppressed for a time, by a nontrum, the composition of which was ucknown, soon retorned again, with a teedeeey to form ulcars, end begae to apread aver the whola body. On his admission into the hospital, in September, under the care of M. Biett, he was, in the following state : -Almost the whole of his hody, but capecially the inferior extremities, were covered with ulcerating pustules of different sizes; in the cantra of each pustulo there was a prominent, black, cory herd orust, surrounded by a white ulcerating margin; the epidermia round the ulcers presented a copper-coloured deficed areals. In those puntules, where the crusts had been detached, the surface was axcassated, much injected, and covered by greyish white, tenucious matter; the akin, between the pustules, exhibited livid bintches, the sours of former ulcers. The patient had, in 1814, auccessively been effected with gonorrhoa, chancre, and huho, and had caver had recourse to a proper mercurial treatment; ha was married, and his wife, who had borne seceral healthy children, had occer presented sey signs of infection. His general health was good.

M. Biett, having for some time employed

even to three, drechms. The crusts were period, the vapoor-bath having been em-gradually detached, end the excaveted ulcers ployed for some time, the patient was per-became more superficial, and assumed a feetly cured.—Journal Heldomadairs. healthy appearance; so that the patient, after having used the subcarbonate of ammonia for twenty days, was perfectly cured.

PROPRIABLE INVESTIGATA, SUCCESSFUELY TREATED BY THE ASSENICAL SOLUTION.

Xav. Hosr, wtat. 39, of a vigorous constitution, was, on the 7th of September, admitted into the Hospital, under the care of M. Biett. Having, up to his eighteenth year, anjoyed good health, he observed, at this period, without any previous cause, e scaly eruption on his legs eod thighs; the scales were very small, dry, of e whitish colour, and alightly adherent to the skin, from which thoy were detached by the least frictioo, leaving some elevation and reduces. In this without any disturbance of the constitution; sometimes, capecially in winter, the cruption disappeared entirely; but, on return-ing, it insensibly extended over the whole body, and the scales began to change into thick crusts, which were firmly attached to consequence of which the discese had become so serious as to induce him to seek longer or aborter atanding, were more or others. less firmly attached to the parts beneath. The skin over the joints, and of the thighs, rous matter, so that the putient was elmost ten ounces, and the use of sume speriouts, medical advisers. M. Biett prescribed the arsenieal solution, of which the patient took four drops duily, and this dose was afterwards gradually to the Ward of Farringdon Without, to whom creased to twelve drops. The effect on the the plan is sgreeable, shall see, at a certain cutaneous disease was satonishing; the hourevery morning, at his own house, all the crusts, which before had been remarkable really distressed poor who may apply, prefor their rigidity and torpid appearance, scribe for them, and send them with the

Royal Veterinary College, June 2, 1898.

must and small, (then and there present, and there present, and there presents cate was have to the person bringing the horse,

The horse was, as it and other, at this time, viz., June last, in the opinion the learned Professor, (I think he calls him-self president,) and also of, at least, twenty other incipient and learned Professors, sound, though old; hat they could not make the calmal young agale; and when I had sobpersed the learned of dismit President, in dolog which I sent to him the customary fee of a sovereign, and for which attendance, io all not on hoor, he, previously to the trial, demanded " his usual fee" of five guiness, besides seother half guiness for the previous inspention of the home, and the previous opinion, as it afterwards turned out, from his own outh, to be, that both he and his colleegues had given. And when the learned and profound-looking Professor lead driven himself in his twiumphal cur, the whole of the distance from the itoyal Veterinary College to Westminster Hall, there to astonish a "common jury" and "learned judge," with all that he knew, and more too, about "structure and function," and God knows what clee, he, the eforeseid learned Professor, and I by no means wish to impete to him any sordid lafluences, or to have it inferred that he was, io the least, haffed at my refusing, out of justion to my client, to comply with his demands, reitereteil, as they were, even while the cause wee trying, with a deal of perti-nacity, distinctly and positively aware, an being examined, that the horse was et, and from the 17th day of May last, up to the then present time, the 19th instact, an ensound horse, he having an oscilication of the certileges of the hoof, and which opinion soundness of a horse, which soundness of "Edmonds s, only one minute's duration of the morse in ametica, in the squae of "Edmonds s, only one minute's duration of the morse in the square in the State of the professor had been in the Court of Common Pleas.

This solution was taken upon the occaminuter Hall, and, as I family believe, from he must have formed from an inspection of having also previously beard the opinions of Professor Sawell, and of Professor Lythe, of the llorse Beaux, that the horse was nescond, it having on ossification of the cartilage of the hoof, sed which Professor Sewell described to be " a gradual thing, unless produced by some severa exertion," and a "fulse ring bone," so termed by furiers. In May last, and near a mouth before our learned President, and his conclave of luminaries of the veterinary art, had examined examination, but he is aged, and has done the lorse, which was declared, at the trial, a good deal of work.

I have the honour to he daily, for the last four years, never to heve either limped, shows lameness, weakness, N. J. Monrow, or over-fatigue.

I remain, Sir, Your humble servant, Heanest Liors. P.S. After the trial was over, the large-professor applied to me for personal of the half-guines previously much by him for the above as It is almost needless to sug porne gave him, as its value really As,—nothing, to his infinite chagrie.

ROYAL UNIVERSAL INFIRMARY FOR CHIL-DERV, WATERLOO BRIDGE.

## To the Editor of Tue Lanear.

Sia,-In your last Number appears a letter, signed "One of the Committee." Of the attack: made upon the medical officers as a body, some notice probably will be sent to your office this evening. I shall, therefore, confine myself to a few points which concers myself.

In the first place, the rules coumerated by "One of the Committee," apply to le-patients. The intection of the founder of this Institution was, that it should be at once as infirmary and a dispessary. There were to be four wards for the receptive of surgical case only. Two have been finished, but, from causes it is unnecessary to men-tion, have been converted to other purposes. Had the benevelact is tentions of the founder ever been carried fully leto effect, I should have felt it my duty either lo parsoo, or by a representative, to have been always present. The case, howaver, in different, it is an infirmary in name only. Ali serious accidents, s we cannot take seyie, are, as is generally the case, taken to the hospitals. Four, only, in the space of nearly four years, have been brought to me, and three of these were earried to St. Thomas's and Guy'e. It is cot necessary, therefore, nor have the Governors ever thought it so, that after the hours of busieess, their house-sorgeon abould not iedulge himself in a walk, read the papers, or diec, aed take wice with a frieed. From ten in the morning, till four, five, or aix, ie the afternoce, as it may happee, I have not, on any occasion, quitted the lefirmery.

Secondly, the patients never come, nor aver came before my time, to have their medicines repeated between four aed six o'clock. They atteed at our usual beura for examining, are spoken to, and if going on well, have, then, the same kind of medicines It is unnecessary, therefore, to peated.

be in attendance at these bours.

Thirdly, ten o'clock, not nine, (see recommendatory letter,) ia the hour when the le-

They is required to be opened, and it also present at that boor.

Fourthly, I wait for my superiors (they treat me as their equal, I am proed to say, and friend) at long as they wish, and I consider it my duty so to do. A few words more, and I have done: the sarcasa aimed at my two friends, the physiciane, in the words, "extensive practice, and axalted atations," will create a amile only; tha shoft will full hermiess; "telum imbelie sice icte."

It only remaies to add, Sir, that it is to It only remains to add, it, that it is to be hoped the next time your oppresentation, he will have the courage to affer his name to it, as the medical officers will the distribute whom to thank for his highest and the presentations the Royal Information and the presentation of the Royal Information and Information and Information and Information and Information and Information and Information an indebted.

I am, Sir, Your obedient servant Dec. 9, 1828.

# THE LANCET.

Vor. L.

LONDON, SATURDAY, DECEMBER 40.

1828-9.

COURT OF KENG'S BENCH.

th was specially appointcone, axelled the most in-Long before the sitting of tense interest. the Court, at helf-past nine o'clock, the dif-ferent avecage leading into the court were so crowded, that there was sceroely any possibility of foreing a passage. It was with the utmost difficulty, with the most active assistance of constables and the officers of the court, that counsel, jury, and witnesses could obtain an entrance. Almost every hospital dergeon and eminant prantitionar in London was present, besides an immense number of students.

At half-past nine o'clock, the defendant ppeared in person on the floor of the court. Mr. Broogham and Mr. Kelly, his counsel, ware also present. Sir James Scarlett, Mr. F. Pollock, Mr. Searlett, and Mr. Platt, ware counsed for the plaintiff. Unly six ape-cial jurymen mawered to their names. After some hesitation, Sir James Scarlett prayed a toice. The talosmen were then called into the box; but before they were oll aworn, three of the special jurymen. who had been previously called and did not baswer, made their appearance, and were awarn. Three taleamen were then added to theighty, and, ofter awarn of the apocial jurymen had been fixed for non-attendance,

the jury were awarn.
On the beech we noticed Sir A. Couper.
(the uncle of the plaintiff, Mr. Brodin, and Mr. Green. Dr. Roget put to the laft of Sir James Scarlett, within the bar.

The defendent, on coming into Court, brought with him a cast of a child in the position io which a patient is tied, when undergoing the operation of lithotomy. He had also a poivis, and case of instruments,
auch as were used on the occasion. He applied to Lard Tenterden to be socommospeakly to 'uney' of the exact bir Aratery."

dated with a table; but his Lordship stated, that in consequence of the pressure at the doors it was impossible for him to have his wish compiled with at present. A table was afterwards brought in.

Mr. Socriet opened the pleadings. The declaration charged the defendant with having published a certain false, scandalove, and malicious libel, imputing to the plaintiff, Mr. Branaby Cooper, the ouskilful performance of an operation of lithotomy, which took place at Guy's Hospital, in March last. The defendant had pleaded several apecial pleas of justification, setting forth the matter charged as libellaus, and aversing that the whole of it was true.

The alleged libel was contained in Nos. 239 and 240 of a weekly publication called Two Lancar, and was in the following

words :--

#### " GUY'S HOSPITAL.

\* The Operation of Lithotomy, by Mr. Brunchy Cooper, which lasted nearly one hour! \*

"We should be guilty of injustice towards the singularly-gifted operator, as well as to our sume-rous resears, if we were to omit a 'full, true, and articular account of this case. It will, doubtless, e overful to the country draft to learn how genn become he is a nephew.'

a hospital surgeon—nephes: ead surgeon, and surgens become to is morney.

The performance of this tragedy was nearly as

A lie personnel of the potential of the labouring man from the courty of Source, thick set, ruddy, and healthy appearance, and 33 y-are of age) was placed on the operating take, at a few minutes past one o'clock of Toroday the 13th. tionably call upon Mr. Harrison to disolo, alreussationes in the jury. In the mean tifry, were do not astricipate the decision of this question, by positively impaging Mr. Branshy Cooper's shill; but we contend, as we inave repeatedly contended but we contend, as we inave repeatedly contended to inference consulons, that the iservitable inches contended as we inave repeatedly contended but we contend, as we inave repeatedly contended but we contend, as we inave repeatedly contended but exceeded in the contended and the investment of the too consider a finally influences, jobbing, and latricupe, to to consider a finally influence opinion, and the too the contended and th rectly end positively simpaga Mr. Branshy Cooper's suggrad shift, but, as some of the material facts detailed in any report have been, or, we believe, san be contradicted, we do not besilate to say that, looking to the circumstences altending this, and other operation, perforance by this verticenan, in counseline with the circumstances are believe that other operation, perforance by the receivers of the sale justified, and that Mr. Harrison, the Transarre of they's Jimpilel, known we are justified, in asylang, the axtrauntiancy alternostances attending his alevation to his present altuation, justice, tunnally, the interests of the medical professions, and the safety of his public at large, call allier for laventiagetion. Whether this laventingtion whether this laventingtion of a justicial character or out, we are ledsferent. We are prepared to meet Mr. Brainby Cooper, if he titlut fit, in a court of justice, we will meet his ale our way person, (for this will not be a case to estivat to a lawyer, have ver cominent or highly glitted,) and we shall see whether Mr. Brainby Cooper till be equally prepared to meet us, the public, the relatives of the astronaute plants.

Along discussion arose, as to which party minus, he considered it essential and nec was to upon the case, Sir James Souries sary that they should remain in court.

contending, that as some of the affirmative directions of the second of th the truth of his pleas, he night to proceed with his case before that of the plaintiff's was gone iuto. In support of his ergument, which was of some length, he cited various authorities.

Lord Tenterdengbeerved, that as the daniamn in this case might be quated bereafter as a precedent, he would take the upinion of his learned brothers, who were sitting in the Bail Court, upon the question. His Lordship then retired, and un his return, in about ten miuntes, stated his upinion to be, (in which the uther Judges consurred,) that the defendant had a right to begin. The plaintiff, as a enrgeon, was to be supposed to be a skilful person until the contrary were shown, and therefore there was no nacessity for him, in the first instance, to go into evidence to establish that fact; and, as the defendant had pleaded the truth of the matter which imputed nushifulness to the plaintiff, it was incumbent on him, in the outset, to prove the truth of his allegetions.

Sir J. Scarlett trusted, as that was the deion of the Court, that whatever the terminating of this case might be, he should be et liberty to examine the plaintiff's witasses. It might happen, that the defendant's case would fall to pieces, and than he (Sir J. Scarlett) should insist, that his avi-dence nught to be heard for the purpose of proving that the operation had been performed with the utmost skill. He should ask, un behalf of the plaintiff, a gentleman of high honour, and who was greatly esteemed, both in and out of his profession, that he might have an appartunity of showing that the calumny, which had been attempted to be fastened upon him, was withnut foundation. He mentioned this now, in mider that, in the avent of the defendant failing to preve the whole of his place of justification, it might not be said that the pluintiff had an right to en into avidance in vindication of his professional character. Lard Tanterden did not think it necessary

for him to give an upinion apon that point

at present.

Mr. Hakley assured Sir J. Scarlett, that he would have emple apportunities for calling all the witnesses he could produce.

The defaudant then suggested that the witnesses on both sides should withdraw.

Sir J. Scarlett had un nhjaction to tha withdrawal of those witnesses who apoka to facta, but those whn were to give opinines, be considered it essential and necesThe defendant said, as he could not need to place is contrast the theories of that momest, make a separation of the liferest individuals in the lecture-nesses who were to apeabore-nots, and those proom, and the practice in the wards of the who were to my as Mona, he would not insist degree a withdrawnl of acy of them. "Mey might remain, if the Court pleased.

The defeedant thee addressed the jury. They had already heard, from the learned gentleman who had opened the pleadings, that this was an action instituted egaiest him, (the defeedant,) the editor and proprietor of THE LANCET, for as alleged libel of and upoe the professional character of the plaintiff. It was stated in the declaration, that he had published a report of a "supposed" operation at Guy's Hospital, from the declaration, that no auch operation was performed is that institution; and that what he had published was nothing more nor less than gross calumey. Guy'a to it an extensive medical school; it had that the principles there inculcated should consequence that those funda ahoeld be approprieted in the best manner-that individuals of the greatest possible akill ahoald he elected to fill the offices in the Hospital, fair that those offices abould be filled in any

hospital; aed this, he thought, was of immeeae importance, for, by ao doing, the lecterers were atimulated to a greater exereise of their duty, as their opinions were laid before the public, who had an epportunity of seeing what those opinions were, aed, at the same time, of seeing whether the practice need in the wards, was a practice of neglect or attention. The publicative of lectures had led to a good deal of discussion is the courts of law. The publication of hospital reports had led to great besefits, as regarded the public, who had falsely and maliciously, and it was inferred thus the advantage of the opicious of hospital aurgeons, if they were good; and having to endure the scrutiny of the poblic, could not back aed carve the patients with impunity. He was, of course, under the Hospital, as the jury must be aware, was en escenaity of employing a great number of institution of very great importance, not reporters, who were in the publice of taking only as an iestitution of charity, but one cotes of the cases admitted, and carefully ahould emanate the first principles of his them. The roporters he had employed, as the best possible manner. It had attached to it an extensive madical school to the most honourable should be it an extensive madical school. had falfilled their duty in a very accurate lectures there, and a very large utleedsnoe and conssistious maneer. The reports of studeets. The practice which the stu-furnished by them, he was, of course, comdents witnessed in the institution was ne-consurily carried by them to the most distant their correctness. They were transmitted parts of the kiegdom. Heece it was of the to him regularly from the various institu-utmost importance to the public welfare, tions. The report of this operation was that the principles there inculcated should seet to him by a geetlemee of very high he calculated to promote the interests of character—a gentlemee whom he should call the public, and alleviate, as far as it was juto the witness-box to-day, and who would cossible, the aufferings and miseries of man- himself state that he witnessed this operation, kind. Guy's Hospital was founded solely and that the report which he furnished, was, by one individual, Thomas Guy, in the year in every respect, correct. He (the defend-1722, or 1723, and he, at that period, left ant) would assert this openly before the to the lustitution, a sam equivalent to Court, only be challenged every inquiry—200,000f., consequently the funds of the In-terry atrict and scrutiniaing investigation—attetion, from the vast increase that had just the repertor's cheracter. Its had taken place is the value of money, were heard, iedeed, that attempts would be made immense. Of course it becams of great to cast some imputation upoe him, but he defied calumny, and courted scrutiny. When the report was transmitted, as he found it one of an entraerdinary character, and as it. referred to circumstances of a still more exboth medical and aurgicul, and it was not treordinary character, he paused before he ieserted it. He did not publish it in the other manner then was consonant with the first number of THE LANCET which appeared Intention of the founder, sed of the greatest after the operation occurred, but waited till benefit to the public. The plaintiff, Mr., the period of publishing a second one Branshy Cooper, was one of the persons arrived. When the report was first brought who had been elected to fill the office of to bits, it contained some statements against surgeon, and, in the dalica of his cituation, the operator, rather bersher than those he performed the operation which was pub-which it new contained. The reporter con-lished in No. 339, of The Lancer. That added it his sluty to cheracterise such an journal was projected by him, (the defeedant) and was first published in 1823. He and he stated, on his humour, before the reconsidered, that by publishing the lectures port was published, that it was correct in delivered in public institutions, he should every particular. Upon that assurance, there-

the following witnesses.

fore, he (the defendant) considered the sound was repeatedly introduced had no nther source to pursue in his jubic Several to error ettempted to be made cheracter than to present it to the public, into the hielder to knife. This instruction cheracter than to present it to the public, into the hladder "" a knife. This instruwhatever the consequences might be. Hering made a few elterations in it with regard
to the expressions he had mentioned, and
introduced the phrases, "nephow and surgeon, and surgeon because he is nephow," called out several times to the operator to
be inserted it, word for word, as he had recaived it. He should prove these facts, that he could not explain the difficulty. He
and had little fear of his case "falling to,
specared to be perplexed and hurried in
pieces," as his learned opponent had etated, consequence of the long delay. He did not
lie believed the learned gentleman would specar to act with any regular scientific dehave ampla cause to produce all his witnesses, and give such avidence as he could force, but it did not strike me as being very
adduce as to the skill of the plaintiff. If it vicient. He need this instruments in the
could be proved that he report was inacquee as to the said if the plaintiff. If it vielent. He need the instruments in the correct, nothing would give him greater rether than to find that he had done an injury upon the etone. I don't consider that the to the plaintiff; for it was not by such forceps entered the hadder the first time, means that the preferaion was instructed; I'm impression on my mind was, that the bet when men name holdly forward to sanction to make the frequency of the forceps in; but I think there stain to the preferaion which the center of was an opening. I have a discharge stain to the profession, which the events of was an opening, because I swa discharge ages could not remeve. If men come for- of water and blood. The operator said, that ward to swear that this operation was but he felt the atons when he passed his staff formed skilfully, he knew not what they fit though the arethra, and could also feel it would healtate to swear, and it must be pression in the person the sound through the in-sumed that they were unable themselves to session in the personam. He also said that perform the operation in any other way, he could not bed it with the forceps. The With these observations, he should leave reason of this was, that the forceps, if the case in the hands of the jury. He straight are slightly curved, would pass unshould call a great number of withdeass to der the stone, which was high np in the prove that the report was, in every respect, bladder. Mr. Cooper made many attempts correct; end if they (the jury) were settened upon that point, he should, of course, be entitled to their verdict.

The definition of the point of the province of the stone with his singer. He less that the stone with his finger. He can be sent that the stone with his case, and measured fingers with those of other gentleman, to see if any of them had Now that the report west, in every respect, instance. But cooper manus many arrect; and if they (the jury) were satished upon that point, he should, of course, is easilided to their verdict.

The defendant then called and examined a longer finger. I cannot say that I think he following witnesses.

If a new think that the course is the course of the operation in a course of the Air. Alderman Partridge. - I reside at scientific memoer. I do not think that it Colehester, and am a member of the College was performed in such a manner as the pub-of Surgeons. I have been in practice rather his have a right to expect from a surgeon of more than fourteen years. I have witcossed Gny's Hospital. The average time for permany operations of historomy, and heve performing sperations of this description, is formed them myself sixteen or eighteen four or five minutes. The operation in times. I witnosed the operation performed question occupied, I think, nearly an hour, by Mr. Branshy Cooper, et Gay's Hopital, After the staff had been introduced, and that in Murch last. I have rend the report of, first incidion made, Mr. Cooper need a thet operation in Tux Lancer. It struck straight staff with a knife. When he found me, et the time, to be correct, and I have he could not introduce the forceps un the had no partioular reason to alter my opinion first attempt, he withdrew them, and made since, though I sid not examine it very another out with the knife without the staff minutely. The patient appeared to be a very being introduced. This is not the custa-healthy man. I remarked it at the time, mery mode. The scoop, as I have always I think Mr. Cooper himself introduced the understood, is introduced to extract those staff; but the second incision was made fragments of the stone that may have crum-without the staff. After the first external bled off. There were no fragments in this Incision, all instruments were withdrawn, osse that I saw. Twenty-five or thirty (The defendant here produced a figure repressiminates is the longest time that I have senting the situation of the petient, which the known an operation of this kind to last. witness deposed to as being correct.) The The average time is about five minutes. In hands of the nation were tied to his feet, and the cases I have mentioned lasting 25 or 30 lisk knees to his neck, as represented by the minutes, there were evidest causes why the model new produced. The patient remained operation should last so long. Thus were in that position nearly as hour. During that where the stone was large, and where it

would be dangerous to enlarge them and there bladder! tho time was lost incomeing at the atone Hanes.—I think it means to convay an gradually acres of the convergence of the converg tian a common Windsor bean, flat and the operator would be the best judge of round. It might have weighed about two whether the forcops entered the bladder or drachms or less, but certainly not more. Stones weighing several onnces have been operator he was. (A laugh.) The operator stated, in the presence which was now taken hold of, and the knife of the patient, that he could not understand corried onwards—somewhere." The learned the case. I never before heard a augusn feel the atone with the sound, but this could not feel it with the forceps. I heard obtain rethe staff strike the stone. The reason why he could feel the atone with the sound, and ne could neet the atone with the second, and taining his licentiateahip by an district false ness of the opening would not admit them. certificate, for which he was liable to fit 72.

I did not hear Mr. Cooper ask Mr. Callsdicted and punished, it was his Lordship's way if he had a long finger, but he mea-aured fingers with Mr. Dodd. I naver saw an operator act in a similar manner while his patient was bound on the table. He apports appeared bruised.

was e competent judge of operations of this ! did not reach the bladder. There was a be urioe, before the forceps were introduced. I am of opinion that the Luife did not reach the bladder. I am a licentiate of the Apothecaries' Company. I am not 2t. My representation of tay age was noteorrect to the Company.

Sir J. Scarlett .- You mean it was false ?-Witness .- Yes.

Witness .- No, I gave my certificate.

Sir J. Scarlatt .- Are clergymen is neus.-No.

Sir J. Scarlett. - Where, then, did you

Lord Tenteral maid he must stop the examination. When the read a person obtaining his licentiate ship by he don't false duty not to allow him to proceed further in hia evidence.

The wimess then withdrew.

Mr. Jeachim Gilbert examined,-I am a peared confused; his movements were bur- mamber of the College of Surgeons. I was ried, he used the various instruments out of at Guy's Hospital in March last, and wittheir accustomed order. The operations of neased part of the operation of lithotomy lithutomy which I had before witnessed, performed by Mr. Cooper. I was present have occupied from two to six or eight mission witnessing any longer, the manner nutes. I prever saw any that lested for a condura witnessing any longer, the manner nutes. I percr saw any that lasted for a cudura witnessing any longer, the manner longer period than eight minutes. Mr. in which the operation was performed. The Cooper's operation occupied an hour. I operator used much violence—I should say, never before witnessed an operation in great and uoncessary violence. He used which so much violence was used; and I is instruments in the accustomed manner in not believe it possible than the patient of other operators. I saw the staff introduced by Afr. Cooper. Mr. Callawey was oware of no circumstance in the sandsing of desired to hold it on the left side of the patient which were calculated ag reader to hold it on the left side of the patient of cased to flow from the external wanted het the second incision, he carried his kulfe for-fore the operation had terminated. The word, and I should say held his arm too orts appeared bruised.

Cross-examined by Sir James Samfeit.—I between the bladder and the fundament. A Cross-examined by Sir James Scarlett. I between the bindder and the fundament. As was twenty years of age lest January. I between the bindder and the fundament. I have not yet finished analyting, and sin attill singer Into the wound, and passed in a pair no explanation of these matters since I came. To straight forceps on his finger. He stand to London. I had no arring of written the struct the atone, but failed to London. I had no arring of written to models. I went from curiosity, to see the operation performed by Mr. Cooper. The surgeon, who performs the operation of the wound, and, in so doing, used great into the wound, and in so doing, used great into the wound, and it is not the forceps. The surgeon, who performs the operation of instrulithotomy, has always a variety of instru- squashing noise was heard. He then called ments near him. I have witnessed about for a crooked pair of forceps, which he half a dozen operations of this kind. I was passed apon his finger into the wound, and on the third or fourth and for the half a dozen that the same of the on dies third or fourtb row from Mr. Copier, poked them about in the wound. In so a little to his left hand. A great number of doing, he used great richence. He then persons were present; there might be na withdrew then, and passed them in a second many as 200. I should think Mr. Cellaway poked them about in the would. In so them in a fourth time, and he then called kind. When the first incision was made, it for "Sir Aatley's kulfe," (a laugh,) and made a cot with it, and passed his fioger small quantity of fluid, which I supposed to into the wound; and, in so doing, used viclence, twisting the finger about in the would. He did not succeed in extracting the stone, and he then appeared to be very much confosed. His haud shook a great drul. He was very pule, and his lips were very white. At the expiration of thirty-fire minutes I quitted the thestre. My inpression was, that the operation was very badly and very improperly performed. I Sir J. Sculett .- Did you unt arear it? have witnessed, at least, twenty operations of this kind. I never saw any lust longer the then from seven to ten minutes; and I have habit of giving false certificates! Wit seen the operation performed in less than a minute.

Cross-examined by Sir James Sagrider, sin taurgeon might, by accident, the the carry on my husiness et B. Indier, sin accident access?

Dorastalire. I om product to Mr. Witness.—I do. (A laugh.)

Pholps, who will be the in question, it is operation of lithotomy performed by Mr. These is a Callage. I came in question, at the time in question, pass the College. 1 am a pupil et Gey's, and I went there to be instructed. I did not see the report in THE LANCET before it was prieted. The first incision did not, and ought not to reach the bladder. You are to avoid the urethra, on making the first incision. The second cutf which ought to bave reached the bladder, did not reach it, but went between the rectum and the bladder. I think it did not reach the bladder, and my reason for saying so is, that there was no flow of fluid. The forceps were thrust in with great and unnecessary violeace.

Sir J. Scarlett .- As if be meast to atab the man!-Witness. Yes, (a lough;) I was on the first row of henches. I went away, not being able to witness the operation out. I never made any communication to Tha Lancur, nor de I know the extent of its sala. I never performed the operation of lithotomy. I have witnessed at lasst 15 operations of that kind at Guy's Hospital, but not one of them were performed by Mr.

Соорет.

Is answer to some further questions by the defeodent, the witness said, be had see the plaintiff perform other operations, and be did not consider him a skilfal operator.

By Sir J. Scarlett,-I should say that he is great benefit to the public to drive him away from his situation at Gny's Hospital. Sir J. Scarlett.-Have you ever witnessed

the operation of tring the subclavian artery 1 Witness.- I have heard of the operation, and have seen it performed once, by Mr.

think requires the greatest skill upon the new school since last Ortober. I was prepart of the surgeon, tying the subclovian sent at three operations in lithotomy at artery, or lithetomy ?

Witness .- I sheald think the operation of lithotomy requires the greatest skill.

Sir J. Scarlett,-Then you think it would Witness .- It would require skill to do say

Sir J. Scarlett.- Have you attended eny lectures since you came to town?

Witness .- No.

(A laugh.)

Witness.-No, Mr. Wakley called at my in part, corruborated their testimony. with him since I came to town.

Bransby Cooper. I heve not read the report in The Lancer. I am demonstrator of enatomy at Mr. Sleigh's school. Speaking according to my impression, I think I never saw an operation performed so unscientifically, and in so bungling a manner, as that performed by Mr. Cooper. I have nover apoken to the defendant before to-day, and I do not even now know his same.

Cross-examined by Sir J. Sourlett .- Mr. Sleigh's school is In Dean-strest, in the Borough. Mr. Slaigh is aurgeon to the Western Hospital, a newly erected institution, which Mr. Sleigh established bimself.

Sir J. Searlett.—Suppose the defendant to be the author of The Lancar, I want to know how it is that he came to know your opinion on this operation?

Witness.—I confose I was rather acryrised at it myself. I was not subpossed till a late

hour last night. Sir J. Secriett .- Do you know now how it

Witness .- Yes. In conversation with a pupil named Brainsford. I made the re-mark that I had seen the operation, and that I thought it was performed in a buagling and unscientific manner. He has tol me to-day that he commendented this fact to an unskilful operator, and that it would be a Mr. Wakley. I have made communications to THE LANCET. I have made four; three of which were inserted. Those communications were at long intervals, and I did not put my name to them. I arrived at the theatre after the incision was made in the bladder, and I stayed about 35 mlastes, ine. during which time the operation was going Sir J. Scarlett.—Which operation do you ferward. I have been demonstrator at this Guy's Hospital.

Mr. Jeffry Pearl namiced,-I witnessed the operation performed by Mr. Bransby Cooper. I have read the report in Tax require no skill to tie the subclaviou artery? LANCET, sod I am not awere of its being incorrect, except that Mr. Cooper asked for but more skill to perform the operation of "Sir Astley's knife," and not for "my lithotomy. was no gush of urins, sa usual, but merely a trickling. I sat about the middle row, on the operator's right hand, (The witness was Sir J. Scarlett .- I mean, none at Wakley's, examined to verious minute facts, deposad to by some of the preceding witnesses, and, lodgings yesterday morning, and stopped also spoke to the violence used, as described a few minutes; but he did not sit down; by those witnesses, and stated, that three and that is the only conversation I have had fingers at open were introduced.) I could, I think, sitting where I did, distinguish be-The Defendant .- Do you think that a very tween a small portion of arterial blood, and

that there issued a small portion of both year, hut am not a member of and ollege of vennus blood and uriue. There was not a Surgaena. guals of fluid at any subsequent period, I Crossexamined by Sir J. Searlett.—I have rather think that Mr. Cooper attempted to been attending the hespital a year. I comintroduce the forceps after the first luci-menced in October, 1827. I was apprenanison, and that, failing in being able to do: a, tick at Woodbridge, to en army surgeon, he made a second inclaion. The same ferceps was introduced repeatedly, and grant times at the hospital now. I have seen force was used. The negrator apaues and most if the operations at the hospital. I abet the forceps with great violance. The never saw Mr. Braushy Cooper perform an in to a considerable distance. The fingars tying the subclevian artery. I consider that if the sperator were introduced, and turned, to be a difficult operation; but it may, ocion the insiston. I have witceased, I believe, estimately, be performed by an unshifted 20 operations in lithotomy, and none were performed in the same manner as this. The meets to Mr. Cooper; Mr. Callaway stood usual time for the performance of an opera-tion, is from four to five minetes. I saw the day it came out. Mr. Cooper did and use one hy Mr. Green, which leated nearly an the phrase " My uncle's knife," but I here hour; but that was a peculiar case; the heard bim repeatedly say, " Fetch my un-patient had been uperated on twice before, cle's gargle, or my uncle's mixture." (A and the cientrix was hard and uneven, and laugh, in which Sir Astley Cooper joined.) ha had two large stones to extract, which It was Dr. Hodgkie's duty to dissect the crumbled into insumershie small pieces in body, as he conducts the past-mortes exemithe hisdder. The time was there occur nations. A gentleman of the name of Lamne force used by Mr. Green, and his man-him at Mr. Lambert's hoese; the conver-ner of using the scoop and forceps was de-estion turned upon this ambject, but I did cidedly contrary to that of Mr. Cooper. The not knew from that, or any other conversations, in the case of Mr. Cooper, was about tion, that Mr. Lambert was the person who the size of a Windsor bass. I heard Mr. furnished the report. The tone of the conthe casse of the difficulty. He turned round I suspected it or not. I certainly did not to the pupils, end said, "I can conceive an suspect it from that conversation. I ansearthly difficulty against my extracting the peoted Mr. Lambert, because he was geneatone." He said, "Hush, bush; I can kear rully ancepeted. I have been at his house. the stone, but cannot extract it when I apply three or four times. I never met the de-the forceps." I thick, centinued the wit- fandant there above once. A pupil was ness, that he might laws taken nut the stoke, present when I saw the defendant. The had he introduced the forceps scientifically, defendant asked me whether the report was did not appear to me to be ie a state of self-passession, eed I think thut he used his in-trument without any rational object. The state that fact, but they gave very good appealed lasted ubout an hour. I asw the reasons for their believing it. Mr. Whitacoeld not discover my same in the forms was there as hour. No model was protion, in account for the delay in the operation. When I saw the builder, there appeared to me to be two incidens in it. A stayed cely tru minutes. There was a competing of the week of the week at the content of the week at the week protion of the neck of the listed for was version as the time of the trial completenen the two incisions. The incisions on. I am not competent to say whether or were oblique, and not horizontal. I think not forceps passed between the bledder in interly impossible that the patient could need the rectum. I had not formed say apiliars survived interaction experition as this nice of the subject, but I can exte that the one. The bladder appeared to be very peratina was not scientifically performed, thickeeed, from violent inflammation. Bruisse | believed that at me time the forceps were in the bladder would be very likely to produce great disorgenisation and inflammasceing the parts after death, I observed sion. I have seen Mr. Branshy Cooper nac-

a mixture of venous blood and uries. After the staff be a good of the by say means. I have end knife were maked forward, I believe been a pupil of Gu, lognital more than e

forceps was a curved one, and it was pushed operation skilfully except one, and that was body, as he conducts the post-mortes exemi-nations. A gretleman of the name of Lampied in removing the fragments. There was bert introduced me to the defendant. I saw Cooper say, in the hearing of the patient versation did not assume that Mr. Lambert and the pupils, that he could not explain was the reporter. I shall not say whether The sound might have passed through a hole correct. The defendant and Mr. Lambert too small to admit the forceps. Mr. Cooper endeavoured to show that the forceps had parts after the death of the patient, and I ker was present, but no other person. I

bladder and rectum, and took the new property we stone. I never saw a perineum in Pr. Hudekin, and said, "thereof, here as which I was unable to reach the hisder opening." I did nearly a Dr. Hodekin say, with the linger. My impression was, that "Then the case in question the bladder could be a supplementation of the lander could be a linear than the case in the case in the lander could be a linear than the lander could be a linear than the lander than the lander could be a linear than the lander than the Thou I this it this rieve alr. Lambert did it.

found the prostate gload alightly enlarged, Choper's abilities are adequate and on the laft side a smollish oblique cut. of surgeon to Gny's Hospital. The parts around the gland appeared to fungona growth, which I have described. 1 was conscious that I had not touched it, and I assured him that I had used no violenco whatever in examining the preparation. I do not remember the name of any Dr. fludgkin said it was not a deep peri-neum. I think his expression was,-"There is nothing remarkable about it." Mr. Key said it was not a deep peritoneum, I said to Mr. Key, " It seems to me the staff which you invented will never do for u deep perineum." Alr. Key replied, that this " was not a deep perineum, and that if I thought so, I knew nothing about it."

have been reached with the finger. I did Re-examined .- The defendant did not not see in the nuck of the bladder, or the persuade mo to give any evidence in this presente gland, on incision like the furm of cause. He asked me to read the report the gorget which was used in the operation. again, that I might be satisfied of its correctness. Mr. James Lambert stated, that he was turn. I have never seen the garget passed present at the operation, and furnished a between the hladder and the rectum by a report to the defendant, from which the skilful operator, or by a person having any printed atatement was made; the latter was pretensions to skill. The gorget was used substantially true. He infurmed the defen-subsequently to both the knives. The duot, on his word of honour, that the report knives were not need more than once each. was true, and rather an under than an over I cannot speak to the cutting gorget heing statement of the facts. The witness theu introduced mare than once, I never saw described the circumstances attending the an operation performed in a similar monner, operation in nearly the same words as the alleged libel. After which he proceeded as follows:—"I examined the parts after they patient could recover under such an operation of the hody, in the determined the parts after they patient could recover under such an operation. I do not think Mr. Cuopor u good monatrating-room. Several of the pupils operator; but I puce saw him tie the subwere present. Alexander Lee won the next witness, and deposed as fullows :- I am not acquainted in the usual munner, but was tedieus. It was the first time I ever saw Mr. Cooper atruments were introduced. I did not ehacree whether the operator was collected. I am not sure whether the forceps was introduced into the bludder on the first uttempt. Mr. Cooper re-introduced the kuife to make a accord incision. The operation lasted for mere than half en hour. I think it did net last an heur. I have no heaitntion in saying, that it lasted from helf au hour to 40 minutes. 1 nm not prepared to use. The atoue extracted was small.

This is more particularly true mi The witness said ha did not like to give This is more particularly true appears and an one age to give an opiniou upon as delicate a point, not by the ere. Lie with to give an opinion. The Lord Chief Justice said, that the question of an operation of this nature, without has a very intribute one. Supposing the operator to explain what appears the meits of the two gentlement to equal, doubtful. No sargeon of experience would the governors had a right to elast Mr. venture to give an opinion, without apeak- | Cooper, if they thought proper. ing to the operator. I think it most presumptuous and rash in a young man, and a papil, to give an opicion, without speaking a mosairator under his uncle, and gave great to the operator. Next to the operator, the person most competent to give an opinion is the assistant-surgeon. The report in elect his nephew, till I toformad him of the company of the competence of the competenc THE LANCET, is a very unprofessional re- | I knew that Mr. Cooper had served in the is not settled in any country, and any ser-geon uses what instruments he pleases. I naw a small discharge from the first incision. It was impossible to say whether it was blood, or blood and urine mixed. Sometimes the stone is bedded in the fulds of the biadder, which contracts on the approach of an instrument. On these occasions, it is better to allow the instruocet ta remain in some

It to the class, to give some explanation of of his case, atating, at the same time, that the case of the aucesoi difficulty. It is an adequate examination of them could not possible, that a skifful operator would have discovered the cause of the difficulty.

Thomas Bolton .- I am a surgeon. I read the raport in THE LANCET. It is, generally, correct. The operation lasted an bour. naver saw so masy instruments employed The operator was not in a state of self-nossession at first, but he recovered. never saw the catting gorget used at the some time with knives, on any other occa-sion of a similar nature. Before Mr. Cooper extracted the stone, he said he could not axplain the cause of the difficulty. I do not consider that the operation was scientifically performed.

Cross-camined .- The operation, in question, was the sixth I have seen performed. I have seen none since.

Benjamin Harrison,-I sin tressurer to Guy's itospital. I have held the office thirty-one years. Mr. Cooper was elected assistant-surgeon on the 14th of May, 1825, and Sir. A. Cooper was alected to the office of consulting surgeon oo the same day. When Mr. Cooper was elected, he was considered perfectly competent to the office. None of the governors of the hospital are surgeons; but they have daily opportauities of use ertaining the qualifications of the apprentices. Mr. Cooper was elected to bis office, because he was best fitted to fill it. Hu would have been elected, if he had not been Sir Autley Cooper's nephew.

The defendant pressed the witeens to plaintiff's case that evening. state, whether he did not consider Mr. Callsway a better surgeon than Mr. Cooper. Scarlett shoold open his case that night, and

Cross-ensmined .- Mr. Cooper was demoestrator under his uncle, and gave great

elect his nephew, till I informed him of It. ort. The mode of operating for the stone Norwich Hospital, and also as srmy-surgeon in Spain, under the Duka of Wellington. He likewise served in the same capacity in Cunada, at the close of the last American war. He afterwards attidied at a Edinburgh for two years. He then came to Guy's Hospital. Mr. Cooper has always meiatained the raputation which induced the bospital to elect him.

Mr. Wakley then proposed to put in the Re-examined .- I think Mr. Cooper owed preparations taken at the hospital, as part

Sir J. Scarlett said, that if the defendant could not make out a case without these preparations, he could not make it out with them.

The preparations were then brought isto Court, and were examined by several medical gentlenien.

Lord Tenterden, (addressing the defendant.)-Whom do you call to speak to these

preparations?
Air. Wakiey.—I call Mr. Alderman Par-

tridge. Mr. Alderman Partridge examined .- I bave examined these preparations. Whilst they sie in the glass I caenot see the incisions; I see the opening in the bladder. I cannot give any resson why the operation should have lasted an hour, without having the preparations in my hand; and I would not like to give a decisive opinion on the subject, without having esamined them by my-self. I caunot, as the preparations are now before mc. say whether the incisions are oblique or horizoetal.

Mr. Walday .- My Lord, I have not had se opportunity of examining the prepara-

tions, nor have any of the witnesses.

Lard Testerden.—I cannot belo that, Sir. Mr. Wakiey said that his case was now closed.

A short conversation took place between Sir J. Sculett and the Lord Chief Justice, us to the propriety of proceeding with the

His Lordship seemed desirous that Sir J.

an." "

proceed with the examination of his we nesses to-morrow; but

Sir J. Searlett submitted that it would be more convenient to the interests of justice, that he should address his remarks to the jury when they were fresh, and not in such a state of exhaustion as they must be in at present, after the fatigue of the day. As far as his own personal convenience was concerned, he would rather proceed that evecing, whilst the facts were fresh in his memory; but as it was impossible to closs the plaintiffs case that high, 'it would be more condecive to the interests of justice, that it should he placed at once before the view of the jury.

Lord Tenterden reminded Sir J. Scarlett that to-morrow was Saturday.

Sir J. Scarlett was aware of it. It would not, however, make any difference, as he should not take np saything like the time that had been consumed by the defendant. He should certalely have to call wincesses to support his etatement. He should call some of the most eminent surgeons in Loudon. He should not call many of them, but some of them he must call.

Lerd Tenterden than adjourned the Court till half past nine o'clock to-morrow morning.

A Juryman complained of the difficulty which he had suffered, is common with his brother jaryman, from the pressure of the crowd that moraleg. They had found it almost impossible to get into Court, and when they complained to the officers of the Court, they got from them neither assistance nor relief. He conceived that this was a little too bad, as the jarymee were liable to be fixed, if they were not is Court by a given by the morties as well as his provided in the Norwich Hospital, the most distinguished to with the exception of history. He served with diligence in that hospital for nearly two pairs. He came to London; he was distinguished to be fixed, if they were not is Court by a given by the morties and half-mearly two years—when, as I hope I may he allow—and the Norwich Hospital, the most distinguished with the Norwich Hospital, the most distinguished with the Norwich Hospital, the most distinguished with Norwich Hospital, where he with Norwich Hospital, the nordinal near the Norwich Hospital, the nordinal near the Norwich Hospital, where he with Norwich Hospital, where he with Norwich Hospital, the Norwich Hospital, where he with Norwich Hospital, the Norwich Hospital, where he with Norwich Hospital, where he with Norwich Hospital, where he with Norwich Hospital, where he will not not make the Norwich Hospital, where he will not not make the Norwich Hospital, where he will not not make the Norwich Hospital, where he will not not make the Norwich Hospital, where he will not not make the Norwich Hospital, where he will not not make the Norwich Hospital, where he will not not make the Norwich Hospital he north Norwich Hospital he nor

Lord Tenterden was sorry for the inconvenience which the gentlanen had seffered. But the fact was, that the officers had that marning been overpowered by the crowd. He had only a certain usmher of officers in tha Court, and, in ordinary cases, they were quite sofficient to provide fur the good order of the Court.

The conversation then dropped.

We copy the following paragraph from The Sun :-

"Such was the anxisty to obtain admission, at the opening of the Court, that ground of his honourable relation wishing one gentleman who incastiously carried a nim to pursue that line for which his abiliaword-stick, had the case of it actselly ties rendared him so peculiarly eligible, and crushad by the excessive pressure. The point of the sword was forced into a gentleman's thigh, and the greatest confusion prepared in the property of the court of attaining great emisence. He went valled is consequence.

SATERDAY.

Sir J. Sourlett rowand addressed the Jary as follows: May it picate your Lordship, and Gentlemae of the Jury, the time has at length arrived whee the plaintiff is autitled, according to the form of proceedings in this place, to lay before you the grounds on which he seeks redress for one of the most injerious attacks upon his fame and fortune that ever appeared in a Court of Justice, invented by felsehood and malice. l'itherto he has been put on his defeuca, though ha is the party who complains, and though he seeks redress at your hands. Such is the fate of human pffsirs, that during sn entire day he has been placed upon his dafence, as if he had been indicted for a criminal charge, and up to this hour you have no reason, that I am sware, to know of what it is he complains. I have no doubt mant, not upon what reparations shall be made to an injured man for any analysis you all feel that you are now sitting in j calumnies sny man can complain of, but whather Mr. Cooper is not a party unworthy of his aituation, who has contributed to sharten a man's life, and who wants that skill and knowledge of his profession which no man hes ever dared to doubt, who had sny skill or knowledge himself. In early life, as soon as his profession was finally chosen, Mr. B. Cooper became a pupil at the Norwich Hospital, the most distinguished, with the exception of those in London for this operation of lithotomy. He served with diligence in that hospital for nearly two years. He thee came to London; he was by anying it, his merits, as well as his mannars, recommended him to that notice by which he was appointed Assistant-Sur-grou to a Regiment of Artillery, and went shroad in 18t3, and was present in avery battle till that of Toulouse-that grand effort which was the basis of the peace in 1814. His first exhibition of cocluess was in operating on the field of battle, under the roar of cannon, and exposed to danger. His experience se a aurgeun was known in that field where a man requires both confidence and telent, and he had the opportanity of shawing that talent which was the ground of his honourable relation wishing in which, if he pursued it with the interest end taleet he had exhibited, he had a prospect of attaining great eminence. He went to Conada, and served nearly a your in the last outappy war in which we had the misfortune to engage with our friends in Ame-

rica. Who that terminated, he was a training a gaged at the time, consider the situation to Edinburgh, and was admitted more as a in which he would have been placed, had atudeut; and there he a tree as a line was placed iff the bigh situation of President of a Society until be quitted it. He was placed iff the bigh situation of President of a Society until be quitted it. He was a last repotetion. Therefore he had it open to him to choose what line he had it open to him to choose what line he incompleted to soy, not by his education thought fit. He might have taken his door on him tow, one of the next distinguished with the control of the state of the second of the second as well as the most properous, and which his view, one of the next distinguished contabilished heyood ell doubt oo the most as well as the most properous, and which his view, one of the next distinguished heyood ell doubt oo the most as well as the most properous and which his view, one of the next distinguished heyood ell doubt oo the most was the Surgeon of Guya Hospital; and he time considerable experience and great was the Surgeon of Guya Hospital; and he true considerable experience and great was the pupil of Mr. Cline, o man edu-practice. He lecame a surgeon upoo his ment of that most eminent man, to dis- unnoticed by Guy's Huspital. He has atdo not anywase such an employment can be ation, without regard to his merits. Has he

had been the pupil of Mr. Cline, o man edu- practice. He hecama a surgeoo upoo his eated in the same school; he become bound own account, atill continuing, bowsvar, to an apprentice to his nucle in 1817. Dor- reoder assistance whom his nucle in 1817. Dor- reoder assistance whom his nucle in 1817. Dor- reoder assistance whom his nucle in 1818 to 1819 t avideoon of that excellent and honourable present, I say onthing,-highly useful, sode man, who gave his testimony yesterday, and of the greatest advantage to the poor; the who was intended to be insulted, who stated | individuals connected with which, the gothat his conduct was honourable to himself, vernors, upon whose character oo impeachand autisfactory to all around him. Sir A. meot was ever made, (until this scandalous Cooper made him his demonstrator of anu- and infamous publication,) thought It expeditomy. Sir A. Cooper, who gave distingtue, but, fur the advantage of their charity, to guished lectures there, found him avaluable establish a School of Acatomy, as well as assistant, which led him to obtain acquaint that which existed at St. Thomas's. They once with all the most abstrace parts of the had a right to do so; having door on, who profession, and he had an opportucity, is it that dates, unless he defected document which every man does not possess, to be and common sense, to complain? Unless come, by-and-by, of the same inne and the because they thought in their own hossame access as his hocourshie relative, pilal, with the consideration of illustrious lie did more than that. Sir A. Cuoper, surgeons, it would be well to found this whose practice has been probably more ex- school, who is it dares to complain that tensive for a number of yours thus any other they did not advertise to the newspapers, surgeon in the world, called by all sorts of and usk come information from Tuk Lanpersons to perform the most difficult upers cerr where they were to get assistance? tions, and who never, as those who know The Lamberts and the Wakleys might him can say, alluwed the cull of the poor to then have been ralled forth from their dark be disaggarded—who bestowed as much in places, to have been made surgions to this humanity as for gain—Sir A. Couper, having hospital. It is not from the actual of daily and hightly requisitions, was obliged Cline, of Guoper, of Green—oo, not even to do that which every person in his exten- 1Mr. Cullaway himself—that we ought tu sive practice must do—namely, have a per-elect aurgeom; nu, it is from the oewspan. and to assist him when he was called pers, to the shape of The Lancz, that you upon to one place of energency, that his longht to obtain infirmation on such a point patients might not want him in any. This is the would that has sunk deep lote ther. Sir A. Cooper found to that ne-bis breast, his dignity has been directions. phew one of the fittest persons to sesist garded; the immense circulation of his work him, and was able, according to the state, has been disregarded,—it has been passed charge the most important dutes, when he tempted to prove that which he had the hunself, from the impossibility of heing in audacity to allege, that it was merely through two or three parces at the same time, was the instrumentality of Siz A. Cooper, that found to employ an assistant. Gondomen, Mr. Bransby Cooper was put into that situthe result of favour; the surgeon whereon proved that! He has proved the very re-place an assistant for that purpose, for his verse. I return new to the isomadiate sub-own honour and interest, is obliged to employer to the operation which Mr. Cooper has play a competent man. He cannot do other-performed. He is now, I believe, at the age wise. Consider, for a moment, what situs. If 34 or 35. He has performed many ope-tion Sir A. Cooper would be placed in, if, rations for the stone—many at Guy's Hos-oo yoor scoding for him to perform a diffi-pital. His successful operations have no cult operation, and, finding him otherwise been reported. I do not mean to say that

them; but I spoak of Mr. B. Cooper, who, ducing through the urethra a sound—a from his experience, has performed many of small rod of steel—this, introduced through the operations most difficult ond complicated the tender passage, finds its way into the —this operation of the atomic capecially. bladder. Then, by turning it about a little, case particularly; but you are not to under- with the instrument, the operator hears the

with respect to others of greater experience; which are calculated to give the least pain or who have perfurmed greater numbers of and uncessings to the patient. The first ouch on operation—I du not mean to con-uperation, howert ; is to ascertain the exist-tend for an instant that he is greater than ence of the stone. This is dune, by intro-Nuw I shull endeavour to state to you this if it oncounters a hard aubatance, atriking it stand that I am giving you a lecture, or sound of it, and ascertains the existence of stating more of the anatomy of the case, than otone. That being done, then ocores the the course of this proceeding make of the operation. For the purpose of the opera-ressary I should be sware uf. Gentlemen, there was a time whoo this mulappy opara-tion, (when I stude to you the practice, you there was a time whoo this mulappy opara-tion was attended with almost certain loss in yer cross that may be corrected by sud-by,) of life. The improved surgery of modern the patient is tied down in the simplest times has much improved the consequences manner. An incision is then made in the times has much improved the consequences manner. An incrinin is then made in the fit his disaster, so that the number of those 'perineum, between the sgrotum and suns., who dio, in comparison with those who are 'Thu finger is introduced into the bladder, sared, is very few to what it formerly was, and it very often happens that whoo it is, the I believe it is generally coosilered nuw, is none is thrown out in a moment without that the number dying is obout two in 15; none to seven unde a laif. Furnarly, purts you say to operate upon do not lie far they very rarely coaped. At one time, the from the surface, and are easily reached by numbers were as one to four or five; now it the first the proof the surface, and are easily reached by the finger. To propurtion as the person because and a ball. This likewise. is one to seven and a half. This disorder comes udult, the parts swull, and therefore sometimes attacks sufants, and in that form it is necessary, particularly in adults, that it is most easily dealt with. Many persons instruments should be had recurred to. Nu are of that tender age, that the stone may man should ever attempt an operation of this be extracted almost to a certainty without kind, without having a number of instruhuxard. With others the danger increases; ments with him. He would be most prebut I believe that Mr. Braushy Cuoper has sumptuous if he did. The eye of the operaperformed the operation on perhaps one of turnloss not enable him to see in what situsthe uldest men that ever antiered it -a per-tion the at-ue is placed-it is ull touch and son whose age was 87. The operation is feel-consequently, a variety of instruments n ver performed os an adult, till be himself, must be mecessary; and every man, who atfiels that the pain he suffers, or the oppre- tends as a surgeoo, knows that he is bound to hers that the land of the loss of life, is greater than the kink of the operation. Every man must judge school of surgery in which he has been of that by his own feelings. There is some taught. The first operation is, then, to include a paperatus more terrible than in troduce again into the mether this sound or thu operation itself, something that operates staff. Mr. Key, a most eminent surgeou of on the mind against being the subject of it; the hospital, kno hern himself the inventor and it is nothing but the extreme pain, or ut the utraight stuff. He couniders it highly the apprehensive of the luss of life, or under useful. Same use it, some do uot. This is the hopes of being relieved from it, that mere matter of opinion. What he calls his gives a party courage to submit to it. You staff is a straight stick, not curved, with a may suppose, therefore, that no surgeon was point. The nrethra is a lung caual, which ever called upon to operate, unless under passeo through what is called the prostate extromity. Where the patient says, "I gland, before it enters the bladder. In the caunot live, I must die under it, the urperstate gland, it has a commonication with gency is so great, that I call upon you for in tother parts of snimal lift, which I need not start rollef; all judgment is ut an end; you allude to. But it is opened into the blad-most perform the operation, or i must die." der. On passing the staff, you penetrate What mourse is left, but to perform the into the opening into the prostate gland, operation? Now, he is understuch, that the land it is inserted into the bladber. Tho particular practics of different surgeous, in staff has a curve in it, which is passed in some slight degree, car.es; but they are all; front, and between the legs of the patient; couployed for the same end. It is not mey are fined, and the one of the curve is, that when the province, here, to describe end remark upon operator introduces his knife, it tunches the the merits of the different achools. You point of the curve. When the point of the have hereful that the french hardly use my knife is in the staff, he then knows he is in of the justruments that we do. We use the the fact that he is the first that he is the province of the province of the province of the province of the different and the province of the

bringing the staff forward, and altering. Cooper, however, could not find the position e little, he gets into the hadder, stone; he had no idea, even, where it was. Sir James Scarlatt then went on to explain The first idea was, that the previous indithe mode of operating, et some length. If estions were fallacione, and that there was the forceps annuat find the stone, thee the no etone at ell; and Mr. Cooper felt very sound is introduced through the opening, anxieus, es any person might useurally be, and it is e common practice, if the atoms under such circumstaness. He then hed caused be felt, to try sounds of different the country his instruments all round forms. The atome may be enfolded in that the bladder, to feel for the stone, which bladder, or as suspended, that it might be would have required furce, or to make a extremely difficult to get at it. Then the second insisien; he chose the latter, eed, salling for Sir Astley Cooper's knife, he and intermentally a temperature in a later. an instrument like a tea-spoon in its shape. larged the wound, and than again tried the With this en ecertion is made to touch the forceps, but without success. He then stone, and thereby cause it to fall, so that it thought he would ascertain, with the sound, may be got et by the forceps. Now, it if, ledeed, there was e stone; sed than, sometimes isoppens, that there ere cases in upon withdrawing the sound, the cerved which the most skillful operator ie befiled in point of their certuanent struck the etcons, his exertions to reach the stone, er to find This proved that the stone ley, es it were, his exertions to seach the stone, or to find out the position of it, and where the cause upon the upper part of the pubes, end actively its election could use the sacratined, to has been only discovered upon a post-morten examination. A surgeon may be convineed that the stone may be lodged somewhere, that the stone may be lodged as where the title is a position where he sameer reach it by ordinary messes. It that asse other means must be reworted to, and e accood incision may become necessary. This is the neusil course of the operation; lift come now to the operation in question, which was performed by Mr. Cooper then used the gorget, but not but I will come now to the operation in question, which was performed by Mr. Thensh the coper. The mass lad beas sent up from a parish is Sussex. Now there were enlineet surgeons at Brighton, end it may be the dead the blant gorget. He used the were enlineet surgeons at Brighton, end it may be secondly, the advantages; was, therefore, only fair to assume that the

were enumest surgeons at origanon, and it has, that of masing the weets activity was, therefore, only fair to assume that the large; sed, secondly, the advantage of not case was nee of great difficulty, or the parish being able to make it too large; fur it would not have gune to the expense of send; cannot make a wound beyond a specific tog him to London to be operated upon "sue. According to all the rules of science, However, he was sent to the hospital, and the cutting gorgat will make a wound Mr. Branshy Cooper as white. Activities to advance a reliably while the advance in present he was a stout man, with a heetic com- ceps, which, while the abdomen is pressed plexion, Mr. Brausby Cooper ascertained down, will catch the stone. This was tha that his kideeye were in a disordered state, course adupted, and it succeeded. It is perand that it was necessary to postpone the feetly true that Mr. Cooper did say that in operation until this disorder was chaled, hould not imagine what was the difficulty of It was accordingly postponed netil the the case; but, when he had discovered the egocy he suffered readered the operation no difficulty, he had used the most skills and longer proper to be delayed—until, loahort, it most be performed, or the patient. The atone was flat, and loy, as it were, upon must sie. Mr. Cooper made as incision, the shelf of the pubes. There was on proend there was an immediate flow of arise—not a guah—for, under such circumstances, and the program of the parts. If then inserted goldaning and the would only reach the prostote gland; and the would was in the right direction; he put the forcepa in to see if he soienes to he carled lete effect—a past-had reached the hisdder. This was most easily to be escertained by the forcepa, for just of the forcepa, being shaped like u pair of saienes, could he easily acquaided within the bladder; and, if the stone was in the endoury election, will easily appended within the bladder; and, if the stone was in the endoury election, would easily shy hold of reach the hisdder, hut he could not do se. it; but the forcepa could not be expended it was no utter falseleed to any that any force was used. He would call Mr. Callaend there was an immediate flow of arise- truding end far the forceps to lay held of;

way, who would tell them that it was to any for such a columny, gross and false as it is, gross and columnious exaggaration to say for the reporter of it, if true, and yet aspable that any force was used. On opening the of throwing it into such a shape as this. hody, a gentleman, who want te witness it After reading the libel, and commenting on for euriosity, put bis finger into the wonod, several passages, the Learned Gentleman and could not reach the bladder, owing to the depth of the perineum. Dr. Hodgkin had and said that the perineum was not tiff, if it could et the same time bo said that deep, but he had said that it was not deep that verdiet was obtained merely by some in proportion to the size of the man. The wound is the hisdder precisely corresponded with the external wound, except se far as a small alip, of no importance, in the pros-tate gland, bad oot hit the very spot of the original wound. There was e cellular membraue between the bladder and the rectum, which was very easily broken; but oo breach had taken place, and it was per-fectly sound. The kidneys were disassed, and that alone might have contributed to the man's death, without the operation baving been performed et all. Dr. Ilodgkin Jury to mark their seese of the serious in-made an observation, that this membrans jury simed et his client by the libel which was easily lacerable, and yet it was per-fectly sound. As soon as Dr. Hodgkie turoed his back, Lumbert took up the part, and exclaimed, " there is an opening ba- plaintiff up to the scern and contempt of the tweeo the bladder and the rectum;" upon public, by giving what they might conceive which Dr. Hodgkin, whe is a Quaker, in- to be a temperate verdict, but which mamediately replied, " if there be on opening, levelener and baseness would convert into a friend, it is thyself bas made it; " sod he source of triumph. had made it. Mr. Key would prove, and The following so would Dr. Hodgkie, that there was no colled :opening wheo they had examined the perts immediately before. He should prove to lock—I am a surgeon or Guy's Hospital. I them the ignorance of Lambert; for, if was one of the pupils there, and saw nearly he had sense, he would know that, if the all the operations which took ploce there. blood; but this was oot the ease, there aix times. Mr. B. Cooper operated acroral was no extravanted blood. I now come to Mr. Lambert, the contributor to Tuz Lan-Mr. Wakley is a wit, and Mr. Lambert partakes a little of that entertaining econorplishment. "My uncle's knife" was a portien of Mr. Lembert's, and he had thrown the whole occurrence into a dramatic shape, This it was: " My unclu's knife, and a half dosen other instruments.- Post marten exwere used Mr. Koy's knife, the cutting gorget, my nucla's knife, the blunt gorget, Ac.; sod on Wednesday evenlog, es might be expected, the man died." Now, Gentlemen, what think you of the taste of a man know not, if the chuice were given to me, have introduced the forceps unless his finger whether I should choose to be the lorenter convinced him the bladder was penetrated.

said that he would not allow this case to go abroad, even with the verdict for the plaindefect in the defendant's evidence. He would out consent to toke a verdict on such terms. For the wke of the character of bis elient, he felt himself bound to produce as witnesses, in support of that character, some of the highest and most eminent men in the profession, and among others Dr. Roget, the relative of his ever-to-be lamented friend, Sir Samuel Remilly. After citing several ceses, in which, for a less aggravated libel, the most exemplary damages had been given, Sir James Scarlett called upon the the defendant had thus published. conjured them not to give on opportunity of triumph to the defendant, or to hold the

The following witnesses were then

Thomas Callaway examined by Mr. Polopeoing was made by the forceps, it would I have seen Sir Astley and Mr. Cooper ope-have been traceable by the extraresseted rate for the stone, and have operated myself times in my presence. I saw the operation in question in my character of assistant-sur-CXT, et eight guiness per month. Mr. grou. The operation lested for ebout fifty Lumbert swears that he knows more of his minutes. I held the staff, I could not see profession that Mr. Branshy Cooper. He the first incisies, from the position in which makes a communication to The Lancer; I was. I distinctly felt Mr. Cooper cut into the groove of the stoff which I had in my hand; I, therefore, entertain no cloubt that the knife cut into the bladder. When the assistant feels the knife in the groove, he delivers the staff to the operator. I was present at the post-morten examination, and eould find no reason for thinking that the amination .- On Tuesday last an operation first incision did not go into the bladder. took place by Mr. B. Cooper, and there No one can form an adequate epinion of the difficulty of an operation but the operator himself. I think that I had the best means of uncertaining the difficulties, next to the operator. There was in this case great difficulty in feeling the situation of the who had witnessed such an operation, and stone. I cannot ferm on opinion as to whewho had thus described it, and then thrown ther the forceps reached the bladder the elescription of it into a dramatic form? I first time, but I think that oo man would the bladder, behind the pulses, and high op., travession of blood. The deceased was an That situation satisfactorily accounts for the unhealthy mas. I have seen other opera-forceps, whether attraight or crooked, not tions for lithotomy. The length of time is fieding it. We generally expect the atone in criterion of the skill of the uperator. I to be in the ontarior part of the bladder, in have seen Mr. B. Cooper perform the opethe hollow of the putes; ie the mejority of ration sleee, successfully, is about a minute, cases it is found there. The shape of this I read the Lancet, but I have not seen the atose was oval sed flat. That there necounts to me why it cluded the forceps. Mr. Coopertie the autorisvian satery, which
Finding that the forceps did not reach the
state, Mr. Cooper tried different forceps, anatomical knowledge, and could scarely aed other instruments. I sounded the pathe done by accident. Tying the subclavian time to a the table before he was cut. I did aftery, is my opicios, requires greater skill not feel the stope until I was withdrawing than lithotomy. A by standar cannot so not reel the atone until I was withdrawing than lithotomy. A by standar cannot so by the sound. Although thus perceptible by well appreciate the difficulties of an operate the sound, it might atill stude the forceps, it on as the operator himself. I should not The patient was a stout man. During the vecture to form an opinion upon the diffioperation I tried, but could not reach the calities of en operation without first commulated with my finger. I might have leading with the operator, reached the prostate gland. I think that The preparations were once more brought in this state of things it was naccasary to lie to Court, and Mr. Wakley requested that

and care. A cutting gorget was afterwards of preservation, was accordingly taken from used for the same purpose. I do not recold the glass, and Mr. Wakley proceeded to lect whether a blunt gorget was introduced, cross-examing the witness.

place it was ?- Certainly he did.

otomy. He was also at Edieburgh atudying minute. with violence. If it had, I must have per- the operation, an given by Mr. Callaway, I

In this case the stone was in the enterior of the it. There would have been an ex-

anlarge the wound, and to do this, Sir thay might be taken out of the glass, as Astley's knife was used. It required time otherwise so accurate isformation cauld be to make this second iscision with caution derived from them. The bladder, is a state

but I do not think that it was. The cutting. There might have been thirty persona gorget acts as a guide for the forcepa, and present at the post-morten examination. I makes the hole large enough. If the wound caneot any that the atone was attached to were aufficiently large before, it would not the bladder, but there was a spot, which do any harm, because it is introduced on induced me to think that that was the prethe finger like the knifa; the atone was cive aituation in which the atone was placed. ultimately extracted.

The operator did say, during the operation.

Now, did Mr. Cooper use the proper that he could not explain the cause of the means to extract the stone, heing in the difficulty: I think he had no knowledge of the situation of the store; there is loose cel-Was eny great ned unnecessary violence lular membraun between the pubes and the used by bim?—I thick none; our were bladder, and attaches the latter to the forthere more instruments used than ware re- mer; when the bladder is empty it is conquired. I think that the operation, ueder tracted, and then it might ambrace the atone, the circematances of peculiar difficulty, was My finger could not reach the bladder; a performed with as much care as the case flat stone is more difficult to lay hold of than cered have required. The delay which oo a round store, and a small store is more dif-cerred in the operation was owing entiraly ficult to by hold of than a large one. The to the situation of the stone, sed the different generation of the opening required time. ficulty of detecting it, sed not to the wast to du it with care. It might take tee acof akill or care is Mr. B. Cooper. conds. The cutting gorget was used celly la Mr. B. Cooper a kilful surgros gase-rally?—Certainly. I know that he was plaie the difficulty while the patient was with the army is the Penissela, soo niso in useder the operation. He did, he believes, America, as so army surgeos. I know he caplain it after it was over, but the patiest was at Norwich Hoapital, which is cele- was nehinding while he was so axplaining, hrated more than any other county for lith- Hn was unbound in the course of helf a

medicise. I thick he is skilful in his pro-fession, and fit to be a surgece in Guy's nior surgeon to Guy's Hospitsl. I have been Hospital; I have knowe him for about 20 a sergeon siece 1812. I have performed 50 years. I was at the post-morten examination, or 60 operations of lithotomy myself. I and saw the bladder and the rectum. From there sees Mr. Cooper operate acveral times, my examination of them, there was nothing; in the operations Mr. Cooper has performate induce me to believe that the forcepa had ed, he has not tout more than the average passed between the bladder and rectum number of patients; from the description of think it likely that I should have dented as everal times. Some operations of the de-the same process as was adopted by dr. Branshy Cooper. The leogth of time occu-lasted as long. The most tedious coel lever plud in the operator. Have known eases aw, was by Mr. Cline, senior; it leasted an hour and furty minotes. The atons was where, although the atons could be tunched, altimately antracted. I have seen the there was yet great difficulty in satracting operation last an hour, bot not oftee; one it, is consequence of the bladder graning by Sir As the store. I think, from the evidence ad- Bospital. duced, that the operation was acceptifically perfurmed. If any viulence had been used, I think its effects could be discovered after death. The passage is the cellular mem-brana would have been found lacorated, and ie a state of alough, with extravasated blood. I was present at the post-morten azomination, and the collular membrane was perfectly sound, and not lacerated. If the farceps had been introduced with great force into the prostate gland, it would have shown thu affect of that force; but no such effects were visible after deoth. The wound presented the appearance of a fair acction into the neck of the bladder, through the pros-tate gland. The cutting gorget was, I think, an instrument applicable to the circumatances of the case; but I think a knife would have onswered the purpose equally well. It is only to very few cases, necording to my experience, that the bludder em be reached by the finger; but it is desirable to do so, if matthe. I had some conversado so, if forable. I had some conversa-tine with Mr. Lambert in the square of the bospital. Mr. Lambert said, "Your straight I replied, "Sir, you know nothing about it, barieg never porformed the operation yourself." Mr. Brausby Cooper, in his upon tions, has seldom exceeded the average fresho sleep 1800. I have tied the aubclavian nutrity dence of Mr. Callaway as to the operation, and I have tied the aubclavian nutrity dence of Mr. Callaway as to the operation, riam, one of the most difficult operations in operation is easy amongh. It requires great instrument which ought to be used. The skill, great presence of miled, and great length of time is so criterion of the skill of knowledge of anatomy, to perform such on the operator. I am acquainted with Mr. operation. I assisted Mr. Bransby Cooper Cooper, and think that he is an inganinus ie performing this operation, and I sever asw non better performed in my life. It lim be holds as surgeon of Guy's Hospital, was for sucurism. I never suw Mr. Bransby There are often cases of lithotomy, which, Cooper lose his presence of mind upoe any occasion. I consider him to be a good and akilful surgeon.

By Mr. Wakley. I one as many iontruments in lithotomy operations as I find necesasry for extracting the atona; sometimes three, sometimes more. If the bladder contracts, it may hold the atona is coutage with it.

Mr. Joseph Loundy axamined by Sir J. Scarlett,-I have witnessed almost all the operations at St. Thomas and Guy's Huapitala for the last thirty years, and have seen Sir Astley Cooper and Mr. Clina perform hy Sir Antley lasted an bour; it was at the

Dr. Hodgkin, a quaker, examined by Sir J. Scarlett -I um a lecturer ou morbid anatomy at Gny's Hospital. I should think that the perincum of the deceased, from bia size, must bovo been deep. From tha appearance of the parts, I was aware of eo other wound, except one from the external surface into the bladder. There was some between the bladder and the rectum. After I removed the parts they were put away, and J. Lambert asked to see them. I, or one of my assistants, took them down for him. I went away. Afterwards J. Lambert showed ma a passage between the bladder sed the reetnm, and, na 1 bad ent seen the passage before, I taxed him with making it. He had bis finger in the passage when he showed it to ma. If that had been made recently before death, there would be an ex-travasation of blood. It is my firm oneviction that it was made after death.

Mr. Brodia examined by Mr. Pollock .-I beard Mr. Callaway's account of the oparation, and I think that it must have been difficult. I think that Mr. Cooper per-

and I have heard of eo circumstance which could impeach the skill of the operator. I surgery; bult wheo there is no disease, the think the operator is the best judge as to the and intelligent surgeon, and fit for the situsfor a long time, buffle the akill of the bear operator, and I cunceive the case, is queation, to be one of that description.

Mr. Green was next a zamined .- I am the acubow of the lata Mr. Cline, and have been for eight years surgeon to St. Thomas's Hospital. I bave often performed the oparation of lithotomy, and am reputed to be very ancessful. I witnessed one capital operation by Mr. Branaby Cooper, that of tying the enternal ileas artery, which, for skill, is somewhat like putting a ligature on the aubelavian priery.

Dr. Babington was east called, and ex-

smined by Mr. Pollock .- I know the plain- | than " tiff well; and the best proof of my con-viction of his skill is, that I have placed my This was the plaintiff's case. youngest son under him as an apprentice.

Dr. Roget examined.-I have had many opportunities of witeessnig Mr. Cooper's practice, and I think that he is a skilful and judicinua aurgeon.

Mr. Mergan was next examined, and gave aimilar teatimoey as to Mr. Cooper's abi-

Mr. Hilton examined-I was a pupil at St. Thomas's, and I am now assistantdemonstratur. I was at the pest-mortem examination, and could not reach the bladder with my finger.

Sir A. Cooper .- I was subposensed by the defendant, and I heard the account given by Mr. Harrison of the education of Mr. Bruesby Cooper. That occount was per-fectly correct. Mr. Bransby Cooper had been in my bouse, and had continued opportunities of witnessing my practice. Hs: -bad opportunities of experience at Salamaues, l'houlouse, and Vittoria, and afterwards in Canada. No man can be a judge of the operation nulcas he had performed it, and no man could judge of the individual case unless he was the performer. I have been 25 years in practice, and I have in ona year performed the operation of lithotomy 18 times.

Mr. Hukley.-What was the particular difficulty in this case ?

Sir A. Coper .-- There was so little water in the bladder, that this mae must have made water immediately before the operation. If the bladder were full of water, the stone would have bean easily atruck.

Mr. Wakley .- How long may the contraction of the bladder continue !

Sir A. Coper.-It might lest un bour. will give you an example. I went into the theatre at St. Thomas's Hospital when an operation of lithotomy was heing performed by a gentlemae who is now in Court. It the hospital surgeons produced by the was one of great difficulty. The stone was plaintiff. They too well knew what pawas one of great difficulty. The stone was enveloped in the folds of the bladder, so that the point of it only could be felt. After nearly the lapse of an hour, he passed tha instrument between the stone and the hladder; but the contraction still continued.

Mr. Dairjunia, the surgeon of the Norwich Hospital, deposed to the celebrity of that hospital for its operations in lithotum; and he had himself performed the operation not less than seventy-six times. Had heard he entreated the jury to do was, to ask Mr. Callaway's description of the operation, themselvas whather they would be wiland saw from that description no iedication ling to employ Mr. Cooper, were it neof want of akill on the part of the uncrator. eccarry fur them to undergo and an ope-lins often had similar difficulties, and has ration to and, if they would not, he would

s that were mentioned as employed

Mr. Wakle replied .- He said it was most remarkable that, out of 200 persons who wers present at the operation, the plaintiff bad thought proper to call only one, a solitary one, to give evidence of his skill, while huat of persons, who knew cothing at all of the operation, were called to support the plaintiff's character. Amongst them were Sir A. Cooper, Mr. Green, and Dr. Bahing-ton. He wondered, for his part, that there were not added to the list, the Emperor of China and the great Mogal. By anch a course, it was attempted to practise the greatest imposition on the jury and the public. But would the jury he so blisded and so duped as to allow themselves to be persuaded that the opinions of these ment were in prove the report in This Lancar inscentat Sir James Scarlett, in his address that morning, had thought proper to dwell at great length on the person whom be chose to call "the litreling Lambert." But Sir James should remember that in this case ha himself was a hireling, had received his fee, and was working for the sake of lucre. Objection, too, had been taken to the term "bats;" but if thes were to have their whiga in politics, he did not see why they should not have their bats in hospitala; and he was very sure that their hoapital surgeons were much more like bats than Sir James Scarlett was like sour milk, which was the manning of a whig. (Loud laughter.) John Hunter had said that bad carpenters made work for one mother; sad so did surgeons; sud that, were it not for had surgeons, good ones would starve. (Laughter.) Bearing this on misse, the governors of Goy's Hospital, in applicating Mr. B. Cooper surgeoe, had, in the same day, sppointed a consulting surgion and an assistaet surgeon to do the work the naw anreeon would make. He continued the jury against putting my faith in what had fallen from tients suffered in the public bospitals to have may feeling for them. Why had the patient leased I Was he not the best judge of what he was enduring? Was he not a free agent? Did he not know both what were the sufferinga arising from the atone and the anfferiuga arising from the operation? and did he not choose the leaser evil! What always a greater number of lustruments then sak them what right they had to send

him back to Gny's Hospital, to torture his were liable to failure. It also appeared that unfortunets fellow-creatures? Again and the length of time occupied, and the number again he would say to the jury, lot them ro- of instruments used, were no criterion of the member that only one of all the witnesses of want of skill of the operator. All these cir-the operation had beee called by the plaie- cumstances the jary were to take into their tiff, and that one a dependent upon the hos-pital. For his own part, he had not words to express the disgust with which he had listeesd to the evidence given by the gang of hospital surgeons produced by Mr. Cooper. (A lough.) They stuck to him, eed for a good reason, because they knew that his case now, might some day be theirs. They had come there to bear down the weight of honest testimony by their names, not by their talents; fur it did not always happen that great nemos and great talents went hand in hand. If the jury, after listeeing Cooper's operations, on o surgeon, and, without that againson, they would not give the plaintiff their verdict,—he (Mr. Wakley) was willing to give up THE LANCET, sud go any where, wen to a dungeon. But he any where, went to a dungeon. But he means go the lengths of the learned counsel, trusted that such would not be his fate. Ho trusted that the jury would overturn this gang of hospitals sungeon, who wanted to support one assistar's had practices! He trusted that they would, in future, prevent the poor from being hacked and hewed in our hospitals. In the course of his address to the jury, the defendant was no overpowered by the host, pressure, and fatigue, that he obtained leave from the court to withdraw for a few misutes. to withdraw for a few mieates.

Lord Testerden then proceeded to sum up the case, and recepitulated the evidence to the judge of the proceeded to sum up the case, and recepitulated the evidence to the judge of the proceeded the followed by loud applause from Mr. Wak-the judge. The proceeded the first the man to be presented, he believed that it the court, was oneered by the populace was pretty generally understood by surgeons that tudges a man was of extraordinary nerve, he of receptable to be released from the operation, to which wish the surgeon. of coarse, ought not to sitend, as long as there was a reasonable expectation of releasing the patient from his suffering. As to the report, he thought there could be no question that it was drawn up in an unprowould have done with a real sense of propriety. The defendant had objected, that only one of those who were present at the operation, had been called by Mr. Cooper; but he (the Chief Justice) did not see whom he could, with propriety, have called besides Mr. Callaway. The others were all young men, nuly pupils, and probably too young and inexperienced to form any judgment in the case, that could be reasonably relied upon. The question was one of the greatest interest to the public, and to Mr. Cooper himself. It appeared, on nearly all hands, Hart Street, Dec. 15, 1828. that the operation was one of great difficulty; one in which the most able surgeons

cumstances the jary were to take into their consideration. If they thought that the de-fendant had proved the unskilfulness, or unsurgeon-like conduct, of the operator, they were bound to give him their verdict, whatever their opinion might be sa to the form of the report, or the motives Mr. Lambert might have had in writing it. If, on the other haed, they were of opicion that that had not been made out, they must return their verdict for the plaintiff; and, in that case, they would bave to consider what dameges the case required. The report oerhand in hand. Af the jury, after listening tuinly placed an imputation on the profes-to the whole of the evidence, would decide sional character of the plaintiff; and, as the that they were willing to submit to Mr. work was in large circulation, if the jury believed that the defendant was in fault, they were bound to give the plaintiff such compensation as should meet all those circumstances; but he (the judge) could by no means go the lengths of the learned couusel,

MR. CALLAWAY AND MO. B. COOPSO.

To T. Callanay, Esq.

San,-Ie my conversation with you at the last meeting of the Kent Medical Society, I hereby declare, that you never imputed to Mr. Brandy Cooper any want of intellec-tual capacity, or professional usakilfulness: and especially, that the word "ideot," as applied to Mr. B. Cooper, was never men-tioned by you.

Yours truly, J. HABLAN, M.D.

### THE LANCET.

London, Saturday, December 20, 1828.

"If," said Sir James Searlett, in his address to the Jury, on Satulday last, " you give moderata damages in this case, you will afford an eppertunity of triumph to the Periodical Press, such as it has nover yet achieved, and you will held up the plaintiff to the contempt and scorn of the public!" We do not, for obvious reasons, coneur entirely in the sentiments here expressed by the Loarned Couusel, but we may take his decisration as a measure of the astisfaction with which he, and those for whom he ishoused, contemplate the verdict actually returned by the Jury. We believe that the trial, and who has attended to Lord Tax-Learned Counsel never yet had cause to reflect, with so little self-complacency, on the offeet produced by his professional exertions. Ha made a most elaborate, but, as it appeared to us, oud we believe to mest of his hearers, a singularly infelicitnes effort. How it happened, that an advocate of such consemmate skill, should have been counsel, however liberally he might have foiled io an undertaking, wherein it was garnished his speech with this charge, had evident that he considered himself secure not made the slightest attempt to prove. of success-hew it happened that he was Neither at this moment, nor at any beaten, with every advantage in maint of former period, have we entertained acc experience on his side, by a mere novice other feelings towards Mr. Buaneny in the field of juriaprudence-how it hap- Coorsa, as a private man, than those pened that he sustained so signal a defeat of respect and entrem. How far our opinion for, upon his ewn showing, he has sestained of him, as a public operator, may be supa signal defeat, we shall ondeavour pres ported, or may require modification, after sently to explain. But before making any the evidence given at the late trial, and after further observations on this subject, we the vardiet returned by the Jury, the prothink it right to state distinctly the view fession and the public will judge, Wo will which we take of the verdict returned by endeavour, as far as possible, to avoid the Jury, both with reference to the inte- making any observatioes which may add to rests of the plaintiff, and with reference to the difficulties of his present situation, but the interests of the public. Mr. Buansay we will not shrink from the discharge of our Conrza has obtained a verdict, and the public duty, whenever any occasion may Jory has awarded him one twentioth part arise which may call for an unreserved pubof the damages which he sought, as a re- lication of the TRUTH. Mr. BRANSHY

paration for the alleged lajury to his reputation. Of this verdiet, as it affects the interests of the plaintiff, we shall merely say, paleat quantum. We have ne wish to turn ngainst Mr. BRANSBY Coeran the woapons with which the indiscretion of his counsel has furnished us, or te apply to his present situation observations which would probably not have fallen from Sir James Sean-LETT, had that gentleman formed a moro judicious estimato of his ewa powers, and relied less upon the chapeo of erushing an unpractised opponent by dint of coarse invactive, and gratuitous misrepresentation. The intemperance of the sovocate received a fit rebuke in the admirable ubservations of the Lemned Judgo who tried the cause. and it must be perfertly clear to every imuartial man who heard, nr who has read tha TEADEN's chargo to the Jury, that whetever might be the necuracy or insecuracy of some of the details of the Roport, we were legully, but not morally responsible; sioce wo stond completely absolved from that . enfounded imputation of malice towards Mr. Baansay Coopen, which the plaintiff's

Coorna must feel that the eyes of the pub- | sider the admissions of Mr. HARRISON, and lie are upon him; and we trust that this consideration, as woll as the remarks made by his socia in the witness-hox, may have the effect of increasing his vigilance, and of exciting or confirming his desire of acquiring a complete knowledge of his professioo. "Give him time," said Sir Asr-LEV. " do not orush him in the outset of his career, and he has abilities which will ereutually coable him to become a good aurgeon, nod an excellent operator." Three years, be 'it 'remembered, have elapsed since Mr. BRANSRY COOPER was appointed to the office of Surgeon at Guy's Hospital, and Sir Astrey atill asks us to gire him time, not percelving that the teoderness which he claims for his naphew, might, uoder diresmeteoces which we sincerely hope may not arise, become cruelty to the public and to the poor, Sir Astray's avuncolar feelings may render him bliod to this obvious inference, but it is an inference which thousands of jodividuals must hy this time bere drawn from the worthy For our owe parts, liaronet's admission wo will show as much tooderness to Mr. BRANSSY COOPER as may consist with the housest and faithful discharge of our duty to the profession and to the public, and no more. Above all, we will not shrink from pressing on the attention of our readers, those topics connected with public interests to which the evidence elicited at the late trial is calculated to give increased interest and importance; nor will we cease to hold up to public reprobation that corrupt system under which the henevelent intentions of the founders of our public Hospitals are perverted and defeated, while the government of those institutions is often virtually usurped by a single individual, and the re-

Sir AsrLay Cooraa, in the witness-box, together with the evidence astructed from Mr. Hanaison before the Parliamentary Committee on Anatomy, as the first steps towards a reform in the system of government at Guy's Hospital; which must, ere long, be conceded to public opinion. At present, the government of that icetitution is un absolute despotism; the governors, generally speaking, take o mere nominal part in the management of its affairs, and they have, with a single exception we believe, been nomicated by the fiat of the Treasurer.

There was one feature in the late trial which we thick it right to notice, as well . from its peculiarity, at from the inflaence which the decision of Loap TENTERDEN will probably have on all future actions for libel against the editors of public journals. By a whimsical interchange of professional functions, the first common lawyer at the bar became, upon this occasion, the nxpounder of points of sorgery, and the editor of a medical journal, having made his election to address the Jury to his own beholf, was reduced, by the etiquette of the bar, to the necessity of argoing a point of lew. "He who wins may laugh," saith the proverb, and therefore, while we have some rcoson to congratalate ourselves on thn saccess with which we performed the part of lawyer, for we best Sir James Scan-LETT on the point of law, we may also he permitted to Isogh at the Isdicrous figure which Sir James made in his attempt to anact the character of sargeon. Sir James, iodeed, refertiess of that legal maxim which gives every man credit for skill in his peculiar calling, threatened, in his speech to the Jury, to axpose our igoorsoce of survenues appropriated to objects foreign to, gery, and we girded carselves up for the and inconsistent with the purposes of challswyer's ottack on our professional knowrity. As far as we were permitted to enter ledge. The threat, however, shared tha into the exposure of that corrupt system at fate of oll the assertione made by the Isamed the late trial, we exposed it; and we con- Counsel; it finaled in the odrocote's speech,

when he came to the examination of witnessea; it was por, somes, sure, mikil. On the other hand, we maintained our point of law; not only against Sir James Scanlarr, but against the opinion of our own Counsel, and we narmen it. As this is a matter which in full court." may involve consequences of great importance to the liberty of the Press, sud as the point discussed was misunderstood la sil the Reports of the trial which we have seen in the newspapers, we shall endeavour to make it class to our readers.

In general, a plaintiff has the right to open his case, and, by consequence, to have the general reply;

> For courts of justice understand, The plaintiff to be eldest hand :

but there are some exceptions to this rule as in actions of ejectment and replevin, where the party who has to prove the affirmative of the 'ssue is allowed to begio. In an action of trespass, owere clowners fregit, (Hodges v. Holder, 3 Campbell's N. P. Reports, p. 366.) the defendant admitted substantially the entering of the plaintiff's close, but pleaded a right of way. liere the affirmative of the issue being thrown upon the defendant, Mr. Justice Bayesy held that he had a right to begio. The same point arose in the case of Jackson v. Hesketh, (2 Starkie, N. P. C., p . 518,) tried at the Lancaster Assizes 1819, and Mr. Justica Bayley, after having consulted Mr. Baros Wood, dacided that the defendant was entitled to hegin, and to have the general reply. Again, in an action of assault and bettery (Bedell v. Russel, Ryon and Moody's Nisi Prius Reports, p. 293,) where the defendant pleaded a justification only, without the plea of " not guilty," and the right of beginning was insisted upoo by Mr. Seriesnt Wrane for the defendent, Chief Justice Busy said, "that but for the authorities

but vanished, with a alight small of sulph ur i the seem of proving the damages sustained. gave the plaintiff a right to begin; but that, as it was of the utmost consequence that the practice should be uniform, he should consider himself bound by those cases, until the matter should be settled

> On the authority of these cases we majotnined our right to begin, and to have the general reply. Sir James Scanlett, on the other hand, insisted, first, that as the plaintiff had to show the amount of damages sustained, the aftirmative was thrown upon hlm, and he was consequently actitled to begin; secondly, that as our secund and fourth pless contained negative allegations, as that the plaintiff had not performed the operation with the skill which the public had a right to expect from a surgeon uf Guy's Hospital, &c., the affirmative of the issue was not with the defendant, but with the plaintiff. We replied that, as to the first point, Mr. Justice BAYLEY had deoided that the question of damagas never srose until the issue had been tried; and that, as to the second point, the sllegatious. in our pleas were substantially affirmative allagatious; and we axpressed a hope, that the practice which had uniformly prevailed et Nisi Prius, in cases where the defendant had justified, would govern the decision of the Court. Lord TENTANDEN intimated an opinium in our favour ; but said, that as this case was likely to become a precedent for all future cases of the same kind, and as he had the advantage of being able to sensult two of his Learned Brothers in the adjoining Courts, he should take their opinion. The Lord Chiaf Justice left the Court, and on his return, stated, that his Learned Brothers concurred with him in the opinion, that the defendant was antitled to begin, and to have the general raply.

This decision will, we doubt not, lead to most important consequences. It is calcucited, he should certainly have thought, that lated to atrengthen the hands of public ing its enemies of the power of casting gratuiteus asperaions on public journalists, monatrating their falsehood. Notwithwithout being subject to raply and expo- standing the congratulations which have aure. Hitharto, we believe, it has been poured in upon un from all quarters, and the established in the late trial, public jeur- regret to our errors in point of omission, er auspected, a jury will, ne doubt, be ioclinad to find, or, if they do not find, to presume, inaccitiacy; but still it will be no agat of all the animosities which may subaist between reporters and the parties whose note are reported, if, by a plea of jackineawhere the facts are true, from responsibility

writers, and to raise a new bulwerk in sup- | adduce, were made solely under the impresport of the liberty of the press, by depriv- sion that we should have been incapable of . replying to him, and consequently of dethe practice of pleaders to discourage pleas success which the kindness of our friends of justification, in answer to actions for has ascribed to our exertions, we may state olleged libel; but, after the precedent most unfaignedly, that we look back with naliats, against whom actions may be brought errors which are partly attributable to our for having discharged what they believe want of experience, but still more to our to be a public duty, cannot fall to perceive attate of physical exhaustion. Could we now the advantage which they will derive from address an untired Jury, free ourselves from putting a plea of justification on the record. the disadvantages under which we then la-If they adopt that course, they cannot be boured, we feel that, in answering Sir borne dewn by calumny, to which they will JAMES SCARLETT'S assertions, we could have no opportunity of replying; for they reduce that learned person to something will be entitled to open their case, and to like his natural intellectual dimensions. We have the general reply. Nor is this the will still endeavenr to do this act of justica only advantage which they will gain by to corscives, and to the public, by demonodepting that course; for, under a plea of atrating that there was not a single asserjustification, they will not be legally re- tion, levelled by this learned person at the aponsible for the malica of an agent, pro- character of The Lancar, which was not vided the alleged libel be proved to be utterly false and unfounded, and with reatrictly, and in all its circumstances, true, spect to which It is not fair to infer that it If malice, on the part of an agent, be shown ; was mere gratuitous misrepresentation, inasmuch as the learned person did not attempt to offer a tittle of evidance in apport of it. We shall this week confine ourselves amall advantage to the editors of public to one instance of the learned Gautleman's journals, whe cannot, of course, be cogui- candoor and leve of truth, pramising, that the aspersion to which we are about to allude, la not more base and nafounded than those by which it was succeeded. Sir tion, they may legally agenerate themselves, JANSS SCAPLETT, faeling that he had no case which he could support by evidence. for the enimus of on agent, for which they travelled out of the record in order to raise cannot, in reason or equity, be responsible. a projudice against us in the minds of the We have said that Sir JAMES SCARLETT Jury, and for that purpose, repeated the raliad somewhat injudiciously on the chance slander, as to the publication of Lectures of crushing us by diut of course scurrility without the leave of the lectorers, which, and gratuiteus misrepresentation. We be- as the readers of this Journal are aware, liave that the aspersions which Sir James we answered on the 4th of October last, in SCARLETT hasped on our character, in sup- a manner which has effectually closed the port of which, the learned Counsel well mouth of all other calumniators, except the knew that he had not a tittle of a ridence to learned Gentleman. We shall insert tha

learned Counsel's attack, and reply to it by had taken great pains to prepare a course of extracting a portion of the article which lectures, which, hy and by, he intended to publish himself, could be endure it, if an October.

"THE LANCET, it should seem, from bis own statement, was established for the purpose of publishing lectures delivered of the aspitals,-in other words, for the purpose of committing plunder on the property of others to assist himself. What! was it to be soid, that if Mr. Chae, or Sir Astley Cooper, or any other eminent surgeon, should compile o course of lectures, and deliver them to the pupils of his own class or the hospital, who paid him fur attendance, and remunerated bim for those labours, that a poriodical paper should rob him of all advautage, and, without his leave and liceoce, make them public, so as to give to ell the pupils in the kingdom, who were desirous of studying his art, the advantages which tha lecturer thought he had earthlished for himself ;-that he abould rob and injure him, and gain ten times more than he did bimself acquire, after being at oil the labour of cam-piliog his lectures !-- that he should du that which would reoder it unnecessary for the pupils to attend the lectures, because all the odvantages derivable from their attendance, might he guined by reading the reports of them in The LANCET? Could it be sup-posed that there were any persons in the bonaurable profession to which Sir Astley Cooper belonged, who were so base and ungentlemunly as to make ean of the privilege which was sllawed them of atteodiog these lectures, for the purpose afterwards were those who were eastributors to Tux!

appeared in this Jacrusl on the 4th of unfiedged papil, who had been admitted to the bospital, and allowed to take notes for his ows instruction, was afterwards to furnish them to a person who meant to commit them to the press, without those revisions and correctious which an author was genorally enzious to make in his works, before they were submitted to the public eye? Could suy man, and particularly a public lecturer, astier such uso to be made of his works? Suppose one of the jury trusted to a person the key of his esbinet, which cuntwoed writtee communications, and that he made extracts from them, and sent them for publication in THE LANCET? Would they but think that that men was one of the basest of his kind, and would they ollaw him to enter their doors again? And yet these were the persons who contributed to THE LANGET; and these were the mesus by which the editor, Mr. Wakley, was coabled to roll in his curruge, and lough at the parties whum he thuo robbed and plundered. He (Sir J. Scarbett) was, upon the defendant'a own coufession, justified in saving that this work (The Lancer) was a sort of lite-rary ruven, which lived by plunder, and shanorlessly held up its head by the injury which it inflicted un others."

> We now beg the attention of avery man who wishes to are a calumoistor effectually exposed, tu the fullowing passage, which appeured io The Lauret, of the 4th of October.

"There is no charge which has been of giving them to the world, without the more frequently brought against this publi-leave of the lecturer bimself? Yes, there cation by those who ere interested in uphalding axisting uluses, and who serk, LANCET, who were base enough to do this, therefore, to depreciate the choracter of a and who thus caubled the relitur (Mr. Wok- Journal which they have long felt as a thurn ley) to make his five craix thousand a year, in their sides, than that we have dishonaurand to gain the reputation of being a "po- ably appropriated the labours of medical pular writer!" The dejendant had himself teachers to our uwn profit, without the cooerowed that Tux Lancer was o work found- sent of those teachers, and even in spite of ed on the principles of rubbery and plunder, their remonstances against the publication He stated that he obtained his communica- of their lectures. This charge has been so them "usen of bonour!" men whu were doubt nut there are many persons who, induced to hetray their trust, and surrender however otherwise dispused to think wall their honour; and who, by making contri- of this publication, beliave that we havebutions of the lectures they heard, furnished not only published Mr. ARENETHY'S Lectus to the public which ought never to tures without his cousent, but that ic many, that to the public which ought never to tures without his consent, but that ie many, come out of the walls of the hospital, ex- or mast, of the lustances in which courses eept by the consent of the lecturers them- of lectures have been published in Tug selves. But this was not o robbery of Lancar, the consent of the Lecturers has property merely; it was a reabbory of cha- not been obtained. We shall insert the racter and reputation. He (Sir James Scar | charge in the language of oos of our calumlett) was glad that he was addressing gent niators, and we shall be content to furfait. themen of education, as he only wished that that issuence which has rendered us the this matter should be judged rightly. He object of so much slander and micrepre-would ask whether, supposing one of them soutstion, if the answer we shall give to it, be not such as shall for ever silence our jourselves. We urged the ground of public

Here followed a passage is a periodical James Scarlett.

a public teacher and that of a privata me, tendance on Courses of Alidwifery were re. | yield. quired by the Colleges or the Universities. We opplied, therefore, for permission to publish them, which was not at that time conceded. Subsequently, certificates of at-tendance on Caurson of Millwifery have bees required, soil Dr. BLENDELL has not only not withheld his consent from the pub- first, his well-known hatred of the Periodi. lication of his Lectures in this Jourosi, but, on they were to go before the public, has added to their value by n revision of the proof-sheets. Dr. Annermono's Lectures on the Theory and Practice of Medicine, were published in consequence of the intimation of one of his pupils, that the lecturer would not affer any objection. Dr. Assuruono did, however, after the appearance of the first Lecture, object to the principle of publishing private Lec-former we must beg leave to say a word or tures, is whole objection was equiesced; but, two in much the same spirit, whereis we having expressed his opinion, he added,

enamics, if they have the smallest regard for nutility—and as he found that the pupils decaucy ar truth." were desirous of possessing his Lectures, he afterwards consented to their publica-Here followed a peasage is a periodical tion, sed acknowledged their securacy. Mr. work, for which we now beg the reader to ALCOCK's Lectures on some Practical Points substitute the tirade in the speech of Sir of Surgery, were published with his conhim. Mr. Lawnence's Lectures on the "It can acarcely be nacessary to remind Anatomy, Physiology, and Discusses of the nur readers of the distinction which we have lys were published with his concent, and always recognized between the situation of the proof sheets were ravised by him. Dr. CLETTERBUCK's Lectures on the Theory or of the principle upon which we claimed sed Practice of Physic were published with the right of publishing the Lectures of Mr. his consent, and the proof sheets were also AREANTILY. The Lectures of private teachers, which we acknowledge to be private the property, we have uvery published, as we shall presently show, without the consent of the Lecturer. The Lectures of Mr. Bassus of the Lecturers; but the Lectures of pub on Chemistry, and those of Dr. HASLAN OR lie medical teachers, delirered withlu the the lutellectual Cumposition of Man, were no mencar teachers, delivered within the line interested Composition of Man, were walls of public hospitals, atted, as we have also published with the express consent of uniformly contended, upon u totally differtho Lecturers. All these facts we have had ent footing. We maintaised this point fear-lessly and manfally against Mr. Adarws-lessly and manfally against Mr. Adarws-nrive in a court of equity, and the issue which their respective Courses were comfittee contest was, that the Injunction pleted, as distinctly as we now state them; which that gentleman obtained against the but we have hithmred disdanced to give this publishing of his distance of the courses were consultance of the course of publication of his Lectures, was finelly conclusive enswer to the calumnics of our dissolved by the Lord Chancellor. So enemies, and we have now, once for all, dissolved by the Lord Chemeellor. So enemies, and we have now, once for all, much for Mr. Assansant's Loctures. Sir adopted this cause, in order that such Astley Courra's Lectures come within calumines, if they be agoin repeated, much principle on which we relied in our contest with Mr. Assansant's hat Sir Asr. Let Cooren a new the name of the market of the market sate, that so those who has been plundred of his literary property; for Sir Astley Cooren for have we been from the imputed necessity of seeking to ultain Lectures by indirect or affectives. The Lecturear Dr. Blowner, and Midwifery, though delivered within the walls of Guy's Hospital, we did not consider as public Lectures three years ago, the contrary, bas heen to deal with the numerous spilication of Lectures, and to as for the publication of Lectures, and that time, an certificates of statemarket on Courses of Midwifery were re-

We have elludud, in the outset of this article, to what we take to be the causes of Sir JAMES SCAULETT'S signal failure in the late trial; these causes ere, in our opicios, cal Press; sad, secondly, his personal feeling in respect to the plaintiff. Ilis discretion seems to have been completely overcame by the joint operation of these two causes. Of the letter we shall say nothing. heeause it mey be founded in sentimeets which are not anamiable; but of the that he should leave the mutter entirely to have commented on the Leaveed Gentleman's attempt to make a figure as a surgical | subsequently proposed as a panaces for all critic. One of the main sources, we under- diseases. Week after week, Mr. Cossarr stand, of this learned person's hostility to inelated that Lawyer Scanterr's poor Bill the Periodical Press, is to be found in the fact of his listing been sent to his grave before his time by the newspapers, and of sequence of these reiterated attacks upon the his having perused the open censure, or, what was worse, the faint and squivocal praise, which has supposed survivors had pronounced upon him. Many men bave, in a serious or playful mood, composed Bill, terminated, io effect, Sir James Scantheir own spitsphs; hot to no living man, perhaps, except Sir James Scanlert, has wounds which his pride received, on this it hem given to appreciate the terms in which his contemporaries have commented complately electrised, but that they are on his decease. Such a phenomenon is in Learned Gentleman may purhaps collect his aplann against the press. For our own from the following passage :

Xen & ounor' circir subsy' shary Boston, TIPIP AV BAPOPTUS THE TEXEUTAIAN IBUS, Отыз кератаз пререк през каты.

that you cannot speak safely to a lawyer's the course of his speech, to express his good or ill reputation, until the devil hatb opinion of our abilities; end, that we fairly laid huld of him,

Sir JAMES SCARLETT's hostility to the press, Sir JAMES SCARLETT. We think him proto wit, his failure as a speaker and legis- digiously over-rated, even as a lawyer; for lator in the llouse of Commons. Whether the rest, we have seldom encountered a justly or unjustly we will not now stop to gentleman possessing the ordinary advansay, the euro by atarvation. Whether gant is other parts of his speech, have litical writers of the day, gave Sir Jaure "average maximum of time."-" anypone,"

was neither more nor less than a project to cure pauperism by starystics; and the conlearned gentleman's legislative labours was, that the Bill, at length, stack in the nostrils of the public, and dropped still-born from the Legislature, With the shaodonment of this LETT's parliamentary Importsone; and the occasion, have never, it is said, been so subject to an ichorons discharge, whenever the teeth of classical authority, as the an opportunity presents itself for venting parts, we lough at the impotent virulence with which the learned gentlemen FAILED to inspire the Jury with the malica which ha antertained towards this Enripid. Tread. 513. Journal, as a part of the periodical press. which passage, being interpreted, mesneth Sir James Scanlerr took occasion, in may not be wanting in a similar species But there is suother cause which is said of courtesy, we will take this opportunity to have greatly contributed to exasperate of expressing our opinion of the oblition of inquirs, but certain it is that the time was tages of education, who seems to be so when " Lawyer Scarlett's poor bill" was completely innocent of all extra-professional s by-word for the scoffers. There was, information. Once, and once only, the and, for ought we know, is, a cartain learned geutleman ventured to play the Swedish physician named Streve, who pro- oritio on a passage in THE LANCET; but he posed to cure all diseases by a process did so in a half-guilty, spologetic tone, which he called the Hungerker, that is to which might, if he had been less arrojustly or not, we will not stop to inquire, screened him from our animadversion. We but certain it is, that are of the ablest po- allude to his observations on the phrase, SCANLETT the credit of having invented, as said Sir James, " that I shall be acarlied a remedy for the evile of pauperism, the for what I am going to say, by Tun Lauvery process which the Barou von Streval Car, but it seems to me, that the phrase

sverage maximum' is unintelligible; an govern the sordid transaction of commereverage is a mean; now, I have heard of a jeist men, and that dignifind contempt for mean, and I have beard of a maximum; but the siller, that high-minded scorn for every I never yet heard of a mean maximum." You judged rightly. Sir James. We must known to characterise the practice of the subject you to a little gentle searification; and we would moreover suggest to you, that there are more things in this world then you have ever dreamed of in your philasorhy. Wn have besten you on a point of isw, and we must proceed to set you right on a point of mathamatics. Your mistake cross from your not knowing that maxima. similar in kind, but differing as to absolute quantity, might be made the aubject of comparison, and that, consequently, one might hn a mean proportional between others. A aquarn is the greatest quadrilatoral rectilianal figurn that can be inscribed in a circle, but the magnitude of the square depends on the dismoter of the eirolo, and different sonnes or quadrilaters | maxima under the similar conditian of inscription indifferent circles may be compared with each other, But lest this should be unintelligible to you, let us put the case of an avorage maximum taken upon the highest tides at London Bridge in a given number of years. Wo use the didactie method. Sir James, on this oceasion, because, sithough you offered yourself as a candidate for the representation of the University of Cambridge, on the score of your passion for sour milk, wn do not find any evidence of your ever horing distinguished yourself, oither as a slamic or n mathamaticion, is the records of University honours. If you are indeed, as we are given to understand, the greatest advocate at the Eoglish bar, the average maximum of talent at that bor must be marvellously small.

As a specimes of the tact, geotlementy tanta, and sound judgment which Sir Jamie Scanter displayed in addressing a Jory of Excume Merchanes, we beg to direct the resder's especial attention to the following felicitous distinction between the vulgar, common-place notions of honesty which

thing in the shape of a fee, which is well members of the legal and medical profusions,

" Gentlaman," continued the Learnad Connsel, " there is a cartain privilege which belongs to this high profession,—it is some-thing that is better felethan described; and the men that does not fael it, will not be copable of appreciating the argument I address to you. In the ordinary traffic of hife, called commerce, there is a coorse of plain dealing, or aimple integrity, that marks the line between honesty and the mern appearance of it; and the meoning of it is vary well understood by every men. But in the practice of a liberal profession there is a certain feeling of honour which becomes a gaustamen, and which a gentlaman only can feel; which renders it not sordid, but which gives it a character which belongs to such a profession-s certain dignity-a certain pride, which makes a man feel that profit is a secundary object to him -that fame and reputation, and means of utility, are its greatest recommandations. Either in the profession of the law, or the profession equally honourable, and, perhaps, equally useful, or more so, that principle is debased, that principle is destroyed, if a man finds that it depends upon whether he makes concersions or no to the editor of such a publication as THE LANCET."

We take leave of Sir Janes Scanlett for this week; and we forbear making any further remarks on the evidence in the late important trial, until we shall be enshied to layan anthentio Ruport before our readers; for which purpose shorthand-writers have heen expressly amployed. The account given in this week's Number in taken from thn Newspapers. We cannot conclude these observations, without expressing our humhis but heart-falt admiration of the putience, the suavity, and the undeviating impartiality of the Learned Judgo who tried the cause ; and our own deep sense of gratitude, for the placed andurance of involuntary technical errors, and the unwearied attention which we received at his hands.

# FOREIGN DEPARTMENT.

PERFORATION OF THE STOMACH.

Tur subject of this affection was a young girl, twenty-two years old, of estrong constitution, who had always enjoyseemed unable to bear even the lightest perforation food. At first she had recourse to medical aid, but finding un relief, she deter- infers, that we are still in the dark as to the mined to suffer the disease to take its origin of the disease in question, and that one morning she auddenly acreamed out softening of a scirrhus, ere by no means and fell slown, complaining of executive capable of explaining it .- Rust's Magazine. pain in the etomach, and over the whole ebdomen; the constenance became of a Extraction of an unimany calculus of deadly paleness, and expressive of the greatest ensiety; the extremities cold, the pulse invensible, the urine and stools were Dr. Krimer, of Aix-la Chupelle, on saund-

On examination, the hody was found not much emaciated, the abdominal cavity was filled by a great quantity of a turbid liquid, but no where could any traces of inflammation be discovered; the stomach being furmed, and the stone estracted with the empty and collapsed, presented on its ente-rior suffice, in the small curreture near the ches long, the inches bused, and the in-ches long, the inches bused, and the inches long is the inches long. Polynius, a perforation of o circular form, cless thick; its weight was 23 ounces; it with defined edges, and twa-thirds of un inch in diameter. On the external surface wards its nucleus, and consisted ni phosphato of the stomach, there udbered o bard, of magnesis, line, and ammonis, except fibrus, lobulus excrescruce, through the the centre, which was unte of line. For ferrus, tobust excresorare, though the feurre, which was made and centre of which the perforation passed. In four days after the operation, the patient all other respects the atomach uppeared per- was in a very precarious state, so as to feetly healthy, and without may signs of jufanimation or softening.

Dr. Libermaser, of Dieseldorf, who relates the care, adds the following remarks favourable termination of the case was from his own obserestion, and those re- anticipated.- Groefe u. Walther's Journ. ported by other writers.

1. In all cases of perferation of the stomach, where the disease has been seeurately observed, it has been of a chronic

and latent neture, 2. The prognosis is very difficult, and there are hardly any signs indicative of the dangerous state of the patient.

3. The remote cause of the disease in Organs.

there any bectic fever; it seems even that began to cause a sensation of violent burn-

disease, in spite of the indigestion, and there is hardly any emsciation observable previous to death.

5. The perforation is always in the py-

lorie portion of the stomach.

6. lu no case have any traces of real infismmution, suppuration, ulcoration, erosion, ed good health until her nineteenth year, &c., of the stomach, been observed; the and for a twelremonth efter the commence ment of menatrustion; at this period, the well-defined edges, which are lurdly ever menses having been suppressed without softened, but rather hard and thickened, any opparent cause, her digeation was im- without, however, being cartilaginous or paired; also became subject to nanses, tuberculona. In ull reports of such cases, sickness, ernetation, and s very napleasant it is expressly mentioned that no trace of sensation of fulness to the stomach, which pus, mucus, or sanles, was found on the

From this, and aimilar cases, our author eourse. The gestric symptoms gradually those affections which are generally elleged increased, without, however, having any as causes of perforation of the stomach, marked effect on the constitution; when vis. chicuio inflammation, niceration, or

On tho tollowing day, the high operation was perrequire large doses of stimulants. At the time of the report, healthy supporation had ensued, and, from his general condition, a

### HOPITAL SAINT LOUIS.

CANCER OF THE SELN OF THE ARDOMEN.

Manal Lacanix, mtat. 62, observed. always the suppression of usecretory setion, about an inch helow the navel, a small red having some close relation to the dignative indolent tumour on the skiu, which very slowly increased, and, at the end of a twelve-4. No real enchery is developed, nor is month, having attained the size of an ende. nutrition is very little influenced by the ing and lancinating pain; countitutional dis-

turbance at the same time succeeded, as loss | Four days afterwards, the would was again of appetite, impaired digestion, fever, uoc- examined, and the disease of the aternum turnal aweats, &cc. These symptoms gra-appearing by no means checked in its pro-dually augmented, and, at the expiration gress, it was for a second time canazinad; of three years, the tumnur was as large no homorrhage ensued, but within a short as a small melan, and was then the seat of time, crysipelas appeared round the would, active inflammation; its surface was nauven, and partially ulcerated, and here and there distinct fluctuation might be perceived. At this period the patient, who had undergone almost avery kind of local and constitutional almost avery kind of local and constitutional pested blacding, antiphlogistic remedies, treatment, was admitted at St. Louis, andar and luw diet, having subduad the general M. Richeraud. Shn was much exhausted, and interly, a great disposition to humor-rhags from the ulcerated parts had come nn. M. Rielermad having observed the patient for some days, resolved upon axtirpeting the wards cicatrisation, which in ten weeks was tumour, whinh evidnutly was of eareinams - nearly completed. tous nature, and, if left to itself, would soon have led to a fatal terminating. therefore, comprised between two alliptic incisions, and, having been remared, the wound was united by sive auturea. Perfect re-union having taken place, the eicatrix wea, after two months, campletely consoli-dated, and the general health of the patient fully restored.

### HOPITAL ST. ANTOINE.

CARIES OF THE STERNEM, SUCCESSFULLY TREATED BY CAUTEMISATION.

5th at July, on account of a tumpur on the right sterno-alasicular articulation. Nothing In August, the pain which had hitherto been could be ascertained with regard to its confined to the right side, began to be felt cause; the patient had nover received any in the left iliac region, where a tumour was injury on the afferted part, nor had he aver observed, the increase of which was ettend-bad a veneral complaint. He had formerly ed by numbers and alcoting pain of the been much subject to rhounatic pains, for left thigh. On her admission into the heswhich he had repeatedly undergone caute-risation, especially over the aboutder. The tho tumuur, in the left iliac region, was ex-tumuar of the steraum was of four months tremely pantin, and appeared to be very stunding, and had no ulcerated surface ideep-scated; it rused the integumenta for shauding, and had no ukeraled surface, jdeep-seated; it rused the integrments for which secreted a sen-purulent liquid. On about an inch shave the rest of the abdo-examination with a probe, the aternum was men, and cauld be covared by the hand; faund denuded and carious. The joint applied to strength of the 1rth leg was much peared free form disease, being in no way impaired; its heat and armishity were impaded in its aution. On the 11th of natural. The patient was contive, and radius, M. Besuchène having made a crucial incision, and detached the flaps from the parts beseath, laid bare the sternum, which parts beseath, laid bare the sternum, which was found diamend. The peared operated upwas found diseased to a considerable caplication of leeches, and the use of cumlicus
tent, its carious portion being aurrounded
by a soft, blacding, hugaid feeb. The disration ensued. During the menatruntion,
ensued aurfaces was touched with the white
hot irms, and the wound afrayments simple in due time and consults the sale and either hot irns, and the wound afterwards simply to due time and quantity, the pain and sick-dressed. Two hours after the operation, a ness somewhat subsided, but recurred after profuse hemorrhage custed, which, as ap- the evacuation had reased. On the 2d of peared on removing the handage, took place. October, the patient having hitherth suffer-from the cancellous thouse of the sternum, ed numb from constant contineness, color and was arrested by compresses of agaric. pains, and romiting, was attacked with pro-

and rapidly apread over the right side of the neck, face, and scalp; the parts were enor-munally awaited, tense, and painful; the pa-tient was very ferenish, delirinus, &c. Reiuflammatary state, the waund began sisu tu assume a healthy seject, and to supporte as before; several places of houn having exhibited, the olders rapidly proceeded to-

### HOPITAL DE LA CHARITE.

SUPPLRATION OF THE OVASIES AND FAL-LOPIAN TUBES.

MARIE DERRUIT, thirty-seven years ald, was admitted latu this bospital on the 2d of September. She had borne three children, had always regularly menstrunted, and, till the last four or five months, enjoyed good health. From this period she began to be affected with coativeness, secompanied by violent pain in the right side of the belly, and numbrass of the right JEAN LABSLE, 27 years of age, of a thigh. 'Injections and apericuta generally vigorous oceanitution, was admitted on the relieved these symptoms, which, if left to themselves, ended in nurses and vomiting.

the districes continued; the stools "mixed with blood, the abdomeo was se, very tender, and tympasitio; the patient was very reatless and feverish, with a small pulse, and cold extremities, and, io spite of the administration of stimulants, expired on the 9th of October. Oe oxumination, the brain sed theracic viscers were found healthy; the liver was firmly adherent to the peritoneum, which was iejected, and contained a sero-purulant effusion; the letestines were united by false membraces, which, is the left iline region, exhibited a very considerable firmness and vascularity. (In the left side of the uterus a large tumour was observed, which, on a closer examination, was found to be an e mous abscess communicating with the fallopian tube, which was, for the most part, much dilated, inflamed, and io e state of suppora-tion. At the bottom of this checosi, the overy was found in an animged state, the overtaining some purulent matter. The abscene communicated with the rectum by a elicular perforation, about the fourth part of an inch in diemeter. On the right si follopian tabe was also found dilated as inflamed, without, however, leading into an absence; the overy was of the east of e hen's egg, and filled with pus. The bh and oteros were healthy; the macous mon-brace of the large intentions, was ulcommed in many places.

### MR. GRAINGER.

### To the Editor of Tun LANCEY.

Sim. - In the report of the trial of Cooper persus Wekley, there are some questions to the gross-exemieation of Mr. Lambert, which imply that I had delivered several demonstrations, and also e lecture, with the view of showing that Mr. B. Cooper's operation of lithotorey was neskilfully performed. As this imputation has been widely circulated threugh the medium of the press, I em desirous of refuting it, in the most public muaner, and I therefore trust you will give insertion to the following notes meet in your next number. In consequence of receiving many applications from gentlemen attending my lectures, who were subthe auatomy of the periuseum, I delivered a lecture, which was numerously attended, and among those present were several atudeets who hed been called on to give evideace, both by the plaintiff and defendant. In that lecture I pointed out the enatomica

fant distribut, and violent pains in the bolly, reletions of the periosum and nest of the during which the tumour neddenly colleged. These leeches were applied to in the dissecting room, in the usual rection, the state pain was given iterately, out the same persu. But in these discharging what I considered the imporative duty of an anelomical lecturer, I studiously avoided all allusion to the operation perfermed by Mr. B. Cooper. On Seturday morelagiset, I reed the above report in the Morning Herald, and I felt enzious to have an opportuoity of etatieg these facts in court, I therefore mede an application through Sir A. Cooper to that effect; but I was informed by him that it was too late. Under these elecumstances, I had no alternative but to publish the letter which appeared in The Murning Horald, of Monday. In the evening of that day I received the following letter from Sir A. Cooper, and by his kind permission I insert a copy of it.

Conduit-atreet, Dec. 15, 1928. My der Sh. .- You level done emissiv as I wished, in publishing your letter. All the aridence on the part of the defination half been examined; and I, who as: Igna-rate of those matters, believed that it was impossible to retrograde.

By sending your letter to the press you have completely exchipated yearself.

ne me, with real care en, always, m

Apr. at Course. In conclusion, I have only to said, that my colleague, Mr. Pilcher, has requested me to state, that in the domain times which ha has given, he has excefully abstained from all comment on the above operation. I am, Sir, your obedient florvant,

R. D. GRAINERS.

### LECTURE VIII.

Basenes the more ordinary signs of pargnancy, sugmented in a providing Leating, three gar, Gouthames, other indications which missifus themselves in particular fadividuals only, and which, though of histdental and monadiest controller, are, howover, sufficiently importants discove attantion; is the considerables of three we will

Dering progressory, version uninefficied have agreed Mings, and still more friquently their gatigathies. Some take an exercise to make the movement of their gatigathies, from the very consequently of their gatigathies, from the very consequently of their gate posterior. Remerically related to their gate of their gate friends posterior particularly before a thirty fore progressor, because the definition of their gate friends posterior has the other parts discussed the definition of their gate for cortain the definition of their gate of general and the superior changes and becomes more series and morous; for cortainly none desirate and morous; for cortainly none foreign, where we materally aminhe, lass that the model and morous; for cortainly none foreign, where we materally aminhe, lass that the model and an electric party of the substantial of an electric party of the substantial par

might be awoks whenever her parturbed constanance seemed to show that she was abouring under those distressing visions of the night. The cause of this I look upon to be, a herried circulation of the blood, and an idinat of it to the head, the discess bases siting, in its nature, to convulsions, on albetics, appearently, of the same family. The two of these mass under my form care here hithered here relieved by suppling and openlog this lowest. The phases engit to be applied in the naps of the need.

The proposable press of the body; In the fingers, ton, side more appointly in the tech.—Odensiejin association effects the whole at one side of the jaw, night after night, for weeks, ingular, and take, too; though the tech, are cound. Both, valinton, and ingular after the remotion which I have bithered.

It is about the third or fourth month, means the fourth shan the third, that weenes have the specifier meantier, which is demonstrated the quadrating in a casalisat sign, occapiting in a certain feeling of metics in the shidomen, actions of the atmosch, part turbition of the state, and a disposition to fainting. Now, in many females, these assentions may servedy be perceived at all, the symptoms are no shight you commit place, relating to the other hand, they are very complemently observed, and in them is, femiles a velocities of the indication of treatments.

When women are program, too, the blind is more or less sing, to that, when you jobs sway some two for three coinces from the arm, the size may often by seen charify smooth on the similar, of the communication, and disciply the large his produced to other causes, yie, in conjunction with the other causes, it forms a valuable infliction

Improportion to common deling with the and is guilty of ling, yet it stains their to deling, respectifier, and the sturing his bean continued for treeffer mainted a nature to six milt, for it rarely. I think, continues to feets are consonly after the first two or three was solvey, that she months, and i suspect that its quality alteria.

You may set down, therefore, among the feetus; and where there is no deception especially deserving of a separate notice, shall treat of the diseases of gestation.

foctus. The movements of the factus may,

anomalous signs of pregnoncy, this suppres- practised on the part of the woman, which sion of the secretion of the milk, for where- there will not be, unless also is anxious to aver e sudden suppression occurs, without be thought pregnant, this sign may be lookany inter apparent sense to which it may ed on as decisive. I have sometimes felt be referred, it may not, without reason, be the child less three or four times to the sacribed to pregnancy. In a word, all the course of five minutes. This point investimorbid effections to which the system begatted, you desire the patient to chaoge her comes obnoxious, in consequence of gesta- position, and lie in the posture of labour, tion, may be looked un as so many signs of on the left side, close open the edge of the its existence; but having drawn out from bod, with the loins posteriorly, and the stitless the indications which I deem more domen inclined towards the mattrass, with especially deserving of a separate notice, the knees and bosom mutually approxi-for the rest belonging to this class, I must rater you to a future lecture, in which I streted. Having placed the patient in a shall treat of the diseases of gestation.

When women ere anxious, as in illegitifies two fingers of the left hand, and pass make gestation more especially, to know to the os nteri. In reputed pregnancy, on whether they are pregnant or not, there is unbroken bymen is not impossible, but it is yet a third mode of encertaining the point, no cartain disproof of gestation; it may be and that is, by a careful examination with proper, therefore, still to continue the inthe hand; and this, indeed, in some dubione cases, in the only certain mode in which membrane, the examination may be made, it can be investigated. Now the meanued but one finger nnly must be employed, examination of pregnancy may be divided When one or more of the fingers have into two kinds; that of the earlier, I been passed to the oa uteri, this may be mean, and that of the latter months. When an investigation is instituted, in the end in many cases, without much disturbance, of a reputed goalation, the patient may be the membranes, sed the bead of the futus, of a reputed generators, not patient may be the memoranes, see the opening, aspecially, in the the pelvis and aboulders modarately eleand in pregnancy. Further pursuing the vetod, and the lumbar vertebres depressed, investigation, you may place one or two so as to approximate the nucles, and give ingers of the left hand on the front of the a complete relaxation to the coverings, on uterl, and the contiguous cervix; making, Care, too, must be taken, that the backer at the same time, with the right band, as a mortiful whether the heart and affects. be emptied, whether by the natural efforts, counter-pressure axternally above the pubes, or the catheter, as the interposition of socuright or laft; and by this nuncourre, promulated water, may frustrate the whole
inquiry. The abdominal surface may be
well lubristed with oil. These praperations made, you may lay the band ou the abdumen above the unbillious, often perceiving the moule of the womb and the symplysis
there, are presents the gravilor of the in-lubility was may direct the applient to sessing there, oe pressors, the gargliog of the in- publs, you may direct the patient to assume features, with some degree of elasticity, a posture intermediate between the seden-especially towards the middle months. tary and the recumbent, in which position Having completed this part of the inquiry, the bead of the fettus may often he felt you next axemine the middle and inferior parts in the way here demonstrated, observ- with a slight blow you give it on impulse, it iog the outline of the nterus—its roundness rises in the water, and, in a second or two, -its firmness under pressure-its equablo subsides upon the finger again. This, too, surface-its position in the middle of the in many cases, may be observed repeatedly, sbduman—and, in addition to all this, in and in a manner too obvious to admit of a some iostances, the movements of the mistake. These observations cannot always fectus. The movements of the factus may, be made, yet they may in many cases; and perhaps, be produced sometimes by the when they do occur, whether reparately or in audden application of n cold hand, or hy combination, they may, I think, be deemed changing the position of the patient, who decisive; for there can no longer be s moy place herfelf successively in the as-dentury, lateral, recombent, or other pos-ean feel the movements—the membranes tures, while the hand still rests over the and, shove sli, the head of the foctus; whereginn in the womb. Under these move—ther this is to be distinguished at the osments, now and then, I know not that I can be the continuity, the acconchour may be able to feal the child distinctly—a sudden bluw it by the jointexemination of the regions by the feal the child distinctly—a sudden bluw is so, then, by feeling the membranes at the

on ateri, and sometimes the head-by foel- tion, the belk of the eterus may be again ing the heat through the neck of the mission internally between the os uteri and the which all petiente mey not be associated in aymphysic published by facility the bend of two uthers may be easayed; and we may the feetus interposed between the two hande feet the large body of the uterue from the regular annealizative externally, and wagine, especially earr the eymphysic public; placed at ones respectively, externally, and within—by feeling, as before demonstrated, the movements of the head, as it rises and fells when affort in the liquor ameii, you mey, I think, ie most, if not all casee, not only raise a high probability of pregnancy, but for a certainty infer its existence; end by this method, in the and of gestation, I

have often been able to decide the poiet. In the sariier months of geetation, you are sometimes requested to determine whether the weman be, or net, pregeant; and if you possess the requisite dexterity, it is generally easy anongh to distinguish on co-largement of the uterus, but it is not so easy to determine whether the enlargement is to be ettributed to pregnency, or other causes; for the womb may grow in consequence of scirrhous, or polypee, or hydatids, or moles, or from a combination of those affections. As opinion in the serlier moeths, therefore, ie alwaye, more or iese doobtful; but these cases of morbid enlargement, ie general practice et least, are not very frequoet; so that if the woman bave bees exposed to the causes of impregnetion, a womb, as large as the fortal bead, ie e strong presumptioe in fevoer of gestatioe; and the presumption becomes strengthened, provided the petient heve manifested, previously, no indications of uteries disease.

When enzious to ascertain with electy what may be the hulk of the womb, is the serlier months, we may direct the petient to drick copiously of weter a fow boure before, so as to enlarge the hladder, which sheeld then be evacueted thoroughly by the cathethoroughly the abdomical coverings in the ordicery, the anomaloue, and these which are region of the pubes. The patient, prepared teken from menuel investigation. Should ie this meener, ie then to be haid upon the full these eigne prove indecisive, there is still left eide, the neerer the edge of the bed the one other which can enterely fell ue; bet I better, and two fingers of the left haed be deem it better uet to mention it; sed I the right hand may be pleased showe the wait till the end of tee or twelve months, pubes, where, with a moderate share of when, soless the gestation is extra-uterine, measual dexterity, the fundus, sud, at the rout of ell ruis, parterition must, sooner or some time, the bulk of the womb mey be letter, occur. felt ie most cases, unless the system he unueually loaded with adeps. Thie observa- Of the Menns whereby one may accretain the Age tion having been made with ours, another of Gastellon, and the time when it was be mey be icetituted; the fore fieger of the help had may be pleticle so the back of the womb, (for the rectain gives access to Of the progress of pregnancy, we may jedge it,) that thumb of this head may, at the seems in two woys, by the reckosing, so it is cell-time, be rected upon the menth of the ed, and by examination, and to the consideration, while, as before, the fingers of the ration of these methods we will now prorright hand may be upplied to the fuedus, (see the method of the comments of the property of the eis pubis; and hy this method of examice- expended, and the womb colorging, there

eide, belenning it in this maneer upoe tho fuger; and we mey place the patient is the semi-recembest poeture of this imege, so that the place of the brim may lie horizontally, afterwards Acertaining the weight of the uterue, by enpporting it upon the summit of the iedex inger, isserted for this purpose a little way into the centeri when by the weight, the momeetum, the bulk of the uterus, where it is felt behind the symphysis, we mey form e shrewd coejecture respecting its general sice. Thus, then, by examining from the vegins, the rectem, and the cover-ings of the abdomen; by weighing, beloes-ing, and from behind the public feeling the body of the uterus, proceeding in the wey which I will eaw demonstrate, by means of this apparatus, the enlargement of the uterus mey, in general, be mede out. not, however, form your opinion too hastily. If necessary, lot a second exemination be made, at the end of a few weeks. If the womh be pregnant in the course of this time, it will acquire a considerable increment of helk, sed this may further help oer diagnosis bare. All petients may out be able to beer these exeminations. The neck of the womb ie, in come wemee, very flexible ; so that while the body remains motionless, the cervix gives way with fecility ; thue, when the womb is heavy, the servix may move with little mementum, and an opinion teken from this observation, wenid be lieble to deceive.

Aud thue much, then, respecting the ister, or the natural efforte, so as to relax dicetiese by which gratation is knews; the ing pleced on the ce nteri, the fingere of should advise you, if it be dechtful, to

> of Gestation, and the time when it may be expected to close.

progress which the pregnancy has made.
During the first three or four months, the

whole halk of the aterus will be found in approaches towards its close, the summit will be found about half way between the navel and the pubes; and a little below the navel in the close of the 6th. In the end of the seventh month, the uterine summit is elevated shove the umbilious, and lodges half way between the umbilious and the point of the unsiform cartilage. In the end of the eighth month, while in the close of pregnancy, the fundus approaches very nuar to the aternum, unless it be sua k again in the abdominal cavity, in consequence of that preparatory contraction which occurs during the last week. These statements you may receive as approximations to the trath, though not, purhaps, as true in the strictest sense. I have verified them, in part, by my own observations; but never having turned my attention assiduously to this subject, I wish it to be considered, that I am not personally pledged for their accuracy. In different women, at the same stage of preg-naucy, the elevation of the funder may vary; nay, it may vary somewhat with the pusitions of the body in the same individual, and in the same stage of her pragnancy.

Further, the length of the carvix bears a fixed relation to the progress of preg-nancy; for, during the first five months, unless dilated by a dropsy of the ovum, the neck retains its full length of an inch and a half; being at this time annexed to the hody of the uterus, in the way of an appendix, as the preparation here exhi-hited demonstrates. Gestation, however, advancing, the neck expands, so as to form a part of the general receptacle for thu In the end of the sisth mooth, its length is reduced to one inch; in the end of the seventh, to helf on Inch, sod to the

Now if the patient be recumbent, and the hladder be emptied, and the abdominal co- leave you to draw your own inference-converlags he relaxed, and the abdominal aur. | sult Starne, if you like. I was surprised face be lubricated, the fundos of the uterus to learn that, in a late investigation before may, io some women of spare habit cape- the supreme tribunal of the empire, hine cially, he felt distinctly enough; and, hy months of the calender and forty weeks, the elevation of it, we may, in many cases, were, hy some of the witnesses, used interjudge not inaccurately of the progress of the chaogeably, as if they were commeosurate pregnancy, remembering generally, that periods; the error will appear on a little when the summit is above the umbilious, calcolating, as the period of nino months is

is, of accessity, an ascent of the fundus, the gestation is in the latter months; when which, together with the dilatation of the helow, in the middle or the earlier, and that uterine neck, bears a certain relation to the during the first three months, the body of the womh is lying entirely in the vicinity of the hrim. Sometimes thu elevation of the fundes will be made out more distinctly by the neighbourhood of the pelvis, where placing the patient in the posture of pat-the aummit may often be felt lodging a turition, and placing the fingers of the last little above the brim. As the fifth month hand on the os uteri, and those of the right plecing the patient in the posture of parexternally, where the fundus lies. Nor is it difficult to form a judgment of the advancament of the pregnancy, by measuring the neck; for if this is wholly expanded, the woman is in the end of the 9th month; if to the extent of two-thirds only, she is in the end of the 7th; if of one-third, in the end of the 6th; and we may venture to infer that she is not beyond the middle, if the neck retain its full measure. New, when it chances to he relaxed, the neck may sometimes be measured by passing the finger along its causi, so as to tunch the subrance; but I would condemn this practice, as not malikely to disturb the prosee of gestation; a safer measurement is afforded by peasing the finger between the courter and the symphysic, so as to touch the body, when the length from the uterine body to the mouth may be ascertained, and with tolurable certainty.

Bot, iodependently of these examinations, the progress of pregnaccy is often ascertained, and more commodicusty, by that computation which is called the recknning, thuo by these more difficult and uncertain observatious on the length of the cervix, or the elevation of the anmost of the womb.

Human gestation, it is asserted, is of forty weeks duration, but I doubt the correctness of this opioion, and suspect, rather, that it lasts only thirty-nine weeks, plus one day. A friend of my own knew, from peculiar circumstances, when impregnation was accomplished; thirty-nine weeks, plus one day, from this time the delivery began, Au acquaintaoce of M. Chambon medu his observations on three pregonucies of his lady; io two of them, the delivery com-monced at the end of thirty-nine weeks, course of the two remaining months, the plus une day, being accelerated some few cervix becomes completely dilated, so that days, in one of the three cases, in conseit can no longer be distinguished as a part quence of a fall. In the working classes of forming an appendix to the great hody of this town, deliveries frequently communes the utarus; all which these preparations so on a Sunday—for Nature does not suruple to make her creatures labour on that day; respecting the cause of this descention, I exactly equal to that of thirty-nine weeks, tioos, and are even said to have cored plus one day, provided of these nine months, bydrophobia, which, however, is doubted five are of thirty days only, and four of thirtyone; and heoce the duration of preguancy, as here stated, is confirmed by the popular observation. This term of thirty-nine weeks, plus one day, may be measured by the lunar mooths or the solar, and the reckoning is called long or short, according as the long or short, in other words, the calendar mouth, or the month of foor weeks, is employed in it. Our women generally use the long reekoning—the ancients seem, at first, to have used the abort.

Rederermade his observations on se many as a hundred cases, and found that in four out of five of these, the quickening, formerly described to you, occurred in the fourth month. When pregnancy occurs, the cata-menia are usually suspended from the first. Now, with these data, it is by no means

difficult to ascertain the date of delivery with useful accuracy, for I believe it will generally take place five months after the quickeoing, nine months after sexual intercoorse, and about nine months and a fortnight after the last appearance of the catamenia, later or sooner by a few days.

A lady once told Lowder, that her de-livery would occur on the civic feativel, the nioth of Novamber, and her decision was confirmed by the event. When the reckoniog is grounded oo the intercourse, its accuracy is sometimes surprising; the reckoning from the amenorrhees and the quickening are not equally exact, yet women are io general compelled to adopt them. Some-times, however, furtive intercoorse, a separation from the husband, or peculiar sensetions felt about the bladder, the secrom, and, in general, the central parts of the body, a few hours after using our sex, are found to mark out clearly enough the coogress by which impregnation has been produced.

I perceive, Geotlemen, that our time la axpired, and I shall, therefore, abruutly conclude.

### FOREIGN DEPARTMENT,

OF HYDROPHORIA.

### By Da. Cz. Mayan, of Petersburgh.

Tax aothor points out two remedies to which the lower classes to Russia, from time immemorial, have attached the most implicit credit as preventatives of rabics; Euphorbia Cyparissias, and Acchusa Officinalia, they are taken in coocentrated decoc-

by Dr. Mayer.

As to the soblingual vesicles of Maroohetti, he has never seen them, nor coold they he discovered io any one of the fifty individuals affected with rabias, who ware treated io the hospital of Moscow.

The awallowing of a large quantity of fresh blood has lately been recommended; and Dr. Mayer was informed that, in the soothern parts of Russis, the blood of the Anse Clypeatat is so ooiversally employed in hydrophobia, that the bird is bred for this purpose alone. There exist, however, no proofs of the efficacy of this method.

Dr. Mayar relates two cases of bydropho bia, which, from their pathological and therapectical interest, deserve the atten-

tion of our readers.

1. A man, forty years of age, was, in the month of May, 1820, bitten by a cat; the wound healed in four days. Un the 19th of March, 1821, he was tormented by a vio-leat venereal desire, which he, however, did not setisfy. On the evening of the same day he became morose, and had all the precursory symptoms of rabies, which first manifested itself on the 25th of May, by a violent shivering and terror at the sight of the holy water, in a church. He was immediately carried into the bospital, and soon exhibited all the symptoms of The contact of confirmed hydrophobia. confirmed hydrophousa topid water camed less shivering and con-topid water camed less shivering and there valsions theo that of soid water, and there was no dread of bright surfaces. The cicatrix of the wound was scarified, and covered with a blister; five ounces of blood were taken from the arm; and, according to Magendie's plan, a piot of water, at 101 degrees, was injected into the cephalic vain of the right arm, during which operation the patient had a burning sensation in the left aubolaviao ragiou : after it, the pulse fell from 90 to 60, and became very small. This injection of warm water was twice rapeated in the apaca of about eight hours, sud accompanied by nearly the same symptoms; the veio became, io its whole course, turgid and paioful, und the patient complained of a very un leasant aensation of beavioess in the region of the heart. At miduight a profuse perspiration came oo, aspecially on the chest, without, bewever, being followed by any alteration in his state. On the 25th of May, the injection was rarested; to the dresd of woter, a perfect horror of wind, or any movement in the air, succoeded. At noon, he was prevailed upon to take some hot heer, of which he at last,

A species of spurge.

A bird of the duck kind, called the shopeller,

by means of a long tube, succeeded in swal-lowing three ounces; it was, however, soon to causo a remission of the symptoms, hat brought up again. On the 20th, tepid water was injected a fifth time, but tetains con-sume they soon returned with increased vinlonce, wallions supervened, and ho died the same also, cabibled no signs of the plague. On

contained a serous affosion; the sallvary glands were filled with a dark liquid blood.

2. A young man had an uleer on the left leg, which he auffered his dog to lick frequently; it healed within a short time, but seal, or rather their Turkish fatalism; the the dog shortly became rabid, and six-and- fifth escaped the disease altogother. Dr. twenty months afterwards the young man Audriac, a French physician, who, with the was, without any further assignshie came, greatest intrepidity exposed himsolf to the attacked with hydrophobia, in this patient, infection, without using any other pressualso, dread of the least movement in the tion than frequent washing with aromatic

According to the custom of the country,

5. For its propagation from one place to every hody kept, from this moment, at suether, a peculiar state of the atmosphere, April, I was requested to visit a female tween it sod infected places, by travellars, seriant of the Austrian Consul-General, M., letters, and merchandise.

Godard. This gentleman assured me that 1. Negroen and foreigners, aspecially if she was not affected with the plague, and, recently arrived, are most exposed to the to overcome my resugnance, rouched her confugioo.

bimself. Having carefully examined the 3. In some years it rather attacks chil-patient, I found her isbouring under violent drea, wounded and timid persons; in short, parenmonia, and ordered leveles to the to all those who are of an notheric diaponichest, but when I, shortly afterwards, re-ition : quarantine is, in such years, of an turned to see her, she was dead, after an use. Such was the plague in 1615 and illness of an more than thirty-two hours. Ittli; the slightest ladigestion, or earem On her body neither bulens and pustules, in drinking, fright, accidents, the most nar the least eraption, were visible, so that, triking would, even from bleeding, or the

tho fid of May I was requested to see the On axammation, the pis mater was found widow, who, I was told, was slightly indismuch infiltrated; the substance of the hrain posed from excessive grief. I hastened to hard and injected; the vessels of the pons har liouse, but she had already espired. Varolii and medulla shlongate, particularly: Thirty-six hours after this event I was mynear the origin of the auditory, fascial, pnausured seized with a violent sit of shivering mognating glossopharyngeal and hypoglossal and compulsions, which terminated in frameres, ware gorged with blood; the araching dome to be a six of the property o narves, ware gorged with blood; the arach- quont vomiting. Withia a few hours my noid of the spinal chord was injected, and hady was covered with huboes, carbuccies, and petechise. This dreadful disease oontinued for two months, and my recovery was not completed heforo a twelvemonth. my five servants, four ware victims to their air was chaervod. He died on the eighth vinegar, and wearing a dress of sere-cloth, ay of the disease.

On examination, the brain and medulla died with a hubo. During, and after my recovery, I saw and came in contact with many patients, as I considered myself par-feetly free from danger; and the charvetions which I had thus the opportunity of making, convinced me, that the plagne is n much more varied disease than is generally believed. The following are the results to L'Ami du Birn, a Jaurual published at which I was finally led :-

Marseilles, contains the remerks of an Itaita physician, who, during a residence of its manifestation depends on several causes,

the end of July.

2. Contact alone is not anfliciant to comnt the time when the European inhabitante municute the plugua; and a certain predis-

home. I coold not, however, cousent to and the re-union of several circumstances, abut myself up in the Freuch quarter, and are necessary. During my stay in Egypt, had but too soon sufficient reasons for re- Cairo was almost constantly exempt from it, gretting my obstinacy. On the 23th of in spite of the continual communication he-

according to the general notions, also had action of a purpositive, was, almost without not been affected with the plaque. A few lany exception, to loved by the plaque, in days afterwards, I was anotherly sent for to lapito of the most rigorous quarantine.

M. Godard, who had been seized with an G. In other years it rabber fittacks adults,

and persons of a robust constitution; and have been written to the dramy music of a then quarantine alous is sufficient to protect yown. The wonder is not, iedead, that has them against infection. This was the case should have been occupied so long in an ie 1816 and 1817.

7. Ie those yeers where the plague is of an astheole neture, ne medical assistance is of et all. Net that he does not possess quaany effect; it can et best but aid o eture dur-

ing the crisis.

8. When it, oo the contrary, exhibits a ethenic character, the etrengest asdatives, especially emetice, digitalis, and prussie soid, in full doses, at the beginning of the disease, ere of the most salutary effect; to such years the mortality is mech greater, owing to the Torkish fetalism sed indelence, thee it would necessarily be if proper precaptions were taken.

9. The plague oot unfrequently ettacks the same person more than once, but bardly

ever in the same year.

### SPIDEMY IN PARIS.

This epidemy, of which we gave some cases in No. 269, has by no mesos subsided, as appears from the French madical journels, and the discussions in the medical societies of Paris. At the time of our first report we observed, that there was a striking analogy between it and the disease called rephraie; end it seems that the French physicians are now of the same oplaion. A committee hes bean appointed by the Académie Royale de Médecine, to dequire ioto its enoses and neture, end we shall give an extract of the report as soon as it appears.

### SKETCHES

OF TRE

MEDICAL SCHOOLS OF SCOTLAND.

No. XXV. : --

DR. MOFRO.

employed to the composition of my work, alluding to his late book on the braio. In

undertaking of the kind, but that he should have ever embarked in such a speculation lifications for the accomplishment of a much mere extensive sod better executed design thee any of those which he has performed; but thet his industry hears as proportion to his shilities sed love of case. Batween his mimel and intellectual properties, a perfect equilibrium seems to be established; or, as the phreeologists weeld express it, the cerebral organs are exactly belanced by the son-tests of the cerebellum. Had not this balance of the faculties kept him in some measure stationary on the road to eminence, be might, are this, be occopying a place in the "tem-ple of fame," along with his illustrious en-cestors, lostead of being au appropriate in-mete for another "Castle of lodolence."

In person and manner, the Doctor looks bis laziness to admiration. His magnitude confers a sort of corporeal dignity on aloth. Accurately measured, he stands about six fest; sed is swkward in his movements in proportion to his bulk. In the extent of organisation included in this ample dimension, it would be difficult to discover one Illustration of the lews of mechanical concord. The component parts of his frame seem as if they had run wild during their growth, ie the indulgance of idleoess and alimentary expeas. His frame presents a "coupors discordis" of members and metions, ie which, though one side of the figere corresponds ecetomically with the other, and each joint performs its duty correctly, yet symmetry has been preserved without beauty, and functional efficiency without barmooy of action. He might ait for e frontispiece to Boysr oo dislocations; his person being a personification of a luxstion, and his geit of a civil war of moseular metions. To see this innoceone dafinition exemplified, (et which the Doctor himself will scarcely take the trouble to smile,) you should be a little behind him on th opposite side of the etract, as he laboured un about one o'clock to the University, along "Nearly twenty-five years," exclaims the North Bridge, through one of those the learned professor, with whose name snow or sivet storms, which are much more these shotches are resumed, " here I been frequent thee agreeable in the empital of Scotland. Just shout the middle of that " ports ventorum." the North Bridge, he this heart-broken ejarulation, the predomi- oppears to repeat of having vestured abroad must feature of ir. Moure's character is without a great cost, with which his robust faithfully embodied. Though obviously in constitution son national contempt for intended as a testimony of the labour bestowed clement weather, induces him to dispense. on the volume, and of its consequent value. In he accents the hill, the storm confined to all who are acquested with the peculia: within the barriets of that vast chasm, rides of the author, this usquarded reflect which divides the udd from the new town of the sounds so the self-gratulation of indo-lebiningh, assails him with increased we leave on complating a painful task. It must be become the drawn the skirts of his frock

other he firmly grasps the collar across the neck; and with the head leaning to windward, and his motions thus Impeded, ho rocks from side to side up the steep, liks a mest in a tempest. About the Tron Church coach stand, his vibration is partially steadied, by a speculation of saving a shilling, and the prudonce of evading the hurricane by a drive to the Collage. The coachmen, who amuse themselves at this corner at the expense of passengers, knowing the Doc-tor's contempt for hard weather, and his respect for a fare, throw a glance alterproof against the surcestic invitation to shelter, he makes up his mind for the worst, and the propriety of sparing the expense, and so works on in a sort of oscillatory pace, in which a deficioncy of metion is one side is compensated for by excess in the other.

Having gaioed his private apartment in the University, ha spreads himself out before a fire, in an attitude expressive of tha teins an account of the interception of u The singularity of the Doctor's person is through the grotesque expression of his fos- cunstant use of black is, however, not one of tures, a shads of humour and good neture, his foibles: an old blue coat, with brase

around his knees with one hand, with the | which is well oslculated to allay any impulses of dislike which this conduct might axcite, though rather irregular lu lts details, the general contour of the physiognomy pleases by its peculiarities. Like one of those rugged procipices or cregs to be found in every part of his pative country, whose rudeness is occasionally softened into heauty, hy somo seattered shrebs and wild flowers smiling in the smallne, the otherwise harsh sod angular lineaments of the face are corrected by the charm of combined effect, and made to swaken sensations of plansure in the mind of the spectator. Upwards of nately at him and one of the vehicles; but afty years have apparently denuded his proof against the surcestio invitation to head to nearly half its extent, leaving a broad expanse of forehead, rich in many of the most valuable eminences laid down on the creniological map of mind, and shaded hy a thin fringe of hair, in whose fading hues mey still be discovered a predomi-nance of the sandy, or national colour. This rough but respectable pile of intellectual prominances rises on the solid foundation most comfortable obliviacence of the sleet of a massy brow, underneath which a pair and his pupils. While the moisture is thus of small, greyleh, and rather circular eyes, evaporating from his garacents, he la learn-pour out oo the beholder an incessesting the heads of his lecture from his sasist-stream of keen, searching, sarcastic light, ant, Mr. Mackenzie; to whose keeping he and approximating uousually close at the is in the hehit of committing his recollec- base of a nose flattened at its origin, and tion, as royal personages do their con- taking a direction upwards to its extresciences to ecclesisatical remembrancers, mity, communicate to this region of the This regal process of preparation for com-countenance a cast of Tartar souteness, or municating Instruction being completed, Highland ounning, mingled with somewhat and a anticiency of caloric being taken to of its ferceness. The shortness of the for the next hour, he walks forth into the neck, too, placing the head almost on a class room, his face beaming with that level with the shoulders, the latter being habitus! good humour which, indeed, is es-spparently elevated, and the former desentially necessary, as it is always effective pressed by a habit of alrunging, in which in conciliating the feelings of students de- he constabily indulges, assists materially in layed daily from a quarter to half an hour; the production of this look of severe and sayon daily from a quarter to hast an hour; the production of this hots of severe and and who, of all men hiring, move in the couching vigilance. Illuminated by the most regulated subjection to the despotissa of the hour-glass. To his cheerful the lips over every part of the face, and soppearance on those occasions, I have soften all its aspertites, the contour of the rarely witnessed an enception, but with whole impresses you with the idea of one a fall in the funds, or a rise io the price of whose social and intellectual qualities, dionstomical materials. ## LONDON MEDICAL SOCIETY.

December 8, 1828.

Dr. HASLAM, President, in the Chair.

Mr. Liove read a paper on the following cuse, which he cossidered wall calculated to elicit some important information e-

Mary Kent, mint. 35, was admitted into atand, as an easminer. I have repeatedly St. Bartholomew's Hospital, Nov. 20, 1828, with a small tumour in her left mamma, him linanur, gn ever a while demonstration which she had observed about a year bea second time, to the junior and more atten- | fere; she was then suckling, but could not tive part of the class, pointing out each eb. discharge that effice with the affected breast. ject to their notice, and explaining away lu the early stage of the grawth, so pain difficulties with the patience end effection had been felt, but, five months before her of a parental instructor. For this charac-teristic trait, his celebrated sneeators were reunding it swelled, and became tender to also remarkable, who were not only in the the touch, which was the period at which Mr. Lloyd first saw the patient, Under eleven at night the patient miscarried. The mild antiphicgistic measures the availing nurse stated, that then she could not have and tenderness anbeided; but, as the to-lost less than three pounds of blood. After night, and was cridently suffering from in- it bees affected. A turpentine enema ad-creased fever. Countenance flushed; akie miointered, which afforded nome comfort, hotter than natural, though not dry: tongue Died in an bour afterwards. white and furred; pulsa quick, and had had a Cu the following day, at three o'clock, Mr. aeveral slight ablverings. Had slight teuderness in the breast, which was a little anuther gentleman. The omentum, attrached awollen, and rather redder than natural, over the intestines, extended is to the palvis, hat the wound looked well, and had be- was in a state of high vascularity; it was gun to uncharge. Ilad ctill no bearing-alightly adherent to the convolutions of tha dnwn pains, nor unensiness in the abdomeo, intestines, the bladder, and limitus uteri, tirdered to be bled to ten or twelve nunces. The lower border, when drawn out of the The dresser not having done this immed polvla, appeared as if it had laid in a mixdiately, end the feverish symptone having ture of pue end lymph. The convolutional increased, pain also being felt in the of the intestince, redder than netural, ad-abdomén, when he performed venesce-herent to each other, but very easily aspation be took away eightern nances. The rated. The peritoneel coverings of the blood was nuch buffed, but not supped; incrue, and its eppendages, likewise inflamelied did not faint. In the evening of the cd, and easted, apparently, with pus and same day some hearing down paine were lymph. The peritoneal investments of the felt for the first time, and between ten and liver end spleen in the same condition. The

man antipologistic measures the awaining lutter exceed, that then and cooling act have and tenderaces subsided; but, as the ta- lost leas than three pounds of blood. After mour ramained as before, and supeared to this the hamorrhage, except an occasional blant to be a newly-formed part—not an in- slight coning, and the pain, occased. She durated portion of the gland itself, conse-, was much exhausted, but, on the adminisquently not to be got rid of without an operation—he proposed that she should go of opium, she quickly railied. When visited to the Hospital. The different surgeons upon consultation, advised that further at pulse 190; akin hot, but perspiring; tongues tempts abould be made to disperse that tumour. The means proposed were tried for several weeks, and, as they produced made on the abdoman; the bowels fresly one effect, the operation was resolved upon, which the patient cheerfully complied with. She was sterrly three months advanced in pregnency, and was anxious to queue hors ammed; and some light farinaset it might become worse at that period, also in the boge that she made had a some seep, but had occasionally vomited. Ordered place with the tumour before parturition, least it might become worse at that period, also in the boge that she made had some seep, but that on ackle with that breast. For a fortnight previous to the operation her gene-while the way particularly attended to. Mr. and tendernees of the abdomen. The sick-loyd removed the tumour on Saturday, near had increased; fulness and tenain of to the Hospital. The different surgeons next morning har countenance was surious; Lloyd removed the tumour on Saturday, neas had increased; fulness and tension of Nov. 22. It was encycled, the size of a the abdomen apperrened; pulse full, and Nov. 22. It was encycled, the size of a small walnut, and contained a sort of cheesy 182; skin hot, but perspiring freely; tougue matter. No difficulty occurred in the course furred, and malst; great saxiety of council the operation; it was borne well; the tensure; the bowels moved, and the sympnommary glaed was but very little injured to most of intestinal irritation greatly subsided brought together by adheelve straps; and to a grain. At see p. m. worse than in the patient walked from the operating theatro to bed. As the bowels had been lower, and the perspiration more profuse; well relieved in the moraing, no mediciae pulse quicker, and abdomen tympanitic was administered till the following day. She passed the remainder of the day comforts—bly, but the night restlessly. On the follow-risily diminished the patien, and some abeeping moraing land slight symptums of fever, land the procured. The abdomen to be ing morning had slight symptums of fever, had been procured. The abdomen to be and complained of a little pain in the kept constantly fomasted. At ten p.m., breast. Took twodness of eperient medicine, breathing with great difficulty; the abdoend the hauet, efferee. c. mag. sulph. 51, men very much distended, and extremely errory six hours. She had no pein in the tender; polane exceesively rapid, but regulation nor in the back. On Mouday she lar; tougue moint; perquiration most prostated that she had again passed a restless fine; the mind not at all derenged, nor had which and the or wheeler sufficient forms in the back.

### RICHMOND SCHOOL OF ANATOMY.

# To the Editor of THE LANCET.

ourseioned by an inflammutory condition of nagement of the Richmond School of Anagels, both to defend Mr. Carmichael and to belabour my unfortuoate shoulders, My quotation provue the value of friends, and the use of their music; and, doubtless, Mr. Carmichael will, like the credulous Timon, lacd the zenl that plucked the instrument from its case, to perform so awest a straie in his vindication.

Richmond, Sir, la o bard hitter, aed [ may asy with Dromio, of Ephesus, " he struck so pininly, I could too well fast his blows : although, to continue the metanamely, that of reducing the action of the phor, " so doubtfully, that I could scarce heart and acteries. I have seen it pre- understand them." But truth is a atrong scribed generally in the form of powder, armour, and needs no invincible coat, like

its wearer from the whip, with which he is As to Richmond's remarks upon Mr. desirous of arming every hooest hand, to Carmichael's rere qualifications as a leclash him from the east to the west. How-ever, he may spare whipcord for the use of this blow is one from which, indeed, I canhis friends, since he belabours so creditably not filmch. I wish him, and the competent himself, and rether atrive to direct his judges with whom be classes himself,—joint meens of offence to a vulnorable point, in- admirere of Mr. Carmichael's lectores and stead of raining down stripes so thick and Mr. Belton's surgery,—joy of their pene-confusedly, that there is no making out tretion; and strongly recommend Mr. Car-where he mems them to fall, or what his michael to read his whole works to them at se the maximum of that gentleman's abseuces, from November 1827 to November 1828. This is cracking the whip with a vengeance; but, unhappily for him, I am furnished with a triumphant proof of the facts I stated, by his reference to the surgeon's signature book. I am quits willing to admit, that Mr. Carmiobael's name may nut be missing more then sleven times during the space alluded to; but as eight o'clock happens to be that gentleman's hour of visiting the hospital, when the popils are waiting for him, I should hardly imagine that the common-place obligation between surgeon and pupil, of having given a sum of Cormichael at soy subsequent hour of the day, when his attendence was uneapected, and nubestowed upon a single patient, un-less at the request of his resident pupil, who might wish to bu relieved of the responeibility of treating an important case. I again assert, that Mr. Cormichael was " frequently, for too frequently, ubsent, during the year 1827-8, on Mondays and Fridays, from his expectant pupils, who were treated, instead, to the exhibition of Mr. Belton, who, so the friend of Richmond, (par nobile fratrum,) is as well qualified for the exercise of his brother-in-law, Mr. Curmichael's duty. Let us, however, consult the signature-book, and we shall find that, although Mr. Cormichael's name may he found pretty coostantly io it, the truth of my assertions will be manifest, by counting the few days on which Mr. Carmicheel visited; his hospitel at eight o'clock," the regular and atlpulated hour for meeting the apprentices and pupils. The ples of ill lealth will not suffice here, available as it may have been since November. The hospital was visited, it seems, by Mr. Carmicheel, but at the hour most convenient to himself. Under this explonation, what becomes of Richmund's fairness of conclusion ? Truly, is it like the lesh of his whip, -lost?

object is in their application. His first blow his next bectures, and Mr. Belton to give is a positive deniel of the statement, that them so hour's attendance at the bospital Mr. Carmiulanel neglects his hospital; and svery other morning: It would bu a great he has the hardshood to affirm sloven times, pity for their admiration to be wasted. I repeat, Mr. Carmichaul is a good clinical lecturer; be addresses his class in a costversational style, and without any of tho painful effort appeaeot in ble surgical readings. I also repeat, that Mr. Belton is a very lame apology for Mr. Carmichael, and one which the pupils have no right to put up

And so, Mr. Editor, Mr. Carmichael will, in his great coodescension, after having parted with his share in the school to Dr. M'Donnell, admit the closs to his clinical lectures on the veneresi disease. In thu prospectus of the winter course of the Riobmond School of Anatomy, Mr. Carmichael muney for a quontum of instruction, could is represented as a lecturer on the theory be redeemed by the appearance of Mr. and practice of surgery, and his namu has, I am confident, drawn many strangers to tho school this season; and they will kindly be admitted to his clinical lectures? Messieurs Professore, Mr. Ex-Professor, infinitely are your pupils indebted to you! They have been assembled by the tinkling of a kettle, and now you would take away the queen hee. Your decoy-duck has done his part, and your market is stucked with as fino a hrood of ducklings so your hearts con desire. Well! Heaven help your morele, eave your friend Lennox. I never suspected Mr. Carmichael'a resignation; Richmond, however, establishes it, and his information stones for his next hluw, (s word and a blow, Mr. Editor, they generally come together,) that the class, instend of losing, is goining ground this season. This certainly appeare to be the fact, and may be accounted for, both in the infloeuce which Mr. Cormichael's name curries with it, and in a promise since smply realized, of erecting oertoin gymnastic apparatus, for the improvement of the pupils in practical anatomy; \*
hut whot, in the name of all the light and blind, dues Richmond mean, " by the advantages ufforded thu pupils by the House of Industry," and which induced several of

Each surgeon, on estering the hospital, signs his name, and the time of his arrivel,

a yellow medium; but it has been directed they were, therefore, lanead. The medihy truth. Not one syllable of my former cines prescribed were, an sperient powder every night, and the dispheretic mixture attendance, we are to furnish a room and danger in the ease, sufficient medicines to last till Saturday were given, on which day the mother wes told to attend. She came, however, on the Friday, and I prescribed for the child, se she had come out of the regular order of attendance. I found the blund cozing slightly from the gum; the chisf disease existing in the child's consti-tution generally, and is the abdomical viscers in particular. An netivo styptic was ordered to the gum, with the necessary directions, and speriants and astringent tonics prescribed. The mother returned again on Saturday, (oon of the days in the regular order of her attendance,) when the physician of that day saw the child. Blood, or rather bloody water, continued to coze frum the gum. Pateeline hed now appeared on the body, and the mother wes made nequalated with the danger. Tha murinted fincture of iron was directed to be constantly applied to the gum; and nitric acid, with Cascarilla bark, were prescribed internally. I saw no more of either the mother nr child."

With reference to the long paregraph of puerile declamation in which the author indulges against the medical officers of the Institution, it is unoecessary for them to make ony remark. It is only where he refers to allaged facts or circumstances, that he re-

quires to be noticed.

2. He aliades to the tearing out of a leaf in the house visitors' book. This occurred soms years ago, under circumstances of misconception on the parts both of a madical officer and house-visitor; but, as the metter was explained at the following meeting of the Committee, and long before the writer of the letter had the honour of being ons of that hody, it could in no way promote the interacts of the charity now to refer to it.

3. The author of the letter naxt slindes to o motion curried in the Committee, reepreting a book, in which they wish the madical officers to sign their names, with the day and date of their attandance, end the time of their arrival at, and departure from, the institution. This the medical officers, without a single exception, have mediately applied, and the two parts brought refused an comply with. The motion was into close contact. A handage was applied proper register-books of patients, with the On the 16th, the wound seemed to he firmly

evary three hours. Seeing no imposdints provide it with couls, when it is the duty of the Committee themselves to do so; and, where one dispenser only is kept, a number of patients cannot always be provided with their medicines in a short time. The physicime and surgeons are in an way the cause of the delay the putients experience in obtaioing their medicines.

We here now edverted to all that requires notice in the Committee man's letter; and we have no besidation in stating, that it has been written in opposition to, or without the knowledge of, the body of which he is a mambar. In conclusioo, we unhesitatingly declare, that, with the exception of periods of illness, our attendance has been noiformly regular; and, whilst we have en-deavoured to advouce the medical reputation of the Iostitotion, we have avoided compromising our own character by acts which, however they he veiled by the gloss of henevolence or philanthropy, are neither compatible with professional duties nor profossionel respectability.

Infirmary, 8th Dec. 1828.

### UNION OF BONX.

# To the Editor of THE LANCET.

Sin,-The following I consider a heantiful instance of the union of hone by the first intention. Should you think it worthy a place in your valuable journal, I shall be happy in having had the opportunity of communicating it.

Your obedient servant, F. Wilson. Bours, Lincolnahire, Nov. 10th, 1828.

Oct. t4th, J. Cawthorn, a labouring man, was feeding a patent chaff-cutting machine; but his foot alippiog, his left hand came in contact with one of the blodes, which completely divided the middle finger from ite extremity to the base of the second phaslanx, the hones being equally divided. On presenting it to be dressed, the would uppeared very wide, the upper portion being much elevated. Strips of plaster were imbrought forward by the author of the letter, rather firmly over the plaster, and the finger and was treated by them with the respect allowed to remain for two doys without it deserved. It should be remarked, that dressing, no inflammation supervening. diseases, dc., are always kept at the losti-tution; and the medical officers preserve that details of the more importanceses.

4. We have nothing to do with the direct

dency to expression, owing to his having used his hand; but a small compress of link ing or providing for the accommodation or rectored the connexino, and from that time comforts of the patients; this reste with the it rapidly united. On the 9th of Novem-Committee themselves. It suraly connot ber, the union was completely restored, be expected that, in addition to gratuitous and the finger firm and sound.

# THE LANCET.

London, Saturday, December 27, 1828.

WE call the attention of our readors to a Report of the Proceedings which took place at the Freemasons' Tavern on Tuesday last, in consequence of on Advertisement calling on the Friends of Surgical Reform, the supporters of a Free Medical Press, and the humane contributors to our Hospitals and laurmaries, to assemble for the parpose of taking into consideration the propositious which, as will be seen, were discussed and adopted at the Meeting. The Meeting was ndvertised for seven n'cluck, and, shortly after that hour, was namerously oftended; but, by the time the chair was taken, the room was crowded to un averflaw; acorly three hundred persons being present.

public conduct by the numerous and highly defence by snother speaker at the meeting, respectable meeting assembled on this oc- that the report in question was taken from casion, but we consider the proceedings at the newspapers, and that we gave sufficient that Meeting more especially entitled to notice to our readers that we were not reattention, as affording a proof of the state of spousible for any errors or omissions with public feeling with respect to the corrupt which it might be chorgeable. Let the avatem which prevails at our charitable in gentleman, who supposed as capable of atitations-a system which must, ere long, suppressing any thing that might be said undergn a complete reform. We are too against our reporter, or against ourselves, thoroughly persuaded of the advantages of wait till we publish an authentic report of apposition in all cases, and under all circum. the trial. The hitterest enemies of this stances involving matters of public inte- | Journal have never imputed to it a want of rest, not to be well pleased at finding, that courage. The Chainman of the mestthe Resolutions proposed at the Meeting ing. (Mr. Parr.) severted to the crosswere opposed; nor hove we much reason exemination of Mr. Banna, in the course to be dissatisfied at finding, that they could of which we proved from the mouth of that not be resisted on any atrooger grounds than gentleman that he had paid part of the those which were offered against them by expenses incurred by Mr. Askanhing, Dr. Suria. If the Corruptioniats are not in the proceedings which the straightlikely to prafit much by the talent which forward and independent aurgeon of St. Dr. Share has displayed in their behalf, they | Bartholomew's instituted against us in are, at any rate, indibted to him for his in- the Court of Chancery, and also that he had trepidity; for this gentleman has value- contributed to defray the expenses of a teered his disapprobation of a work which, person who had published a wretched imita-

it is plain, open bis own showing, that he does not read. The readers of this Journal will require no atronger evidence of this faot, than that Dr. SHEIL has ventured to repeat the charge, that the Courses of Loctares published in Tue Lancer, have been published without the consent of the Lectarers, a charge, which even Sir James Scan-LEFT, wo apprehend, must by this time admit to be utterly false and unfounded. We refer Dr. Shall to the last Number of THE LAN-CET, or to the Preface of our present volume, (No. 266,) or to our 275th Number, in which the demonstration of the falsehood of this chargo was published, "in order that this calumny, if it wore again repeated, might he as much contemned in all other quarters as it has been uniformly contemned by ourselves." With respect to the rsmark made by another gentleman at this meeting, charging us with having published We ore not insensible to the mark of op. on inaccurate report of the trial, we have probation spontaneously bestowed upon our only to repeat what was indeed said in our

tion of this Journal. Mr. Pary remarked It happened that the first advertisament, by that the evidence of Mr. Bacorn, though it an error of the press, was headed "Waklay against Cooper;" the word at having been mistakeo for "against," instead of being, as nation had been formed against Tax Lan-CET, was given in a muchy and atraightforward manoer; and in this remark we entirely concur. We shall not be suspected of any desire to fatter Mr. Baopie, but wa must say that his avideoca might ba, in many respects, most strikingly auditonourably contrasted with that giveo by aoma of his colleagues, and that we consider him by for the most becest and consciections of the Bars which winged their way; on the late occasion, to Weatminster Hall.

### SURGICAL REFORM.

A Meating was hald yesterday ovening, he had three mesos of redress. Ho could at the Freenssons' Tavern, to pursuance of challenge the defeodant to a public trial, an advertisement calling on the "Friends before a tribunal where the evidence as to of Surgical Reform, the Supporters of a free the libel, would be affeed and examined by Medical Press, and the humano Contribo-either aide. If the complainant was not tors to our Hospitula ami Infirmaries," to coutent with this mode of redress, be might meet there, in order to adapt measures for appeal to a criminal prosecution, in which that occasion.

medical profession.

it was, mercly ao obbreviation of " at auit" Cooper. Nobody could be blamed for being tender of the reputation of others, and it was far from his intention to moke or permit any attack na the character of any iodividual. But it was necessary to draw a lina of distinction between men in public life, and those who were strictly private iodividuola. He knew that many members of the profession objected to the liberty of the medical press, though they were friendly to the general liberty of the press oo all other oubjects. The reason clearly was, that they were semetimes sut to be wounded by it; but though this was occasionally disagreeable to iodividuals, the truth was, that it was the barb only that made the weapon stick. (Cheera.) The liberty of the press was not the enemy of good character, but its beat and surest safeguard. If anybody io this country coosidered himself aggrieved, he had three mesos of redress. He could presenting Mr. Wakiev, the Editor of The the truth of the libel was nut causidered, Lancer, with some decided mark of their but it was regarded merely as a public approval of his spirited conduct, in his late offence, because it was likely to sir up the trial to the Court of Kirg's Beach, at the individual libelled to revenge and bloodshad. auit of Mr. Bransby Couper, and of the pris- But the other mode was certainly more just ciples which he au powerfully advocated on and honourable in its coture-he meant that of a trial for damages, by civil action, io At half past seven o'clock, Mr. PATA which the arcuser brought his evidence was called to preside over the Meeting, fully before the Ciurt, and proved whether which consisted chiefly of members of the the delendant was right or wrong. This was that trul of which Englishmen boasted, and The Chairman and he would glanly have of which no man had reason to comavoided the honour they but conterred on plain. There was yet another mode of him, but for two considerations. The advications, which he thought the most hovertisement represented the meeting to be nourable of the three-manely, to contradict for the advancement of the cause of medical the accession through the same channel reform, and for the support of a free medi- that published it, without having recourse cal press. He owned that he was a friend at all to an action. In most cases, public cal press. He owned that he was a trend at all 0 an action. In most cases, public to both. He was owner that there were used found this remedy sufficient; and in some who were appeared to them. In the that which had railed them together, if few words he should say, be trusted that Mr. Bransby Couper had mently and disnothing would be construed into other by the trust stated that the report in 1st Laxitier press, should be also the friends of order confidence in the honesty and integrily of and decorum. tha defendant's witnesses. Nubody would majority.

\*\*Administration of the observing that Mr.

\*\*Administration of the observing that Mr. naturally be more disposed to defend him. Mr. Heastey then, after observing that Mr. naturally be more disposed to detend that: here remergiate, and consider the said, than a person whose credit, vouched "Walkey's conduct was highly praisework, oo unth, was impeached. The witness did because it tended, in every way, to the heright to report the imputation, for other neft of humanity, moved the second Reso-wise the report might have gous forth that lation, which was to the fullowing effect:— it was uttered in his presence, and he had 2d. That the purposes for which the it was uttered in his presence, and be had 2d. That the purpasses for which the not dared to rise and answer it. (Cheers.) Hospitals and Informatics of the metropulis 11c did not helleve, huwarer, that it were founded, and that the views of thu had been meant as an attack on the wit-bumane cuntributors to their funds, are nesses, thought the Gentleman who made it materially promoted by the weekly publihad come amongst them avowedly as the cation of Riparrs, detailing the medical chompion of the other party. (Cheera, and and aurgical treatment of the unfurturate eries of "Questioo.") He would not be patients, and that Mr. WAXLEY hoving put down by clamour, as what he was any originated the practice of mblishing Hosening, was relevant to the busicess of the trat likeways, has conferred important meeting. He had been the term "mob" hencets on medical science, and on the used. He suspected that those who used cause of bunnity. it, did not know where to draw the line; which separated the mob from the anti-moh. As to the circulation of THE LANCET, it did not belong to the mob. That meat- for any man who wished to promote chari-ing, it could not be denied, was respect-ties, not to approve of this Resolution from able; and be had no doubt that two-thirds beginning to end. He would not, therefore, of it were subscribers to Tux Laxers, attempt to appose it. (Cheers.)

thrown all open. But his enemies said he moving :-

Mr. Smith accorded the Ren lution.
Mr. Erons said it was really impossible

The Resolution was then carried mani-

Nubody hoving seconded and when Dr. Mr. John Elliott, on moving and it was about to fail to the ground, when Dr. Mr. John Elliott, on moving and the the did not come there to solution, said that he did not come there to Shee stepped forward for the purpose.

Mr. Ster said: He did not belong to the interfere in the quarrels of Wakley and medicol profession; but as the advertise-Cooper. They had acknowledged that Mr. ment invited the friends of medical reform. Wakley's exertions had been very conducive he had come in that capacity, and would of to medical reform, by the lost Resolution fer a few remarks. The question was as to they had passed. Indeed, there could be the conduct of Mr. Wokley. They might no doubt that he had greatly served the take the evidence of his opponents as a test cause of humanity, by prevauting idleness for his. What had they done? Why, truly, on the part of medical persons, and comthey bad established a publication of exact- pelling attention to the poor placed under ly the same kind as his, but inferior in ta- their core. It was his equition, that the lent and integrity. That there was n party editor of The LANGET ought to be indumi-warfare in the medical profession be re-find for the whole expense satisfied on him joiced, because advantages would nrise frum by the late trial, including the damoges juces, pecuse avantages would prize frum by the list trait, including the damogen it, and the public welfare would be promo- awarded against him. This would nut be a ted. Mr. Waklay deserved the thanks of private subscription, like Brodie's, but one the community; be might, perhaps, some- open to the world, and not to be questioned times go further than he could justify; but, in a court of justice. He would not supported by the reverse in the property of the the public hospitals; but Mr. Wakley has Medical Free Press. He concluded by

SI. That the independent and impartial ideal profession, but he hid watched the principles on which The Lakeur was first progress of this case, because he was, is all established, have been preserved by Mr. instances, a firm fittend of the liberty of the Waarzv et all risks; and as it was echanged at the late trial, that the legal circumstances, Mr. Wakley was entitled to

Wakley. He was not his opponent. He this paper, and the stumbling over built legitives not acquainted with Mr. Choper, nor ble words, that he thought at better, after lead to any under motive for opposing the in white, to abandon the attempt. Residuations; but he was affaid when they went ubroad, they would give an unfair ide of the attach the meillend profession in England. As to audocription for Mr. Wakley, it he had suffered any has for defending the liberty of the Pices, he ought to be reimbursed. But it is case, thought the report in the Larry if they thought the report in the Jury if they thought the report in the first had a such was the case; but as the action for the prevent him, the value of twelve honest men, was against him. The subscription, herefore, would be in the nerth of the Jury, and of the Mr. B. Cooper. Wakley. He was not his opponent. He the paper, and the stumbling over half legiwould be in the trerhof the Jury, and of the Mr. B. Cooper. would be in the negative me so, and the state of the Lord Chief Justice of England. If Mr. An eidetly Greenstan and, that he constituted Tank Wakle, had auffered loss in publishing Ting An eddetly Great an aid, that he certainly different periods with the verdire that would aimit, with some degree of tabut, had been given by the jury. (Applance) In the interests of the Medical Profession, had his opinion, a justification of the statement in the Larry and how more degree.

It will be necessary, will do well to attend on Saturday, Jan. 3rd, however, before we advert to the "various when a proposition of a most infamous and sheaded emotions by which the mind of turs is to be submitted to their consider man is liable to be agitated," to endeavour to ascertsin, if possible, the different fundarenowned for the practice of benevolence; with auch overpowering effect in Milton's add to these, large cautiousness, and I will Paradise Lost? Impossible: bowever trite anawar for it with my life, that what auch a

poverty,

With regard to the illustrious Hampden, it is easy to conceive a development of brain, the possession of which would render it highly improbable, if not impossible, that the devoted patriot should ever become the fawning courtier.

The phrenologiat, however, never ventures to assert that certain actions must necessarily result from a certain development of brain, being fully aware that the feelings are often excited and modified by exteroal circumatancea; still be maintains that every act will be in perfect accordance with auch development. But, although the phrenolologist cannot say which way a feeling may be directed, or to whot degree it may be excited, by external objects, yet be bas no hesitation (after baving exemined a head, and observed its relative proportioos) in pointing not the powers which will have the strongent tendency to action, and couse quently the motives hy which the conduct

will most probably he influenced,

The phrenologist is fully sensible of the influence of education on choracter; io proof of which I might refer A to Dr. Spursheim's "Elementary Principles of Education;" o work which he might read with singular advantage, and which would have the effect of enlightening bis crude and undigested ideas, if, during the perusal, he would, for once, anffer his self-esteem to lie dormant. In admitting, however, the influence of education, oud the excitement of external cironmstances, let it be distinctly understood that they never did, and never can, create a faculty, although they may strengthen it, and offerd opportunities for its action. Napoleon Buonaparte never could have assumed the mighty ottitude which he ao long austained, had he not been gifted by Nuture with gigantic powers of mind, such as rarely fall to the lot of man. These powers were, doubtleas, improved and directed hy education; sod the "apirit of the times" afforded an opportunity for their display. Dugald Stewart speaks of " powers, or ca pacities, which are generally formed by particular habits of study or of business. Such are the poner of taste, a genius fupoetry," &c. &c.; and, in another place, be anys," what we call the power of imaginaresult of unquired habits, aided by favourable circumstances." But can it for a moment be aupposed that John Locke, by any partientar habits of study, and sided even by the most favourable circumstances, could ever have orquired that power of taste, and that

the old adage, ' Posts neseitur non fit,' may man gives away will never bring him to be counidered, its truth is not to be disputed.

> " Fruitlesa ia th' attempt. By doll obedience and hy ereeping toil Obscure, tu conquer the severe usernt Of high Parnusus, Nature's kindling breath Must fire the chosen genius; Nature's hand Must atring his perves, and imp his eagle wings.

# ST. BARTHOLOMEW'S HOSPITAL.

PRILEGMONOUS BRYSPRIAS OF THE MAND, FORBARN, AND ARM.

Jaac Muso nove, mtat. 28, a brickmaker, and s man of apare habit, was admitted into Luke's Wurd, under the care of Mr. Vincent, Sept. 17, with considerable awelling ond inflammation of the right band, forestm, and arm, extending to the aboulder, oceasioned by o alight scratch on his thumb, inflicted by his wife with her nail, shout ten days previous to his admission. Stated that he went to work the day after he received the scratch. In the evening the thumb began to inflame, and the greater part of the hand and foreurn the day after. By the time he was admitted into the Hospital, the inflammation had graduolly extended to the aboulder, and ulcerated openings were formed ubout the hand and finger for the discharge of pus. Tongue brown, and dry; skin bot; pulse 100; full and hard.

Calomel and jalap, with house-physic in a few bours efterwards, and the spline mixture with antimony every four bours; a bread and water poultice, and fumentations,

to the arm.

19. Complains of less pain in the orm; ins less heat of skin; tongue moister; inlie (4), and less full ; bowels open; finetuation was discovered on the outsile and middle of the forearm. Alr. Vincent made in opening of about an inch in length, and bet our about on source of pus. In a day or two subsequently, Mr. Vincent made two more small upenings, one on the buile of the forearm oud enother on the inside of the orm, and pus was evacuated. Afterwards matter formed in the axilla, which was also let out. Although pus was evidently fluctuating within the integoments covering the triceps muscle, Mr. Vincent, unwilling to encourage the fucining practice, forborn to make an opening for its east; it theresublimity of imagination, whice is displayed fore made one for itself, and cloughing of

### GLASGOW INFIRMARY.

WE have received a long and able letter from Mr. THOMAS CADIER, in confirmation of his report of the case of " No. 3 Nurse," und in refutation of some contradictions to it, which have appeared in Macleod's Fungus. Mr. CARTER oeed not write another word on the subject; his report is believed to be true by the whole profession, and the Cow-ses, Coupers, and Blac Lachlans, are now olassed with the Joe Burnses, the Stanlays, and the Simon Pures, by every intelligent surgeon in the kingdom. Mr. Carter shoold know, that Maclead's thing has neither in-fluence nor circulation. Mr. Brodie, in his evidence the other day, ocknowledged that he adraceed mocey "to set the man up;" but that "he now knows nothing of the concern." As soon as gasgress appeared, Mr. Brodio left the poor excrescence to slungli quintly under the care of its natural nurse Roderick.

# LECTURES

ON THE

GRAVID UTERUS, AND ON THE DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT GUY'E HOSPITAL BY

DR. BLUNDELL.

LECTURE IX.

Of some of the Diseases of Pregnancy.

By the diseases of pregnancy, Geotlemeo, you are to understand those which orise from pregozney as their cause, or which, from their accidental concorion with gestation, require a modified form of treatment, and of some of these I now proceed to trest.

Among the diseases, which are either referred to pregnsocy, or which require a modified treatment in consequence of their enonexion with it, une, not the least troublesome, is the irritability of the bowels and stomach, producing, to the earlier and middle months, both vamitings and purgings. Sometimes both those symptoms are occurring together, but more frequently they sitemate : where there is diarrhors, there may be less excitement of the stomseh, and there may be vunntious where the distribute is suspended. In those cases, in which there is much irritability of the atomach and bowels, of course the patient becomes a good deal reduced by it, and she may din perfectly exhausted in consequence of the inaution, produced by the somitings and purgings. and the incapability of taking food; or again, when much reduced, she may be carried off by a flooding, uccurring, perbups, during premature delivery.

It is not slways in our power to put s stop to these rountings and purgings; but, by re- hospital of New York it had been tried in sorting to the following measurer, I think vomiting, with advantage, I was induced to we seay, to many instances, conduct our give it an essai, and I can at least aver that cases to a favourable termination. In the I have seen no ill effects from it, not to mid first place, thro, if suspicious that there is that it has seemed to be of inal efficuer. The may thing offensive und irritation in the sto- method of administering it, is in the turm of

so or uot; and if there is, be careful to purify the stomach and bowels by some mild evacuants.-Chamomile tes, warm water, incencunolin, and so oo, may be used, if emetics seem proper; and of the milder lasstives, you may employ maons, senns, rin-borb, and the like; or if you wish to purge more setively, perhaps senos and salts may be preferred.
Agaio, it is very desirable that you should

diminish the irritability of the atomach and bowels. The irritability of the bowels is sometimes restraiged by mesos of the misturn cretm, the confectio sromstics, the praporations of opium, of kino, of cateebu, of hiemstoxylor, all in their operative doses. Where there is a great deal of irritability of the atomach, the effervescing draught, atrong coffen, opinm, charcoal powder-perhaps, too, that potent agent, the hydrocyania, may be savantageously tried. An invaluable remedy in gestrin irritability is the effervescing draught; four scruples of the citrle seid, dissolved in five ounces of water, may be put into one bottle, and five acruples of the carbooute of potass, in four ounces of distilled water, may be put ioto snother; then a table spoonful of the solution from each of those bottles respectively, when put together, will effervence amartly, and may be taken in this condition every half hour, for several times io auccessioo, unless the vomitiog previously cease. Often the first two or three quantities will be thrown up, but the medicioe must not, oo that account. be rejected in a pet. Opium is not very effectual in cases of this kind, when taken into the stomuch. A piece of lint, dipped iuto the tincture of opinm, and laid over the scrohiculus cordis, has oppeared to me, io some cases to be uf great apparent service ; it is recommended by Heberden.

It seems, à priori, not very probable that powdered chareoal can ha of use in these cases, but learning tions a friend that, in the mach and howels, aggerthin whether this be a very fine powder, 20 grains every two or

three hours, till it has produced an effect. It is not to her nonrishment, but an emetic-I ought to observe, that it makes the atoola Now if, under these oircumstances, she will very black. Of hydrocyanic acid I beve bad very little experience in these ceses. Some of my medical friends think it of much efficacy in quietiog the atomach, end I would, therefore, recommend it to your attention. Recollect, however, that the remedy is not ing, -ss, no doubt, most of you do know, without its dangers, and beware. Five or that when you wish the patient to abstain aix minima in the day I would not rashly exceed.

junctive of the eye, there is an irritability chester, a case is narrated, in which s bypo-of the other perts of the organ; if there is chondriac, entting his throat with a razor, an inflammation of the inner membrane, the inflicted a wound on the waophugue, withbledder end the urethra become irritable; out, however, destroying life. By the ad-and, in like maoner, the atomach and huwels vice of this distinguished practitioner the pabecome irritable elso, in coesequence of tient sbatained entirely from food to be taken fishmation of the membranes which line into the etomach, and, during three whole them. That such is the state of the mu-cous tunic of these parts, you may sus-trients injected into the bowels. Hidasus cous tunic of these parts, you may sustrients injected into the bowels. Hildanus pect, if the tongue is red and swelled; bas reported the case of a woman who, from pect, if the tongue is reu and aweireu; is serviced in the evacuations are emitted with im-irritenility of the atamach, rejected all food petuosity, and with heat at the auus; during a spece of five weeks; but she was or if, lastly, the pulse is at 100 or 105, supported the whole time in the way above and the shdomen is somewhat tender under intimeted, being cured, and becoming, at the touch. When the irritability of the length, the mother as a vigorous infant, bowels is caused by inflammation of the By Dr. Friend, in his elequent letter to mucous membrane, it may, perhaps, be cut Dr. Mead, another case is recorded, in short by the entiphlogistic plan, more especially by applying leeches to the abdomen, to be followed by a large blieter, the practitioner not forgetting cautious veneaction, The cases which ere the beat sdapted for the patient, a noblemee, was supported in this sort of treatment are those in which the manoer mentioned by Hildenue. In and where the patient, though still labouring ble, and you wish the stomach to be per-under the disease, has a moderate share of feetly quiet, you have it in your power to strength remaining. I was requested by my aupersede the operations of this organ, for strength remaining. I was requested by my aupersede the operations of this organ, for friend, Mr. Sterry, to see a patient who had days, or even weeks, in succession, by a When I saw her, there were about ten or ito enswer the purpose, as well as most twelve watery evecantions to the course of kinds of nourishment; but I have had but the day, the tongue was awelled and red, small experience here. the enue was sore, there was tenderness and large vesication was afterwards produced, the first place, that, if the woman is very who seemed to be in great danger of sinking under the discharges from the nlimentary tube, was completely re-established, and afterwards became the mother of another child.

There is a third method of treatment, the woman throws up every thing she takes, permits, it may be better to delay the deli-

remain for a few deys, two or three, for example, without food, the irritability of the stomsch may subside aomawhat; and food, nfterwards given with caution, may be re-tained. And here it is worth your knowfrom taking fund into the atomach, she may be aupported by nutrient injections into the If there is an inflummation about the con- bowels. By my friend, Dr. Hull, of Man-

which, from e stricture in the manphagua, the food was prevented from entering the gastric cevity into the atomsch; and, in this cose, it is added that, for weeks together, you have the symptoms here enomerated, short, when the bowels are not very irritaa good deal of irritability of the atomech, judicious administration of Intestinal nutricommencing in the middle period of preg- tion. Preparation of eggs, strong broth, or, nancy, and continuing till after her delivery. Perhaps, the serum of minuta, may be found

Again, should all these remedies fail, you heat about the abdomen, and the pulse was have yet another, and that is the induction about 100 in the minute. In this case, or- of premature delivery; for, when delivery dinary remodice having failed, about twelve occurs, there is reason to hope that this vo-leeches were applied to the abdomen; other failting will cease. In determining on the remedies had been tried, without effect; a use of this remedy, however, remember, in and the cure, of coosequence, was audden much reduced, there is always a danger in and complete. The evacuations became these cease, lest the patient should sink un-more solid in a few doys; and this woman, der eccidental flooding; this ought to be mentioned to the friends before the operation is performed. Further, provided tha delivery be brought on before the completion of seven months and a fortnight, the child will frequently die, but if after tha seventh month and a fortnight complete, it from which great advantage has sometimes may be expected to live; and, therefore, been derived, and that is abstinence. Where when the remaining strength of the woman

the third place, is it to be forgotten, that, four-sod-twenty hours the irritability ap-where premature delivery is thus brought peers to be the lesst oxcited, in order that on, children are often prosenting neutrons. It food may be, ut these times, adminis-turally,—the leg or the nates, the arm or tered. Again: solids may sometimes be nogement, in consequence of this unfovournule position.

to nourish the system; and this, provided all or the greater part of the food taken by the gother impracticable. I remember onco, many years ago, taking a dog, and nourisb-ing the snimal for three outire weeks, though repeated observations were made, it could be observed, during his three weeks' abstincoce.

for these purposes.

middle, and some in the lattor period of the observations.

day; the tendancy to morning veniting, In some cases of gustric and intestinal day; the tendancy to morning vomiting, In soloo cases of guartic and intestinal during pregoancy, is notorious to all. Now, irritability, certainly the disease seems to io patients isbooring under the disease be kept up by mere irritability of the surwhich we are now considering, you ought (see of the bowels, and of the atomach, in-

very till this term is completed. Nor, in stomach, and ascertain at whet part of tho the shoulder, heing placed ovor the centro of retained by the stomuch, where fluids, which the pelvis, instead of the vertex; nor that give rise to more dilatation, may be speedily the child mey perish, under the best mo- thrown off; and therefore you should occurtain, from observations, which uf those two kinds of nourishment may suit hest with When, from irritability of the stemach the gostrio cavity. Solids have the advuoand bowels, women are in a bigh degree of tago of lying in o amaller compass, within weakness, it becomes of great importance that compass the coutain a much larger aupply of nourisinoeut, nor are they so opt or the greater part of the food taken by the to produce gos. To these two remarks you mouth be rejected by the stemech, is by no may add a third, which is, that much domeaus a vory eusy task. In cases of ex- peuds, in cases of irritability of the stomach, treme emacistion, in consequence of this upon the mero bulk of the food taken. A gastrio or intostinal irritability, you will woman, may, perbays, be able to bear two not suppose that I design result to advise or three table-spoonfuls of some fluid, as you to nourish the patient by the injection milk, for example, where she would not be of blood into the vessels; I cannot, how sble to hear half a pint. Now it is to be over, forbear remarking on this occasion, recollected, that if your patient is lying that this mode of treatment is not alto- quiet in hed, a very smoll quantity of nourishment, either of solid or fluid, may be smply sufficient to support the system. Accordingly, patients lying in bed, who could meroly by means of blood, which was in- not hear the larger quantities of food withjected into the external jugular vein; avory out rejection them, have done very well, day, or every other day, several ouoces were when they have merely taken two or three injected, and, in this manner, without the teble-spooufuls of milk every three or foor help of any food, the system was sustained; hours. In their stote of quiescence, this water only was allowed this dog; and, nourishment was enough.

Causes.-Upon the more immediateosuses is remarkable, that no vurseity of appetite of irritability of the stemach and bowcle, in these cases, it is not my design to cularge; for, on the subject of proximate causes, I bave observed to you already, that though important, we are oil ant to talk where the stomach fails ultogother, the nonsense, but the following lunts may not system may, to appearance, be supported by he mispluced. A principal disposing causa intestinal injections ; nor must we ever lose to the discose, seems to be pregnancy in so sight of this, every four or five hours, io much, that though we find the discase, it is cases of this kied, the injectious may be true, continuing sometimes after delivery, thrown up, say to the measure of six or jet, generally, it is relieved by it. Prejeight ounces; and, in those cases in which unney may be supposed to operate by a sort the rectum is irritable, perhaps its reten- of sympathy aubsisting between the stomach tive power may be assisted by opiates-hy and howels upon the one houd, oud the the small measure of the injection, and by gravid uteres, and its appendages, upon the cautioos manner in which it is infosed, other; and by sympathy here, I mean, as on Reid's excellent syrioge answers admirably all occasions when I use this term, a combiostion of unseen couses, whereby an in-But wherever the stomach is not totally pression on our part is enabled to operate ou disabled from acting, gastric nourishment mother, with which it has no obvious conis, I think, to be decidedly preferred, and nexion in the way of conse and effect, and the following bints may not he without which causes may certainly not the less exist their use. Throughout the whole four-end- ood operate, olthough we are unable to polut twenty hours, the stomsch moy not be out distinctly in what they consist; like the equally irritable; and thus some may bear principle of gravity, their existence and openourishment in the earlier, some in the rations may be demonstrated by focts and

carefally to inquire into the state of the dopendently of any inflammatory excite-

the more personded, because in dissection I have found in ebildren, labouring under a similar effection, the marks of inflammation, or of iocipiest ulceration on the istestinal surface, to be seen, indeed, in this prepara-tion. Reduces of the tongue, sorecess and hest of the nous, sub-obscore tenderoess of the abdomee, sed a pulse of 105 or 110 in the minute, all sometimes observed-strongly teod to enofirm our euspicioes of an infismmatory irritation.

Effusions of water during pregnancy, no eot uncommon in women, even whee in high besith. Of these effusions, the most frequent is, coloma of the limbs, sometimes of the right leg, sometimes of the left, ocessicoally of both, and more ur less extensively, for the discose may be confined to the ancies merely, or it may recel to the knees. But besides this adenis, which is so frequent and unettended with suy danger, there is a dropsical offection which is noseen in two coses, where the wome, during bringing the gratation to e close as soon as pregnancy, has a tendency to a general of mey he. Now in the middle and latter fusion, water extiding in all the principal parts of the body, the legs, the arms, the peritoneal sac, the chest, the head; the disritoneal sac, the chest, the head; the dis-eose concetinous predminiosting in one part of the body, and sametimes in snother; mentalong the seek and mouth of the womb, but all the principal perts being affected at puncturing those membranes, and discharg-onee. Nor on I speaking here of general ing the water, all which might be done withcombining with pregnancy by a more seei- two fingers, for as to the forcing a delivery dental concurrence; but of those general is these cases, by turning, ur instruments; may essail the woman, though in all other quite out of the question. respects she oppear to be healthy ecough, A woman, of vigorous constitution cough, nor in any way the probable subject of such (for 1 will relate one ar two illustrative inao uttack. Now where the patient labours stances,) was seized, during pregeancy, with under ordioary coleons of the legs, the dist general effusion; justurition, however, eose is of no importance; but where, which came oo, end the complaint ceased. Boseldom happens, the effusion is general, as coming pregnant again, she was a second in the care under consideration, there is time seized with an effusion, which took place much in be apprehended; for the water in the legs, the chest, and the abdomen. A may occumiate so largely, as to interrupt very emineot practitioner was colled in coe-

Treatment.—If a patient labour under one our way clearly to bloodletting; the water of those general effusions of dangerous continued to accumulate, and the woman consequences, of course your treatment ultimately died, apparently from hydrothoshould not be inactive. The most power-rax. Now here is ecase, then, which illustral hydrotic remedies, including relateration, you are justified in using you will ring during pregnoncy, only in the earlier or find this to have a various effect in different middle months, even in womes, to uppear-

ment; but though this may be true, I em | shearption. Bot besides the ordinary repersonded, that what I stated before will oredie's proper in dropsical affections, I be found to be correct, in many cases, should, in these cases, feel strongly dispused namely, that the irritability of the stomach to make trial of blood letting, first, because, end howels, is itself sometimeere errible to as a matter of observation, I thick I have e certoin inflammatory state, which exists seen it useful, and, secondly, because I in the mucous membrane; and of this I am strongly suspect, that those effusions are not produced by dehility of the woman, but rather by an increesed setion of the exhaleot vesaels, spprosching to inflammation. If, indeed, e womae is very pale and thin, and weak, and opparently of dropsical diathesis, the dropsy may be considered as accidental, rather than the result of pregancy; end I should not be isclined to recommend the laccet bere; but if a patient, previously in the full vigour of health, hecomes impregoated, and afterwards in tha early, or middle, or even in the latter period of gentation, is suddenly saized with effusion, I should ennsider that the use of the lancet was proper enough. Borns, who has written so well on midwifery, has, I think, made the same observation.

There is, too, yet mother remedy peculiar to this form of dropsy, and cor to be lost sight of, and that is, the delivery of the woman; for the disease being concected with pregnancy, end evidently of danger, in ticed by others, and which I have myself the more pressing cases, we are justified in months, this acceleration of delivery may be accomplished without ony greater rick than dropsies arising from shattered health, and out the introduction of more than one or drapsies, to the course of her greatstice, which In the present state of knowledge, this is

the great fonctions of the hody, and is that sulfation with myself in this ease; nothing manner destroy life. patients; 8 or 10, or 12, or 14 watery evaluations heing accusations being accusted by one-time efterwards, 1 was called to another sixth of o grain, and powerfully promoting patient, also of a constitution tolerably

sound; in this case, effusion of woter had women, but in the lower orders of largo taken place into the lega, the abdomen, and number; and, in this town, ot least, ant probably the head; for at the time when law wholly averse to debauchery, these syphiber she was insensible, sod had occasion-littic pregnancies are of occasional occurally convulsive fits. This women was very rence, thingh atill, perhaps, on the while, freely bled to the amount of 40 nr 50 numes not vary commun. at least, in the enarm of twn or three hinnra; three or four bours before she expired. Now with corresponding coution. here is a second case, in which you have an cample of a patient an the whole thership cipal modes in which syphilia is treated; by healthy as in which syphilia is treated; by healthy, seized under pregnancy with a ganeral effusing, productive of the most slarming symptoms; in this case, tno, you have firms un part. If the latter remadies are an example of the effectual relief derived really as efficacious os it is contended, and from the active use of the loncet, and the as all who wish well to mankind have reaevacuation of the utarua; therefore, it seems, and to dasire, these remedies would be pethat, in addition in the ordinary remedies of cultarly fitting io gestation; and surely in dropsy, the shatraction of blood, and the in-syphilitie pregnancy, if ant in syphilis duction of premature delivery, are, in these generally, the milder mercurial action is to esses, the principal remedies, and on them. feel atrangly disposed to rely.

But what is to he done in those slighter ness of the mouth. attacks of sickness, or dropsy, during pregnaucy, of more ordinary occurrence, for the more active practices count be required here? why, in the cedems of the legs, a hundage, a laced sincking, a little purging, the borizontal posture, patience, tune, and delivery, will be of service, end in odema of the lobie, pressure with a T handage, and compress. In both esses, puncture of the compress. In both esses, puncture of the akin might be serviceable, but I never yet faund it necessary. In noorning sickness, time, pstience, said the advance of the preganey beyond the fourth month, will usually cure the disease: bleeding from the arm may he useful to the pictheric; the horizontal posture is proper to prevent the bear iog of the uterus. If any offensive smell, or Other obvinus cause, excite the stomuch, this should be intercepted. Dr. Lawder had a heat iodication of an aptitude to these expatient who was effectually relieved, by removing from the factory of her husband, a coach-maker, for when she became pregnant, the amell of the paint continually excited the stomach.

I have not ascertained, hy my own phaserprematura delivery was intended, but par-turitinn came nn of itself in the enurse of in cases of pregnancy, has a tendency to the four-end-twenty hours; the next day bring on the premature expulsion of the I found the patient a great deal better; nvom; but such & the apinion which has the day afterwards ahn was so much im-proved, that she oppeared to he in a state of the decide on the point; end I have heard speedy ennestescence; unfortuneticy, haw-over, she was weized with the puerperal fever, leasert, that in the words of this hospital, s comploint very prevalent and futal at the its furmer days, the administration of mertime, and though she was in the hands of a cury in the higher doses, agreeably to the very excellent practitioner, she sunk under ancient practice, has been observed by the the disease. Her improvement under the sistern in induce miscerringe, at least whem dropsical ottock had been so great, that I spititude existed. The administration of merhad taken my leave of her; nor did I see leavy, therefore, in cases of pregnancy in her under the puerperal fever, till some the earlier ar middle mouths, must be used

the fuller action of mercury-hy its milder action-and by remadies of which increury forms on part. If the latter remadies are be preferred to the violent; and instead of without neglecting other measures, I should relivating the patient, you nught to content , yourselves with producing merely a sorn-

Again: there ore twn ways in which tho mercurial action may be managed in the syphilis of pregnaucy-1 mean, either in such manner on may completely cure the disease, hy extroguishing nr destroying tho poison, nr in such manner, as may effectunlly check any pressing symptoms under which the patient may labour, so as in sus-pend and oritigate their violence; the remedy being laid aside, when this purpose has been obtained, to be resumed afterwords, should the symptoms require it. If a woman ware in health, and not prona to miscorriage, I should be inclined to give the mercury, if I bagsu it ut ell, in such quantities as to destray the prison alto-gether; but in wamen more weakly, and who have repeatedly aborted before, the pulsions, I should incline to try the sdministration of mercury in smaller quantities, and in suspensive doses, as it is our duty tn savo the child, if circumstances will permit; alwaya, however, in British midwiery, reophilis, in connexing with pregnancy, is, | collecting the maxim, that the life and bealth an fur as I know, not in he found among the of the woman are paramount to every other upper and middle rooks of our country-| consideration. This suspensory practice,

hewever, it must be owned, is both difficult and delicate.

If a dalivery occur after seven months and a fortnight, should the child be duly taken care of, it may liva; if, however, on the other hand, the parturition occurs before this turm is cumpleted, it may be no easy task to rear it; and, certainly the earlier end the younger the fætus, the smaller the chance of its aurriving. Now this is e large opportunities, and very capable of principle, of which you capable to avail your judging—I mean the late Mr. Pearson. He selvce, in treating apphilitio affections by says, that in using the nitric scid, he has mercury; and if you have ae option, you found that the primary symptoms were not certainly ought to delay-I do not say the infrequently cured-rarely, however, permercury, but the ptyslism, till the seventh month and a fortnight are completed; an yet sometimes aren permanently. He says that if the child be expelled, it may still further, that where patients have been laliva; and the lungor you delay your merchrial action on the system, the greater will the disease, the primary symptoms have be the chance of survival, should premature sometimes been cured sitogether, and the expulsion occur. Nor can I accord to the saccordary have sometimes been cured elso, upinions of those, who think that if mercury is to be given, it should rather he the said, that it seems to improve the given in the earlier periud of gestatim, strength, and that it may he given in con-nuder the fear, that if delivery should occur junction with the moreury, but that this while the patient is in a state of salivetion, | combination does not diminish the quantity ill consequences may be produced by it. You will remember, in the present mode of administering mercury for ayphilis, the remedy is much less violent in its operation, than when given according to former muxims. In the general, I beliave, (but you, es surgeoes, must decids this,) it is quite sufficient to produce, end tu keep up for six or eight weeks, or a little longer, a decided sorecess of the mouth, produced, for example, by the hydrarg, cum creta, Now, I will not say that a high etate of calivation, concurrant with delivary, might not givn rise to some danger, though I do not know of any ill consequences that have ousued in soch cases, for opportunities of observing are not frequent; but I am satisfied that there is no immediate danger resulting from a slight sorenass of the munth, which is all that may be requisite, in order to aubdue the syphllitie affection. With respect, therefors, to the use of marcury in cases of syphilis, these are my opinions in summary: as mercery is liable to produce miscarriage, use it with coution, and soreness of the mouth is, ie all cases, to he preferred to an active ptyslism; in all cases, mercory ought to be used sparingly; but caution is more espacially necessary, if the aptitude to miscarriage be manifest; provided a disposition to miscarriage is keown to exist, it is desirable oot to induce the acreeess, before the seven mouths and thu fortnight are accomplished, sa the child, if expelled prematurely, can scarcely be expected to survivn; yet abould the security of the mother demand on carlier adha made paramount to every other con- the Indian Peninsula, I am informed that in sideration.

When we meet with syphilis, in conjuection with pregesney, we are, of course, led to inquire, whether much banefit might not be derived from any other anti-apphilitic. And the nitrie acid has been so much recommended, that it ought not to he nver-luoked. Of the efficacy of this remedy, I forbear to pass a personal opinion; but I will give you the sentiments of a man of manuently, for they were apt to return, and bouring under the secondary symptoms of of the mercury, which may be necessary fur the cure. Now these ere properties which may very reasonably recommend the acid to your attention, in the cases under our consideration; if it will sometimes cure the primary symptoms-if it will, in many cases, really suspand the symptoms, both primary and secondary, even for a few weeks only, cases of symbilitic pregnancy may now and then occor, in which it may do effective service, in place of a less desirable, though a more certain, remedy.

in cases of syphilis, we have been advised to make use of the woods, guaiscum, masereon, sassafras, and particularly the compound decoction of sarasparilla. In this country, the woods have, I believa, beau very generally rejected by the regular practitioner as cures for the affection, though an opinion is again gaining ground, that ayphilis may be surad without mercurycartainly good news for the human race. In the wermer climate, the woods, it has been aurmised, may be of greater effect; and, owieg to a greater virulence in the disease, they may lose their effect in the colder elimaten; for there is a larking suspicion that the vancreal poison becomes more violeet in our colder altitudes, than in those regions which lie center the lice. Now, if it really be the case, that the wnods possess a greater power in the warmer countries, if any of you should be practising in the East indies, for instance, es maey of our countrymen do, it might, perhaps, be worthy our while tn givo a fuller trial to the woods there, though 1 doesn it right to add that, ministration of the reneedy, her safety must by Mr. Massell, who has practised much in

tion, and that is the caustic. For it is a enrious fact, that the malignity of the local poison of the cheocre is so great, that if left to itself, it will go an committing its raveges, till at length it has destroyed the geoitels to a great extent, and yet the whole of this malignant topical power resides in a mere film of structure, probably not thicker then the fuger nail, so that if you can but get down, through this structure, upoo a healthy organisation, you may ubtain a complete cure of the disease; the constitution remains affected atill, but topically the diaeaso may he cured. Now, for this purpose, the destruction of the morbid arganization, the stronger caustics mey he emplayed; but I bare myself seen, hy menus of lucar caustic applied ten or fifteen times, auch a complete destruction of these southid films as occasioned a camplete aicatrisation. Now, in a women laboring uoder cheocre, email and manageeble, it would be for your consideration, whether you had not better beal by caustic, and refrain from the use of the meroury notil the lotter months, or till delivery was effected, when you might have recourse tu such administration of the mercury as would completely destroy the disease in the constitution. A friend of my own was telling me, some two ur three years ago, that is the early period of his life, being seized with a chancre, he thought to heel it by the application of caustic; he attacked thu discess very early, indeed on its very first appearance, and he had permaded himself that it was completely subdued by this treatment, but, though the ulser healed, in oine months afterwards he was selzed by a regular ettack of coostitutional symptome; the disease appeared on his skie, throst, and nose, and he wes abliged to use mercury very largely, not without furnigation, to get rid of this troublesome affection. This case proves, what, probably, you all knew before you entered the theatre, that though you may heel a chancre by canatic, even when the first speck of ulceration is masifested, still you esnoot prevent the countitution from being affected; but obsorve, what is bere to our paint, namely, that where a chancre is healed in this manner, the disease may lie, to all appearance, quiet io the system for nine months, per-haps, io some cases, for a longer time; and, haps, io some cases, for a longer time; and, end to colergement of the glauds of the in the apphilie of pregnancy, to gain time neck. It soon bacame evident that she was

syphilis, mercary is the remedy on which night, that critical periad of gestation the Eurnpeac practitioners rely.

In the ayphilia of pregnency, there is to coable it to support an independent exacothur palliative which deserves our atteneyphilis, the forms may he affected also; hut this subject has been considered before, It is not to generrheen, but to the cheocrous furm of the veceres disease, that the preceding remerks are designed to refer.

# FOREIGN DEPARTMENT.

DRIVALE UTERUS, AND POUBLE IMPREGNA-TION.

L. B., etat. 30, af a robust constitution, had been in labour for two days, when Dr. Gaiss, who describes the case, was sent for. He observed that the pains were cuofined to the right side, where the uterus reached almost to the true rihs, while, on the left side, it did not rise higher than the nevel. The external genitals were regularly formed; and it baving been found that the shoulder presented, the operation of turolog was resorted to, and a healthy female child ex-tracted. Soon after delivery, the right side of the abdomen collapsed, the left half retaining its size. An hoor after the birth of this child, the lebour pains returned, and, on examination, it was found that, at the side of the os nteri, sod quite distinct from it, there a xisted a circular opening, through which the distended membranes of aoother child protruded. It was a full-grown boy, eod, after its birth, Dr. Geiss, heving introduced his band into the left savity, coovioced himself that it had no communication with the right half of the uterus, which had already cuntrasted. The left nterus con-tracted rather slowly, and the patient lost much blood from it. Two months afterwards, hoth children, as well as the mother, were perfectly heelthy. I'wo years after-wards she was again delivered, but of one child only .- Rust's Magazine.

# TRANSFORMATION OF THE SUBSTANCE OF THE HEART INTO A FATTY MASS.

A young girl, whose father bad been offected with caustitational syphilia, had, until her ninetcenth year, enjoyed good health, when she became sobject to rheumstio pains, is a pain of primary importance; for, by affected with a chronic disease af the heart this mesos, we may be enabled to proif or she slept very little, sud frequently creatines the nse af mercury till after delivery is accomplished, mr, at all events, heyand the term of seven menths and a fartcynaupe; she complained of violent lancinating pain in the left aide of the thorax, Tha indictment charged the prisoners incepability of lying an either aide, a troublesoma enugh, with blandy espectoration, against Burke, accused him of hoving, in the and a very oppressive burning secostion in month of March, April, or May, 1828, in a that region of the heart. The pulse was house in Gibb's Close, in the Canougate, in weak, frequent, and mequal; the extramites cold; the checks and flogers of a Mitchell, by placing or laying his body or the public of the heart learners are returned. mittee coid; the cheeks and angers in a Situation, by placing or laying his body or blue colour; the pulsations of the heart person, or part thereof, over or upon the wera very feeble, sod could hardly be breast or person and face of Mary Paterson, felt, &c. Sha died, after an illness of ten when she was lying in the said house in a mundlis. On opening the thurseic cavity, that of intoxication. It then went on the lungs were found accepted to the pleurs charge him, that by the pressure thereof, and the pericardium, the intercal surface of and by covering her mouth and nose with which was covered with whitish yelluw, his hady or person, and foreibly compress-solid filaments, about ona-third of an inch ing her throat with bia hands, and keeping in length, and some of them attached to her down, notwithstanding her resistance, the heart, the external aurface of which or in some other way to the prosecutor no-was also envered with villous excreacences, known, preventing her from breathing, did and two-thirds of inasubstance were changed antiocote or atrangla her; and this the ininto a fatty mass of a greyish yellow colour. dictment charged him with dning, with the The other organs were found healthy, with wicked aforethought lataot of disposing of the exception of the spleen, which was or selling the hody to a physician or surnomewhot enlarged .- Heidelb, klin, Annal.

### PUESBRVATION OF LEECHES.

M. Hamgre has, by the following method, succeeded to preserving leaches for a considerable time :- They are kept in small barrels, the internal auriaca of which has beau reduced to charcoal, the bottom heing co-vered hy aand, moss, and charcoal. In summer-time the water must be changed every eight daya; during winter, it is sufficient to renew it every aixth week .- Journ. de Chim. Med.

# [From THE TIMIS of Monday.]

THE LATE HORRICLE MURBERS IN EDIN-

# (Abridged from The Edinburgh Evening Courant of Thursday.)

The High Coort of Justielary, at Edin- that Burke was charged with the nurder of burgh, proceeded on Wednesday to the trial; list two first-mentioned victims. It also of William Burke and Heten M Dougal, in charged them with the munder of Madgy, dicted for marder. No trial that has taken for the purpose of disposing of her hady for place for a number of years past, has ex dissection.
cited such an unusual and intense interes; In answer to the indictment, Borke auband an unusual and incease accreas; In all were to the contribute, force and a sile doors and passages to the Contribute were intended that he was not bound to plead to be besieged at un early hour before day-light, to be tried upon a lib-l, which not only and it was with the greatest difficulty, and what so that the connected unupone, that admission could be procured for and at a different place, but also combined those who were coon-cted with the properties. ccedings.

MEADOWBANE, and Lurd Blackenzis.

geon, or some person in the employment of a physician or surgeon, as a subject for dissection.

Tha second count charged Burke with having, in September, October, or November, 1828, iu a huno in Tanner'a Close, Portsburgh, or Western Portsburg, in ur near Edioburgh, attacked and assaulted James Wilson, commonly called Duft Jamie, by leaping or throwing himself upon him, when the said James Wilson was lying in the said house, and that be having sprung up, Burke did struggle with him, and did bring him to the ground, and hy laying his budy ur person across Wilson's face, and hy compressing his mouth, nose, and threat, did authorate and atranglo him in the same maoner that he murdered Mary Paterson, and with the intest of disposing of his hody for dissection.

REAGN, TO ORTAIN RUSJECTS FOR DISSECTION.

APPROACH TO ORTAIN RUSJECTS FOR DISSECTION.

APPROACH TO ORTAIN RUSJECTS FOR DISMININGS WITH LINE WAS A PROACH TO THE CONTROL OF THE CONT The third count charged Burke and Helen bergh, murdered Madgy, or Mary McGooseand or Duth , or Cample It, or Docherty, hy sufficiating and straugling her io the manner

was not even alleged to have had any con-The Judges present, were the Land erm with two of the offences of which he Jranes Caras, Lord Physics, Lurd was accused, the the merits of the case, he had only to state, that he was not guilty; and he rested his defence on a denish of the facts set forth in the indictment.

Helen M'Dougel made a similar defence. Mr. P. Robentson, in support of the dofence, made a most eloquent address to the Court, on the eril of comprising so meny offenees in one indictment. Such an accumulation of charges was not cunsistent either with the practice or the principles of law. The three offences were totally seperate and distinct; they did not appear to have all formed a part of one foul and nefariums tronsactium, but they were committed et different times and at different ber deed body at the police-office : ale was places, and might have been done for differ- between 40 and 50 years oldent ends-fur private revenge, or for rohhery. The crime of murder incurred the two uther charges, with which she was not | box. alleged to have had the slightest consexion.

being done with the same intent.

three separate acts of murder.

of the three octs of murder, the une on which ito have been recently turned. he should go to trial; and with this under Jonet Laurie, or Laur, who lived in the atunding, that, if he failed in the first charge, same possage with the former witness, corthe prisoner was unt to complain that he ruborated her statement. was ugain tried under suother.

The Loun-Auvocate said he should pro ered upon the last charge, and therefore the woman must be detained, and put upon bar trial with the mon.

The prisoners were then called upon to plead, and they said they were " not guilty."

The first witness proved the accuracy of the plan of the house at Portsburgh, where Burke resided.

Mary Stewart proved hoving seen Madgy, or Margery Campbell, at Ediabargh, in Oc-tober, end she said she came from Gleagow to look after her son; she afterwards saw

Charles M. Lean gave similar testimony. Il'illiam Noble, shopioen to Mr. Rymer, of bighest punishment of the law, and the dan- Portsburgh, said that, on the Stat of Octoger to which the prisoner wes exposed in ber, a woman, similar in appearance to this junction of cases, even of baving prejudice excited ogainst him to the minds of the was Ducherty, came to the shop asking Jury, who could not seperate the evidence charity; Burke was in the shop, and, hearapplicable to one, from the evidence appliing her name, be said she was some relation
cable to another, and who could not fail, notwithstanding all the precautions that could swoy with him, saying be would give her be odupted, to borrow evidence from one breakfast. On the next day Burke pur-action, in order to convict upon another, chased some groceries, sod on old tea-box, The cose of the other prisoner was even at the chop. Witness added, that he had worse. She was brought to triol on o seen a man named Hare in company with churge of murder, which was combined with Burke, and Hore's wife colled for the teo-

leged to have had the slightest connexion. Ann Black, or Connexay, who lived in The LOAD ADVECATE said, he had placed Western Portsburgh, said that Borke end the woman in the same indictment with M'Dougal resided in the same house as Blurke, in order that she might derive ad- hernelf. On the Sist of October she saw vantage from it. If he had tried the other Borko enter his house, with a woman folprisoner tirst, the whole of the cridence od- lowing him; to the afternoon she went into duced on that trial, would have been pub- Burke's apartments, and saw the same wollished end universally reed, and her case, insa sitting by the fire, supping portion therefore, would not here been heard by the and milk; also had scarcely any clothes on, Jury in an unprejudiced state. He thought and they said they had been washing; he was bound, in fairness to her, to include M Dougal soid that ahe was a lightland her in that indictment. He would consent, wuman, a friend of her husband's: some since her advisors thought it beneficial to time ofter dark the woman appeared very her, to delay putting her on her trial at pre-intexticated; Mr. and Airs. Here come in sent. He, huwever, expressed his deter-with a bottle of spirits before supper, and minution to proceed against Burke upon the Hare insisted on drinking; they ell tasted, indictment for the three offences. The ond were merry; and Hare, Camphell, and murders were all cummitted within the lest M Dougal donced; hetween 10 and 11 six months. They were oil done to the u'clock Burke come home, end o disturbsame plure, and they were oll charged as ance soon ofterwards touk place, as it flurko ting done with the same intent. and Hure were fighting. In the morning The DEAN OF FACULTY enforced the ar- witness asked M Dougel what had become guments of Mr. Rubertson, end pointed out of the old woman, end she replied, that the great prejudice that would accrue to the Burke and her had been too friendly togeprisoner from crowding into one indictment ther, and she had kicked her out of the ree separate acts of morder. house; adding, at the same time. "Did After a short consultation, the longer degree you not hear it?" She sew a boundle of livered their opinious seciation, to the effect, straw at the hottom of the hed; it had bun that the public prosecutor should select out there must of the summer, but it appeared

Hugh disten, who lived in the same house

with Barke, heard a noise on the night of witness and Jones, for when he came out Stat of October, and a woman called out he found them at the end of Newington. "marder!" he also heard a noise of two Dr. Knox gave witness 51., which, to premen, as if wrangling and struggling, and the vent disputes, he was to divide; and hoving woman crying "murder!" That cootinned gone to a house and obtained change, he for about a minute, and then he heard a cry, as if a persoo had been strangled; he heard his share, leaving the sum to the porter that no noise of struggling; he was aften slarmed had been bargeined for. Five poonds was by cries, and was afraid of fire, but never thought of murder; he returned a second time, and heard the sound of the men's voices, who were speeking in a lower tone, and the woman had ceased crying; he then went into his own residence.

David Paterson, keaper of the museum belonging to Dr. Knox.—Knows the prisonar by sight. Witness went home no the Sint of October, about twelve n'olock, and found Horke knocking at the door. He asid to witness that be wished to see bim at his house, and he accordingly went there with him. He found in it two men, including Burke. There might be more, but he did not recollect. There were also twn women. After he went in, Burke said be had procured something for the doctor, and pointed to the head of a bed, where some atraw was lying. The observation was made in an under voice, but not in a whiaper. No observation was made by any of the other persons. Nothing was shown to witness; but be understood, when Burke said he had procured something for the doctor, that he ailuded to a dead budy. His words ware, he had procured something, or there was something for the doctor, and he used the axpression "to-morrow." There was a aufficiency of atraw in the corner to have concealed o dead hody. Al' Dougal was one of the females. Witness sent his sister about nine next morning for Burke. (Witnass was bore abown listn and his wifa, whom he identified as the other persons that were in the honen along with Burke, on the Sist of October.) Hurke come next morning about nine, and witness said, if he had any thing to give Dr. Knox, to take it to him, and settle with himself. He meant ten-chest. It was put into a collar, the instanco a note was given to bimself, and dnnr locked, and Mr. Jones went to Dr. he handed it to these men, but the purchaso Knava hause and informed him the men was not then mede. had brought what was expected. The men James Gray and his Wife were next excessioned. and the porter followed, or bad preceded -They said thay were acquainted with the

laid the money on n table, and each touk not the whole price understond to be paid; the balanne was to be paid on Monday, when Dr. Knox saw what had bean bruught. The price he believed generally was to be 3L, ont no bargain was made. On the Sunday morning, Lieutenant Patterson, of the po-lice, and Serjeent-Major Fisher, called on him, and be went with them; opened the door of the celler, and gave the purkege to them, which had been left the night before. It was given up in the same statu in which it hed been left the night before. The package was festened with ropes. He masisted in opening the box, which was found to contain the body of no elderly femule, who did not appear to bave been interred. The extremities were doubled up on the cheat and thorax. The head was pressed down as if fur want of room. At the request of the Licutenant of Police, he examined the bady externally, stretched on a table. The face was very livid, and blood flowing from the mouth. In his opinion the eppearance of the cuutenance indicated strangulation, or auffucution, by being overlaid. He found other external marka upon the hody that would be aupposed to cause death; be was not present of the disacction of the body; the eyes were unt started, nur did the tongue bang nut; the head was a guod deal pressed down for want of room; abserved no mark about the thrant; the lips and nose were dark-coloured, sod n little tainted with blood.

By the DEAN of FACULTY,-His reasons for saying death bad been caused by suffocation was, that the blood, in o atrangical or sufficated person, rises in the head, and gives the face a livid appearance. He had seen the man Here before, and knew that a subject to dispose of: and Burke went Dr. Knox had deelings with bim for the away. He saw bim again, in one of Dr. procuring of dead hodies; he also had had Knox's rooms, in Surgeon's square, along dealings with Burke; thay seemed to act with Hare, Mr. Jones, Dr. Knox's assistant, jointly; had seen both assume the princiand the Ductor. First either Burks or pal part; they frequeutly braught subjects Hare say they had a dead body, or subject, to the lecture-rooms; had heard of a class which they were to bring at night, and witch they were to bring at night, and witch they were to bring at night, and witch the subject of t and package which they might bring. Wit- men attending poor patients who did give ness end Mr. Jones were in the way shout information of that fact to Dr. Knox, who sevan o'clock, when Burke, Hare, and a hunded over the direction to such persons porter, named M Culloch, came with an old to endeavour to make a purchase; in one

was not right, and when Burka and M'Dongal left the room they exsmined the atraw, They immediately took up their small hunper week. Gray replied, " God forbid they should make money hy deed people." and immediately gave information to the

John MC Cullack proved having been employed hy Burke to couvey the hody from his residence to Dr. Kaox's house. It was taken uut from among the atraw, tied in s sheet, sed put into tha hoz. They had great difficulty in getting the body into the hox; they had to rack it to get it forced down. When he arrived at Surgeon aquare with his load, he was joined by Burke and M'Dougal, and Hare and his wife.

The police officers proved having apprehended the prisoners, and finding the dead body at Dr. Knox's bouso.

was cautioned by Lord Meadowhoak to speek treth. He said he understood he was called only as a witness in the case of the women Camphell (he emphatically said, " the old woman.") lloving beau sworn in the com-mou form, he said he was a native of Ireell one, he aupposed.

The examination proceeded.—He had been sequainted with Burke about a twelvemonth; M'Dougel lived with Borke, thea, ea his wife; witness lived in the Westport, not far from Burka; was is a public-house in the Westnort on the forenoon of the Stat

prisoners, and had lodged about five nights [gal. The old woman was washing her short in their house. They recollected the old gown; it was white and red atriped. womae coming there on the night of the (Identified the bed-gown.) Witness re-Sist of October; and on the following mained in the house ebout five minotes, and morning M'Dougsl seid she had been im- then went home; was in Conosway's bepudeet, and they had turned her out of tweee eight eod nine o'clock on Hullowe'en They, however, suspected that all night. Thera were Connaway and his tright, and when Burka and M'Don wife, William Burke, and John Broggan, and another lad whom he did not koow, the and found the hody under it; there was old womao, Helen M. Dougal, and witness's blood oe the face and about the mouth, wife. They had some drink there, Burke, Broggan, and the led, weut out; but witness remotised later, end went into Burke's, lesving the old woman in Conuswey's; was dies, and were quitting the bouse, when remotived later, and were into Burke's, they met Mrs. Borke, to whom they men-lessing the old woman in Conuswey's: was tioned what they had seen. She told them not long there till Burke himself, and the to hold their tongues, and she would give old woman, oama in. She was so unoth the them 2s. or Ss., and it might be worth 10s. her feet. There was some dencing in Con-oaway's. At this time he did not think that any harm was to beppen to the old women that night. When in Burke's, some words took place between him and witness, end blows ensued. He asked what had brought bim there, end he replied he had haen is vited by M'Dougol. While they were struggling, the old women ran twice into the passage, and called out either "morder," or "police." Helen M'Dougal brought her back both times. While witness and Burke were atruggling, ha (Ilure) pushed her over a stool; she got up so as to rast upon her elbow, but was so druuk as not to he shie to regain her feet; she wea slways celling on Burks to quit fighting, and he did so: having stood for some mioutes on the floor. Burke stood stride legs over her, and laid himself down shove her-his breast being on her head; she gave a cry, and then mouned a little; ha put onn hand open her nose and mouth, and the other under her chio, end stopped had, and had resided in this country shout ber breathing; this was continued for ten ten years. He was asked if he were s or filten mieutes; he never spoke while Catholic! Ha snawered, he was. He was this was going on; after he bed risen from thea saked if he wished to be sworn ie en ye bove ber, ha put his arm epon her mouth way? He said, he did notknow; be nevar for some minutes; she sppeared quite dead; hed teken an oath before, and the form was witness was citting all the while on a chair; he atripped the body of the clothes, put it into a corner, doubling it up, sad covering it with straw; wituess's wife and M' Dougal when they heard the first screech of the old woman, ran into the passege, end did not come in aguia uatil the body was covered with straw; before this they were lying in the bed, and witness sat at the head of tha of October, when they had a gill; hausked the bed, and witness sat at the head of tha witness to go down to his house, to see hed; did not observe blood on the floor, or the shot ha had got to take to the doo- on the woman's face, at the time; did not tor's; he said ha had taken su old woman observe the women, in the passage, cry; off the street, and wished witness to go and but nobody came to the door during the see her, and see what they were doing; time. Burke had not been shove the understood by the word shot, that he was woman a minate or two, when the woman golag to murder the woman. He went to Burke's house, and found there was a some of them ettempted to seve or assist the stranga man and woman, (their name was old woman, sud such could not bave buy-Gray,) the old woman, and Helen M'Dou-pened without his sceing it; sew them

women went to their beda again; neither quasitons that might cumtuals him. Was asked for the woman Docherty; when Burke returned, he brought the Doctor's Declined snawering the question. Was this mos with him—a person who lived o hitle of the old women the only one in which he doctor's man to look at the body, but he succeeding the question. Was concerned? I bedieved to snawer. Was conquent into it; the women were to the Understood that the use of the term shet, leed while the man was i. the house, but he was used by living as meening a person for could not all whether they was a waske or la subject. In order in moring them, then of could not tell whether they were awake or a subject, in order to muriet them; heard not; witcess fell saleep himself; he was him use it wheo he did not mess to murrather the worse of liquor, but he knew well dir. but understood that to be his messing enough what he was about; he awoke about (at the time; said so to him in the foremen; zeven o'clock in the morning; he found was dunctog in Connaway's; the old woman aeven o clock in the morning; he found was curring in Commany's; the out woman bioself on a chair, with his head on the was there, but, at that time, hed no oution bed; the women were in the hed, and a lad has there was to be mischief that night, named John Broggan, who was lying beyould his ann!; Binke was at the fire-side; boundon that there would be muchief, when he and his wife got up and went home, he saw Burke stunding over the old wuman, when they found Gray and his wife there; has so bulke stunding over the old wuman. They had quarrelled, sud therefore had no Borke called witness into Ryoner's shap, thought till he saw Burke in that situation; and wished him to go with him to Surgeon saw the body of the old wuman in the Sunger which witness around to de accuming the head would be the same that had the more Square, which witness agreed to do, efter point coffice, he then said he had never he fed the awine; they went to Surgeon's seen the body of the old women before, and Square, where Burke ioquired for a box, daubed that he had seen the woman sive, but they did not get one; he said, he he it was on the Sanday when he saw it, and apoke one from Mr. Ryner's abop boy; denied it then. Have you had several trans-this box was brought into the passage by actions with Dr. Knox, or his assistant? the porter, (M'Culluch,) but there was no Declined to answer the question. Burko body in the house when they went in; they had received money from Dr. Knux, but took the box in, and waited at the back witness never did, nor from any of his door till Burke came, who said, "You are ossistants. Burke received of for the hudy worth little that have not put it into the from Dr. Knox, and they were to receive box;" witness saststed to put the body into more on Monday; Dr. Knna's man said the box; the porter pressed it down, and they were to get 51, more; thinks it was the hoa; the porter pressed it down, and they were to get 51, more; thinks at was observing some of the hair over the side of Burke who poul the porter, but is not surn the hus, put it down isside, saying, it was whether it was Burke or Mr. Paterson; "a bad duing to have it hauging out." The Burke threw two notres across the table hox was roped, sud the porter lostructed to long with the chauge; is certain that Mr. Carry it to Surgeons' Square; witness and Burke accompanied him, and met the though he folded up the two notes and discovered in first; witness accompanied them; the quarrel with Burka about the payments, nor no in first; witness accompanied them; the quarrel with him shout money matters, body was up it into a cellur, cod witness malled the woman over a stool, Burke proceeded to Dr. Kaox's, at Newing-land ade was so drunk she could not rise; ton, but did not go ulto his houss. Mr. before that, she had gone to the door, and Putersoo, who was to pay the money, took called "police!" when Burka got on the them went toto the public-house.

come again, and Burke go out, when he was I han that of the old woman, but had seen it absent a faw minutes; the women asked no done; had naver been concerned in raising questions, sod he made no remark; the dead hodies. He was warned not to answer women went to their beda again; neither quastions that might criminale him. Was Putersoo, who was to pay the money, took called " police!" when Burka got on the them into a public house, where he got uld woman she gave a abrick, which could change, and paid the porter as., Hurke he heard same short distance; et that tima 21.7s. tid., and witness 21.7s. 6d.; under did unt hear ony one call for the police; atood that M. more was to be paul on Mon. Burke and he were lighting before the woday. Saw the women both in going to and man shricked; Broggan and the two women returning from Newlogton, but mather of were in the hed; he was setting at the side of the hed, and Burke was at the fire; thinks that it was ten minutes before Burka Cross examined by Mr. Coccaras .- had murdered the old woman; never at-Had been a heatman on the canal; had also mempted to prevent him, but remained in had a horse end cart, and sold fish; had the house all the time; sat by, and luoked been concerned in furnishing medical bee- at the transaction; did not go next day in lurers with subjects; was never conceroed the police, and inform them of it; but, in corrying any other bodies to surgeons; when examined by the police, he denied all

dnwbank informed the witness that, what M. Dongal; did not make any seswer to ever share she might have in the murder of M'Dougal when she spoke of the shot, and Mrs. Campbell, sin would not he called does not recollect taking with her about upon, ar branght to trouble, for such shure the body when going to Newington; when Burke and his wife, were there: has spirits du sc.

It is proved that the that nurder was the most beinous of crimes, prisoner, in going up the street after some of There is no doubt that it is the daty of the his usual avocations in the morning, fell in Coort to pronounce sentence on the priwith the poor unprotected old woman, with soner; and I now suggest that he he de-whom it is quite clear that he was perfectly tauned in the Tollmoth of Edinburgh, and whose it is quite clear that he was perfectly tauned in the Tolbouth of Edinburgh, and unacquainted before. Now began his arrangements for ensuaring his victim. With 28th day of Jaquary next, and his body he given for dissection.

Lord MACKENZIA expressed his con-

### THE SENTENCS.

The Lord Junion Cayan then addressship to har, iusomuch that she expressed ed the prisoner nearly as follows :-- Wilgratitude to Mrs. Connaway for the kind-liam Burks, you now stand convicted, by the verdict of an intelligent und respectable Burku, Hare, and his wife were taken to jury of the nirocious murder charged egainst ithe gaol: M'Dougal was liberated last natere of the offence, that I will not occupy the time of the Court with commeeting on it. A crime more utrocious, a more coldblooded, deliherate, and aystamutio preparation for murder, and the motivo so paltry, is unexampled in the unuals of the country. It is now my duty to inform you, that if ever it was clear beyond ell possibility of doubt, that sontonce would, in any cuse, be carried into full execution, this is one of those cases. other chance; und I would now solemnly waru you to prepare your mind, in thu most unitable manner, to appear, is a very short time, before the throne of Almighty God, to number for this crime, sed for every other with which you stand chargeable in your own conscience. The nucessity of repressing crimes of this nuture precludes the possibility of mitigating your seutence. The only doubt I bure in my mind is, whether, to satisfy the violated laws of your country, and the voice of public iedigin chains, to blench in the winds, in urder to deter others from the commission of similar offences. Hut taking juto consideration that the public eye would bo offended by so diamal a spectacle, I em willing to sosentence, and that your body shoeld be pub-licly dissected. I trust that if it is over costomary to preserve skeletoes, your skele-ton will be preserved, in order that poste-to call in Mr. Davies. There was nothing rity may keep in restembrasco your stro-cious crimes. I carnestly advise you to lose uo time in bumbling yourself in the in the course of u few minutes, and thu pusight of God, and that you will seek the tient remained for about an hour and a half. eid of the ministers of religion to whatever to use her own uxpression, " quite comprofession you may belong. The present fortable." An ulurming state of collupse against you, it is my duty to inform you, that you have but a few days to live.

His Lordship then pronounced, with due and place, on thu 28th of January next.

The scene was altogether uwful ond impressive. The prisoner stood up with unshakou firmness. Not a muscle of his features was discomposed during the selemn address of the Lord Justice Clerk, counguing him to his doom.

you in the indictment, upon evidence which night, having been only detained in the could not leave a doubt of your guilt on the lock-up-house for her personal protection, mind of any one who heard it. I so fully We understand that Haro has made some concur in the view which has been so also disclosures, in which he confesses having quently given by my learned brother of the been concerned is no less than twelve differeut acts of murder, in some of which he wus the principal, ued in others an accesnory, end that he knew of another, in which, however, he was not u party. Burke, pre-vionu to his trial, stated, in conversation to those near him, that he hud made up his mind for the worst, being certain that he would be convicted, which may, in some measure, eccount for the apathy und apparent indifference which he meintained dur-You may rest assured that you have no ing the trial, and particularly when the other chance; und I would now solemnly uwful seutence of the law was pronunced upon him. Sieco his conviction he is appurautly penitent, und seems resigned to his fate. In his religious opinions, we undurstand he is a Romun Catholic.

### SUCCESSFUL CASU OF TRANSFRISION.

DR. BLUNDELL on the 7th instant pernation, your body ought not to be exhibited formed the operation of trunquision un a lady at Walworth, assisted by Mr. Poynter (of Somerstowe,) Mr. Duvies, und Mr. Lambert. The circumstonces of the case were briefly as follow:-The patient, a delicate womue, 25 years of ege, the mother of two cede in a more lenient execution of your children, was taken in labour on the moreing of the 7th; Mr. Poynter had been engaged to attend her, but it was found necharges having been fully established somewhat suddenly ensued, and it weu found that considerable hamorrhuge hud taken place from the uterus: pressure wus made on the ubdomen; ice wun introduced solemnity, the acutence of the law, to be into the vagina, and various means en-curried into execution, at the usual time ployed. No further discharge at blood took place, but the patient was in an extreme state of prostrution, blanched, and perfectly bloodiess in appearance; the pulse not higher than 120, but sometimes ulmost imperceptible. Stimulants (brandy ued port wino) were freely given, but with no murked benout. In this state of offices, Dr. Blundetl After the triel, Burke and M'Dougal were arrived, and determised on transfusion, abremoved to the lock-up-house, whither liure serving, that although there were some und his wife had been couveyed after giving symptoms sheent, which were necessary to their evidence. They were detained there make the case one of un untreme kind, till four o'clock yesterday morning, when namely, a greater rapidity of pulse, and restlessness; and although there was a s very slight pain only; hut, after the third, possibility of the patient recovering, on the homorrhage was restrained, yet looking to the exhausted state of the patient, and the slight temporary benefit that had accrued from the use of stimulants, he thought the balance was ogsisst her, ond that it was desirable to give the pshulum vite,-blood. About eight onnees, procured from the arm uf Mr. Davies, were jujected at different times-the whole operation occupying upwards of three hours. It was not ustil the whole quantity had been thrown in, that there was any decided amendment in the condition of the patient; she then rallied, and became in every respect better. Her convalenceoce has been gradual, and at this timo, eleven days after delivery, she is duing well. The lochial discharge has returned within the last three days, and she says that she feels stronger and better than in the same lapse of time, after her two pre-vious labours. There has been some tumefaction, and likewisa pain of the arm, in which the transfosion was made; but these have subsided. It is worthy of notice, that the patient expresses herself very strongly on the benefits resulting from the injection of the blood; her observatious are equivalent to this -that she felt as if ije were infused into her body.

### SECALE COSNUTUM.

# To the Editor of The LANCET.

Six,-The fullowing case, the treatment of which, though some may be induced to censure, I consider may be useful to the profession at large, I submit to your disposal.

A lady, in the sisth month of pregnancy, after some premonitory symptoms, which had then vanished, was suddenly seized with labuur, and as her medical attendant of soid hospital, who generally makes it a resided at some distance, a neighbouring point to stand directly between the students practitioner was called in. The fectus was end patient, (helieving, no doubt, that he is quickly born; but, unluckily, in attempting on transparent as the goggles for lunks the estraction of the piscests, which ad- through, ) to the no small assuvance of such hered very firmly, the umbifical cord was as may attend for practical information, broken near, if not at its placental extremity. Now, I consider that, for the hearest of After some time the pains left, and the all concerned, such a practice ought, most Doctor also; one, two, three, and even five decidedly, to be manifolded, and that m Doctor size; one, two, three, and even are percure, to be anomared, and down assets, yet still the piscents was rejectually a source of considerable irritation. It was absolutely no ally indisperable to the performance of the
cessory that something should be done; preferred by the considerable of the consideration
and having heard of the extranomory that the obove-mentioned practice is a effects of the sociale cumutum on the oterns, " marker ingraregens," induces me to reit was determined to give it u trial. Acquest that it may be made public through cordingly, hour scruples were boiled, in four the malion of your Journal. uunces ul' water, down to twu, and hall un cuace given every half hour, until some effect was produced. Two doses occasioned Glasgow, 19th Dec., 1828.

the uterus acted most powerfully, expelling a quantity of coagula, together with the stier-hirth. The patient remained in a very week state, but soon recovered, and, in must expressive luoguage, extolled this iuvaluable medicine.

The pains, she observed, were of a soverer kind, and gave considerably more torture than any experienced during previ-ous confinements. This, probably, might be owing to the revival of the oction of the uterus su soon after delivery, which always produces some soreness of that organ, and also to the presence of a substance, which though formerly untural, had become foreign to the cavity.

It has been said that the ergot becomes inort by keeping; that used in this instance was shove twelve months old, and it certainly possessed all its virtues. That it varies in quality, seems much more plausible.

Dec. 6, 1828.

# GLASGOW INFIRMARY,

### To the Editor of THE LANCET.

Six .- You must andoubtedly know, that the intent of the presence of medicul atudents at surgicul operations, perfurmed in public hospitals is, that they may see the various steps of various operations; but really, when I reflect upon my attendance in the theatre of the Glasgow Royal Infirmary, in nine cases out of ten, I saw the patient only brought in sud taken out: during the performance of the operation I boked, but, in faith, I could see nothing. This catirely arises from the presence of a multitude of unnecessary spectators immediately aurruunding the patient. I could particularize one man, a brouch of the medical department

> 1 sm, Sir, your ubedient servart, ALEX. NATIER.

# THE LANCET.

London, Saturday, January 3, 1829.

WE approach with horror the sebject which has lately occupied the High Court of Justiciary at Ediehurgh. It was most truly said, by Lord MEAGOWGANE, that in the history of civilized society there was which one of the wretches, who has trafrather aeries of erimes, which the late trial hea brought to light, indicates, no doubt, the existence of a state of deep-rooted moral disease among the lower orders of the popu-

eager to receive the price of his victim's corpae from the haeda of the anatomist. Our first proposition, therefore, is, that it is the boundes duty of the Esseutive Goverement to see that all rna masacrino HOOMS IN THE SINGSOM BE FORTHWITH Clusan.

The immediate cleanro of all dissectingrooms is the only measure which will effectually prevent the repetition of the erime, mothing parallel in structty to the crime of by removing all temptation to the perpetration of it. The injury to medical science, ficked in the hodies of his murdered victims, the ieconvenience to medical teachers, the has just been found guilty. The crime, or interruption of anatomical atudies, are all utterly insignificant considerations, compared with the overwhelming necessity of protecting the public against assauline, who traffic in the dead bodios of their victims. latice is Edinburgh; but we shall not oc- It is evident that some measure must be cupy the time of our readers by apeenlat- adopted by the Legislature, without delay, ing on the dreadful traffic, which has been for the supply of our anatomical schools with cerried on in the Scottish capital, as a ambjects; but, until such a measure shall be symptom of moral disease. What we shall adopted, it is of paramount importance that maiely insist upon is the necessity of put- the traffic hetwoen the murderer and the assting an end, at once, to this horrid trade tomiat shall, at all events, be put an end to. between the murderer and the anatomist. Let it not be heatily supposed that we are The perpetration of such crimes is a state raising an alarm oot jestified by the circumupos human nature, het the repetitios of atunces under which bodies are fureished them may be effectually prevented. It is to the anatomical schools in this country, fearful and humiliating to reflect on the or that we are auggesting a remedy against enormities of which wretches wearing the a contingency which is not likely to happen. humae form are capable; but the murder of No mae, who reads ettentively the evidence men for the sake of obtaining the price of given before the Parliamentary Committee their dead bodies, is n crime which the on anatomy, can say, that murders similar Government may at once prevent. The to those brought to light at Edinburgh are remedy is in the hands of the Government, not likely to be conneitted in this country. and that remedy it is the huunden duty of No man, who weighs that cridence attenthe Government to apply. The crime may tively, cen feel assured that such murders not be ecclined to Scotland. Murderers, have not already been committed in this like Burke, may he, sed probably are, at metropolis. It was proved bafore that Comour owe doors. While the temptative to mittee, both by the testimosy of aurgeous, cummit the erime is suffered to remain, no end by that of individuals who had themman can say, with certainty, that it may not selves supplied the schools of neutomy with be his own fate, or the fate of his children, subjects for dissection, that the resurrectiosnr kindred, to be marked out as victima for men belonged to the lowest drogs of society, the disaceting table, and to perish beceath that they were, for the most part, thieres, the poigeard, nr the gripe of an essessie, house-breakers, mee of the most absedened ARILEY COOPER's evidence to which we

" Does the state of the law actually prevent the teachers of anatomy from obtaining the body of any person which, in couscquence of some peculiarity of structure, they may be particularly desirous of pro-curing?—The law does not prevent our ohtuming the body of au individual, if we think proper; sue THERE IS NO PERSON. LAT HIS SITUATION IN LIPE BE WHAT IT MAY, WHOM, IF I WERE DISPUSED TO DIS-SECT, I COULD NOT OBTAIN."-Minutes of Evidence before the Committee on Anatomy, p. 18.

The main objection, leaves unexplained; to us it seems difficult however, to the proposition of The Times is, to assign my rational ground for inferring that it goes to sanction the principle of sasothat such on enactment, supposing it to be ciating dissection with pusishment for crima. operative, would not have such an effect. a principle which was condemned by nearly An infliction on the dead body, which is in- all the witnesses examined before the Parliatended as a mark of infamy, and a punish. | mentary Committee as absurd and impolitic. ment for crime, must surely tend to increase the aversion of men to see the same pro- corded its opinion by recommending to the cess performed on the bodies of innocent legislature the repeal of the enactment subpersons; and, consequently, must tend to jecting the hodies of executed murderers to increase the prejudice against dissection. disection. But though, in the quaint lauguage of that law, a suicide is one who has committed tions respecting the efficacy or expediency felony against himself, juries are seldom in- of pueishment directed against the dead as a fit subject for penal animadversion; and these observations, pervade, we regret to the effect of such an enortment as that pro- say, the address delivered by the Lond bility, be to diminish the number of verdicts upon the panel Bunks. of felo de-se. Hence the supply of subjects from such a source, " small" us our contem, says the learned Lord, " whether to satisfy perary admits, and insdequate, upon any the violated laws of your country and the supposition, to the demands of science, untrobe exhibited in chains table here present arctage amount of cases of felo de-se; commission at similar offeeces. But taking doubted, whether any inflictions on the dissected. I trust that if it is ever custodead bodies of self-murderers, have ever many to preserve sheletous, your skeleton

seicides. A few years ago, it was the practice to hery the bodies of persons who had destroyed themselves in a cross-road, and to drive a large stake through their guilty integuments. This practice was ebolished, though not without many serious remonstrances, and prophetic warnings on the It is plain, from the last sentence in the part of persons, who maintained that the national taste for self-destruction could only he restrained by the terror of that salutary and of which the Committee itself has re-

The same vague and unphilosophical noclined to regard the act of self-destruction bodies of crimicals, which have called forth posed by The Times, would, in all proba- Justice Clerk, in pronouncing sentence

"One of the doubts I have on my mind," could not be expected to reach even to the winds, in order to delec others from the and as to the tendency of such an enactment, he offended by such a dismul spectacle, I am to prevent suicide, it may reasonably he willing to accede to the more lenient execuwill be preserved, in order that posterity of last January, when he began to feel un-may keep in remembrance your atrocious well at times, but still was able to continue crimea.

As it may be the duty of the Lone Jua-TICK CLERK to pass sentence of deoth io ten or twelve aimilar osses, he will do well to reflect, that the escae of the crimes committed ot Edinburgh, is the high price givan by aurgeous for numan bedies; that this high price is occasioned by the difficulty of prosuriog subjects for dissection; and that this difficulty is caused by the state of the law, which has absurdly made diasection a punishment for crime, and which has, coosequently, created an artificial horror for dissection, as applied to any innecent individual, which does not assautially belong to it, and which is totally distinct from that natural opposition which all men make to soy violation of the feelings with which they regard the bodies of those whom they have loved and venerated when living. Let the Lono Justice Claus reflect, that, ao far from there being any natural connexion between dissection and punishment, in France, the bodies of men executed for crimes are not suffered to contribute to the advancement of science; that in France, executed criminals are the only class of men on whom the operation of dissection is not allowed to be performed.

CASES OF INTERMITTANT FEVER, IN WHICH BLEEDING WAR EMPLOYED IN THE COLD STACK.

By JOHN MACKINTOSH, M.D., Lecturer on the Practice of Physic, &c., in Edinburgh.

(Continued from page 111.)

CARE 21 .- Francia Trail, mtot. 26, prescuted himself at the Dispensary early in the beginning of May, 1823, in a pule and very weak condition, with awollen features, when he gave the following account of himacif:-He is a native of Ireland, and went to work at the harvest in Lincolnahire in 1827; remained there about a fortnight; at that time was in the enjuyment of good 50; face pale, and features contracted; health, and contioued so till the begioning tongue loaded, but moist. A vein was

at his work on the rail-road, near Dalkeith. About the end of February, he was seized with violent shivering, which was succeeded by great heat, and terminated in profusa perspiration; the peroxysma have continued ever since in the tertian form, and be has been unfit to do any thing, bia bealth and strength hecoming very much impaired. He was bled early in the disease, in the hot stage, without any remission of bia aufferings, and without preventing the accession of the regular paroxysms. The cold stage generally continued from half on hour to three quarters, and he experienced great auffering from poin in the head and lumber region, with aickness. Oo Sunday, 10th May, he was bled to 16 ouoces during the cold stage. During the bleeding the rigours cenaed, hut afterwards a hot stage took place, accompanied with pain in the bend and loins.

On Tuesday the 12th, on he felt light ond easy, and better than he had done for a long time, he walked a few miles out of town to see some friends, and he had a paroxyam, but which was not so severa as on former occasions. On Thursday be had another paroxyum, which was slight, quattended by rigors. After this period he had no cold stage, instead of which he felt languer, headache, sickness, and pain in the lumber region, in a slight degree; he recovered his health and strength rapidly, and in about a fortught from the time of the bleeding he had no complaint. He stated that his appetits was now good, his strength daily improving, and, at the end of May, he returned to his work cured.

Case 22 .- Dr. Cambridge, 29th Septemher, 1827, had repeated attacks of intermittent fever at Ostend, four weeks ago, at which place it was prevulent at the time. Since his arrival in Edinburgh, three works ago, he has had a daily paroxyam, and used the sulphate of quinine, without effect. His appearance is far from heing emsciated, but he looks pale and weakly.

The rigour came on severely at nice this morniog, accompanied by insupportable pein of head, shooting from temple to temple, inability to take a full inapiration, with acase of tightness across the chest. rigonra continued fur the space of three hours, and then censed, but the sease of extreme coldness, and other severe symptoms, continued. I was called to see Dr. Cambridge, and made my first visit at one o'clock, when his sufferings were still unmitigated. He atill felt cold; his pulse was wesk and appressed, 130 in the minute; respiration to flow; he expressed, in strong terms, his and he had no return of the disease, and his senso of the audden reliaf ha experionced; at the expiration of a minute he could dilate his lungs to the fullest extent. Eighteen ounces of blood were taken, which occupied three minutes of time, and before the arm was bound up all his unessiness had cessed; the paluful sensation of cold changed to that of a pleasont glow of heat, and the surface of the body was covered by a gentle moisture. No debility followed, and he was ablo to walk through the room; a brisk laxative was ordered.

30th. Had no heat of skin yeaterday after the bleeding; his feelings were comfortable during the remainder of the day; he massed an excollent night, and felt quite well this morning up to the moment of attack. The psroaysm came on at eleven A. M., and although he shivered smartly, yet he distinctly declared that he weat quite free from the head symptoms, and all the other very painful feelings which hed distanced him as for the same than the same th tressed him on former occasions, excepting the tightness and oppression at the chest. Respirations 36 is the minute. Pulse went, and not to be counted. Mouth slightly ulcerated, and complains of a bad taste. Tongue loaded, brown in the centre, and rather dry. Had four large dark-coloured and fetid evacuations since last night, which produced a burning sensation at the extremity of the rectum. A vem was opened, and blood was drawn to the entent of ten ha described, in poetical language, his relief, which was as sudden on it was perfeet. The pulse was reduced in frequency, and became much stronger, and ha said he was secuible of an increase of strength; indeed, he was abla to walk through the room immediately without support. In about un hour efter I took my lenve, the rigours returned with considerable severity, but unattended by headach, and there was little oppression in the ohest. He had some fever. and a sweating stage, The sulphate of quinino was again had recourse to, and he had only one other slight paroxysm. His health improved daily, and was som perfectly roestablished.

CARE 23 .- Dr. Cambridge mentioned to me, that after reading my first paper on bleeding in the cold stage of intermittents, which his met with on the Continent, he had an opportunity of was ing the life of a clergy. man, upon whum he tried the practice, with complete success. This geotleoun's health was reduced to the lowent possible chh, by repeated attacks of intermittent fever. He had tried bark in all its forms, and quassia and arsenic, without the least mitigation.

opened; immediately after, the blood began | Dr. Cambridge hled him in the cold stage, hosith was quickly re-established. This circumstance I have Dr. C.'s permission to mention, as wall as the particulars of his OWN CREE.

> I have been fovoured with the following ease of come, occurring in the cold stage, treated auccessfully by bleeding, by Dr. Heury Lucas, of the Royal Artillery.

Casz 24 .- Gmner William Smith, 9th Battalion. Admitted, Angust 16, 1827. In perfectly innenable; eyes fixed, pupil partially contractilo; respiration alow and deep; pulsa full nod alow; ekin cool, ospecially shout the lower axtremities. Is complotely inscosible to external atimull. Was brought from one of the guard rooms, where he had been complaining of feeling ill. He had attacks of ague. A veiu was opened in tha arm, and he recovered sense and motion on lowing six ranges of blood. He complehed of cold, though hy that time the skin was warmer. Twelvo ounces of blood were taken. Warm buttles were applied to the fect; cold lotion to the head; and a tur-pentine coems. In the evening he was found aweating. Bowels not free. Cathurtic mixture ordered.

17. Bowels moved once by the mixture. Pulse soft and full. Skin moiat and warm. l'ongne rather loaded.

Repent cother tio mixture.

18. Ilad distinct rigours last night, sucounces, which occupied four minutes of ceeded by increased heat of surface, and time: before no ounces were abstracted, awasting. Hu was discharged on the 24th, cured.

> Cases 25. and 26 .- The following is the extract of a letter from Mr. Brown, now assistant surgeon in the 52d Regiment, dated Jersey, 8th August 1827 : "Since I had the pleasure of hearing you lecture, I have, in three iontoneen, tried the effect of bleeding io the cold stage of intermittents, and twice with complete success. The patients were invalida, sent from Cihraltar for change of climate. One bad had an ogun for eighteen months previous to his cuming under my earn; mil at the time he left the deput for Chatham, seven weeks from his being in hospital, he had no recurrence of forer. In the third case I was not so successful; it was, I think, from the hungling manner I uprued the vein, I couldn't get the blood to flow \*.

Cases 27, 28, 29, and 30 .- Cork, Marlhorough Street, Wednesday, Nov. 14, 1827 .-Sir, The perusal of your paper upon the nti-

I have ulready shown bow difficult it is to open a vein during a rigour, from tho commution in which the body is thrown.

that remedy, in the only four cases of the discase which I have met with since. The disnase is of comparatively rare occurrence io this city, and never assumes a very sggraveted form. Three of the cases I sliude to were atout labourieg men; the fourth was a deli-cate girl about twelve yeers of age. None of them presected very dangerous symptoms. The most distressing symptom was severe paie in the head, which was generally most intense during the cold fit. The loss of blood, so far from causing collapse, or edding in any degree to the feeling of deblity which existed, seemed to produce quite en apposite effect. The patients expressed themselves immediately relieved, n gentle perspiration ensued, and they appeared as if revived by the influence of a generaua cordial. The bleeding, however, did not effect a cure, but the subsequent attacks were is ficitely more mild, and yielded in a short time to the exhibition of the arseniate of potane.

The beneficial effects of this practice fully answered the expactations which you acnounce; and I have nu heaitation is saying, as far as I nen judge from limited experiesce, that we are isdebted to your asgacity for a bold end unusually successful ienovaconstantly buffled nur heat directed efforts. You will excuse this brief communication, but I am aware that no reward is more grateful to a physician, than the sasurance faint. A but sed awesting stage succeeded. that his suggestions have received and merited the approval of his brethree.

I am, Sir, with much respect. Your obedient Servact,

(Signed) D. B. BULLEY, M. D. To Dr. Mackintosh, M. D.

Sin,-In consequence of having read, with great interest, your valuable paper upon the subject of bleeding in the cold tage of interesittent fever, which was published in the Edieburgh Aledical and Surgical Jaureal for April last, I resolved to adopt your plan of treatment, in the first cases of ague which should occur to me-Agee has not for meny years been cudemic in this neighbourhood, as that the opportunities I may have of further trials of your treatmeet will probably not be nunorrous. The results of the two cases, of which I take the liberty of seeding you so account, are very favourable. They uccurred to me io my practice on physician to the General Infirmary here. With a strong conviction that future experience will coofirm the cor-

lity of blood-letting in the cold stage of in-stice of medicine, by a distegard to long termittent fevers, induced me to resort to established prejudices and erroneous doctrinea

1 remain, Sir, your obedient Servant, Junas Malden, M. D. Worcester, July 27, 1827. To Dr. Mackintosh, M. D., Edinburgh,

has also been successfully trind by Dr. Ilaviland, the distinguished Professor of the practice of physic in the l'niversity of Cambridge, the result of which was communicated in me, with Dr. Haviland's permiasuch cases that I have the highest opinion aion, by Dr. W. II. Yates, formerly e most of the practice; hecause it will succeed assiduous pupil of enne, and now of Dr. when so other remedies will have the slight-The following are extracts from Haviland. Dr. Yates's letter: " Dr. Haviland tells the cases of Ward, to Mr. Marshall's case, me, that is consequence of your communiestion to the profession on the propriety of the Edinburgh Medical Joureal, as well ea bleeding is the cold stage of fever, ho was to the cases of David Lumbert, Robert disposed to make trial of it, having, as you Young, Dr. Cambridge, and his friend, tha would oxpect, frequent upportunities is clergyman, at Ostend. William Holland, thase low countries. His priceipal abjuct James Douachie, and Francia Trail, commuwas, to the first place, to ascertain how for nicated in this paper,

ago. He has for some time been wander- it was practicable; for when be read tha ing about the country, and sleeping in the account, it atruck bim that it was a practice quite consonent with his own views. He was always assured, that in these cases there existed causiderable congestion of the larger vessels, and that, could a portion of their contents be sifely removed, the general rean hour, and was succeeded by a hot stogo sult would be good. He has since tried it end profuso sweating. The pulse in the is several osses, with decidedly beneficial rigaur was 120 and very small. The bawels offects. But it is a practice which must have been very freely opened; stools of a not be omployed indiscriminately, and which is more osmentially beneficial in those cases in which there appears to he a disposition to inflammation of any organ. Under the cold fit yesterday. Whilat the blood such circumstaces, his pise is to wait the was flowing, the shivering diminished. The return of the next cold stege, and then to has atage followed, but lasted a much shorter take blood from the arm as circumstances: time than usual. The pulse was not per- direct; and in no instance bas it failed, and in eo instance bas be had reason to repent it. He is quite convieced that it is a vary safe practice. But whee the constitution is broken down, or the general health much impsired, from whatever caese, we should be esreful how we edopt such a practice, and it will not do in every case. I distinctly asked Dr. Haviland, if, ie these cases, be bad administered bark or quining; be distinctly asswared, certainly not, but that there were two cases in which he fullowed up the bleeding, after a lapse of time, by quieine, but in all the rest tho bleeding was treated to alone. In these two iestances, it was givee under particular circumstances. The Professor tried bloodlettieg in the tertian as well as the quartan sque; hut be considers it of the greatest consequence in the latter, as being more likely to effect o radical cure of the disease. 27. Had a short and a slight shivering I thought you would be pleased at this comyesterday afternoon. No but stage. Acc- mucicatiou, acd I cm sure, if you know Dr. Havilsod, you would be delighted with him. and consider his opinions of great weight."
It affords me the highest degree of ples-

sure ie cammunicatieg another extract frum this letter, although it is rather doobtful how far I may be justified in so doing; but the practice of mediciun, as taught at Camoppearance, and was discharged oured. | Irridge, has been so after ridiculed, and The praction of bleedieg in the cold stegn | particularly lo a late paper on mrdical edu-

<sup>\*</sup> Upou further experience, I feel perausded that Dr. Heviland will see cause to modify this opinion, for it is precisely in est effect; in proof of which, I may refer to and to that of A.B. in the 27th volume of

gical Jouroal, by Dr. Dunoau, junior, the neum, down to the nrethra, of obaut two former editor, that I think it only an act of inches in length, and acveral smaller incijustice. The communication is made to sions, or ponctures, in different parts of the mae by a geotleman well informed in every large acrotum. Firstid end dark-coloured urice part of his profession, sed an excellent pathologist for his atsanding, and one well qualified to judge of such matters. "I assure judical to judge of such matters. It assure you I was agreeably surprised when I same to Cambridge. I expected to fied Dr. Havisunder. Ordered Call of the profession of the pass a cutheter, but could not succeed. Ordered land full of Gulen und Arctmus sed book learning, but with little practice; instead of which, he is a very clerer, clear-headed man, of very extensive practice indeed, with very liberal notions; elways happy to conversa with those who apply to him; he hides nothing, for when be has been mistaken in hia diagnosis and opiolons, he does nut beaitate to poiet it out, und to comment upon it, which is the sure road to great-

I shall only add, that it is much to be wished three-fourths of the professors of medicioe in Great Britain and Ireland, were compelled to study for two or three years, under Dr. Haviland, in order that they might manly demeanour; and also that they might ace the superior advantages which a teacher possesses, who " enjoys on extensive practice,

## ST. BARTHOLOMEW'S HOSPITAL.

### EXTRAVABATION OF URING.

JOSEPH WISHART, wtat. 54, a shoemaker, formerly a suilor, of a spare nuhealthy habit, was admitted into Harley's Ward, under the care of Mr. Earle, October 21, at half past 9, r. M., in great agoey, with enormous disteoniun of the perineum, scrotum, and cu-verings of the penis. He had made no water siece the night of the 19th, when the swelling commenced soon after endeavouring to void his urine, and rapidly went on till it attained its present state. Has been was also given yesterday evening; dist sobject to atrioture for the last 25 years, for hourishing. which he has been in the habit of having 28 Complains very much of reatless-bongies passed. The difficulty of making ness during the night; appetite not so water has, of late years, much increased; good, and the pulse more feeble. Afr. Earle

cation in the Edioburgh Medical and Sur-parrived, and made an incision in the peri-

Calomel, gr. iij.; Opii, gr. j., statim;

with saline mixture every third hour, and hot and moist flunuels to the part.

22. Ten o'clock, a. s., greatly relieved by the operation, but slept little during the night; inflammation and distention diminished; tongue brown and dry; pulse quick : urine dribbles through the would in the perincum and incisions in the scrotum; bowels have not acted.

> Culomel, gr. iij.; Jalap, gr. x., statim.

Mr. Esrle saw the patient again about learn, not only how to read Aretmus, but to two o'clock, r. M., and, the bowels not havimitate his enodour, frankness, and gentle- ing acted by that time, ordered a common enema.

23. Passed a better night; bowels have heen freely opened; tongue mniater; pulse and who does not trust to the knowledge he still frequent; the swelling and distention has acquired in his closet from books. I sin subsidiog rapidly; the cellular tissoe around cerely hope to see Dr. Haviland soon trans. the wounds presents a sloughy appearance; lated into a aphere where the influence of has passed some urine by the urethra to-

his talents as a teacher will be more extee-sively felt.

25. Has had a very reatless night; toogue brown and dre; pulse feehle; much thirst, but no appetite; the aloughing of the would in the perioeum extending rapidly towards the scrotum; part of the prine escapes by the nrethra, but the principal part through

> 27. Better to-day; tongue moister; appetite returned; pulse of more power; the alooghing has extended couniderably iuto the acrotum. Mr. Earle ordered him yesterday to coult the salise mixture, and take the inflowing :

Ammou. oarb. 3j.; Tinct. cardam. c. 398.; Mist. Camph. zvau.; M. capiat coch. i. mag. moni tertia hura.

The bowels not ucting, a common enema

water man, it was your, much increasing ground to provide a factor for the alongh, which, extended freely into the akin and cellular years has not been able to retain it at all, tissue of the scrotum, and ordered the solution has been obliged to have convenience, thou of the chlorido of soda to be used. Go for its escape, at work. Mr. Farle soon on with the mixture.

30. The alongh separated this morning, attatim, and to be repeated in four hours, if and left a large excavated wound in the nacessary. Head to be shaved. perineum and scrotum; the aurface of tha wound is red, healthy, and granulating; viously ordered (but it had not been taken) pulse stronger; tongue mniat, though white; appetine improved, bowels open, nights. still disturbed. The urine principally comes through the wound, but some passes by the pania.

Nnv. 11. Mr. Earle attempted to pass n catheter two or three days ago, but did not ever, passing by the wound, which is granumeans of liut; half a pint of wine daily;

appetite and atrength improving.

in introducing a silver eatheter, which is night. Urdered to begin with the samon, to be withdrawn in a day or two, und carb, and mist cample, and to have the an elastic gum one introduced in its place, leatapl, sinapia repeated to-night. A plug is worn in the catheter, und the urine evaruated at pleasure. Some atill passes by the wound. Much improved in

health and apprarance.

Dec. 18. Since the former data, has been taking the sulph. quinine, and the general health attended tn. The opening in the perineum is not quite clased; a fistulous peaaage remaino, through which a small portion of urine escapes. Various applications hare been resurted to, such as the lotic cupri, lotio argent, nit., and the bais. Peru.; the latter is now applied in the wound. The catheter has been increased gradually in size, and is still retained in the bladder. General health now pretty good, and all going nu well, though ha is unable to leave the hospitel yet.

PATAL CASE OF PRIEGMONOUS ENVEIPFLAS OF THE FACE AND SCALP, TREATED BY STIMULANTS!

Richard Humphrey, at. 43, a coal porter, atontly made, and a great porter driuker, was admitted into Luke's Ward, Dec. 8, with phlegmonuus erysipelas of the upper part of thu face, extending over the forehead. The integuments of the nase and eyelida are exceedingly awriled, red, tense, and shining in appearance, so that he is unable to men his eyes. The inflammatiun extrude upwards over the forehead and duwnuards un the threks, the integuments uf which are also much swelled. States that the awelling cummenced about aix days from the aurisces, when divided. Slight ago, effer having felt unwell for u few days purulent deposition was discovered over the previously. Tongne brown and dry, skin lett temple, un cutting into the substance of hot, and pulse frequent. Complains of pain the scalp. The vessels of the dura material that head. Ordered by Mr. Staoley, who strended for Mr. Vinceot, but and moiat membrane was very opaque, and elevated flannels to the part, cal. gr. iij. jalan gr. xv. by serous effusion ioto the cellular texture

Mr. Burnett, the bouse-surgeon, had pre-

Mist. camphor, 3ias. omni 4ta hora.

9. Passed a very reatless night, and urethra. Continue the mixture and catepl, became delirious towards this morning. Nn complaint of pain in the head. The inflammation and awelling have extended over the acalpmand around the ears, but aucceed. The greater part of the nring seem rather diminished below the ayes. escapea now by the urethra, some, how. Pulse frequent and feeble. Tongue not so dry as yesterday, but covered with a clammy lating, though somewhat alowly A weak adheave mucos. Bowela moved last night solution of orgentum nitratum applied by after the cal and julap had been repeated, eans of liut; half a pint of wine daily; and have acted copiously this moraing, petite and atrength impraving.

15. Mr. Farle, with difficulty, aucceeded sinapis applied to the cape of the neck last

10. He became so violently outrageous towards yesterday evening, that it was necessary to have the atrait-waistcoat put nn, to confine him to-bed. Hua been talking incoherently, at intervals, during tha night, yet answers reasonably when ques-tianed loudly, and puts out his tongus when desired. The catapl. ainapia was applied both to the threat, and napa of the neck. Two doses of the ammon. carb., and mist. camph., have been taken, and it is now

ordered to be omitted.

This morning, by Mr. Burnett's direction, n blister was applied to the summit of tha head, and an injection of house-physic given, which bas ected freely. The bowela were not moved before, since yesterday morning. Subsequently, the dresser ordered cal. gr. iij., pulv. jacobi. gr. iv. statim m-mend. The inflammation has not extended, unless slightly backwards. Pulse full and quick. Tongue dry.

Mr. Stanley saw him about mid-day, and ordered a blister to be applied to the nape of the neck, and the pawders to be eantinued every five or six hours. Continued outrageous and atraggling till about ten minutes heferr twelve o'clock, r.u., when he became endilenly calm, and died at twelve.

Post-mortem Examination of half past Tiro o' Clock.

The scolp was excessively thickened, and a thin turbid sero-fluid oozed plentifully

of the piamater. The anbatance of the year ego, he became subject to what is pobrain excessively vascular. The veutricles jularly termed "white awelling." Leeches, contained a considerable quantity of fluid, fomentationa, cupping, blisters, &c., were Mr. Stanley, on exumining the abdomen, discovered a double hernia on the right aide ; one see apened through the external, the nther through the internal, ring, and the epigastric artery ran upwards between them. The liver was dork-coloured, and soft.

ARM. .

Mr. Lloyd, on Saturday last, removed the left arm of Edward Sharpe, at the Inferior third of the humerus. The patient, at. 23, a coal porter, was admitted into Henry's Ward on the 31st of October, under the care of Mr. Lawtence, with a large sloughing ulcer of, and fongua growing from the forearm. About twelve mouths previously, a small tumour made its appearance on the middle of the forearm, which gradually extended to an enormous size, and proceeded tn the state in which it was on admission. Two or three pieces of the radius came away through the opening, by exfoliation. On the 12th of November, Mr. Lawrence having made up his mind that the disease was malignant; and being about to leave town, requested Mr. Lloyd to remove the limb on the following Saturday, should be concar in the propriety of the operation. The intumescence and inflammation of the arm having, in some degree, subsided, and the opening having acquired a somewhat healthy appearance, Mr. Lloyd got Mesars. Vincent, Earle, Stauley, Skey, and Wormald, In performing the operation, Mr. Linyd the tourniquet on the oatside. WESTMINSTER HOSPITAL,

AMPUTATION.

resorted to without effect. Puz was secret-ed within the capsule, and an appairing was made for its exit. The man being of a scrofulous habit, his health gradually declined until hia admission.

The liver was dork-coloured, and soft.

A profuse discharge of uffeasive matter proceeded from the joint, and twn ainases extended up the thigh, nearly as far as the trochanter major. The probe did not indicute caries, but the nature of the discharge affords strong evidence of its existence.

On the 6th instant, Mr. White performed the operation. The man was placed in the naual posture, and a tourniquet was applied hy Mr. Harding ; the circular incision was begun about the middle of the thigh; the first cut penetrated a sious, which contained about two nunces of matter. On dividing the femoral artery, a jet of blood issued out with such force as to go over the operator's shoulder. Sir Anthooy Carlisle immediately jumped from his sent, and screamed out,-"The arroy is bleeding! the arroy is bleeding! Stop it, for God's sake, Mr. White, or the man will die uader your haads! Stop it, or he will bleed to death before our eyes!" Mr. White, fortunately, did not participate in the slarm of the "humble" knight, bat, with great coolaess, laid hold of the artery with his finger and thumb, and immediately secured it, observ-ing, "That there was nothing which a surgeon ought more to be on his guard against than sudden panio; indalgence in such a to see it, who all sgreed that, at any rute, the weakness (he observed) might lead to seoperation, at that time, ought to be deferred. From consequences, and would certainly inoperation, at that time, ought to be deferred. Though, for some time afterwards, the apputation of the thinds are the limb, jet, at late, decidedly in curble apputation of the families apputation of the families apputation of the femoral artery, and placed in performing the operation, Mr. Linyd, the tourniquet on the outside. Dossils of

Dec. 20. The stump appears healthy, but the general appearance of the man forebodes the development of phillisis.

Samuel Pickering, ætat. 29, admitted 26th March, 1823, under the care of Dr. John Bright. He states, that he has been sub-CHRISTOPHER START, 37 years of ago, ject to palpitations for the last year, which came in 20th Nov., for the purpose of having were aggravated by a cold caught on a jour-his leg amputated by Mr. White. July 6. Gradually became worse; occa-sional expectoration of blood. This morn-April 9. The continued use of the digi- log, five o'clock, on making an effort to talin has produced an effect. Pulse weak, reach the close-stool, ha suddenly lost all irregolar, and intermitting; profuse perspi- sensa and power of moving. The face beration; nausea; swimming in the bead; came livid; popils dilated; respiration ster-cough relieved. The following mixture pre-torous; both temporal arteries were immediately cut. Ha expired in a few minutes after the commencement of the paroxysm.

### Sectio Cadavaris, thirty hours after death.

The mucous membrane of the largux was rough and thickened; the traches end brachim of pretty natural appearance, except that the smaller branches of the latter contained e few clots of blood, sad much iuspissated mueus. The lungs/erepitated, nearly throughout; they did not become collapsed on opening the thorax, and were found engarged with bloody scrum, which flowed out in great quantity when the luog was cut into. The branches of the pulmonary srtery appeared dilsted. The heart was found of enormous size; at its hase, tha dinoteter was six juches, the eireum ferenca lifteen, and from the tip of the right suricle to the apex of the left ventricle, were seven inches; aono of the cavities were greatly dilated. The walls of the left ventricle were, probably, an inch and a half thick; sll the valves eppeared bealthy, except the semi-lunar valves of the sorta, which were thickened, and puckered up lute fringed edges. The inner membrane of the arch of rough, sad thickened, end cootaining numevessel was not enlarged. viscera appeared healthy, except the liver, which was of larger than ordinary size.

### BRUISER AND PRACTURES.

Jacob Burkitt, ætac. 45. a mason, admitted October 11th, with acvars injuries, occasioned by the falling of a brick wall. There was a wound of the scalp three inches long, a little higher than the pinus of the left ear ; about a square juch of the tegument was detached from its convexion with the parietal bone. The left clavicle was fractured about its middle, and severe bruises existed over the deltoid and pec-toral muscles. The 5th and 6th ribs of the left aide, and the 5th, 6th, and 7th of the right were fractured near their angles. The uloa was broken shout a third of its length from the head of the olscranou. A contused wound laid bare the externol condyle, but did not communicate with the joint. Countenauce pale; pupils contracted; respira-tion unequal; pulse small and weak; ex-tremities cold. The wound of the scalp was clused with a suture, and simply dressed; a baodage opplied round the body; the frsctured forearm treated in the cuatomory manner. One ounce and a half of brandy was theo given. Six huura after admission, he bad partiolly recovered from collapse; pulse 80, moderately full; psin of head and chest, tain fidgetty movementa, evinced consideraadministered. V.S. ad 3xij.

cotion of leeches and fomentation. unconflord.

blood, and some pus, treely flowed from the gaslies. Calouiel and colucynth; saits ond

17. Considerable discharge of pua. Tuthe fever hun declined. Mr. Guthrie again divided the sculp so as to connect the lougitudiual with the transverse incisious. About four ounces of bloud trickled away.

18. Much relieved by the last inciniona. Pupila natural; pulse 104. Ordered to

The abdominal | occasional aperients and nutritious diet. quantity of pus, which had bagged in the common tegument, opposite the transverse ridge of the occiput, was let out.

28. The patient continues to improve. An abacesa farmed under the clavicular portion of the great pectoral muscle, which while it lasted greatly inconvenienced him, but which hea now entirely disappeared. He is allowed eight ounces of wine daily, and fund ad libitum both in quantity and kind.

Dec. 17. Convolencent. The wounds of the aculp have healed, and the hones of the clovicle and furearm have united without defurnity. He walks about with the help of a staff.

### STRANGULATED HERMIA.

Jomes Bingley, 50 years old, brooght in 15th October, with a strangulated ecrotai beruia. The tumour was of extraordinary size. The usual symptoms of atrangulation were present. The man hol bod reducible bernia fur eleven years, which at four o'cluck in the afternoon preceding his admission, descended much lorger than usual, and became excessively psinful. Clysters, warm baths, bleeding, and the taxis, being of no avail. The "anthor," assisted by Dowager Lynn, determined to enact the operation. Before commencing, the operator, by cer-Brandy discontioued. An aparient dose ble auxiety, occasioned prabably by the reminiatered. V.S. ad 3xij.

Mr. Guthrie made to return the protruded viscers. The openthree incisions down the cranium. One ing into the abdunieu was agoin and again three inches and a half in length in the culurged, so that the operator's three course of the sugattol suture, the other two fingers, which are none of the thinnest, at a right angle with the first, and of the could easily pass into the belly, but as fast same length, extending from the coronn on ns one portion was returned snother propitis towards the ears. On introducing the truded. The patiest had now been fifteen finger, a frocture of the left parietal bone minutes on the table; the umentum was quite was perceptible. About aixteen ounces of cold, oud the epiphnic veius were distended to the utmost. Mr. Guthrie, who cumplained of the perpetual atruggles of the patient, resigned, with somunlight chagrin, his post to his micient colleague. This Nestor of surmefaction of scalp lessened; has slept well; geons hed actively assisted in the operation; he carefully examined the aituotion of parts, ond, with considerable duxterity, returned knurkle by knuckle into the obdomen, nut withdrawing the pressure of the finger, ustil each aucceding portion of intestins was pushed as far on an to prevent the regress of take aulphate of quinine three times o day, its predecessor. The operation was completed in the usual manoer. On being pot the npening of the left fallopian tube was to bed, an coems of salt and gruel was ad- readily futued, but not the slightest trace of ministered. In the afternoon, pain and tenderness of the abdomeo supervening, he was bled to twenty nunces. Under antiphlogistio treatment, all unpleasant symptoma disappeared.

10. Convalescent.

## HOPITAL ST. ANTOINE.

#### EXTRA-UTERINE PERDNANCY.

Augustina M., mtst. 22, of a strong and plethorie coustitution, bad, about a year before her admission, miscarried in the seventh month of geststinn. Since that time she had anjoyed pretty good health, and become pregnant for a secood time. In the fourth mouth she began to comploin of pain in the luins, and general debility, which apparently slight symptoms had existed for no mare than two days, when, on the maraing of the 15th of October, she swokn with a very violent paio over the whole abdomen; alm was immediately brought to the Hospital and placed under the care of M. Rayer. Her countenance was pale, sod expressive of the greatest saxiety; tha lips were livid; the tongua moist; the sbdomen swallen, and very tender on pressure, especially at nor dilated; the uterus was somewhat enlarged und tender; the pulse was scarcely to be felt; the extremities were cold, and the patient had frequent attacks of syucape. In the afternoon of the same day, the symptoms still incressed in violence, and in the evening she expired, apparently with all the signs of internal hemorrhage.

On essinination of the body, nearly two piuts of fluid blood were found extrevassted in the abduminel cavity, ond a triangular congulum of considerable size, extending from the small pelvis up to the umbilical regioo, was found coveriog the lower half uf the abdaminal viscero, end, oo a closer inspection, oppeared to originate from the uterus, by means of a thick pedicle. This cungulum having been carefully removed, a fortus, five inches in length, was discuvered in the left ilioc regiou. The uterus was enlarged, and exhibited twn tumnurs, separated by a longitudinal incising; that of the right side was the largest, and ruptured on its upper portion; between the edges of cord were inserted. The oeck of the uteros was obout an inch in length, and slightly diluted by a gelatinous matter; o probe being introduced from below upwards, enboiog opened, was seen lined with the mem-

readily fuund, but not the slightest trace of the right tube, or of any communication with the right tumour, could be discovered. It was perfectly separated from the left half of the uterus by mesns of a septum, of about an inch in diameter; the tumour itself was eleven inches in its transverse, three inches In its vertical, nod one inch sod a half in its antero-posterior diometer; on being opened by a crucial incision, it was found to contaio the feetal membranes and the placents, which were somewhat protruded towards the rupture. The left fallopian tube was healthy, but that of the right side passed towards the lawer portion of the tomonr on the right side of the uterus, and was tutally obliterated. It sppears, then, that the foctus was developed in a morbid cavity, formed in the substance of the uterus, having no communication with its cavity, and that the case belongs to those of interstitial extra-nterine pregnocy, which was first described by Mouridesu, Schemit, and Albert.—Journ. Hebdomed.

## HOTEL DIEU.

### LITHOTOMY.

N. R., about 50 years of ege, had been the sides. The os uteri was neither painful in the habit of evacuating calculi of considersble sise with bis urine, till within the last ten years, when, this discharge having ceased, he had suffered much from dysnris, and violent pain in the bladder and glands. When examined by M. Dupuytren, a sound rould scarcely be made to enter the bladder, at the neck of which it was arrested by a hard substance. A floger introduced iuto the rectum, discovered s salid body of considerable size, which could also be felt by pressing on the hypogastrium, and was oppurently about two inches in dismeter. The patient was simost constantly in paio, sud obliged to make water every five minutes. The operation having bean decided nn, was performed in the following manner: -A staff, curved only far about on inch at Its extremity, was introduced, and carried between the stone and the bladder, so that its groove could be fe hby the finger in the rectum; an incision, 1f oo inch and a balf, having been made in the perineum, and through the sphincters, a bistoury was inserted into the gronve of the staff, and this rupture, the congulum and umbilical carried un, so as partially to divide the cord were inserted. The oeck of the uteros neck of the bladder. Through this opening, the dnoble lithotome caché was intraduced. sod, by retracting it, the bladder was opened transversely to a considerable extered the left portion of the uterus, which, tent. M. Dupuytren then grasped the stone with the forceps, and, while an usaistant brane decidus. This having been removed, forcibly depressed the hypogestrium, tried

to extract it. This, bowever, after many fruitless attempts, be found impossible. The patient was thurefore removed from the table, and put into the warm both; a few hours ofterwards, 24 leeches were epplied to the hypogastrium, and the warm bath was repeated; in the evening he was bled, and placed a third time in the hath. On the following morning the pulse was very full and strong; there was no shivering, any febrils excitement, or pain of the abdo-men, but the patient complained of sickness, and pain in the rectum. On the third day the iliac region became painful, the nauses continued, the patient was in a state of the greatest debility, and complained of much pain in the wound. The atom heing found to have descended a little, e vertical incision was made in the hladder by n probe-pointed bistoury, and, after several fraitless attempts, it was at last extracted. It was of no oval form, two inches and a quarter in its largest diameter, had an even surface, and weighed five ounces and 36 grains. After the extraction the patient complained of great dehility, thu pulse was very amail, the countenance pale, &c., and ho died on the fourth day after the operation.

On examining the perts in question, the cellular tissue of the perineum was fund infiltrated with pus; the bladder, being small, thickened, and of a fungoid appearance, presented some traces of old ulcerotious; the kidneys contained a great number of cyats, of the size of a filhert, filled with pus and adipocerous matter,

### MUTILATION OF THE CENTRALS.

F. B., a middle-oged man, having attempted to destroy himself by amputating the penis, was brought into the Huspital. The hemorrhage was inconsiderable; some ligatures were applied, and a catheter haveing been placed in the ur-tira, the wound was simply dressed. On this occasion M. Dapaytren related the case of a man who, in an attempt to suicide, having made an incision through two thirds of the root of the penis, was placed under his care; the divided parts being kept in close contact by autares, perfect re-union took place, but the corpus cavernosum obiiterateu at one side, so that this man, when perfectly cured, offered the singular phenomenon of a somilateral erection. In another case, a little ! boy, who was almost cumpletely an ident, i put a string round the jeuis; the skin und nrethra horses become gancienaus, as nin-ficial opening formed, through which the urine passed; the corpora cavernous had become completely obliterated under the li- il gature, and the root of the penis only was capable of erection .- La Clinique.

### DRONCHOCKLE.

Benj. Chavre, a native of Savoy, eight-teen years old, of a lymphatic constitution, had, from his fifteenth year, when he at-tained to puberty, been affected with bronchocele, which soon reached such a size as to produce cansiderable dyspuces, frequent attacks of suffication and hourseness. Buing admitted into the Hotel Dieu, the tumonr was found so large as to occupy the whole space between the middle of the neck and the clavicles; it was formed of two labes, and lifted up by the pulsation of the caro-tids; in its substance, also, an alternating enlargement was visible during the arterial expansion. The general health of the patient not being affected, he was put ander a course of iodiue, of the tincture of which he took from six to ten dropo daily. Thu tumour grodually subsided, its lobes became moin distinct, the which more natural, and the difficulty of respiration cressed altogether. It is worthy of rumark, that under the use of iodine, the genitals hecame, as it were, atrophic, and that elections and pollutions to which the patient had formerly been very subject, were naver observed during this time. La Clinique.

## LECTURES

ON THE

GRAVID UTERUS, AND ON THE DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT GDY'S HOSPITAL BY

DR. BLUNDELL.

## LECTURE X.

Diseases of Gestation concluded .- Dymepsia.

Drumo pregonney, patienta ara somotimes affected with dyspepsis, to be treated on the some general principles as a dyspepsis, apart from gestutiun, though the following remarks may be worth your coosidera-tine:—Io dyspepsis, purgatives are not in-frequently advised, nor ought we to forget that the milder should be used in the cases through the body, from the sternum to the to which we are bera referring, especially to points of the blada-bonas. Vomitings are to occasion it. Nor let it be forgotten, that | distressing. this remedy varies much in its effect on different persons. I yesterday saw a lady your patients are occasionally assailed,

whn told me that also knaw, from sxoerience, that if aho were to take but two or three grains of calomel she would be completely under the mercurial influence, and, on o mora minute inquiry into all circomstances, I found this to be correct. On the other hand, now and then you meet with patients that you can scarce briog under the mercurial action, under any administration of the blue pill; and, consequently, on the influence of mercury is produced in some constitutions with such surprising facility, and as there ore some refractory countitutions which so powerfully resist its operation, you nught to proceed with no little caution, unless you are acquainted with the constitution of your petient.

Heart-Burn .- With very severa heartburn, women, when pregnant, are sometimes affacted; great haot of the stomach, a great deal of pain, accompanied with a drawing which seems to approximate the pit of the stomach to the spine, with pais shooting to which we are evering, especially 10 points of the blade-bones. Vomitings are women known to be prone to miscarriage, on the cocor, and vary strong scililities may be according to which, on me occasion, I gave in the back part of the mouth. When you sament; the symptoms seeming to demand it, bars a symptoms of this kind, concurring Emetics, too, may be required in these cases; with much acidity, there can be no doubt but they should mever be used without a last to the nature of the disease; and after clear necessity con he established, and the clearing the bowels, which may be neces-milder are to he preferred. I su not sun sary, entacids may be properly soough adthat there is so much danger from the use ministered. Lime, chalk, sodu, magnesia, of canciles which are active as from active may all be employed in their turns,purgatives, for it is certain that women, chalk, if you wish to shut up the tubeduring geststion, sometimes hear comiting magnesia, if you wish to open it. Among and retrining authorizingly well, as in those our various antacid compositions, there is spontaneous morning attacks of which I was one furor which has been recommended by yesterday trenting. In dispension you may Simms, Denman, and others, and, using at deem it necessary to have recourse to the on their outburity, I have tried it with combine pill, and other smaller remedies, and siderable advantage: -the drachm of the in these cares you must be very careful burnt magnesia, one drachm of the aqua that it du not give rise to any lock degree ammonio pore, three courses of the usua of salivation, because, as I have just been ob-1 commona, and five and a half of simple aerving to you, more expansibly where there water? these are to be mixed, and the pa-ina pronunesa tomocal risga, the higher do tient may take two table spansius of the grees of mercurial earliement are supposed mixture whenever the associous are most

Fastidious Taste. - With fastidious tastes

and wamen, sometimes, have a longing for womb in the earlier period of gestation, if thecefore, the wars of nature, ought never jugaiosi any further attack. to be unreasonably opposed.

perious of pregnancy, constipation is he no accompanying. This arises from three causes; cersory to secure the patient's health. I am incour or the uterus, though but a little way, nerally, however, recommend that the lew-runder which at brings down the varing a fortaight before derivery is expected to the vagina, so as to distort it and obstruct, take place, because then I think, the bowels These I believe to be the more immediate being thoroughly clemed, the delivery may enoses of the discuse, and liberding from the being thoroughly chairs, and freed of some jum, leaches above the symphysis pubis, inconvenences. If a prominess to constitution the continuences in a prominess to constitution of the quitals, and the parta-pution exist, some laxative thould be at above, confinement to the indixontal peahand to requiate the intention! tube. If the ture, and drinking very freely of the diluform be putatir, rhoberth may be prescribed, jents, so as to ditter the arine, may, I think, with some small quantity of caloniel; if a he looked upon as principal remedies. Soda mixture, caster of may be preferred. Salts, and avoi arisi may be tried.

lier and muidle parts of gestation, but more calculus of the ordinary size; but in the commonly in the entiter. They have a leel-bladder a calculus may form, even larger ing as if something would issue from the hedy, that no pullet's egg, and such an one I was with hearing and arbing across the sacrum, shown by a very excellent practitioner, Mr. and sometimes over the frost of the abdo. Hipple, of Mitcham. This atone was re-men. In the greater number of cases, where moved from a woman supposed to labour un-the patient labours under a descent of the dur cancer at the time, the symptoms being

certain kinds of food, and, more fre- she lie on a sofa are is relieved, and at the quently, they become the subject of in- end of three or four months, when the tipathica: these, indired, are more common womb, acquiring a larger bulk, finds test than the former; some, when gravid, can upon the brim, a complete cure may be obnot bear sugar, some butter, some tea, some ; tained. In rarer cases, however, the pelvis wine, and so on. Of these festitions tastes being of very large size, the womb conti-I have to remark, that when they can be aues to descend, and then the horizontal gratified, I think we ought by all means to posture, and perhaps a pessary, may be c mede, more especially with respect to resorted to; though I believe it is very antipathies. I do not think a woman ought acidom that a pessary becomes necessary, to be ridiculed, or urged, 5 the use of those and caption must necompany its use. In things to which she feels a strong and in-some cases, too, the womb being duwn in the automountable repugnance; of and h experi privis, remains and grows there, and makes ments I cannot approve—why should we a strong impression on the surrounding and make them? Even in unimals watch, to do postiguous viscera, and becames incareethem justice, are free from affectation, con- rated in the carrity of the pelvis. Reteaspiceous changes of taste are observed during from of urine concurs. In such cases, a gestation. This change becomes manifest, in catheter, small and flat, may, with proper a high degree, in the rabbit, than which no caution, be introduced into the hindder, and animal can be more clearly of herbirorous the urine heing drawn, to the unount of nature, for the rabbit in all cases, after de- two or three pints, sufficient room may be livery, devours the inter-birth, that is, it made for the ascent of the uterus; after becomes cornivorous; and thus, I auquese, which, by a little well-duccted pressure is the reason why she so after destroys her upon the os uter, the womb muc be ushed young also; for, finding the placenta a very above the hrim. When once replaced, the delicious morsel, she is afterwards impelied worth is not likely to descend afresh; for a stack and devnur her young too. Now, the very conditions of the case imply that in the same marmer as maintals become the the uterus is grown too large to admit of easy subject of these extraordinary appetites, lodgement in the pelvis, so that if the patient women also may have their appetites, in- be cautined for a week ut two to the horiflornced by certain changes of the nervous zontal posture, the worsh menotime growsystem, resulting from gestation, and these ing, she becomes accured, in consequence,

Metarition is very common in the endur or Constitution. In the earlier and mindle middle permis of pestation, dysario, perhaps, menus it common; and, by some, this sixte the first, a certain irritability about the of the body has been asserted to be natural neck of the hadder, derived, perhaps, from to gestulant. If the bowds are opened with the dreus producing a tendency to special regularity once in the day, or three times in the second, a bearing of the uterial upon the two days, probably this is all that is not like neck of this organ; the third, a deels should be upened more frequently about and methra, which is in connexion with

are cold and flateient.

[ Calculus in the Hindder, during pregnancy,
Pealope & Uters - With prolapsus uters, is exceedingly rare; yet this, however,
patients are nonetimes affected in the ear-idea occur erasionally. I hera show you a

produced by this great calculus. A calculus | digestive organs and nerves. In dry cough, of very small size would, must probably, but paregoric elixir, to the amount of a drachm, occasion any material inconvenience during will sometimes give present relief. The delivery, but, if larger, it might obstruct hydrocyanic acid, to my mind, deserves a parturition; and the bladder too, being trial though I have had but little experience compressed and bruised between the coiru- in this medicine. has on the one hand, and the head of the Convalsions .- During programmey, women fortus on the other, a slough of the vagina are sometimes affected with convulsions, a and cervix region might ensur. In all cases misease I considered very largely in a prewhere the calculus is large, it is very de- coding Lecture, and I forhear, therefore, to airable that it should be taken away before enter into that topic again. Where condelivery occurs. Now, by the operation of ruleions do an actually occur, there is lithotomy, it may be removed, or more sometimes a very obvious tendency to the safely, perhaps, by dilutation of the arethen; actack, finding of the face, threshing of an operation which has, for the last twenty, the carnids, severe pains in the head, years, hern recommended from this chair, and scusations of the brain, as if it were and which has, of late, been admitted into two large for its receptacle, which, indeed,

middle or latter period, and a cort of jann- kind, are bleeding from the arm, or the dice which is to be referred to gestation hape of the neck, or temples, by cupas its cause. Where it merely arises from piog-glasses, or by beeches, and then the gentation, it is to be ascribed. I presume, to! warm bath, with purgatives, to rhaps emethe pressure of the uterna, which, not com- ties, and, ultimately, when the skin is open, ing in contact itself with the luliary ducts, anothers. I aloud not use the warm bath may, however, press other parts, the inter- | till ble-ding had been premised. The whole very they are cured, for the pressure is then fore. taken of the ducts; and even before deli- (Montalein .- Wanton may suffer severely tentines, and the vellowness disappears.

best remedy I know of is bleeding from the the effect of oriesting the disease, an that arm, leachings, uplum, hyacinths, or other throughout the remainder of her gestatino, anodynes; laxatives may be taken to keep she continued almost entirely free. the howels regular, but not to disturb the

more general practice.

Jaundin: -- in pregnancy, your patients of the blood flowing into it too copiously, are sometimes affected with jaundire in the like best remedies for aymptoms of this

times, for example, against them. At deli- of this important subject we considered be-

very, this port of jaundice may cease about from edental zia, in the course of pregnancy; the 6th or 9th mouth, for the words enlarge and though the teeth are all sound to aning in its size, nod altering, perhaps, its its pearance, yet, night after night, there may shape, gets a bearing on other parts than be severe attacks of the action, so that the boury ducts, and these causis become, while sit the rest of the family are copying ing persons, the gall escapes into the in- other recose, our luckless patient is obuged to get up and pure the chamber to cool the Dupmen.-In pregnancy, where the stor evanem, and quiet the irritability under which much is cincased, or where your patient is she labours. From this pain, the whole law lughly hysterical, she may become adected may suffer severely. The extraction of the with dyspnora; and the attacks may be and tooth, in cases of this kind, is out of the den, and alario her so much, as to give her an question ; if there are none of theor ohviimpression that she is going to one; nor to onely affected, and even if a tooth were pulpitation infrequent, and, tuneed, this is enrious, I should besitate before I had reiont probably the more immediate cause of course to this operation, believing, as I du, the disease. This disease is more abruing that it is amribable to a cermin state of the than dangerous; it scarcely ever destroys nerves which pregnancy produces, rather line, though, awing in a disorderly action of then from the condition of the tooth. Burns the heart, it may produce sensations of says, that miscarringe is reported to have fainting and death. Opinin, effect, and followed extraction itself. The violatile other remidies of that sort, are calculated inecture of valerica, bark, and carbonate of to moderate the risletce of the symptoms, iron, are principal comedies here. Would datteution must be paid to the onet.

With cough our patient may be affected was once called to a young Greek lady, a during pregnancy, and here I don't make the Smyrmote, at the other rad of the town, ordinary catarri, which cures itself, and suffering violently with this disease, night passes off in the course of two or three days, by night, so that she could get me rest; all but I mean sovere coughs, accompasied with the ordinary remedies had been tried, in great afflex of blood to the head, and attended ordinary doses, but in value; I kave her the with a great deal of pain. In those cases volatile tincture of valerian, and bark, as where the abdomen is much shaken, the largely as the stomach would been and with

Very copious seliration will sometimes

occur duting gestation, and where the palturing the membrane and discharging the nicut has not taken one grain of mercury. I water, because in the later period of gestaawine case of this sort, which strongly re-awine case of this sort, which strongly re-sembled mercurial ptyslism, but the factor tion, may still carry the child the full was wanting, ond the guns were not offer the factor tion; if, however, the droppy occasion much of the salivary apparatus. If the quantity pala and incooverience, so that something of saliva is not very great, the patient may awallow it; and in that manuer, perhaps, that I knaw, is to disclusing the fluid, so d she may molecule complete the subspection. It is may be done to disclusing the fluid, so she may moderate somewhat the exhaustion, this may he done by opening the mam-which would utherwise occur; my patient, branes, either extensively, so as to emit the however, accreted the salies so plentifully, whole of once, or hy making one or two small that when she awallowed it the stooned punctures, so as to disclarge it by degrees, was offended, and a vaniting ensuel. Now it be latter being the safer, though the more should the salive be formed in very large tedious mode. A bandaga should be prequantities, and should the system saffer pared, and tightened as the water is discounsiderably in consequence, I should re-charged, atherwise syncope and collapse commend the induction of delivery, which, may be produced. That of my friand Mr. in all probability, would cure the disease; Guitskell will answer very well. but where the secretion is smaller, a remedy Your patient during gestation may suffer a of this kind would not be justifiable. A good deal, in consequence of rigidity of the meddlesome midwifery is bad. The patient addoness, particularly in the first pregnancy. did well without.

Mastedonia. - In the first programov. the breust called mustodynia, sometimes to he felt particularly about the edge of the referrible to a sort of tendency to infismmstion; for, io the first pregnancy, e large and raind development of the breast may oc-bused with the hepstic doctrine, tha liver, of cur. tha mamma becoming two or three course, becomes the scape-goat, and blue times or large as hefure marriage. When pill is the medicine prescribed. the woman auffers severaly from this, I would recommend leeching, bleuding from the erm aparingly, fumenting, and the ordioury remedies for slight Inflammstory If the disease were inconsiderable, I should use friction, with oil, perhaps a little olive-oil and camphor; io ganeral, poultieea, fomentoticos, tineture of opinm, and oil mixed together; but, fur such cases, pa-

tience is the best remedy. It was observed in a praceding lectore, that whenen are sometimes affected with dropsy of the ovum, a disease which I have now seen repeatedly. Perhaps a pailful of water moy collect in the cavities of the uterus, and under this disease sudden slarming symptoms may occur. The abdnmen may fluctuate as if from ascites, so that the tenderness of the obdoman; perhaps when you touch it there is outery, and independently of the pressure, the saffering may be great, and there are pains as of partoritioo. Suspecting what is the nature of the you make your examination, and when you in keeping the aterus in its place, muy, in general, clearly feel the membrace False Pains -- You will now and then be muy, in general, clearly feel the membrace lying to the na uteri, stready begun to dilate. called to women, in the course of preg-If the dropsy of the own is not considerable, you are not justified in rup-siderable, you are not justified in rup-

Thnuterus growing very fast, the abdominal enverings do not grow in proportion, and women may ouffer a greet deal of pain about this produces o distention and unessiness, ribs, or supposed to arise from the state of the bladder, and if you are thoroughly im-

If you can clearly refer the pain to this over-distention of the abdomen, and the rigidity of its coveriogs, lesshes over the sbdomen, positices, and shatractions of blood from the arm, will be found the best remedies, if, indeed, remedies be required.

Some women are labouring under an offection just the raverse of the preceding, I mean on exceeding laxity of the abdominal coverings, so much so, that sometimes when they are pregnant, the womb, not being duly supported, falls to thu one side or other, or forwards. Much ralief is obtained from lying recumbent un the sofa, but, independently of this, you may sometimes help the patient by meons of a well-contrired corset or handage, which the cornet-maker may be dirocted to cuntrive; in general, women will first impression on your mind is, that the make things of this sur better than the aut-dropay is uf the peritoneum; there is, geon's instrument maker. In short, any too, aometimes a great deal of pain and thing that will give a general amport to the abdoined, and throw the beoring upon the apine, may be found to answer very well. Sometimes, besides the support which is given by the bandage with the cornet, a very broad busk, as it is called by woman, that is, disease-from the oudden enlargement of the a broad leaf, or lamella of steel, placed in alidomen, from the repaired pregnancy of the stay over the yielding part of the alidnthe uterus, from the pains and the forcings, men, may he found more or less effectual

parturiest, bet oot arising from delivery. was obtained. The restraint of the child, Those fulse pains an produced from three the effective use of opinm, the discharge of causes commonly; first, they may be pains the liquor annils, and the abstraction of scated in the uerres, but this is rare; blood to the amount of ton or fifteen ounces, accordly, they may be the produce of are the remedies to which I look in esses apams, of the bilary durts, of the ureters, of this soit. Probably the child, when born, of the produce of the produce is the produce of the of the Intestieva, or of the womb itself; will prove weakly, and may die within a few and, thirdly, oed most frequently, those hours afterwards. psios mey result from iofismmation, and be secompanied with a fever. They are known not to be the pains of labour by their sesttheir sensation—their mode of return—and sometimes, and, io some measure, by their being permanent, and, above all, by so examination. If the pains are those of is-bour, we find that the os uteri opens and MUSCULAR ACTION, AND ON THE CURE widees, and the membranes protruding, and i these being broken, the head bears down; on the other bend, if they sie oot, the pains of parturition, probably the os uteri is shut, sed there is no bearing down; or should the os uteri hn open a little, wo do not find an On Dancing, and on its advantages to Young increase of the dilutation. OF DEFORMITIES.

## By Mr. SHELDRAKE.

Those who sfeet to think that the most remarks I must now refor you. Of coorse, indifferent of our actions should always be the treatment of (sise peins must vary with described in a manoer which indiestes the their outure; but, of general means, the bighest degree of morshity, speak of dunrieg most effectual ere bleeding, option, and one in terms that I shall out repect religious and then, perhaps, the warm bath, though fanatics speak of it in a way that is ron-very often this is not required. Inflamma-tion may require vory settive remedies, but this was considered before. for the state of the state Fatal Turbulency.-Lastly, a woman may show that they thick it vary inferior, in suffer severely from a turbulect feetus, point of utility, as well as in the power of which kicks, and cuffs, and plunges with exciting pleasurable assistion, to their violeuce, perhaps in consequence of con-lown exercises. Those who attend to three valuion, until the woman feels as if it discourses, will be in a condition to judge would make its way through her body.—how far those opinions are correct; but as I A lady, the wife of one of my medical differ in opinion, upon this subject, from all friends, was stracked severely with this those persons that have been meetioned, I disease. Electing may be tried, in these shall only consider daucing as something cases, to the amount of a few ounces, in that either has, or may have, peculiar order to relieve and diminish somewhat the effects upon the bealth, as well as upon the excessive oritation which thu pain end form of those who practice it. Denoing is elarn produce. Opium may be given, ac-ome of the most healthy, as well as one of the cording to the effect produced, with a view most pleasing, smusemmuts that has been, of quieting both the mother and the factus; or that can be practised, by females of the and I have no doubt, from my own experi-ments, that when the narrotice are taken, from those who are well qualified to teach they often get ioth the blood and mingle it, and practised, as it ought to be, con-with it; and this may explain to us how the issteady with the instructions by which opium, taken by the mother, may operate in is teught, it will contribute more to improve the child, for being taken into the muterual the health, as well as the form, of those who blood it mey pass into the placents, and get practice it, than any other excreise. I adshorbed, through the piscenter pures into vance this decisively, because I have lately

fortus to lie quiet; and under a very severe tudes for bours togethor; and to the manner paroxymm of this kind very effectual relief in which it has led, in different ways, to the

simple and lasting foundation,"

English explanation, I would say, the whole to do very effectually. is a tissue of valger impudence that hea no foundation in truth, and has been used to confound those who only wish to know the plain meaning of plain words. This being the case, as I shall have occasion to pay much attention to the writings of this person, at a future period, I shall only endesvnur, st present, to show what are the real effects of dancing, that those who are interested in understanding it, may see how lit-the this person knows about the matter.

Dancing, as it will now be considered, must be divided into two kinds; and, as thu difference between them has not been very carefully examined, I shall say something upon the history and peculiarities of each.

When the ministry of Louis XIV. found that they could not subject the different nations of Europe to his arms, they determined, and were more successful in the stiempt, to abtain auperiority over those nations in the practice of those arts which increased the knowledge, the comforts, and nvnn the amusements of mankind. Besides other arts, they paid much attention to music and dancing; they even founded a Royal Academy of Dencing, in which that art, and everything that related to it, was taught in the most perfect manner; it was raised to the dignity of a science; and being always Madama Simonet told us, that in the so considered, became one of the most French Academy, where she was educated favoured and most universal smusements of for her profession, all the papils, before

most distressing circumstances. If long which the babits of the people made them perseverance, to any habit, he sufficient to think dencing the most important; sod as produce distortion and deformity in the the French wern accounted the most polishing splead arrangement of solut and athletic ed nations in Europe, the French dances males, it will surely be much more likely to were adopted by all who were desirous of induces them in the sickly and pampered amulating or initisting them. In England children of the afficient. Though usrious they became universel. They were not they he received for the increased only adopted to the first the formula of the formula causes may be assigned for the incressed only adopted na the fernurite emunement of prevalence of these complaints in our nwn the most polished circles, by whom they time, I am coavinced that the relaxing were not only considered as a pleasing effects of hot rooms, and a ... o ardent pursuit amusement, but as being conducive to of ferminine accumplishments, are the prin- health, and to the improvement af the cipal ones. By edultting the elasticity of figure of those who practised them. The the fibrous structure, and its disposition to change of modern fashions in this sountry, stretch under certain favourable circum, aubstituted others for the dances of the stances, we are enabled to understand French; and those which have been substi-many obscura nections which are going on in Inted, have less desirable properties the the animal economy, end in particular, tu those which preceded them. The writer fix the doctrine of apinal distortion upon e whose opinion I have quoted, and come others, have represented descing es inju-It would be an newarrantable display of ribus to the health of its voteries; and as it is tenderness to the writer, in use any of will elways be a favourite amusement false tenderness to the writer, in use any of will slunge he a favourite amusement the terms that are commonly employed to while mackind are what they now are, it describe the writings of medical meu, tu will be an acceptable service to show that give a character in this passagn; it will, however, he doing him justice, to use a is erroneously and discussion be doed in term that is well understood to a unighbanuring country, when they say a thing is principles to their very faundation, which all botheratins; in if he should prefer an stem peculiar circumstances will enable me

In the year 1782, of 1783, the managers of the Italian Opera introduced at their theatre a number of French dangers of the very first class; their performances were very ampetior to anything that had been seen to this country before, and excited a great sensation in all those persons who stiended the theatre. The late Mr. Birch was of the number; his professional pursalts induced him to examine what he saw, with ideas that were connected with his profession; in gratify those ideas, he had formed sa intimsay with Madame Simonet, who was the principal female dancer of that group whose performeners were then so popular, that he might, as he said, get from her some knowledge of the secrets of her profession. I was familiarly sequested with Mr. Birch; and as he knew what were the nhjeats of my pursuit, he intro-duced me to Mademe Simonet; she told no all that we wished to know; sad, in Mr. Birch's drawing-room, she explained, hy eshibiting in har nwn person, every action that she had described: by the information which I obtained in this manner, I sequired a knowledge of the circumstances which I shell communicate, and which I trust wili now be found useful.

the people.

As France took the lead among the nations of Europe, in all the elegant arts, of called the encoins preparations; that is, a

system of exercises, which endued all their case of the lags, were practiced with every limbs with atrength, firmness, plasticity, variation, till they were quite familiarised and activity; whose they had acquired these to them; thay then were qualified to go to properties, to a proper degree, thay began to dance; ahn not only told us this, but shownd us how she had herself bean taught tu practise than entrcises.

Ship successively learned to stand flat and firm upon both her feet, with her legs quite atraight, and the whole of her person quite npright, but ant stiff; then to lift one foot from the ground, and keep it so, for some time, without moving any part of her body; she then replaced that footon the graund, and raised the other in the same manner. These aimple actions were repented till the pupils were quite familiar with them; they were then directed to keep the body quite erect, but not stiff, and, bearing firmly upon one log, to raise the other from the ground, gradually and, slowly, by bending the thigh at its junction with the pelvis, at the same time making the kean straight, and poieting the toe to its proper extent, but no more. The foot, after it had been kapt in this state for somu time, was reterned to the ground from wheoca it was taken, and the uther foot treated in the same manner: when quite familiarised to these actions, they were directed to walk (march, as some people will call it) slowly, performing the same mutions with the feet alteroately.

The next leason was to keep thin foot torned out in a proper extent at the anglejoint, (a circomstance which will be particularly explaneed in at her place,) to raise the fuut more than is necessary in walking, keeping the toe printed, the knee atraight, but making a semicircular mutiuu with the hip-joint, so as to turn the tooutwards, und carry it round and backwards as far as the metare manine should be will allow it to gu: these motions should be a ide by each leg, tirst moving the toe forwards and round till it was curried backwaids, and then throwing the foot out backwards, and bringing it gradually round, till it is placed upon the ground in the from. These may be called the elementary motions of the legs; and this mode of exercising them may, not unaptly, be called tha rudiments of muscular action, as it should be used to the practice of dancing.

When the pupils were quite familiarised to perform all the simple motions of the lags, with the greatest case and activity, thay were again directed to stand upright, with the feet clean together, the body firm, erect, and motiunless upon the pelvia; and, in this situation, they were directed to give every motion to the arms and to the body, without stooping, that the natural structure of the joints, and the cetural actions of the

what may be called their finishing exercise; that consisted in placing themselves in any attitude they were directed to, at the inatant the direction was givee, and to change from that to any other, however opposite it might, to the uniniated observer, appear to be. To sech observers, these attitudes might have appeared to be strained, or painful; het they were not se, because the previous exercises had enabled the pupils to perform them at once, as military men perform their munceuvres at the word of command, and therefore do with preclaim what they could not have done at all if they had not been so instructed. When the pupile had sequired the power of perfurming all these axercises with due precision, they begae to practise dauring, at which we shall leave them, while we atop to observe, that these preparatory exercises being followed steadily by young people till they became natural to tham, being necessarily kept in constant use by their professional pursults, fixed upon them pecclisrities that accompanied them through life, viz., attength, activity, and health to extrema old age. these facts I can produce many examples, but will only particularise two, which have had much notoriety.

Garrick, after the peace of 1758, determined to improve the entertainments of his theatra by introducing better dancing than had been seen there; in attempting to axecute this scheme, he sagaged a unmbar of foreign dancers, the principal of which was Anverre, who was accounted the best maitre de hallet at that time ie briug. was a native of Switzerland, and had been as far as the source flexion of the hip-joint Academy at Paria, and all his professional practice was founded upon the French principles. The public, or the party that called itself by that apurious name, took offence at the lutroduction of so many foreigners immediately on the termination of the war : and, as Foots whimsically explained it, dutermined that no Swiss or Italian dancers should be employed on the English stages, because they hated the French. Parties were made to interrupt the performance, torn down the interior of the thustre, and the nefortunate foreignera were driven out to seek thair fortune wherever it could be found. Most of them became teschers of dancing in different parts of the kingdom, and ended their dayabere. Noverre was thn principal of these, Iln was sugaged as hallet master by Garrick, upon the destruction of whose underraking, Nuverre became a teacher of dencing of the first rank in Loudon, where hn coded his days in that employment. - L muscles, would admit of. These, as in the knew him well in his old agn; he was under

the middle size, lively, setive, and with the these incontrovertible facts is, that if we, general manners of an accomplished French to very early life, teach young children to gentleman of that time. In this condition practise similar exercises, and fullow them ha lived to a great age, I think past the steadily afterwards, we shall confirm them age of eighty; yet no one who saw him in in excellent health, and prevent the accespublic, or mixed with him in society, with- sion of those evils which so often cause out knowing the facr, could have thought deformity to the figure, and destruction to him to be more than aixty years old.

The late Mrs. Garrick was a German, I think a native of Vicana; also was edueated in the Academy of Paria, to qualify in which those persons are trained, to the her for the profession of a stage dancer, successful practices of their several occupawhich she practised in Loadon, with great tions, and so to modify them, that they may applause, for aeveral years. On her muratage, and retired into the case and ele-gance of private life. She enjoyed an uni-dertaking will contribute something to-firmly good state of health, with as moch of the elegance of her forms as a life word words producing this desirable. of the elegance of her figure as old age and nature could admit, together with complete erectness and activity, to the end of ber daya. She frequently want, without a companion, to ber own box at the theatre, and, on the last morning of her life, she ordered her hox to be prepared for that evening as usual; but, when the time came to dress, abe was unexpectedly taken ill, and, instead of going to the theatre, laid down in her bed and died that night, at the age of minety. niae years.

These two examples of a centinarian and octogenarian of this profession, passing in health to the extreme verge of human life, may, so far sa age is concerned, be thought satisfactory proofs of the healthiness of this practice; but I have, through life, been aconly that we can accusus for the fact, that minuet, cotilion, allemande, and other addiers are well-formed, and always healthy, liamea, which it will not be accessary to unless they are made otherwise by accident motice at this time. or disease. I have never seen a soldier with. It need not be dealed, that, in those apinal curvature or other personal defur-times, what were called the pullahed manmity, or a stage dencer, of either nex, with ners of elegant society, were tinctured with a deformed person; it is, perhaps, impossion a degree of formality, which ma longer ex-ble that such things should exist, for the ists is the members of any class; this ex-plais resume, that the axerciese which they tended aren to their smusements. Their begin to practise early in life, and continue favourite minute was so constructed, as to regularly through its whole course, render make it contain every motion that could be it impossible for them to become so.

the constitution, as later periods of life. do aut propose to make every boy a soldier, or every girl a dancer apon the stage, but to adopt the principles, by the application qualify other classes of society to follow

As I have said that so much advantage may be gained by the practice of dancing, it becomes necessary to add, that that observation is only true so far as it is upplied to that dancing which has been exclusively practised by the l'iench, or by those who have received it directly from thom. There are other modea of dancing, which have no advantage over commini exercise, and some that ure almost as injuriona to the health and figure as common tumbling, or the gymasstic exercises; of these I shall treat in their turn, but shall now proceed to con-sider the Franch dances, and their effects.

The principal dance of the French was what they called " Le Grand Ballet Heroique;" it was alwaya founded upon some customed to see many persons of the same story of sucient history, or mythology, and profession; I have communicated my own in the representation of it were employed observations to many others, and all have all the powers of painting, music, and agreed in remarking, that those who follow scenery, sa well us such acting in dumbthis profession have, vary generally, excel-show as thus chose to apply to it; but leat health, which very many of them carry what neservations are nuw made upon it into extreme old age. This indisputable will be confued to their dancing only. The fact can only be accounted for by aupposing, dance that was next in importance was the that the preparatory exercises which thuse "Bullet Comique, on a thuil caractere," persons go through, are a modification of the personages and practices that were rewhat I have called regulated muscular ten- presented in them approached more nearly aion, or action, and the early and constant to the characters and manners of ordinary practice of which lays a firm fuundation for like. These lances were executed upon the that high health which accompanies them singe to amuse the public. Their favourite through life. It is upon the same principle dances, for private amusement, were the

used by elegant parsons, in the superior The inference that is to be drawn from ranks of society; as a necessary consequence effectual way to acquire the manners of elegent soemly, was to learn to dance the minuct at a very early period of life, and to

learn to dance it well.

This being the case, all who desired to be elegant in their persons or manners, em-cises, as will justify the generally received ployed much time in ecquiring that accom-plishment, and it became an assion in all dance, in a very effectual way to improve the superior ranks of society, that the dancing-master was the best teacher of polished advantages that are connected with it. manners. That he taught the best way that wes then knuwu of giving the most elegant form to the female figure, according to the practice and opinions of that time, is certainly time, but though it was equally true that the health, as well us the form of those I would say, that the duncing which is who used it, was improved by the practice, there attributed, exclusively, to the French, about.

writing, to some questions which I put, in truth of this doctrine, I shall be excused the same manuer, to a gendeman who is a for going into some details. very eminent teacher u dencing, and who When Garriek determined to introduce is well acquainted with what was dose in superior dancing upon his stage, he was

of this, it was always thought that the most | cata the knowledge of these exercises to those they teach to dance, but only parrot them into the practice of such dances as they teach; but even that imperfect mathod of teaching fixes upon the pupils so much of the good effects of the French preparatory exerthe form of their persons, as well as other

Having said so much of the advantages of practising dancing upon the French principles, it will be proper to show that other medes of dencing do not produce the same

effects.

this fact was neither known nor cared when it is skilfully taught and carefully practised, gives to those who do practise it Fashion has caused the minuet to be laid with skill-strength, agility, and grace. saide, and dancing of a more questionable | When this practice is begun early in life, nature to be adopted in its stead; as, being oud regularly continued, it contributes greatnecessarily, by my professional pursults, by to the permanent health and longevity compelled to think much upon this subject, lof those who do practise it; while nil the naturally formed opinions of my own with other modes of dancing which, so far as I respect to it. I was willing to knuw if knaw, are practised smong civilized nations, those opinions were similar to, or different require great exertions of strength and acfrom, those which were entertained by tivity, but which produce dehility, and lead others. To determine this point, I request- to early decrepitude and premature uld sge. ed a friend to ubtain for me the answer, in As proofs may be produced to establish the

the uld, as well as in the modern, school aware of the prejudies that existed in the of his art, and this is the suswer I have re-nileds of the gallery part of his audience, coived :--"The principles of the art of descing are and therefore was cureful to employ no exactly what they were, but the style is French performers, nor any foreigners but changed from the Scotch to the Freuch; Swiss, Germans, and Itshans. This cauthe quadrille and the walts appear the rage tion, however, did not nave his scheme of the day, and, as far as fashion is concern-from dearnetion. As all his foreign descers ed, we are slaves.

were turned adrift, they became teachers of were turned adrift, they became teachers of ed, we are sures.

'I consider the minuet the best basis to deneing: this gave to those who had moground the pupils on, and they still are tives for making observations, abundant sometimes desced; sud could I have my opportunities for doing so. Though these own will, in this case, all may pupils should instructors taught their scholers to dunce dance the minuet. But little is required the minuet, and other French dances, their of a teacher of dancing at the present day; manuer was always decidedly inferior to a few quadrille ateps, and the usual atten-, that of the French. The reason for this diftion to personal manner and style, being all ference was, that the Italians never underthat is necessary, except to comply with the stood, or practised, the preparatory exerwhims and caprices of the public, which I close which gave to the Freuch dancers the consider the difficult part of the business." frances of saution, se well as strength and This gentlemen's upinion, so tar as it activity, which was so visible in all their goes, agrees entirely with my own; but it movements. The Italians had nathing af is necessary to add, that the great superiotitis quality; their strength was labour; rity of the French professure of deacing when forced into activity, it became hard over all others, is caused by their early and labour, and soon ended in debility, both in long practice of the preparatory essercises, those who were instructed by them, and in which are siways practised in their academy, the teachers themselves. Of this, many perior to all others who practise the same ert. Those who teach dancing do not communique introduced by Garrick to execute his de-

sign, which was terminated so unforted upon the stage at the same time; and the nately for his praperty, were either Swiss, contrast was parfectly indicrous. Garmans, or Italians. may he demonstrated by producing some dent and every motion that was displayed assumples that have been well known. When in the rival ballet. Delpini, in the characteristic was one of the principal public ter of a clows, burlesqued the densing of amusements of the superior classes of and the younger Vertris, and he did it most efficiety, the managers of our threatness collected formally, his sglidly was equal to the sglidly every thing of that kind that would interest of Vestra, but of very different quality, for their audiences. In those times we freighted not a particle of grace: in more spectrum, and make the specific property have french and Italian densers strength, he was perhaps, superior, but in

counted the best professional dancer in his that the eyes of the spectator could scarcely own country. The unfortusate termination see the motion of such foot as it passed beof Garrick's project, prevented the public fore the other, and certainly could not hear exhibition of any talents that he might pos-the sound as it struck upon the boards. In seas; but he commenced private teacher; her prograss, she profuced attitudes the he married the sizer of a nohlemse, and, by most elegant and the most graceful that means of that counexion, passed his life in could be inagined, and that the anisatructed teaching in the first oless of society. I spectator could not evan attempt to imitate, knew him well in his latter time ; he was a though most lanflectually, without making stupid, clumsy old man, and resembled a the greatest esertions; and, therefore, it Jew old-clothesmas more than a teacher of might be sopposed that the dancer made the dancing. I was sequestined with several of most painful exertions to produce those his countrymen, who were of the same pro-

Although the exertions that were made came decrepted old men. The cause of this by these persons were really wonderful, the difference between them and the French is preparatory exercises which gave them the evident. The preparatory exercises, in which power to use each limb, and almost each the French dancers were theroughly practions whose actions them notions were tised in very early life, gave to their bodies performed with an much apparent case, that and limbs strength and framess, which fixed a smilet, and after the greatest exercion, the upon their constitutions properties that breathing of the dancer did not seem to be carried them through the fatigues of their either secterated or deraged. When the profession, and left their impression upon I takians came on the stage, they began them, even to extreme old age; in the their movements slowly, and increased them same manner that the military exercises gradually, passed into a state of laborious give to the recruit the power of performing activity, and soon seemed to be sicking unmilitary duties, which other men cannot der excessiva fatigue. The most striking go through; and when, at last, age does proof of this difference between the two sets disable them from performing those duties, of dancers, was perceived when the grand the course through which they have peased ballet beroique of Medas and Jason was pertheir lives, still leaves them scrive, vigorous farmed. Jason was personated by the elder old man, But the Italiane neither knew nor practised those preparating exercises; they began to learn their art, if it may be so called, as labourers apply to the practices of effect by Mailame Simonet, and the younger ordinary labour; like ordinary labourers, as:

Vestris had a character that was introduced their natural strength increased, they interested their exertion, and actually did and elegant style of dancing. These them

let, founded upon the story of Mother Ship-The truth of what has now been said, ton, in which they burlesqued every inciengaged in the same performances, and using it, his exertions amounted to greatlabour, for he jumped about so as to ahake It has, likewise, a motion in the ancle joint; the heards, esif he ware thumpleg them with it is made by turning the great toe lewards, two peatles and mortans: it was perfect estrained by turning the toe ancle riceture, but he could not do etherwise; it joint; it is made by turning the toe anche was the atyle of dencing which he had beed wards. As much and acrious injury is eften taught, and the leating effect it had upon his sustained by persons who do not understand person in his latter days was as visible es the atructure of this joint, and the proper the effect which similar exercises have since way of managing it, to produce the affect produced upon poor Grimaldi: before he that was fifty years of age, he was a decrepid old bere. man ; it is more than forty years since I saw him creeping in the street, es if he could close together, and his toes so placed, that a scarcely move one foot before the other, and perpendicular line, passing through the midcould not expect to live het a very short die of the patella down the leg and foot, by time. I thought he was dead, and was the inside of the great toe, his fact will be greatly surprised to read in the newspapers, in the atroogest position it is possible for that in the apring of this year he died at | them to take; they will be capable of makthe age of 99 years! 50 of which he must ing greeter exertions, and for a longer porhave pussed in a state that rould reader life time of time than they can make in any other hut very little desirable. Vestris, on the con- position. This is the position in which the trary, if he be living, is, in all probability, enjoying as benithy an old age as his father, Auverre, Mrs. Garrick, and others, did before him; as that seems to be the natural consequence of the system of exercises which they steadily persued from their very the ica, and thus driven himself forward, earliest days.

We now arrive at the conclusion, that there are two systems of dancing, neither of which that term is applied to such practices as have n tendency to shorten life, but one of which certainly has a positive effect in producing aarly and permanaut debility, which it is certainly desirable that all should endeavour to avoid. The other, which I have called the Freach system, because it is founded on which will prove, to their consequences, the most pernicious practices that have yet been invented, under the pretence of im- in the rudiments of their own art, or acproving the health or heanty of the humeo quesetad with the atructure of the homan ågure.

As I do not enter into the technicalities of dancing. I might here take leave of tho tion some peculierities in managing the legs

First, the feet abould nlways be kept directly under the legs, and not to allow them to turn or twist beyond what, for want of a better term, is called the natural form. In this state, the foot has its greatest motion directly backwards and forwards; of this motion, the greatest use is made in dancing.

that they desire, it will be well to explain it

If a person stands upright, with his heels akaiter places bis foot, when he is preparing to strike with the full power of all the muscles of his thigh, leg, foot, and toes; heieg prepared for this action, he strikes, with all his force, the justide of his great toe against while he atands firmly upon his other foot.

This action of the great toe is like wise of grent importance in dancing; the dancer, can, with propriety, be called unhealthy, if indeed, often has occasion to turn his toes outwards, much mere than the position that has been described; but when he does so, if he noderstands how he should proceed to perform it, he keaps his foot firmly is the posi-tion that has been mentioned, and turns his leg outwords by the bip-julet, which is so formed, that it is one of the atrongest of the practices which originated with the teachers human body; it allows of more mution, in every of dancing in France, has a direct tendency direction, than any other. We have seen to increase the health and strength, as well out French dancer, who was so complotely sa the elegance of form in those who adopt master of himself in this respect, that he it : it is, therefore, to be hoped, that those stood perpendicular upon the great toe of whose influence leads the fushion upon such one toot, bent his body downwards upon subjects, will induce their fullewers to adopt one side, sed raised his leg on the other, this practice, in preference to all others that and thus belauced bimself in the form of n are used with similar intentions, and, above T square, and in that situation turned his all things, to avoid the gymnastic exercises, pirouette in a maneer that was really most astonishing.

Those teachers who are auf well grounded body, frequently do great injury to their achelurs, by forcing the feet too much; as by turning out the toes, they twist the feet subject; but it will he well for me to men- at the ancle joints, injure the ligaments, weaken the musclas, and produce a species and feet, which it is proper that all should of lamecous that is more difficult to cure than any other that I am acquainted with.

### PRRENOLOGY.

## (Continued from page 414.)

WITH e view to put phrenulogy to the test, let na attempt to analyse the mind of a man who has lived in our own times, whose character, both public and private, is well known to many, end of whose head an accurate cast may be obtained by any oon who is anxious to astisfy bimself upon this aubject-I mean John Thurtell. I shell here avail myself of an able and most intereating article, " on the cerebral developmeet and dispositions of Thurtell," contained in the accord number of the Phrenological Journal. It is evident, upon looking at the east generally, that he was one of that class of persons in whom the organs of the coimel propensities were very largely devaloped, and the argans of the sentiments also considerable in size, while the organs of intellect were deficient in proportion to the others. Such individuals ere, to a cunsiderable extent, the creatures of eirountatauces; and the phrenologist would expect to find in their conduct, elternate manifestations of the lower propensities in great vehemenee, with the most opposite displays of higher and better feeling, and this appears to secord with his character. It was industriously reported in the newspapers of the day, that he had no destructiveness, yet it appears, that of the heads of forty-three murderers, in a collection at London, five only arn so wide at destructiveness as Thurtell. Combativeness is also immanse, and no murder was ever committed with more daring. Secrotiveness was very large, and was a very remarkable part of bia character. His cautiousness, which was very large, was displayed in the pains he took to concest the murder, to hide the body, to remove any risk of the deed, by causing Weare's card to be left at Lord Egrement's, in Sussex, about the time he murdered the man ro Hertfordalire. Love of approbation was very large, and aelf-estoem was likewise large, and these feelings were atrongly manifested upon many occasions. Benevoleece elso is fully developed, from which e phrenologist would infar, says Mr. George Combe, that the real motive of the crime was revenge, for injuries real or supposed, proceeding from wounded self-esteem eed lava of epprobation, united with destructlyppess, rather then a blood-thirsty desire of murder, or of simple robbery. It is well known, indeed, that Thurtell, with all his violence and dissipetion, was a kind-hearted man. Equally large with his henevolence away by force; " for God's sake (said Thurwas his attachment; and the co-operation tell) take him away, for he unmans me,"

exploins some of the favourable traits of bia character. His attachment to lfunt; his distress at taking leave of his brother; his last remembrances to his own family, particularly to his mother, prove the waimth of his attachments. The organ of imitation is large, and it is said, that he was, at one period, ettached to theetricals, and that his imitations of Kean were above medicerity. But I must refer the reader, for further particulars, to the publication before mentioned, as an ettempt to delineate his entire character woeld occupy too large e apace la the pages of The Lanert. There is, how-ever, another feature to his conduct, so atriking as to make it worthy of particular notice, I meen his firmness, the organ of which was very large. By the way, I canout evoid making soether allusion to the very curious and most erroneous notion which A cotertains of the faculty of firmness. "Firmness of conduct," says he, " (for it is no quality of the mind) can arise from no other cause than the excess of one passioo, ar class of passioos, above some other passioe, or class of passions. The firmest of all mes would consequently be he who had but one passion to gratify, since he would aternly persevere re his course without any mental conflict, or clashing uf emotions.

According to this novel ides, the man who, unfurtunately, has some predomineting victous propensity in his composition, and in the indulgence of which he persevers with unabating ardour, manifests the most decided firmness. To attempt a refutation of this opinion will be unnecessary; its abaurdity will be instactly apparent, if wo turn our ottention to that peculiar power of the mind evinced by Thurtell. Ilia was a continued manifestation of firmness, says the writer alinded to, from the onement of the crime to the moment of his execution : imperturbable firmness, such as would have well become en innocent person. No pride, no vanity, no hope, no conscinuances of lanocance, could have given him this. Conscinusness of isnocence he had not; hope he might have had during his trial, hot not at the time of execution. As to religious hope, that he aurely had not, while he uttered the most palpable untruths; and at the last, certainly, he had out such inten-sity of religious feeling as to allow us to ascribe his firmaeas to his fervent hopes of a blessed hereafter. Neither could pride nor venity, I think, have given him framess at parting with his brother, when his beecvolence and adhesiveness were in full operation. His brother was so affected, that I'hnrtell called to the tornkey to take him of these two powerfully-developed organs in truth, framess is a distinct attribute, or

firm tess. Thurtell was viulent, amicable, prodiginusly firm. "I was convinced (says thu samo writer) that firmness was o distinct power, before studying phreaningy, by reading Mr. Forster's well-knowe and justly-entremed earny on Decision of Choracter. Now, if the argana of the moral that the mental pparatus of phrenosentiments had been very greetly deficient logists is anid, by A, to be "anmetimen tract :-

good mimic.

It is stated in reply, that Dr. Ellintson's explanation of the character of the individual la singularly correct is every particular; and, at a subsequent meeting of the Literary Society, the following resolution (on the motion of the Ray, Dr. Joynes) was Birmingham, Dec. 1, 1828. unanimonsly passed ;-" That the charac-

function of the miod, and totally lacaplica- ter given of L. by Dr. Elliotson, from the blo nu may ather supposition. A person inspection of the skull, corresponds so exmay have motives coungly to be firm, but only with his history, that it is impossible may, constitutuding this, be deficient in the consider the coincidence as the effect of chance, but that it is an instanon which, if supported by many athers, affords a strong

foundation fur the troth of phrenology."
With this weight of evidence before us, I am surely warranted in asserting, that phrenology affords the means of analysing every variety of human charocter.

In Thurtell, those of the animol propensities clumay from its racess; at other times, luremaining as large as they are, thu phreun- efficient from its scantiness;" and that it is logical character would have been that of a " evidently the work of their own hamls." flend; and the better dispositions, which Now, this is a most unwarrantable asserbe actually manifested, would, on such a supposition, have been as ioexplicable as libel. What ground has A, let me sak, for imputing to the purchasel of the mark for imputing to the phrenningists conduct so oess, secretiveness, and firmness had heen and so dishonurable? What right annall. I will only add, " if ever head con- has he to charge them with manufanturing firmed phremilogy, it is the head of Thur-ion toll." But, perhaps, phreonlogy could not the world as the work of Nature berself? more effectually be put to the test than it The phremulogist is an ardent and durinted was in the course of last your, by the fol-lover aftersti; the grand abject of his pur-inwing experiment. After a debate on the suit is truth; and be would consider that subject, in a Liturary Society at Chatham, it man unworthy the came of phrendlogiat, was agreed, at the suggestion of one of the whn, from deficient conscientionsness and members, that the skull of a person, with misguided enthusiasm, about attempt to whose previous history they were well ne- practise a deception. It was only by a long, quainted, abould be forwarded to the Lon- laborious, and patient search after truth, don l'hrenological Society, with a request that the mental apparatus, with which  $\Delta$  is that they would inspect it, and atate the opinion entertained it is development. Dr. mental apparatus, so besutiful is simplicity. Elliotson (the President) returned an an-iso admirable to arrangement, sud so woo-awer, of which the following is an ex- derful in contrivance, could only have been the work of that Almighty l'ower, " in "I take it for granted," says he, " that whom wa live, and move, and have our be-the deceased was of soond mind; but, to ing." Let & frankly declare that he has be accurate, we should likewise know how deligently pursued the same mode of inves-fer be had been educated, and whether his tigation, and let him, by facts, (not by soconstitution was active or indelent. His abled the satirist to direct an unerring shaft portrait of this geutleman was what might egunat a comifest abuse, it has also giveo naturally have been expected: a feeble two "servile press" full opportunity for ministry of the descriptive powers of Erimailgnant appealons; if it has been the neurine "qui ridiculos minus ido!"—an manus of affording a just sketch of charac-unintelligible jest, and a selection of lan-ter, it has often presented a deformed pic-tura, miserably daubed, to suit the taste of a of the dictionary of Grose than of Johnson, secret runmy. We have heep indebted to form its principal fastares; the whole drawn it for a reflood and pulished diction, that has with sufficient candour to place out of view beauty.

duct, since his connexion with Richmond and, according to seniority, they are sunu-Hospital, may enoble us, however, to sppreriate its value. A long experience in the instruction of students, had previously made him aware of many defects in the routino of bospital attendance. Pupils had been habitually in the practice of making their hospital walk an opportunity for tille conversation, rather than chuical instruction, sud, at some periods of the year, it could hardly be otherwise. A number of persons collected about a patient's bed, their attention directed to the same object, as opuque as Leneox's. Such students, therefore, se did not wish to expose themselvus to sundry elbowings, jostlings, and couse it to pass away most agreeably. obvints the ill effects of this system, Dr. M. Duwel had papers printed in such e form, that a short obstruct of each case, the daily treatment of the patient, sed the sucbe briefly noted, and placed over each bed ; was this all; such of the pupils as wished. to record cases, provided regularity was eacase buoks belonging to the several wards.

The gentlemen whom Lennox has honoured with a blush, was one of those who thought the plan useful. Clinical instruccommented upon, on opportunity was taken tradiction. of explaining the different views and treatment of the profession at large; nor is it aurprising that the muss of information tails of professional experience must be un-interesting. Where a sketch of the lecturer occupied the attention, the lecture could

attempt at correction might destroy its | their professional improvement: he closely observes thair hospital attendance. Privote A simple review of Dr. M'Dowel's con- instruction is given to them every week, ally appointed, if competent, to a residence ie the hospital; thus giving them an opportunity of acquiring much practical information.

To proceed in these details is unnocessury; eulogy soon wearies the ettention, bet justice to Dr. M'Dowel demands these facts, which Lennox has carefully passed over; anything walch would prove that Dr. M'Dowel had so much consulted the interests of the hospital pupils, or those cummitted to his immediate charge, would generally formed a barrier of skulls, fully be quite inconsistent with the general outline of the character Lennex would wish to present to us. The mention of an unauccessful case—a misrepresentation and a squeezings, had no other alternative than to falsehood-more exactly suited bis general occupy their time ie whetever way might desige. With regard to the first, we would To remark, that excision of the saphens has been frequently perfarmed for the cure of varicone ulcers, with complete success; probably the gentleman might bimself have witnessed some of these instances. Mr. cessive appearances that took place, might Brodie's operation was elso found to afford but temporary relief. The single futal reso that any pupil might, at one view, be suit alluded to though perhaps a sufficient made acquainted with its progress. Nor resson for discontinuing the prantice, could nut have been, in any way, sufficiented. It may elso serve us a oseful hint to the genaured, were invited to take charge of the tlemen, to inform him that raricose ulcera, huwever troublesome, are naunity small. The boy who " left the hospital ten times worse than he entered it," was perfectly cured of a most tedious disease, and is now tion, at the badside, was regularly adopted, in the House of Industry, a living contraand clinical lectures more frequently deli- diction to his sesertion. As to Dr. M'Dowel's vered. At these lectures, beside the mere medical treatment, the charge is too absord rejectition of symptoms that had been daily to meet any other seawer than a flut con-

From these eircumstances, we may be enabled to determine the value of Lennox's portrait. We would assure the gentleman which was sometimes given, might have that we are not one of those who " would encumbered the genius of Lennox. To a absolutely commend his very funits," but a tuind auticipating literary fame, the dry de- natural indignation compris us to expose a melicious misrepresentation. A part of Lennox's complaint, if we may be slinwed so to call it, access to be, that Dr. M'Dowel only be judged of by its length; and we does too much. Occupying an hour and a Annw how soon "weariness begins when belf in examining patients; a clinical lec-edification cesses." But to proceed: Past- ture three tiness a week (it is, inwever, mortem examinations were also conducted given only twice); a demonstration pro-with avery publicity, and, frequently, any-longed sometimes beyond the hour, may thing which might be thought interesting certainly not be agreeable to meny of his was arbibited, not only at the hospital, but class, and, for aforesaid reasons, still less also at the school of medicins. Such are a to Lensex. The superficial knowledge of few of the facts, wideh Lennox bas embraced austomy and sufgery necessary for e Lonin the seatence, "bard work and great at- don diplome, can be communicated with far tention." He has alluded to Dr. M'Dowel's less pains; and when we only wish to know apprentions. He is one of the few surgeons the shape of the stomsoh, or where it lies, who devote a large share of attention to a minute detail of its coats, arteries, nerves, glands, and its several relations, must be advanced, that if I did not immediately excessively irksome; besides, to burden a aboy the aummons, the woman was likely memory, not remarkable for its retentive to be delivered before I could reach her powers, would necessarily give rise tu im- residence. On my arrival, I certainly found patience; and the more, since it appears in each woman in pain, and the os uterl, an be an "intrusion upon time," that we find examination, dilated to the size of a crown so usefully disposed at. We would beg, juice; but soon after I had takes my seat then, that Dr. Mr Dawel would certail his at the bedside, and asked the necessary lectures; it will, at least, give an apportu- questions, uterine action e-eased. This is nity to Lennox for further "aketches" of known not to be an anusual occurrence, an character, thet may afford him more inte- the entrance of the prantitioeer, particurest and gratification than the study of hie larly if a young man and a stranger. In profession. We would sise entreat a bim to each of these ten cases, I waited from proceed, since it appears that "the Rich four to eix and eight bours, and have even mond School is losing ground," and Leanux's retired to mother room, and uterine action " sketches" would have such a beneficial did not secur. I have then praposed the use of

Your obedient serrant, R.C. Dec. 26, 1838.

## THE LANCET.

London, Saturday, January 10, 1829.

Ma. GUTHERE has just put forth a pamphlet, lu which he favours the Government with the fruits of his extenditations respecting the best mode of supplying the schools of anatomy with subjects for dissection. Nearly all intelligent men both in and out of the profession, who have reflected on this cobject, having concurred in the opinion that the difficulty of obtaining subjects, and the swils occasioned by that difficulty, are, in a great degree, attributable to the law which makes dissection e punishment for crime, we ere not surprised to find, that the remedy preferred by Mr. Guthele is, that all executed criminals should be dissected This proposition is worthy of the genius, but scarcely reconcileable with the wellknown modesty of the distinguished author, since it is directly at variance with the recommendation with which the Perliamentary Committee slowed their Report, after a deliberate examination of all the evidence given before them. The legislature has to choose between that regummendation and the advice of the highly gifted and modest author, whose importance seems to have been strangely overlooked by the Committee. seeing that they afforded him no opportu nity of exposing the fallacy of the views on which their Report is founded. " Repeal that provision in your penel code, which makes disception part of the punishment for me," my the Parliementary Committee, " Extend and perpetoste that provision, by making dissection s part of the punishment for all capital offences," says the " modest author," Mr. Gurnara.

If the number of crimicals annually exesuted were sufficient to supply the demande of science, it would, perhaps, he worth conconveniently appropriated to the use of the

snatomical schools; however abourd it may be in principle to regard dissection as a ponishment and a mark of infamy, and, however impolitic to legislate on the supposition that crime will slways be equally abuodunt, or our penal code equally sanguinary. But the number of bodies that might be supplied from such a source would be wholly ignufficient to meet the demands of oor schools of anatomy, and the svils against which the legislature is called upon to provide, would be increased by the adoption of e measure which would be, practically, as inadequate to the end proposed, as it is in principle absord and impolitic. The proposition for consigning all un-

claimed hodies, under certain conditions, to the discepting-rooms, is entirely free from the objections to which all other plans which have been hitherto augusted for the supply of our anatomical schools, are liable. We say all unclaimed bodies, without distinguishing the next of the deceased, or the places in which they mey have died. The class of society whose bodies will thus be made evailable for the purposes of science will, no doubt, consist chiefly of destitute persons dying in workhouses and hospitale; because Prisons who leave property behind them will seldom want friends who will be ready to show a tender regard for their remeins. But the want of a claimant will furnish e just efferion of the propriety of consigning a hedy to the dissection-room, whenever dissection shall cease to be a stigms, and a mark of iolamy. So long as it continues to be a part of the legal punishment Marinestit will be unjust to subject men, because they are poor and friendless, to the disgrees of dissection, efter their decease to poblic hospitals and workhouses. But when the provision, which consigns the bodies of executed murderers to the anatomist, shall be repealed, the dissection of enonelaimed body will reflect no other disadering, whether their bodies might not be grece on the deceased, except that which may wiee from the presumption it will af ford of his having died guilty of a prime | The Langer a libelloos publication ! A libelof no small magnitude in a country where lous publication,-let the intelligent and hotalent, and honour, and morality, as com- neat reader direct his attention to the folpared with wealth, are considered more lowing pages, and then say if it be possible poverty.

chie means of supplying the dissectinglic against abrocities similar to those which seasonable interposition ?

Ir the exemies of a free medical press,if the corruptionists of our hospitals,—if the live a man of more strict integrity, or e man despicable Bars and Anashman Duns, who whose life has been marked by a more nodisgrace medical society, cannot distin- deviating course of honourable conduct. ments. Idiots! they are dessired; which " malice" entirely. What are the therees is beyond reach, and when they are over- Judge, and the "unprofessional" character whelmed, and present to the earth, with of the report. But, we forgot. There was no the neuropeanes of fielt own falling, sharps, no account, anogic

dust in the balance, we mean the crime of to libel the authors of e proceeding of which he will there find a faithful account. Is Whether any steps have yet beso taken there any language sufficiently strong to by the executive government, or by the exhibit the basenous of the revengeful teachers of austomy themselves, to put of wretches who instigated the measure sgainst atop to dissection, until the legislature Mr. Lanaunt, or to adequately depict the shall decide ou some cafe and unexception- servicity and felly of the slavish tools by whom it was sanctioned? Are they for room with subjects, we know not; but we attacks un character? If so, let them look again earnestly entrest the Government to to their " houses of glass," which may aztake this subject into their serious considers. | perience a storm et once terrific and annihition; and we must once more express out firm litting; whoe stincked by an assassin, you conviction, that nothing but the immediate are justified in seising the dagger of the closure of all the dissecting rooms in the murderer, end plunging it into his own bemetropolis, can effectually protect the pub. som. From the commencement of this Journal we have fought our enemies openly have just been detected et Edinburgh. If and fairly with the legitimate weapons of the commerce between anatomists and literary warfare. This course it is nor wish resurrectionists be suffered to continue, and to purpus, and this course we shall pursua, if murder he perpetrated by trading as unless our opponents place in our hands cassina in this metropolis, will not an awful uther instruments, which it would be baseresponsibility attach to these who had it in ness and folly not to wield in defence of ourtheir power to prevent the crime by selves sed our friends. What is Mr. Lawmany's offence ? His late connexion with THE LANCEY. The creatures who voted against him at the Westminster Medical Society, know end feel that there does not guish between ferbeurance from four, and They know full well that be is their supeforbearance arising from pity for the fullen, rior in talent, as well as in honasty, ead that we will soon teach them a lesson, which when they are rotten and forgotten, and they shall nut forget to the last hour of forgotten before they are rotten, his same their filthy existence. Probably they form will stand conspicuous in the surgical estals gived we are so intoxicated with our re- of his country. We refer the reader to Mr. cent success, that we are insensible to Lawsent's condid, menly, and unenswerpessing events -- blind to their more- able defence of himself. He dispresses they may, perhaps, discover, when remedy against him, then? The mosthesas of the man i We shali stili refrain from commenton the evidence, because it is not yet published but in viodication of Mr. LAMBERT's character, it enrely is not oriminal to state, that the words attributed to the Judge, to the report of The Times newspaper wern not uttered by Lord Tenterden. His Lordship's words were these-" You do not answer any one question directly;" and Mr. Lamnenr's occusers should beer in mind-if they can bear in mind envthing that is favourable to a man-that questions may be so mixed up with fact end fiction, that no lovest witness can answer them immediately, nor until by has coparated the one from the other. Besides, was it not the counsel's object to produce hesitation and confusion in the defendant's witnesses-hie object to destroy, by every means in his power, the value of their testimony? And way? Because in had only one, out of upwards of two bundred nyewitnesses of the operation, to oppose their evidence. And how HE succeeded will be seen on Tuesday next. On that day our report of the trial will be published. To the charge of the report being "unprofessionel," the unewer is easy: it was an " unpreferient " operation. The operation was a caricature—the report was slightly coloured. " But says the apright Chairmen, there should be so sprit de sorpe in our profession-Mr. Launeer should have thrown a gionk over the affair; be should have gone to the operator, and 'lamented;' in e word, " he did not do as he would be done unto."

Mr. Thompson should recollect that there is an aprit de corpe among thinves. Honour smooth there—bound by a generous spirit of union. But the welfare and security of society tracks us that it is advantageous, considerably to reshove these gentlemen, by an operation at the Old Bulley, not less effectual than some of those performed at Garj's Mongital. "But, Jones the security of Chalerana," He as you would be done

Person of the upright, the impartial, Chairman i We shall still refrain from comment on the evidence, because it is not yet published but in viodication of Mr. Laurara's character, it enrely is not oriminal to state, that the words attributed to the Judge, to the report of The Times newspaper were not uttered by Lord Tenterden. His Lordship's words were these..." You do not answer any one question divertly;" and Mr. Laurara's accusers should beer in mind...if they can bear in mind say. thing that is favourable to a man...that questions may be so mixed up with fact and fiction, that no hovest witness can answer.

There is only one point which Mr. Lananar omitted to explais in his speech—we refer to the state of the parts on the postmortem examisation. Here, again, Mr. Lambert is a sufferer from the calumnice of his "Hole and Coroor" actusers, and, as an act of justice, we feel it to be our duty to insert in this place a portion of the evidence of Dr. Hodgkin, extrapted from him in his cross-examination.

Have you read the report in The Lancer of the post-mortem examination of Stephen Pollard's body?—If I have not read it. I have heard it read.

Here you not read it?-I am not enre that I have.

Will you be kied enough to read it?— (inading the report.)—I here heard it read. Was there my inaccurate attement in it?—There was an inaccurate elatement respecting the third lobe. It is extend there what I believed at the time, but which subsequent azamination proved not

Is not that report taken from YOUR OWN WOILDS!—I BELIEVE IT IS: it is so stated in my notes.

Did you try to force your fingers there, (between the bladder and rectum,) before you exhibited the preparation to Mr. Lambert —I have not.

Did you not !- I po not ancouract

Did you examine it particularly !-- I ex-

Are you certain that opening did not exist, at the time you showed the parts to hir. Limbert !—I have stated I am nor ang rr, mail he showed it to me.

Westminster Medical Society. We believe always be attended with the best results. there are still in that holy enough of honograble and independent members, to work is evidently a performance of great come ferward on Saturday evening next, labour, and that the manner in which it is and who, by not allewing the minutes of the executed, reflects infinite eredit on the talast meeting to be confirmed, may rescue lents and industry of the author. Mr. Lambert from infended injustice and insult, and the Society from impending infamy.

to the "Corner," of the London Medical Society, " Read the evidence before you decide against Mr. Lambert, and also keep in remembrance what we have binted relative to those who reside in " houses of glass."

A Supplement to Myology; containing the Arteries, Veins, Nerves, and Lymphatics of the Hamen Hody, the Abdomisal and Thoracie l'iscera, the Ear and Eue, the Brain, and the Gravid Uterus, with the Fatal Circulation. By E. W. Tuson, Lecturer on Austomy and Physiology. Fol. pp. 9. Coloured Pletes, London, Callow and Wilson,

Mn. Tuson's "System of Myclogy" has already reached a second edition, and, from and, further, he considered it proper that the great merits of the week before as, it all visiters should leave the room. will, mest likely, experience e still more decided anccess. These plates must not be regarded as mere drawings or paietings, but as presections of deswings, and, in point of accuracy and utility, are second only to actual dissections of the human body. In the study of these dissected plates, the sense of touch is exercised as well as that of sight; hence their vest apperiority over every other description of graphic illustration. All the parts of the body, from the skiu down to the bone, are arranged in their nataral order, and thus the student, (us in dissections of the dead,) before he raises a muscle or e fascia, &c., may ask, " What parts shall I next expose ?" &s. This is an admirable method of exercising the memory, and, meeting of the Society. The following is

determined to expel Mr. Lambert from the if persevered in for any length of time, must

We feel no hesitation in saying, that this

On this occasion, we shall merely say WESTMINSTER MEDICAL SOCIETY.

Saturday, January 3, 1829.

Dr. Somenville at first took the chair, but in the course of a few minutes, and bafore any business was sutered upon, gave way to Dr. A. T. Thomson. The minutes of the last meeting wern then read, from which it appeared that a proposition had been not by the Chairman of that evening, (Mr. C. Hawkins.) to send round a ballot box, on the question of expelling Mr. Lamhert from the Society; but that subsequently it was agreed, on the auggestion of Mr. Mayo, the ballot abould be postpourd uctil this evening. Dr. Thomson said the Society would new proceed to act on this resulution; and it had been considered right, that the slection of the members about to be balinted for, should not take place until the next meeting. His thought this an act of parties towards the individual unfortunately implicated, as well as to the Society at large;

Some objection was offered by Mr. Lambert to visiters leaving, until the ballot actually took place. He was about to address the meeting at some length, eed he did not wish to speak with elosed doors. The Chairnan, hawever, permated in requesting visitern to withdraw; and, in consequence, a great number of gentlemen left, and others were prevented from entering the room.

The gentlemen who had thus been compelled to quit, and all who efterwards arrived, both visiters and members, collected at the door on the sturcess. Mr. Webley was pacing up and down the lobby, and a fow minutes after the visiters were expelled, he seat the following question, in writing, to the Chairman :-

" Can Mr. Wakley be admitted?"-declaring at the same time that he had at-tended for this perpose of answering the columnies which the Chairman himself had directed against his electronic the previous ley's note :-

" Certainly not."

A. T. T.

On Mr. Wakley learning from the gestlemeo at the door, that the Chairman had not at the commencement of your last meeting, put the quostion to the Meeting, the follow-ing oots was handed to some of the mem-of my expulsion, and that it was sventually bers in the room, who passed it on to the President :-

" Mr. Wakley requests that the sense of the mombers may be taken on the question of his admission?"

mitted. Amnogat the gratlemen ootsids measure of the measure now proposed. would be made of it by their suemies, and, case, as far as I am concerned.

if the Meeting thought proper to exclude There was one charge made of the members.

the written answer returned to Mr. Wak- I assure you, geotlemen, I came down this night igooront of the charges against mo. I learned, by letter from a friend whilst in the cooutry, in attendooce on a sick brother, that a proposition was made from the chair, agreed the ballot should take place on the following Saturday. I hastened back to town, that I might be present at the ax-traordinary scene, and then found that the meeting was notate take place until this In reply to this demand, the person in the evening. I waited, and most suniously ex-Chair said there was no conver. He was peeted, that some official notice would be evidently disconcerted, and afraid to take sent to me, with a specification of the the vote of the Alecting on the proposition, charges, or charges, adduced; but to this At this time there was some disturbance at hour am I left in utier ignorance of the the door, the members who were excluded accusations, and, but for the fortuitous complaining loudly of their not being ad kindness of a friend, should have been we saw Mr. Ashwell, Mr. Thomson, (son of demand, what are the charges against ma? the Chairman,) Mr. Howell, Mr. Habiogton, I Who are my accusers? Will they stand foraud Dr. Locack, and many other visiters and ward and confront me? Am I to be mice
susmbers, with whose names we were unseown accuser? Shell I take the sharpes
quainted. From the greaterowd, the pressure at the door was such; that on several THADUCK MR in the last trial, or must I coloccasious it was nearly forced open, and it ject them from the whispers of my enemies? was not collectly closed until the Meeting Proceeding on these uncertain grounds. I proceeded to the ballot. Mr. Wakley rehave been led to believe that the late trial peatedly uneat reaseally enterated that no forms the basis of the stack new made upon violence might be employed, observing if me; and I assume, therefore, that I have a there were, he wall knew the use which right to estar fully into the merits of the

There was one charge made against me the visiters, they had a perfect right to do at the trial, that has nince been reiterated so—that no wisiter could have a right to with such mondacious hardinood, that it has enter the room in opposition to the wish passed current, I do believe, in the minds even of many disinterested persons-namely, Mr. Lamosar now rose, and addressed that the report of the malancholy operation the meeting nearly as follows:—Gentles of lithotomy at Guy's, was distated by men,—Belog tha "individual," (to me the "ualick," on my part, towards Mr. B. phrase of your Chairman.) who is "unfor Course. Now the fact is, that this charge purse of your charman, I wing as " mayer course. Now the sect m, that this charge insaledy implicated," I demand to know on a f " malice " was merely used as a foll,—as what grounds my expulsion from this So-la discriming—to draw attention from the ciert is sought. If I were to declare myself recorded fasts of the case, which were insussifieded by the proposition, I should do controvertible. I might sak with much as injustice to the state of my feelings. I propriety, (even supposing that, for the and eeply and painfully affected. The promoters of this measure are well known to tome, and I would scorn to older them explains and contempt to and fur these and his he great body of this Suciety, consisting, they are my conduct which may be independent and impartial men, i do not hesitate to applain of instruments to be amployed? Was it my sensity that occasioned a major of intruments to be amployed? Was it my sensity that occasioned a major of intruments to be amployed? Cooper particularly applied the remark to | tion into the eavity of the abdomen. himself. In consequence his vacated his arat; and, after some angry eltercation, I left the room, as I am ready to admit, with a very strong faciling against ma. Gentlemen, you may vary fairly question the propriety, taste, and discretion, of the line of conduct 1 adopted; but whatever may be your opiniona on this point, such were the facts, When I liad laft the room, reflecting that from the personal manner in which Mr. Cooper had looked upon the affair, that the matter could not reat here, I addressed a note, requesting to speak to him. I then told Mr. Cooper that he had octed upen an erroncous supposition—that my observations had no parsonal reference to him. We shook hands, and Mr. Cooper offered to walk back with ma into the room; this I declined.

What was my conduct after this affair? 1 continued to report from Guy's Hospital; and it is fair to conclude, that it I had imbihed the revengeful spirit which has been attributes to ma, I should have sought an

I have thus andeaveured to show you, Gentlaman, that no change took place in my conduct of reporting towards Mr. Bransby Cooper, after the time and occasion at which it has been affirmed "malies" commanced. Look at the femarks made upon the operation of tying the anbolavian artery, and tell ma whether you can or do, for a moment, think they bear the impress of malice. I must new alludo to a transaction In private life, friendly act on my part towards Bransby Cooper—one for which he must knew and fael that he stands indebted to me-one which, if he were present, I hope and think he would schnewledge. You are all aware, that in 1827 It was stated in various sources, that Sir Astley Cooper had entirely retired from practice. A paragraph at this time uppeared in the Morning Heru to the effect, that Sir Aatley had teft his house is Spring Gardens, and had com-pletely withdrawn from practics. I need not tell you, that to Mr. B. Cooper, whe aarly opportunity of atabbieg Mr. Cooper's was looking ferward in aspectation of aur-reputation. But how stand the facts? Why, casding to some portion, at least, of his reputation. But how at and the facta? Why, cauding to some portion, at least, of his is March, 1827, a few-very few weeks unclose practice, this paragraph had an leaster this directly malice had been created, I jurious tendancy. People would ream perfermed the operation of twing the carotid thus—Sir Astley is gone from Spring Garartery, and Mr. B. Cooper was with ma on done, and I will go to some one else. Faciliat occasion as a friend. This, to be sue, log this, I expressed my epinion to Mr. B. looks very like malice. Passing over this, cooper, and advised him to procura the lot as look to the reports of bospital cases treated by Mr. Cooper. It is but fair again, that although the former sesertien was true I say, to presume that I was here exceeding treated to Sir Anthry resigning practice, ingly virulent—that a meles commen pervaded yet it was not so as regarda the house, ingly virulent—that a melas animus pervaded the whole—that the deep and bitter aprirt of which, (for such was the fact,) had belonged rerange ran through all which I wrote appearation to Mr. Cooper. Here is a specimen ; it was on the occasion of Mr. Cooper for some time past, and that he had succeeded to his nuclea practice. Mr. Cooper called at my house at tying the subclavian artery, and runa thus. Walwerth twice on the day after I had mendered to the succeeded to his nuclear transfer of the man and the man and the second that he had succeeded to his nuclear two that he had succeeded to his nuclear transfer of Mr. Cooper called at my house at Walwerth twice on the day after I had menderally at the second that it was seen and the master-by style. Although we contially concert transfer on the day after I had menderally at the second that I advised. Gastlemen, I as it was in the present operation, it must be seed that I advised. Gastlemen, I all not been aslamed to mention this, occusioned the second transfer of writing the late report from mathere were no enjortunities, during a period of fifteen months, of showing mulice—that lice. I never did enteriain such feeling, full the cases treated by Mr. Cooper were of safe those who hast knowne will attest that the same praisewerthy description to the office of the months of the parties of the same praisewerthy description to the office of the same praisewerthy description of the bearing maintening to the least capable of the same praisewerthy description of the bearing maintening to the same praise warmly, and the same praise warmly and the same praise warmly. mult be need, in reference to The Lavers riod. I feel warmly, often speak warmly, for the year 1827, there were various cases reported, which subjected ample opportualty but if you believe the assertion of malics of manifying revenge, if I had entertained made against me, you must really believe it. Not to go through all the untoward made against me, you must really believe made, I may mention a case of harmin, where a pertion of sangatum was removed broaded for fifteen months, even, during the Mr. Chapper, and canth sanuad from in horse against me, care some the first many manifest in the caressing the victim I was about to seem a house the sangatum gut was reduced, bead, but I will detail you no lenger o. this was have a gaugement gut was reduced, bead, but I will now say a faw words on what has been called the "naprofessional" my professional existence—to him am I in asture of the report. Looking at the literal gratitude bound. What then had I been the meaning of this word, I am to suppose by inconscious means of effecting? Why, of this clearly, that the report was not written a scriously impeding, if not of atterly highlight-in the nanul mannes of professional cases, ing, the professional career of his clear the dramatic form being substituted for this son, to whom he was an sinely looking up, narrative. Are the members of this Society as a relief in declining years. No man, save than, to ait as judges of style in writing? I entered the witness-box; and I say thus question, and an words which I could employ would account you may the more would account the course to you the ploy would adequately convey to you the state of my feelings on the subject; I wrote the report under the exatement of those feelings; I characterised it in terms which you, who have not seen that which I asw, may regard as harsh, bet I felt that the justice of the same demanded that it should be depicted in the most vivid colours. I maintain here, as I have done classwhere, and ever will maintain, to the last hour of my life, that not one single lots of what I have written is untrue. When the corps shall with me outweigh the bester feelings of homanity, I may, perhaps, comprehend what is really meant by atigmatizing the report as "nuprefessional." So painfully sente were my feelings on the subject, that I will say, if the case occurred again to- freedonal ability, as well as of excellent morrow, I should describe it in n similer manner.

It has been made matter of accusation against me, that I evinced much hesitation in giving my evidence in the late trial, and the extra-judicial remark of Lord Tenterden has been cited egainst me. Hesitation I may have been guilty of, but not prevarica-tion or contradiction. I assure yun, gentle-men, that when I was asked respecting the affair at Gny's dinner, I was completely bewildered, so entirely and effectually was the whole occurrence buried within me, I was required to swear positively on subjests which had totally passed from my mamory, and, because I hesitated, I am condemned. I suppose that, if I had gone into the witness-box, and swern " straight forward," through thick and thun, without any deliberation, then we should have beard nothing about hesitation. Gentlemen should reflect for one moment upon the appulling circumstances under which I entered the witness bur. Feeling, as I did, that the whole case hinged spon ma, being the writer of the article from which the whole oause aprung, is it not untural to suppose my mind was deeply and painfully agi-tated? It was so; and, in this state of feeling, let me semind you of what occurred. My cousin Claphan,, who was called to

what has been called the "naprofessional" my professional existence—to him am I in appearance of dismay or trapidation.

It may have opposed to some that I made a false statement respecting the prosuring of Mr. Clapham's diploma from Apothecaries' Hall, because I said, in reply to a question of connect, that I was not sware of Clapham's going to the Hall, and that when be informed me, I was much aurprised; whereas the secretary of the Company deposed, that a certificate of moral character was given, bearing my signature. I have no hesitation in avowing, that this certificate was written by me, and I shall be readily able to explain the apparent centradiction between this act and my evidence, when I tell you the certificate was one of a general nature, being a testimonial of proprivate character, having ne particular reference to the list. I knew that it was Clapham's intention to pass the Hall before he left town, but he was summened hastily eway, in consequence of the severe illness of his father ; and he, therefore, passed his examination with but a few days' preparation, when he came to my house, and informed me and my family, to our great surprisa, that be had obtained his diploma. I do most explicitly declare, that I was entirely ignorant of the means he had used to prove his being of sufficient age, nor did I know, in fact, what was his precise age. I have no wish to gloss over the immerality and high culpability of making affirmation to that which the person knews to he falseyet if axtanuation can be pleaded, what can be more powerfully urged, than the desire of rendering a nick, and for aught he could foreace, a dying parent, happy ? This young man is the lines, the main stay, of a large family, who would look to him for support, from professional exertion, in the event of his father's decease; and I know, and helieve, that e contemplation of this led to the commission of the effence.

I have thus endosveured, Gentlemen, to explain natisfactorily to you every part of my conduct in the late trial. I have been My cousin Chaplann, who was called to compelled to be sayown accuser, and my town, through my agency, to give evidence own defender. But why is this attack in this case, met me at the deer of the court, alone made upon me-why am I singled out as I was about to be called forward, and as a libellar—why. am I prescribed, and as hriefly informed me of what had transpleed stempt made, as it infores, to hust me down? respecting himself. I was apprenticed to Mr. If even-handed jumils is to be dealt and—Clapham's father; to him am I indebted for if this be a measure calculated to make: degradation on the writer of that which is Mr. Evans. Sic. I, for one, ask to judged to be a libel.—I sak again why am I know the neture of the nharge brought But, then, to be sure, all this was done not to vote against him. Mr. Lambert has, ogainst the Editor of THE LANCET-lies and to my complete satisfaction, done away with for the profession, which, I dare say, we shall hear something about. Gentlamen, it A Member, whose name we could not may seveur somewhat of egotism for me to learn, asid,—My resson for not voting on for sespection. For my success in life, I the bold manoer Mr. Lumbert has done; am maioly ludchted to my own exertions, let them state their charges openly, and I have pursued the study of my profession then let us be asked to vote. with seal and assiduity. I have done no Dr. Gercony coemiered the report to wrong, and I fear no man. If I have not explained all satisfactorily, I shall be happy tu do so in answer to soy question that may be put to me, or io reply to ony observation that may be made on what I have said.

[In the course of the speech, the Chairmin, ie the most unfair sad indecurous stner, repeatedly interrupted Mr. Lambert, advising him as o " Fatzen !" not to make insinuatives against any member of the Society, me they were mesessary to the "defence," and not " belitting the nituation" in which Mr. Lambert stood.]

The Presenter. Geetlemen, the ballotbox will now be placed at the bottom of the table, and the Members, will do as they please in giving liter belief, from a secose of justice, knowing the faiture of the ques-tion, and what has been said.

paged to on a theel—I sak again way am I kaow the meters of the nhurge brought alone selected? A jury of the country have andoubtedly decided against the relation for a man to be placed in; and I may not which I wrote—but? I ask, is there no sorry to fied, that those who have proposed that called the sold decided? In there not a member, fixing any definite charge against Mr. Lamnuw in this room, who was coorioted of one bett. My impression against him was of the most cold-blooded, malignant, had strong and I came down here to give my attronium lightly that way was usuad and and wets and I came down here to give my atrocious libels, that ever was peneed—one vote against him; but that was before I which was declared to be as low and conhad heard his axplanation. Since he has temptible in its style, as it was acaedaloon come forward in the open, bold, and manly and infamous ie its iesieustion—and one maneer he has done, and given the explawhich the cowardly assassin dured not justify I cation he has made, I feel that I ought scandal are, then, of course, fair weapons, the charge of matus animas, on his part, to-lbut I trust this Society will not lend itself wards Mr. Couper; and, in respect to the to a base faction, who seek to crush me, on other of bentation to the witness-box, I secount of my baving been connected with can readily believe that a man of the strict-Tra Larger, and, as such, contributed to est integrity, with sensitive foclings, and a expose their shollowoess and rottenness. I mied to tured as Mr. Lambert's was—I would simply sak, whether this is to be a say that I can satily conceive such a man ballot to expel me, because I have done would healtate, and he would thus wear tha wrong in writing the report, or, rather, is impress of having something to concess, it becomes I contributed to The Lakert I I trust that this Society will not identify Oh! I will vesture to say, that if the report itself with the rumour out of doors; it was had been drawn up against Mr. Wokley, or upon that which I had formed my opinion, any of his filends, we should have heard and I trust the Society will now heatists nothing of a hallot for my expansion. So before it comes to that decision which, in much for the love of justice—the respect all probability, will be fatal to his views in future life.

A Member, whose name we could not seert it, but having a covert sud cowardly this question is, that there is no specific attack made upon me, I shall be excused in charge brought forward. I cannot conneive saying, that the whole tenor of my life has it justice to sak a vote from us against here strictly correct and honourable. There Mr. Lambert, whon there is no specific is no humae being who can say aught in dis-charge whatever brought forward. I do paragement of my character; I should not talek some originators of this resolution fear to have every action of my life written there must have been; I know them not, io large characters, and laid upon that table but let those Gentlemen come forward in

> have been made in an unprofessional maeuer, hut declared, that if Mr. Lumbert would retract his statement, that if he had the report to make agaie, be would do it in the same menner, he should voto for his contiening a Member of the Society.

The Punispent, finding at this period the inclination of the Meeting to be in favour of Mr. Lambert, and bla despicable and informous associates in originating this maligoant step afraid to let theeselves be koown,-gagged, and unable to open their lips, obdicated his sect in forour of Dr. Somerville, that he might advance on tha opposite side of the question, and invigo-rate his aculking companions with fresh courage; cod ito thus began 1— Sir, I know nothing on this occasion of

malice; I know nothing of acy malice, but

there is a duty which we one to enneives | neurable profession | that man in it are to of which he is a mamber. I state before he has done wrong; but to come to the God, that I have no makine towards him. I publio, to blazon these eircumateoces behave seldom read the paper of which he is or every one—good God is it possible that anys he is the reporter, and I can have be loves the profession? No man who loves formed an particular opinion; but from wheth he profession could here doon so. Now, I have read, and from what I have heard of Sir, I do condemn my friend IVr. Gregory the reports of this operation, it is say thing but that give him the ordit of believing it was don't maderstands his profession, who has a christian feeling withis his breast, and that neight said. He said, that if he had to make the proving it is the condect as to the public like roport over again to-morrow, he would and himself. Sir, I am not afraid to utter ide it in precisely the same way. Ho bas, ony thing in this Society, when trath and therefore, done tho act, and he glories in it. Christian charity are in the way. I state, I be bas stignatised the cheracter of onother, ony thing in this Society, were train and therefore, done into act, and he giories in it. Christian charity are in the ways. I state, it is be as signoished the cheructer of conduct. Sir, upon acted upperfessionally in the measurer in the whole, I do conceive that Mr. Lambert which he reported that operation; in the is unoworthy to be a member of this Society; second place, I say that he prescricted in I shall vote eguious him, and trust that every the witcess box, and that one of the mildest man who has a true sense of the hoover of and most apright judges this country over his profession at heart, will also vote against saw, has expressed his spinios upon it, and him.

Mr. Lamsert has gone forward to the public, like Cate, with a mark branded on his pied so long a time, I shall now compy but forehead. (Greet confusion.) I beg leave a very few moments longer. I return Dr. to state, while I was to the Chair, that I Thomson my thanks, for having come forpermitted Mr. Lambert to be heard with ward in the "streight forward" measure he being said is inrious to his feelings; I trust, forgotten the distinction between public and

and the profession, I say Mr. Lambert, in ast in a straight forward and honourable his description of that operation, was multy manner; that they are to sat with that of a violation of duty towards one of his pro- against which Mr. Lambert appeared to feedinal brethren. In what he did, he was seen an earli de come to act in a way, doing unto Mr. Cooper that which he would calculated to honour the profession, and not not like others to do to him. If Mr. Lum- to display the apost in the aun, when they best was performing an operation, and I would not, but for their conduct, be perdare say he has performed many, and very caired. Sir, if Mr. Cooper was the bad ably, and another was to consider the ope-surgeon which Mr. Lambert supposes him tetion was not well performed, and reported to be, still it is not becoming of Mr. Lamin such a manner to the profession and the bert, or of any member of the profession, to in such a manner to the profession and the peri, or of any member of the profession, to public, I am quite sare he would not like it. hold him up to animadversion. Sir, If he hed. This gantieman says, and, in truth, he delad the honour of the profession at heart, he clates, he le the evowed reporter of The would be gono to Mr. Cooper is private, Lancer, and the author of most of those and lamented orer whot had happened. It reports that same to it. Now I state as conceive it a presumption to tell a man, one, that I will set ait longer in the Society even in private, such se Mr. Cooper, that of which he is a mamber. I state before the has done wrong; but to come to the state of which he is a manufact anomala him. I builting to blance these insuranteeres here.

stience !! and that I prevented any thing has done. But Dr. Thomson has entirely being and is prevented only truest, forgotten the distinction between public and therefore, while I am addressing the Chair, the same indulgaces may be meted out to a clock over the situation and conduct of arc. Sir, I say it was broadly stated in the public officers? If I were in a public situation and answered one question in a straight fort to the public, that that gauteman had not answered one question in a straight fort to the public, that very case about be ward way as he quight with have done. Mit begorted that came ander my hards, good Lambert should not say that I belong to a ser bad. Dr. Thousou has, therefore, emparty, or that I came here to vote against tirely minaken the view I take. If I had him because I beve makic against him. I followed the base example of one member know onling of Mr. Lambert, I hnow cotting of Mr. Lambert, I hnow cotting of Mr. Lambert, I hnow cotting of Mr. Lambert, I hnow and the straight of the straight of the public, that the product of the public had straighted the same and the department of the production. If I had subsered that amentary of my life. I never spoke to him, I am not hitherto regarded an earred, by all but the judging between Mr. Lambert and Mr. veriest acus of writens—If I had from saite which I entertain for either of them—the holds a men up to indicate the rime to this profession is to be hald up as an head ward and it, the when I have a higher respect that should a men up to indicate the rime to this profession is to be hald up as an head wards not selectly, and all this when I have I have be the man and the wards not selectly, and all this when I have a ward and the content of the profession is to be hald up as an head wards not selectly and all this when I have a such as the selectly and all this when I have a label of the profession is to be hald up as an head of the profession in the lead of the profession is to be hald up as an head of the profession in the lead of the profession is to be hadd up as a man head of the profession in the lead of the p to be false—then, indeed, I should have me, and then refuse me an exportunity of deserved your scorn and reprodution. I defending myself?", have set again, why have not the Society. A seem of the greatest confusion now took

testified their hooret and just indignation at place. Violent attempts from within were such conduct? It is true that I said, that if made completely to shut the door, whilst I had the report to write over again, I an immense throng of visiters and members, should do it in the sema manear as that assembled on the outside, for a consider-which I had done; but I said that I wrote able pariod prevented it. Dr. Wubster, and It under the highest feelings of aznitement. various others, declared themselvas per-As to Dr. Thumson's threat of retiring from factly lacapable of abutting the door, or of the Society, it is probable that his presence pushing back the visitors. Mr. Wakloy, who here will not be much disturbed by me; was atsuding in the lobby, again earnestly I have not attended the Society coose this entreated that the gentlemen would not season before, and, but for this affair, it is attampt to force the door. Dr. Gregory revery probable that I should not have been quested that some persons would run to the bere spine. As to his resignation, I suppose that nothing short of an earthquake mest?! (Roses of laughter, berealeg, and would cause after it. hissing.) The Doctor, finding no one observed. would ensue after it.

Dr. Johnstone. Sir, I came here the diest to his call, forced himself toto the fast night on which the Society mat, not passage, exclaiming, "They say it can't be knowing any thing about this question; I done, hat I'll see that it's done." When, knew nothing whatever of it when I acter- with an appearance as wild as a deer, and here nothing whatever of it when I noter-with an appearance as wild as a deer, and at the room, and I will now state my reaas pale as a ghost, he thought he had got some for meaning to give my vote against out of the room, he was under the necesMr. Lambert. #### LONDON MEDICAL SOCIETY.

January 5, 1828.

------

Dr. Ilaskam, President, in the Chair.

POINT OF ORDER-SPECIMEN OF DISEASED REART .- COINCIONNES OF DISTARES REC-TUM WITE PHINIS PULMONALIC.

Whan the Members began to assemble at a few miontes before ciglit o'clock, the timepiece in the Society's room was observed to be ten minutes behind the proper time. A

stated, that as the Council wore engaged in some very important business below, he did the touch. pot know whether the President might

until they arrived.

The Puzzious observed, that If he (the Registral) were present, that was quite auf- of a tating, that a paper had just been put deisot; he did not see that be had any into his hands from the Council, with a reright to wait for the Council; indeed that quest that it might be read to the Secrety. was quite out of the question, therefore he requested the Registrer to read the minutes of the last evening's proceedings, declaring the business of the Society to have commenced.

· The minutes of the last Meeting were

read.

contraction, which he had collected within of the Society, will please to signify the the last fortisight; there was also hypertrophy is some of the suricles and voniticles. Mr. Pacorran, I think, Mr. President, the of them, particularly, was a very bestit-

fibres crossing the base of the tabe, so as considerably to have impeded the flow of blood, and, by the additional force required tn throw it out, a portion of the sorta had become elongated, and nazrly driven off from its connection with the heart.

Mr. Howayween wished to know the symptoms which led Dr. Remedge, during life, to conclude, that the patients had dis-

eased hearts.

Dr. RAMAGER had seen them whom labouring under a state of diepsy. There was a good deal of finid in the lower part of the client. The ventricies were to be heard acting very feebly, except in the instance where the left ventricle was in a state of piece in the Society's room was observed to hypertrophy, and then there was consider-be ten minutes behind the proper time. A nile action. The patients, for a long time gentleman near us observed, that it had been before their dissalution, could not remain in ut back for some purpose or other. The their recumbent position. Placing them in President desired one of the door-keepers a chair, and getting se assistant to held the (a son of the Registrar) to put it forward inferier extremities and lawer part of their to the proper hour. The President took bodies steadily, by shaking the superior not being present, he requested the doorkeeper to inform him that the time for comsymptome also. The requested the doorkeeper to inform him that the time for comsymptome also. The requested the husbane of the symptome also. The respiratory functions. meacing the business of the Society had did not act clearly. In some of the cases there was a strang impulse communicated to The RECIPTARA, at five minutes past the fuger behind the ribs epposite the heart, eight o'clock, made hie appearance, and by some small arteries, which, nader common circumstances, are not detectable by

The REGISTRAN, (the Council having new think proper to delay commencing business ontered the room, and it being upwards of twonty minutes past eight o'clock,) hegged to interrupt Dr. Ramadge, for the porpose

> The PRESIDENT. Is it in the ordinary rontino of business to read it now?

> The REGierran. I am directed by the Council to read It.

The Presinger. Well, but is it in order that it should be rend? That is the first thing, I presume, to be exemined into. I thing, I presume, to be executined into. I Dr. Biles requested to know whether should be very happy to read any thing that the President had taken the opinion of the is sent up by the Council; but whether this Council upon a point of order he had small interesting subject that Dr. Ramadge is he should do?

The Parameter replied, that he had the this point, I alled take the sense of the council upon a more replied, that he had the this point, I alled take the sense of the council to he had an information from them, nor upon it myself, but will take the sense of the had he had no information from them, nor upon it myself, but will take the sense of the had he had no information from them, nor upon it myself, but will take the sense of the had he had no information from them, nor upon it may be the council. had be been delegated with any answer to the Society now the operation. These that the question put to him.

Dr. Ranadoz, exhibited to the Society Council should now be read to the increase property bearts, in a state of surjoular ventricular ventricular to and a second or the ordinary business.

send up any thing that was not interesting cause, let it be fully understood, that it is to the body of the Society. I apprehend it if or you, and not for myself, that I wish to will be better to hear the paper read before preserve avery degree of order and regular-your motion is put, and then the sense of the ity that appertains to this Society. I should Society can be taken, whether it should be presume, before we meet to canvass thu agreed to or not.

terrapted by the reading of it.

Mr. Asnwall. Sir, I do not know what the paper is; but I lave now lad the plea-sare of belonging to this Society for a very long time, and I have never beard such a question as this antertained for one moment. I do not know that it is in accordance with tha law; hut, as a matter of courtesy, I have always observed, that any paper sent up by the Council to he read, was put to the Society at once. As I said before, I know nothing shout what the paper is, but I cunnot conceive that the Council would send it here, if it did not relate to a matter of easential interest.

The Passinger. I am precisely of your opinion, but I cannot admit that for which there appears to be no law. I respect every thing that comes from the Council, hat I do conceive it to be my duty to take the sense of the Society upon whather this poper should now be read, to the axclusion of the

business at present going os.

Dr. Sheannan. Before, Sir, the question is put, I would ask, it what an awkward predicament such a source places the Council? After coming to a decision upon a question they have had under their consideration, if it is not to be permitted to be communicated to the Society, the sets of the Council become entirely sunultad. They have come to a resolution of vital importause, upon which they think it is essentisl for them to take some measure, and they wish it to be communicated to the Society; but if the question from the choir is to be put, then that will be just an much as to may, What are the deliberations of the Counoil to us ! Those deliberations are to go for nothing. (Cries of read, read.)

The Pursioner. Then, gentlemen, if it be

your pleasure, it shall be read.

The REGISTRAN new read the notice one passurer, at uses no read.

The Reciseraan new read the noting of the Reciseraan new read the noting of the Reciseraan new read the noting of the Reciseraan new read the pages, Taball Starter with what has fallen from Airmed it to you again. It is a read it to you again. It is a read it to you again. It is my daty to put it will inform us what is the nature of the de-to the Society, whather the business of the linquency that is to bu inquired into, (cries Society should, in the first place, be in of hear, bear,) in order to know what we are about, and whether it is proper to call a meeting or not. Mear, hear.)
hir. Paccron. I think it would not be

fair to the individual himself, to canvass the reasons, at present, of coming to this re-solution; because Mr. Lambert will have the opportunity of defending himself at a future period; he will then have his friends around him, and I hope he will be able to acquit himself; but it appears to the Cooncil that there is amough to warrant them in

calling a general meeting.
The Parsiot Nr. But a general meeting must be called for a specific object, and that object must he stated. What has be done?

Mr. Paocron. Why, that is the question

hu is to be saked.

The PRISINENT. Wall, hat every person secused has a copy of his indictment. (Hear, hear.)

Mr. PROCTOR. Sir, we hold him innocent at present, and he will have an opportunity of defending himself; but I think it is within the competency of the Council to request that the meeting shall be called. The Passingers, You hold him innocent,

Sir, and yet you appoint a day for his trial !

What is the meaning of that i Mr. Shaanlay. What business have we with Mr. Lumbert's character? I know nothing of Mr. Lambert; but if his conduct have la to come into collision with whell I apprehend, is really meant,—that which took place upon the late trial,-then I say that we have nothing at all to do with it. nat, hern? That is the question.

The Reuserane, Sir, I rise to order. We cannot indulgs here in these observations. This is a simple notification from

the Council.

The Pustment. A simple notification?

we the measure put into a tengible slaps, clife purpose for which the secting is We must have a accusation, that the gencular collect; this appears to me seeking but theman may be herry either to condemn himself, or to be condemned by action, from which I am sure this Society others; that I feel really salamed to have to sever will depart. I hope, therefore, that others; and I feel really salamed to have to state so much; for I declare I left the Coundil under a notion that the paper that was to he drawn up was to be very different to the thing be referred back to the Council; that which has just been bad. I understood it.oras to be a motion of the Council to summon a general meeting of the Council, to accertain whether they would, or would not, recommend to the floriety some proceeding. I say I mistook the meaning of the Council, is paper combins their intestion, other-

Dr. Briter. Mr. President, I apprehend that the whole of this is irregular. We have a number of visiters here; they have so right to speak on this subject, and therefore it cannot, by possibility, be in seder. It appears this is a notice seat by the Council agreeably to the rules of the Dociety, and we have nothing to do, but to suppose that an accusation has been made to them sufficient to authorise this notice, and we are bound to accode to it, believing that the Couscil would not have come to that resolution, without proper grounds.

Dr. Suren. As I am a visitor, I beg leave to withdraw, if my presence is at all ob-

jected to. (Cries of no, no, no.)

Mr. SALMON I believe the error has arisen from the fact, that the Registrer bould have gives to you, Mr. President, the paper before the business of the Society had commenced. The business of the Bo-My is one thing, and that of professional character another.

The REGISTRAN, It appears a simple

Mr. Salmon. It appears too simple to warrant a breach of good meaners. (Cries

of hear, hear, and laughter.)
De. Ramanca epologized for having intraduced his sub oct before this business

had been brought forward, and withdrew his properations.

Mr. Satmon meant by what he had said, that Dr. Ramaige ought not to have been interrupted by the Registrar in the first in-

The Pantipant. Yet, Sir, but you t agree upon it first (bear, beer); and I do The at

but show me matter of fact sufficient for the jounceive that we ought not to be summissed attpulation of may individual, and I shall be the jame, but for a specific surpose; there ought first to adopt the measure; but I do wish to to be a declaration of that which is the speeither something specific will be mastioned, which we are to meet to consider, or that and perhaps on the following evening, they will declars tile specific purpose. This op-pears to me to be but feir, and what sught to be, for I have ever held your honour end respect as secred as it was possible; and I de not like it abould go forth to the world, that the Medical Society of London called a meeting egainst an individual, without specifying a single thing in which they supposed he had done wrong.

Dr. Hamanca thought it would be highly

proper that the Conocil should re-consider the paper, insamuch as one of themselves bad disagreed with it. It purported to be the unenimous opinion of the Council, whereas one of the Council had declared it was altogether inconsistent with what he understood the regulation of the Council

to be.

Dr. CLUTTeseucz's opinios was, that it was altogether irregular to have brought up the paper to the Society. Part of the busiciety, was that of originating business to come before the body of the Society. It was perfectly competent for the Council themselves to have summoned a general meeting for the purpose stated, namely, that of taking loto consideration the conduct of Mr. Lambert, and they ought to here done that, without having troubled the Society at ell. He thought the subject, at present, ought to be allowed to pass without further observation, leaving the Council to act as they thought proper.

This suggestion was adopted, and the unisess of the evoning permitted to pre-

The Paratorer inquired if Dr. Ramades wished to resume his subject? Dr. RAMADOR declined making further

observations upon what he had introduce to the notice of the Society. Mr. So inor exhibited a specimen of dissaid rectum, to show the coincidence of Fir. Peacer thought it ought sow to be that disease with disease of the large. He decided, whether the 'general moving, at the time named, was to take place or not.

The Rectargate. To zero time, this is a had died of skidds paisments that they had examined several such passents, and examined several such passents, and regular circulum, of it will be next the namely, a contrasticil of the whole examined for the whole examined of the sum of the whole examined of the sum. of the gut, and that ant budy section to the sectors, but extending to the significations.

presented, in case of stricture in ano. The there could be no doubt that the primary calibre of the gut was not larger than merely to admit of the tip of his little linger, nevertheless he believed, though he had not out it open, that the muceus membrane remained From this he thought the Society must discover the exciting cause of that which is most common in this sountry, namely, structural disease of the lungs. He believed disusses of the zectum, in many cases, to be the primary and exciting cause of phthisis pulmonalis. He had cared copious empectoration from the lungs, by re-moving this exciting cause. The patient from whom he had taken this specimen, was a woman who had been run over on last Lord Meyer's day; had for some time been in the habit of epitting blood, and had been under his care about a week after this spitting began. The right lung was comparatively sound, without any adhesion to the patietes of the chest; the left lung was perfectly unsound, fell of tubercles, and adherent to the cheet in every part.

Mr. Gosser looked upon this specimen as a simple contraction of the rectum, than which he considered nuthing was more common in the latter stages of phthisis pelmonalis. Without further evidence, he could not believe that this had any thing to do with the exciting course of diseased lungs. Did Mr. Selmon regard a simple contraction of the rectum as a proof of disease in that

Dr. RAMADOS had examined 1000 pationts within the last 10 years, who had died of plathisis pulmonalis, in most of which the rectum was found to be perfectly sound, end the intestines healthy throughout; he had very seldom, indeed, met with a sees where the rectum was diseased.

Dr. SHEARMAN Was doubtful as to the achidity of Mr. Selmon's doctrine. He wished to know whether the disease of the lungs in this case was not much more likely to have arisen from the violence of the acrident, and that the rectum become subsequently affected.

Mr. Trunker inquired how Mr. Salmon accounted for diseases of the lungs follows ing a morbid state of the rectum? He thought it might be easy to explain how thought it might be easy to oxplain how diseases of the rectum followed philipsis pal-menalis, but, for his own part, he was not able to give a potentific reason for the reverse position.

Mr. Lat nor did not consider simple contraction morely of the rectum as a part of disease, but, in the present inclance, the getwas not dilutable by any force that would bly the applied to it. This patient's t, matter, brother, and some sisters, that of phthlide pulmonthis, therefore

cause of disease existed prior to the 9th of November last. He was not able satisfac-torily to explain Mr. Tyrrell's query further, than by saying, that if a man had a diseased rectum, by which one of the most important functions of the body was put a stop to, it was not surprising that that should bring forward any disease to which the individual had a predisposition. Mr. Abstractly had handed down his name to posterity for one in the simplest selbolboy things ever heard of, namely, that if a person kept the bowels ampty, he would, in all probability, he very low too selbolity to be very low too selbolity. long free from internal disease. But let them be werleaded, and he would atmost imme-diately be ill. He believed diseases of the rectum to be very much that exciting conne, both of phthists patmonelle, and fatule in one. By caring the rectum, when both it and the luege were discused-by ouring the restum when in a morbid state, and when fittele in one existed, he had restored the patients to perfect health, and without any operation but that of caring the stricture. If these facts were generally believed by the prefrezion, he was persuaded that operations for curing fistals: would very soon he thrown into the shade.

Dr. Suret made a few unbonnected observations, and efter a further brief discussion, the Meeting broke up.

TO THE SUBGROUS AND CENERAL PRACTI-TIPPERS, MEMBRES OF THE WESTMINGTLE MEDICAL SOCIETY.

GENTLEMEN;-The proceedings which to luce at your Society on Saturday evening inst, at the instance of a miserable and malignant faction, are calculated not only to overwhelm every member of the Soci with diagrace, but also to affine stigms on the medical character of this country. The only opportunity that you can have to wips away the stain, will present itself on Saturday evening next, the day on which you will read this; when I cornectly entrest you to stand, and, by your spirited and importial emident, recent the Society from the thrul-less of a security and contemptable justs.

I am, gentlemen,

Your obedient servant,

JAMES LAMBERT.

#### GUY'S HOSPITAL.

Ow Tuesday, the 30th of December, Mr. Key performed two operations of lithning; the first was on a man about filty-five years of agn; cight pieces were extracted, and the operation lasted about eighteen minutes. The other was no a middla-aged man; sed tha stone, which was rather small, was extracted in one minute and a half; the patients are doing well. Mr. Morgan likewise amputated a child's leg, at the calf, for dissensed foot.

Jacob Land, Amitted October 29, under the care of Mr. B. Cooper, with a tumpur rather larger than a pigenn's egg, situated beneath the claviele, towards its scapelar extremity. On placing the hand over the tumour, a sensation was given, almilar to the pulsation of an artery, and which the nounce subclavian ancurism; but, on a more minute inspection, it was discovered that this swelling was an enlarged gland, which derived its motion from the pulsation of the artery is its vicinity; in consequents, mer-cuty was ordered, so as to effect the system, and the swelling rapidly diminished but, in consequence of the man's general health becoming impaired, it was discontinued; from that time to the present, (Jan. 3,) the awelling has gradually increased; and isnew arenly the size of a heu's egg; the patient is again taking small quantities of mer-

Sir Asiley Cooper visited the hespital on the same day, in company with a foreign gentleman, whose name we could not accertain. The worthy beronet, in noticing the case of nævus, siteated beneath the chie, which is at present is this hospital, under the care of Mr. Morgan, recommended the following plan for its removal, which he said he had adopted with success: first, passing a perforator through the centre of the tumant at its base, and through the perforation a ligature; this was afterwards intersected at right angles by another; these ligatures were then tightoned, this was a ligature, when the prevention of the control of t

On Tuesday next, it is expected Mr. B. Cooper will perform the operation of lithotomy on a child at present under his exce, in the hospital.

## HOPITAL BEAUJON.

CASE OR INVESSION OF THE BLADDES AND MALFREMATION OF THE GENITALS. M. C., west. 28, of a healthy appearance, was admitted. Nov. 20, on account of the fellowing mulformation of the urinery and genital organs. - The recti abdominis, which had their natural attachment and situation above, began to divarge at the navel, so that at their inwer natromity they were distant from each other about an inph and a half, as were the casa pubis, there being no symp sis. On the lewer part of the median line, there was a red tumour of an eval form, (the longest dismater being transverse,) the circomference of which was covered by apidermis, and the nextre by muchia membrane; from its lower part a deep groove extended along the dursum of the penis, to the extremity of the gluns, and from this there was a constant discharge of urine, mixed with mucas. The peuis was two luches in length, compressed laterally, and attached unly by skin; the gland was very small, its lawer portion only was covered by the prepuer, the apper presenting the above-mustioned urethral groove. The penis was, of course, Imperiorate, had no power of erection, and the patient appeared to have no renereal desires, though the acrotum and lesticles were regularly formed.

### LECTURES

UN THE

DISEASES OF WOMEN AND CITILDREN.

DRLIVESED AT OUY'S MOSPITAL BY

DR. BLUNDELL.

### LETTURE XI.

Of some of the Diseases of the unimpropts Genitule Of Retroversio Uteri.

GENTLAMEN,-Having concluded our observations un the gravid womb, and on those diseases which are crising from pregnancy, I proceed this morning to the consideration of the last section of our subject, the unimpregnuted genitals, I meen, and the more important discuss to which these parts become liable when in the unimpregnated state.

Retroversion of the Want .- The uterus, as you will soon find, if you are secustomed to make exeminations, when healthily sitoated, is placed at the brim of the pelvis, and the fundus of it is lying forward above the symphysis pubic, and the mouth of it is lying backward and below, in apposition with the middle of the sacrum, in the po-action here demonstrated, the bledder being placed nateriorly, and the rectum be-hind. In the disease under consideration, however, when the wamb becomes retroverted, a total change of position enaug the fundus uteri falls down buckwar and helow the promontory of the morne, and the mooth is lying forward, and rises we the symplysis poble; so that more one compression, both of the rectain and d, the vagina being drawn serviced forward s . Where the uterus is in Cibe policie. Where the november by thetion, (responsible) if the policie be or if the majority det. Morbielly deveinverses morbially deve-owever, to be originally utly of any increase

may give rise to a good deal of pressure upon the ractum, the bladder, and the parts contiguous, and, in this manner, it may distress much ; more generally, however, where retroversion produces distancing symptoms, these will be found to be accompanied with an enlargement of the uterus, becoming, perhaps, as big as the head of a full-grown futus; this enlargement of the uterus, reaulting most frequently from pregnancy; oc-casionally, however, from scirrhosity, from polypus, or from a collection of hydetids. When, from any of those causes, the uterus is enlarged in its size, It may distress the patient greatly; the rectum is so obstructed, that it is said the faces will scarcely pess along, and it may be accounty to have recourse to injections, in order to remove its contents; thu bladder, too, and the arethra may be so ambarrassed, that there may be a difficulty lu introducing the catheter; and accumulations of water may take place in the bladder in such quantity se to give rise to disruption, or at least to injure the structures of this organ; so much so, that souto inflummation, or fatal chronic diseases, may enoug. Nor must I forget to mention that the womb continuing to grow in the retroverted position, it must make pressure on all the parts which are lying emong the bones of the pelvis, and, in so doing, must give rine to more or less irritation, of various nature, according to the functions and other properties of the parts compressed.

Cruses,-There are different causes, to which this retroversion of the womb may be ascribed. Whatever enlarges the nteras within limits, so as not to make it too belky to undergo the retrovertire movemt, seems to dispose to the disease : and see it is, about the third or fourth munth of pregnancy, when the womb becomes large as the head of a full-grown futus, that retroversion is most prone to take place, and the like effect is apt to be produced when from scirrhous-polypus-mole-or s combination of these affections, equal bulk is re-quired. Again, a couse which tends much to the retraversion of the aterus, and which, perhaps, is brought hito operation in four ps out of live, is the accumulation of using s ains beyond the rivels dimensions, it in the bladder. When the bladder becomes

times, when the presence is great, it may, slone, produce the retroversion. I here show you as apparatus, which represents the bladder lossed with water, together with the nterus disposed to retroversion: on inspection, yes may perceive that the operation of this cause becomes obvious enough. (Dr. Blundail bern demonstrated the nature of the accident.). In retroversion of the aterus, beside ..... two causes, there is yet a third which sometimes operates, and that is, the sudden action of the ebdominal muscles. Wemen labouring under retroversion of the uterus, will often tell you that they have had a fall, or that they stumbled, and made e strong effort ouddenly to recover themselves; or, that by a violent fit of inugling, or cooghieg, the attack was occasioned. I should suppose it rarely happens, that the mere action of the abdominal muscles alone, ausided by the distended bladder, is giving rise to retroversion of the aterus; but where there is so imagine, that the retroversion of the aterus accumulation of urine le the bladder, so as occurs during pregnancy only, for, indeto produce, by pressure, in the way I have pendest of gestation, evirtoversion my be been showing yee, e disposition to retroversion, the sudden action of the nurseles may it we cause is vary different, it becomes complete the displacement, as this spearates will clearly demonstrate. (Dr. Blueof those, I mean, in which you have gestioned.) dell again gave the demonstration.) Lastly, tion as the cause of the enlargement of the retroversion of the uterus is sometimes to uterus, and of those, too, in which the retrobe secribed, though not frequently, to se version of the uterus is wholly unconnected enlargement of the overy. A dropaical with preganney, And first, of the more overy, or scirrhone, may give rise to retro- frequent, and therefore of the more importversion; and, in these cases, just as the bladder everleys the uterus, so also may the domen striking, with great force, egalast a situation of reatraint; and that afterwards, stone that was lying by the road side. On on retiring and trying to svacuete the some her return home, a very copious accretion tents of the blaider, not a drop of the maof the uterus, shout the fourth month, as distinctly as in a case of sector; fade Inspection was made; when it appeared, the effects may be at great as those of y stearly, that in consequence of the fall, burities, and may very much repeable the electry, that he consequence of the fall, burition, and may very much research there had been a rupture of the overlan I wish you to understand, however, and eyet, and a flow of water late the party important it is that this should be into tones are, whence it was absorbed and that, in the retrevision of pregnacy; effused by the kidneys, the remains of here not siways, nor I think govern brum, which, becoming retroverted, was tion is partial. Your patient, as before, a

very much loaded with water, it makes a fixed by inflammatory adhesion in the re-pressure on the uterus behind; and some-troverted position. While this unhappy lady remained numerried, she felt but little inconvenience, but marrying, and the en-largement of the uterus taking place, the worth, in consequence of adhesion, not admitting of replacement, a fatal pressure of the contiguous parts ensued. And here, then, are the principal causes which give rise to the retreversion of the sterus;the enlargement of the overies; the strong and sudden action of the abdomical museles; the distansion of the bladder, from the over secumulation of prine; and the culargement of the utarus itself, provided it does not acquire so large e bulk as may disable it from undergoing the retrovertive movement. Of these causes, by far the mest commune is the over-distansion of the bladder, first, I believs, noticed by Dr. Denmau. The womb is most prens to retroverainn when it is shout as large as the head of the full-grown foctus.

Ynn are not to seppose, as some seem to ant, retroversion, which is occurring in the certier ments of gestation.

overy. A lady, labouring under overlan . When the womb is retroverted, it not dropsy, was recommended to take a ride in successionly happens; that the resulting rean open carriage every day, for the im- tention of the arine becomes complete, for provement of her health, taking the air as the enlarged uterus hearing on the neck of much as might be without occasionley the bladder and on the urethre, as demonmech fatigue. Is one of these excursions, strated by this apparatus, a total closure the vehicle chanced to be turned over, and sudges. In this case, the patient often tells she was thrown out with violence, her abber shriser that abe has been placed in some her return home, a very copious secretical tents of the blasser, not a copy or an me-from the kidneys ensued, with great abdomi-nal pain, when, in the course of a few days, ossered perhaps, for hours before you see-the recovered, and found herself entirely her, the secundation of uring having one liberated from the droppy. Sometime after-intended ever since; so that there is a great wards and entered into the marriage states; deal of the abdoman and heat, with and died with an irreducible retroversion; focusing said finetention, which may be the the cyst falling on the uteros; and surviving these complete retreetices of urine ; for exemit down below the promontory of the second where the uterus is retroverted, the retains

been placed in sems situation of restroint, joined with, occasionally, bearings down; do retiring she finds, an before, that the and provided, also, the rectam appears to secretion does not flow in a full stream, be abstracted, so that the contents are not though a few cunces may, perhaps, come sway, not however without much pain and difficulty; from this time, a partial foren-tion continues; day after day the fluid is sparingly emitted, but haver in such quantity as to empty the bladder completely, till by and by, perhaps, the secretion begins to steal away invelocatily, or sho may have strong efforts to pass the urice avon sgainst her will, and with every effort a smell gush may be produced, or there may be a contienal drippieg, and yet, notwithstanding slithle, an accumulation of water may go on very gradually, so that several plets, may according units, may be gradually accumulated. At this time there may be externed or the sowe.

Imba, especially if your petient be in a state and where an accumulation of water in the of gestation; and you, (for the case is exceedingly deceptive.) feeding that the large ing the whole time; further, on examining ore codumetons, that the abdomen in large, increasily, you will find a large awelling, a tumour filling the paivin; the vagina lying this time there may be edema of the lower ating with distinctness, and that the patient, instead of having a retention of urine, on the contrary, emposes herself to labour un-der an iccontinence of water, the retention of the sacretion may be the last disease which you enspect, and you are inclined rather to macribe all the symptome to motites, overlan dropsy, dropsy of the ovum, or other cooms. If you err, nothing is done, and the bladder may baret: in the prepara-tion before you is an example of the socideat. Even when the bladder is emptied, chronic disease is to be expected, or there may be a fatal ioficammatice, or a miscarriage. In cases of this kied the urine may continue to accumulate for three of four weeks together; nearly two gallons have been knowe to coliect.

A woman labourieg under symptoms like sacitee, a practitioner proposed, I think, the operation of tapping; there was, however, some obscurity about the case—a great deal of pain more especially ; and an accombine being called in consequence, a catheter was introduced, and water was drawn to the amount of seven quarts, (nearly, therefore, two gallons,) which had been accumulating in the bladder for two or three weeks, in sequence of a retroversion of the will That retroversion of the womb backs yeb may in general mapoet, provided your patient bell you sho is anothe to seem her water in a pleany stream, and in large quantities at want, we that she cannot have year in all nilters of the water, a few days, or yearly so the state of the state o

water school

expelled at all, or whan capelled, flattened, for this is said to be a symptom of the discase, though I have not given attention to the symptom myself, these symptoms should the rather excite suspicion, if the woman have been placed in a situation of restraint, and if sho be in the third or fourth month of her pregeapey. All these symptoms, bowever, can de to only a supicion of the neture of the disease. It is by examination, and by axamination only, that it is certainly secertained, whos it may be recognised b the following marks: the abdomes you will always find of a large or swollon size, and fluctuating very distinctly, especially where the retention has been of several days' standing, bladder has been gradually proceading derin the general not to be felt, or not to be felt without a good deal of difficulty, when It lodges in front of the peivis above the pubes. Again, on emptying the bladder, you further know the disease by ascertaining that the womb is not le its healthy situation, above the symphysis, the observation being made with facility, on account of the relexetion of the covarings; and by year observing, morcever, when the tumour is pushed from the polvis, that it may be falt in its ordinary place. It has been asserted, you may recognise the retroversion of the aterus always, by the situation of the on uteri.

It has been asserted, that if the uterus is not retroverted, the os uteri will always be found lying forward and upward, abovo the brim, le froet; bet this is a mistake. The occurrence is sufficiently frequent to render the diagnostic worth your ettention ; remember, however, it is far from being the sola or principal one by which you are to judge; first, because, when the neck of the uterus is very flexible, as sometimes you may have a retroversion of the body only, the uterus doubling backwards upon its own cervix, and the on uteri remaining nearly in its former situation; or, secondly, which is a great defect in the diagnostic, where you have as enlargement of the overy; this viscus will sometimes fall down and tiff the uterus, so as to place it with the funder upon the phenomicry, and the mostle spon the syn-physis, insenuch, that the mouth of the womb will stand much in the situation in programmer were second. I see may wome was seen mean to be studied in reinterest support the user provided the painterest support of the ordinary kind. It is,
which I would be placed, provided the reinteresting were of the ordinary kind. It is,
which I would be placed, provided the reinteresting were of the ordinary kind. It is,
the symptoms, paint, the moreum,
blue, the symptoms, and not by any which it would be placed, provided the re-trieversion were of the ordinary kind. It is, therefore, here, as in most cases, by a comsingle symptom noly, that your upinion must the fingere, after which, with gentle pres-be guided, and when you find the abdomeo sure, often, I believe, without the least diffifluntuating, the pelvis filled with a tumour, with the vagies before it, and the rectum behind, and when emptying the hladder, and raislog the awelling, you find it takes the situation of the uterus, then, and not till then, cao you say, with certainty, that the disease is the one under consideration.

Treatment.-Io treating the retroversion of the uterus, before you sttempt to put the womh into its proper play, remember that it should be your first object to evacuate the hisder thoroughly, first, because if the bladder is full, and lying over the eavity of tha pelvis, it will obstruct the pelvis so much as to render the reduction of the oterua, perhaps, impossible—there will not be room for its reduction; and, secondly, becanae even if you were to overpower the resistance, and replace the nterns, yet, hy forcing the womh into the abdomeo, you might tear the bladder, and, io that way, destroy. Dr. Cheston was onne called to a oase of retroversion, where large accumulations of urine had taken place, and where the eatheter could not be istroduced; suzious, of course, to svoid the oced of tapping the blad-der, (a very grave operation,) he and others attempted to reduce the retroversion without previous avscustion; but, fortoostely, they did not succeed; I say fortunately, benause if they had succeeded io urging the tumour shove the hrim of the pelvis, disruption of the hisdder would most probshly have been the consequence. Failing fo this, of course they were obliged to have recourse to their surgery, and the hladder was tapped. Now it is remarkable that in this case, after the orice was withdrawn by means of the trocar and canula, the uterus itself returned into its proper situation: and though Cheston, who was a very able man, and others in company with him, could not succeed in replacing the uterus by manual effort, yet it returned itself after the bladder was emptied.

Here, then, is one of the first steps to he taken-let the hisder be thoroughly avacuated by means of the estheter, for it will rarely happen that any tapping can be required, if the catheter be committed to proper and dexterous hands. When this has been accomplished, you may then place your patient in the usual obstetric positioe, on her laft side, close to the adge of the bod, with the shoulders forwards, the ioins posteriorly, and the abdomen facing a little towards the hed; this dooe, you pass your fingers, say all the fiogers, of the right hand, but the vagins, so as to lay them upon

oulty, you may raise the womh above the brim of the pelvis. This may be easily done, if you have drawn off eight or too pints of urioe, or even two or three, beesuse the abdominal coverings become so exceedingly faccid, that they make no more obstructine than if the body was laid open. Well, then, in this way, with the fiegere in the vagios, and the thumh in the rectum, sa shown by this spparatus, the womb may often be re-placed without any force; but should you fail in this attempt, under gentle efforts, I should then recommend to you an excellent practice, advised by Denman, and which consists to keeping the bladder thoroughly emptiad, latting your patient drink hot little, causing her to perspire as much as may be, and introducing the catheter some two or threa times a day; sud the bladder heing kept empty, the womso is placed with the pelvis inverted, for which porpose she ought to take her position on the knees and albows. The more time abe passes in this posture the battar; it may be necessary to use it for hours together. Sha is oot to give way merely on account of the fatigue, but to continue it as long as the replacement may require. Now the bladder being emptied, sometimes the womb becomes replaced io varioca time ; a miaute msy be required, or hours; hot I think I may vecture to add, that it pretty certainly returns at last. To this method of treating the disease I am execedingly partial, because it requires nothing more than the introduction of the eathetar, and the abstraction of the unneon introduction of the hand into the vagina -no entraces of the fingers into the rectnm-no force-no contusion-no lacera-

But it sometimes happens, and I will pot this case for our consideration, that in naither of these modes can replacement be obtained; you have tried them both-you have emptied the bladder-you have pressed with the fiegers-you have placed the pelvia in the inverted position, yet day after day the inversion continues. Where this is the esse, I would recommend you to sllow the urion to accumulate afresh, to the amount of two or three pints, afterwards abstracting it by the cathotar, and then placing the patient on her knees and elbows, in order that you may have the full effect of gravity to help you, endeavour. again to replace the uterus by means of mauual operation. Now there are three ways in which we may endeavour, in these cases, manually to replace the uterus; in the the body of the uterus, and at this time, first place, we may content ourselves with provided the patient can bear'it, which may often he the case, you place the them is the right hand, more or fewer of them the rectum, and thus get the uterus between precaing the womb, endeavouring, at the

same time, to urge the fondus shove the brim; in the next place, placing the fiogers.in the vagina, and the thumb within tha rectum, so as to get a deuble bearing on the uterus, we may attampt, by this dooble actice, to earry the uterus shove the brim; or, lastly, if Dr. Hunter is to the brim; or, lastly, if Dr. Hunter is to
be our guide, one of the fiegers of the
left hand may be passed into the rectum, so
as to get a bearieg on the fuedos uteri,
which lies on the front of this bowel; sod
one or two fiegers of the right isand may be
rested upon the os uteri, and the bearings made to extruct it, and these having resided upon the os uteri, and the bearings made to extruct it, and these having failed,
he to describe the right isand may be
rested upon the os uteri, and the bearings made to extruct it, and these having failed,
he to describe the right isand may be
rested upon the os uteri, and the bearings made to extruct it, and these having failed,
he to describe the right isand may be ie this manoer, we may endeavour to urge swallowed a large piece the fundus above the promontory of the peared that deglatitiee, sacrum. This last mode, recommended by ful, was perfectly free. of both hands, and the one must embar- duced no effect ne the arrested bons. ratiog, hy placing the fiegers in the vogies, ond the thumb within the rectum.

Whee, in eee or other of these ways, you have eccemplised a reduction of the uterus, direct your patient still to cootinos in bed fer two or three weeks. If there is sey dis-position to a return of the retroversion, yeo should advise her to place herself upon the keees sod elbews, nece or twice in the day, direct her slao te empty the bladder repeatedly io the course of the twenty-four hoers, never suffering any large accumulation to take place. Under this practice, the uterus may be expected to remain ultimately in its situatine above the brim; because, in tha course of a fortnight or three weeks, in the case of pregnaccy, the uterus grows and enlarges so rapidly, that it becomes too buiky to admit of displacement. Add to this caution, that after the bladder has been evacuated, sud tha wemb has been replaced, you shoold siways he on the watch for inflammatico of the bladdar or ni the abdomen, for such inflammation may not unreasonably be expected to occur.

At our next Mosting, Gentlemeo, I will resume,

## FOREIGN DEPARTMENT.

PERFORATION OF THE GEOFFACUS.

being obtained, the es uteri may be drawe he tried whether it could not be pushed downward when the fundua is elevated, and, down into the stomach; he accordingly dowo into the stomech; he accordingly dowo ioto the stamen, and it ap-swallowed a large piece of bread, and it ap-peared that deglatities, although very pain-tal, was perfectly free. The pain continued Hunter, appears plausible enough, whee unabated at the same place, (ee the left side tried en machinery, and such preparations of the upper part of the cooplagus;) and, as are new on the table; but I am per en the fellowing morning, it had increased seaded that, lo most leatances, it would so much, as to reader swallowing almost be found to he very inapplicable in prac-impossible; the patient new took an eme-tice; in the first place, it requires the use tic, the operation of which, however, prorass the other; then, too, it requires you to the third day after the accident, he was get held of the ea uteri, and hear down-seen by Dr. Gilbert: the pain was very wards if you can; het what if you cannot? violent; deglutition then impossible; and You may have a difficulty in reaching the when the patient cedesvoered to drink, he os nteri; it may, too, become alippery was tormeeted by an ietolerable burning from mucus; after your utmest endes-sensation at the places in which the boos yours, yen may be unable to retain your had seemed to be arrested; nething could be beld. In future practice, after due experi- seen ie the throat, er esternally; but the one, yen must choose for yoerselves among parts were so tender as scarcely to admit of those three methods of performing the asy touch; there was much fever, with a full manoal reduction; for myself, however, I hard polse, headach, &c. From the patient decidedly prefer the second method of ope- having heen able to swallow after the ingestion of the bone, it was inferred that it had descended into the atomach, after havieg caesed a riolent irritation of the cooplisgus. He was freely bled from the arm, and by leeches; an emollient poultice was ap-plied to the chest, and siespisms to the lower estremities; be was then put seto the warm bath, and a mucilagieeus injection was admieistered. This coergetic treatment for so hoor or more at a time; and you may had but little effect; the fever, and the severe pain in the exophagas, continued unabated, and deglutitien remained impossible; oe the fifth day, however, some purulent matter baving been brought up from the pharynx, ha was shie to swallow some finid, elthough with the greatest pain; from this time he falt often sick, sod vemited blood mixed with pus; on the afternoon of tha seventh day, the pain in the usophagus aud-denly disappeared, and he was able to drick a great quantity of water; there was also. on pressure, but very slight paie; he said is felt quite well, although apparently much axhausted; the nights were restless; the fever had semewhat subsided, but he was eften taken with abivering; the head was free, and there was no delirium. In the night of the 9th day, he was much agitated,

up, and walked across the room; draok a literated. The mucous membrane of tho large quantity of water, and awallowed very atomach was softened and friable; that of casily; in the morning and afternoon, he the intestinal canal had codergons the same had asveral violent fits of shivering and ofteration, and was of o brown colour, such trembling; at the same time respiration here is in observed to incipient gangrane; the came difficult, he begun to lose his sanses, valvulse consoivents were hardcoed, sod and did out recognise the persons, fround the whole tract of the small instantine was him. The local affection of the exacplangua empty. The mucous membrane of the recseemed to have entirely subsided. He was tum was of a violet colour, thickened, beset ordered atmulanta, and twelve leeches to with hard scirrhous excresseoors, and cuver-the sous. In the ensuing night, he was ed with very feetid pus. The messoterio response and had frequent attacks of glands were in a natural condition; the shivering; respiration was very short and laborinos; the pulse very frequent and of fat, and were one substitution at the same at the same at the state of the sta but, on a closer inspection, it was found that near the lower horn of the thyroid eartilage, there existed a small depression of the mucous membrace; and that between the muscles of the oeek, and the left portion of the thyroid certilage, the cellular tissue was gangrecous, and, to the extect of two inches in diameter, iofiltrated with a black liquid matter, in the middle of which wos found the fragment of hone, which had beco the cause of death. It was two inches and Stu,-As it is but right that the operations a half in largeth, pointed, and of the thickness of every public body about be brought of a large pin. The atomach was, both the before the eye of those by whom auch body large and small curvatures, of a dark-red is appointed, and so the justice and upright-

Being, of course, equally happy to see the truth of what I had advanced thus acknow-

specied, I addressed a letter to the surgame early as possible to " the gentlemen then attending the Indimery, that they might have an apportunity of forming a correct npinion as to the truth or falsehood of what I had advanced." This request was, how-ever, altogether unleeded; and it can scarcely he wondered that (as I was still lying under the disgraceful charge of falsebood) their silenes very acon elicited from me a second, and certainly not so mild a letter us my former one; for while, in my first, I only ventured to make a request. I did not hesitute, in my seeppd, to samure them that, if it also was unattended to, I should speedily take an opportunity of laying the whole of their conduct before the medical world, that it might have an opportanity of judg ing if there were not good reseast for my baving spoken as I did of the surgeon under whose ours the case was first placed; and also, if there did not exist a very consider: able aced for change in the conduct, even

to come on, almost immediately, as sur-geoms for the present winter. Charges to be preferred sysinst me, I might bu sllowed an account of them immediately, truth of what I had advanced thus acknow-ledged, and omused, to find how completely This sequest of mine to the managers was my two friends had been disappointed in size unficeded; and, after baving met with their pious hopes and endeavours to effect them at the appointed place and hour, in my exputation, I did not wait long before profer to any comuthing in defauce of any sending a second letter to the Editive of Thes charge which the might think it proper to Lancer, acquainting him with the confirmation of the companion of the co mation which my attements bed received, the room, without being informed either of and with the unjuer, though unsancessful, what I had done to offend, or, in short, if I attempt which had been made to get me uspelled the Infirmery. In a short time after, allowed a chance of saying a single word in this second letter also appeared, and, as I defence of any thing I might have done, was informed, gave vary considerable offence. Now is this, int me ask, justice? Is this to our two Infirmary aurgeous, John Coupur way of proceeding either great, or gestife-and Rubert Cowan, who had then ontered manny, or generous, or good! Shall like be on their wieter campaign.

lo the course of days, (my memory will stand fair in the remembranen of mankind? and allow mu to speak decidedly as to the le it. I would inquire, fair, that while the particular one,) thu nursa, whose case I vilest marderer who ever breathed, shall be had reported, died; and, as I had been quietly and patiently heard, of any thing ba secused of falsehood in both my luttern re- may wish to say in justification of his foul lating to the mass, I thought the death of deeds, I shall be thus deprived (as I have the surse afforded an ozcellent apportunity most shammfully and disgree-fully bees of for clearing up the matter; and learning, those rights and privileges which even the mosterors, on the following day, that the most degraded and cacerbies among villatak body of the narse had been privately in la slowed, unmolested, to enjoy? And will ls sllowed, unmolested, to enjoy? And will lt, I sak, be believed that this very usage of of the Infirmary, requesting that the result which I complain, was purmitted in an of the inspection should be made known as assembly where the Lord Provest of Glasgow presided?

On the day following this meeting, (i. e. on Friday last,) I received from Mr. Christie, the Infirmary aurgeon, a notice, that " the Directors had ananimously ordered on to be immediately excluded from attending the infirmary;" and was elso informed by the porter, on going up at the asual visiting hour, that he had received orders, buth from Mr. Christie and from the attending surgeons, to refuse ma ed-mittance, in the event of my coming up.

Disposed in give Mr. Christin and bis omployers, the Directors, credit for as much truth and justice as possible, I had really persuaded myself, (as luformed by Mr. Christle,) that I was expelled the infirmary, purely on account of my having written the lettern above alluded to, until Saturday. when I was assured of my neistake; and told that it was not on account of my having written the aforeasid letters, but because I of our present surgeons. This seems to have had not thought fit to pay to my Lord Probeen more than they could beer; for, through vost, Convenor M. Leun, and follow-directibely instrumentality, a meeting of the Di-tors, jast so much homage as they had rectors in the Infirmary was called, and I was buyed I would. Even admitting, however, invited to attend, in order that I might be that my expulsion from the Iourmary was allewed on opportunity of saying say thing I determined, an account of the letters which wished in my defence; but what I was to I have written, my expulsion is at once andefend, I knew not; nor was I ever in generous, illegal, and unjust, and such I

publicly and cohesitatingly declare it to be. And I challenge the Directors to show u aingis law, by which they are authorised to act as they have dono. Secret laws, it is, to be sure, true, they might have, and secret laws they might indeed frame, for the effecting of avery purpose, which it is either their in-terest or their desirs to occomplish. Bot I can only say, that to so law do I consider myself ameeable, unless I be allowed on opporteeity of hecoming equainted with the law. If, then, the uxist laws on which the studeets are lieblu to iefringe, I ask the public if a copy of these laws ho cot a right to which every etodant has u just and lewful claim, and if it de not betray u proof of the grossest und most insufferable neglect, on the part of the Directors, that they shall suffer us to remain (as they now do, and as they have hitherte done) sitogather onacquainted with those very lews which we are to regulate our eneduct, eed to which we are accountable for all our actions?

Not satisfied, howaver, with simply exeluding me the privilege of uttending the Infirmary, whee I have in my possessice u "ticket of admissice," which entitles mn to attend till May 1, 1849;—" not satisfied," I say, are they with thus opeely and unjostly trampling on any rights, but they most ulso doprive me of my just and lawful myoperty, by withholding from me that pledge, which they received, alono oe the condition that I aloneld be silowed to attend the practice of the Infirmary "till the list of May, in the coming year," for which ettredance they gave me isermission, sed for the receipt of which pledge they thereby mada

acknowledgement.

It had been my intention to lay my several letters, for which, it is pretended, i am expelled the leftmary, together with my justification of uvery thing contained thereio, before the peblic of Giasyow, through the medium of your independant paper; but perceiving that it would encroach far beyond what it is possible to allow, I have altered my mind, and intend, in the course of u few days, to print u copy if the letter ubove alluded to, end, at the asmo time, to put in my justification, together with an account of the whole sellid:

I remaie, Sir, Your obsdient servant, Thomas Canter.

21, College Street, Glasgow, Dac., 15, 1828.

#### GLASGOW INFIRMARY.

MR. TRUMAU CAUTER.

#### To the Editor of THE LANCET.

Six,-The original of the fellowing paper was this day delivered to Mr. Christio, Secretary to the Glasgow Royel Infirmary, accompanied with a request, that it might ho laid befere the Directors ut their first meeting. The signatures attached to it are comparatively few, considering the number of students at present attending the hospital; but this neither you eor your readers must for oee moment suppose, arises from an approval of the proceedings of the Direchiany were actually afraid to algu it, dreading the fate of Mr. Carter himself, should they do so, while others were prevented by private considerations from the public axpressioe of their sense of the Directors' injustico towards their fellow-studeet. What adds to the value of the documeet is, the eames of more than one gretleman being unbecribed, who, you will ohserve, state themselves to have been uctoully heatilu to the system of hospital reporting, sed public animadvaraice on the con-duct of public mee, ie u public charity.

I am, Sir, your obedieot servant,
Amicua Justitis.
Thursday, Dec. 25th, 1828.

"We, the undersigned stodents of medicine, who either here here, or are at pressor, uttending the Glasgow Royal Infirmary, heg most respectfully to sapress our disapprohatine of the lets proceedings towards Mr. Thomas Carter.

REPART OF INTERMITTENT PROBACT TO SELD PLREGING WAS EMPLOYED IN THE COLD

By JOHN MACEUNTORN, M. D., Lecturer on the Practice of Physic, &c., in Edinburgh.

(Continued from page 442.)

The following Cases and Dinections are extracted from the Work of M. Bailty."

Cass 1 .- Pernieieus intermittent fever, attended with come and convulsioes. Stay in the hospital from 2d July, 1892, to the 4th in the erening. Antupay; arachnitia, cephalitia, gaatro-enteritia.

Benoit Simouelli, metet. 30 years, of a strong constitution, affected for some time with a tertian fever. He cumn to the hospital on the 2d July, 1822.

3. Had a slight febrile access, ofterwords

took aij, of bark.
4. Towards mid-doy he walked in the word, felt very well, and laughed with the other patients. All of a sudden he was seized with violent sluvering, to which shocoeded a very high fever, during which he had alternate fivalun and extension of the forenems, and profound coms. He died in six hours after the commencement of the attack,

Dissection the following day, at 2 a clack, P.M Vivid injection of the whole of the

"I knew not the lews of the hospital on the point, nor do I believe them generally

Case 3.-Stay in the hospital from the 2d August to the 5th, lu the evening. topsy; arachnitis, slight gastro-enteritis.

Pierre Donad, metat. 28, of a good constitution, was brought to the Hospital of Saint

Esprit on the 2d August, 1822.

Towards an bonr and a half after midday, he was seised with an accession of fever, which commenced by excessive coldness, followed by intense heat, and stupor. tie lay upon his back, with his eyes half open; he swoke when any one spoke to him, and fell again into the same state of coms; his pulse was frequent and strong; the skin hurning. In the night, copious sweating appeared, the intellectual faculties returned, and, in the morning, be was in a state to answer concerning bis health. Took several ounces of bark.

3. The fever returned half an hour after mid-day; commenced with a very violent coldness, followed by heat, sod stupor; but, nevertheless, be always awoke when any oue called him, and he opened his eyes. The forcarms were bent upon the arms, and could not be extended; the teeth were clenched, which prevented the state of the tongue from being seen. Sensibility of the skin diminished; he lies upon his back; there is no pain upos pressing the belly. At half past two o'clock, general perspiration, but not so abundant as the first. In the evening, return of sentiment and intelligenee; cessaties of contraction of the arms; but the ideas are less clear. Other doses of bark.

4. The morning of the third day after his arrival, at holf pust seven o'clock, the pulse frequent; stupidity; together with a drunken appearance. At cleven o'clock a return uf the cold, which was less letense, and of shorter duration; fever more violent; atupor more profound, come, return of rigidity of the limbs; subsultus tendieum; he alweys ties upon his back; pulse full and strong. At half past three o'clock awest appeared, but less copious. After the sweat, he enuld not give an enamer, and he won nuconscious of his own state; cessation of the contractions.

5. At nine e'clook in the morning, o new accession of fever, the cold stags shorter, the hot more violent; contractious of fore-

arms; coms, difficult respiration, râle. Died colour as that of the akin and dura mater.

at 10 o'clock in the evening.

Dissection 12 hours after death .- Lively in-

Case 4 .- Pernicious intermittent fever, with come and jaundica. Stay at the hos-pital from the 24th August to the 25th. nitis.

pital of Saint Esprit on the 24th Angust. In chas could not be distinguished in the midst prod. or Saint Reprict on the 24th Angust. In [rass could not be unsinguished in a minet the evening, the surface of his whole body of the red, bloody, and awolden folds of the was of a deep yellow citron colour; said nuccous membrane of the dualentum, but by this colour appeared during the last parox-this means. The ductus chiedechas being year; extremities cold, while Lie has feet-joened, presented nothing remarkable, exign finternal liest; tongue red and dry; expt that its mouth was drawn into the dualents. quil, and replied perfectly to all that we fluent. saked him.

25. In the morning, coms; immobility; lies upon the back; insensibility of the extremities, when they are pinched; but when pressure is opplied to the region of the atomach, he shows algos of suffering. Yellow- grachnitis, gastritis, voluminous and diffuness contlases. Polse insensible at the forearm, but in the leg it is 12? He took several spoonfuls of bark during this access, thun, was brought to the hospitel on the 6th which be comitted; and died this same morn. July. He was then without favor. In the ing at ten o'clock.

Dissertion .- The hody was of a lemon yelthe diminution of colour was scarcely perceptible; injection of the arachnoid; cortical substance of a deep colour; yellowish serosity between the convulutions. On sliving the brain, a number of jed points were seen: a little water in the ventricles; the cerebellum naturel; the lunga healthy; the sibility; immobility of the extramities; eavities of the heart appeared to us larger tongue dry. Died at seven o'clock, than usual; in the right ventricle was a clot Dissection.—Injection and thickening of entirely formed of albumon, as yallow in the spackaold; engargement of the vessels

The belly, before being opened, was concaro, and resting on the vertabral column; fishmation of the whole of the srachneid; the stomach contracted on itself; it was serosity between the circumvolutions; en- every where of the colour of less of wine. gergement of the vessels running on them; Although it was well washed, there adhered injection of the vessels uf the lyra! The to its surface a thick mucus, similar to the brain being raised, there escaped half a tenacious expectoration of patients labourpound uf blood. Some points, or red color, in the stomach and integence; liver curvature, and a portion of the greater, pregorged with blood; spleen reminious, and readly torn; no morbid prevance in this No. 30. When manning with a lens, it offered nothing more remarkable than to the offered nothing morn remarkable than to the naked eye, only instead of appearing to con-sist of small parfectly round playations, and with come and Jaurdica. Stay at the hos-pital from the 2th August to the 25th, communicated by their bases. The reduces Antippay; cepitalitis, gastro-enteritis, sple- of the atomach was less lively towards the nitis.

François Lauretti, shoemsker, estat. 60, like duodenum, where it was very intense, of a fean constitution, fell sick on the 17th and continued without interruption in the or a rean constitution, tell sick on the 17th and continued without inverruption in one August, 1802. He had the fever every day, inmail and large intertines. The gall bladder beginning with shivering, and terminating was green externally, and filled with a black in the night by aweating. At the name and thick bile; no preasing it strongly, only time he was constituted, and had a pain in a few drops could be made in pass into the the epigastrium. Was brought to the Hotol duodenous; the urifice of the duction chaldedpulse 108, like a thread. He had still so denum, in consequence of the swelling of much recollection, that he smiled on seeing the inflamed tissue of the latter. The liver us approach lim, for we had already spoken was of ordinary consistence; its onlour was to him when he was brought to the hospi- of the yellow of puwdered lark: this is thu tal, and before be was yet put to bed. He ooly time I ever saw it in this state. The complained of nothing, appeared quite tran. spleen was of the usual size, and quite dif-

evening the fever came oo, preceded by abliverings, and followed by violent best. low colour. On opening the head, the Thu pulse was strong, 120; coma. He lies dura mater was linged as yellow as the akis; typon the back. Right arm intuoveable; by repeated washing, this tint could in part the left arm bent and earried towards the be removed; but on holding it to the light, beed; sensibility every where. When as heed; sensibility every where. When an attempt is made to upon the left eye, he appeers to experience paio, and someracts the eyalids. Belly paiotal.

7th, in the morning.—Come; Hee mon the back; pulse strong, 108. In the evening : coma ; a claumy, fetid sweet; lusen-

base of the brain; phicgmosous eminences black blood, slightly congulated, and of celin the atomach, which were of a grey slete lular bands, which alone offered some re-

CARR 6 .- Stay in the hospital from 3d July in the marning till that evening. Autupny; muchnitis, gustro-enteritis.

Vincent Ornini, etst. 60, came to the hospital the 3d July, 1824, in the following state :- Cnms ; pulse iosensible ; extremlties cold; demi-flexion of the two theracic extremities; when one wishes to extend them, o resistance la folt on the part of the fewor muscles. Left eyo half shat, right eye open, pupils dilated, immove oble; tongue dry, lying is the vary betters of the mouth. He resultests pain when pressure is applied to the helly. He died the same evening.

Dissection of Case 6 .- At the essemination vivid inflammation of the arachaoid, with great injection of its vessels. There cacaped some serum, which was situated between the days mater and grathmold. A fibrous tumour, of the size of a large nut. adhered to the dura mater, under the posterior angle of the parietals, and compressed the brain; although the injection of the arachnoid was very lively on both sides, it was, however, greatest on the left. Hyda-tid in the chorde plerus, the aire of a small pea. The water must was between the aracknoid and dura mater was more abundant on the left side than on the right; brain pretty soft. General inflammation of the atomach; the S. of the colon was of a brownlah red.

Case 7 .- Stey in the hospital from the 19th Jane to the 20th, in the evening. Autupsy; pephalitia, putrilaginona softening of the liver, enteritis.

Douato Fauti, o colller, mint. 50, was brought to the linspital of Saint Esprit, la a comptose atute, which coolinged even till death. The pulse was strong, beating 80 times in a minute; when the extremities were pinched the intient manifested palu; the akin was hot and moist; when they opened his eyes, he did not direct them to any object. It was impossible to see his tongue, because his june could not be separated sufficiently to see it. He only complained of pain when he was pressed in the region of the liver, and he did not appear to saffer any thing when pressed on any other part of the helly.

Dissection .- On opening the cranium several ounces of blood escaped; the arachuoid was atroughy adheront to the dars mater by granulations, resulting from old inflammation; the vessels of the brain were much emporged; on slicing it, drops of blood os-

which run on the convolutions, which are caped from the divided vessels, which re separated by watery axudations; the left appeared even after wiping. The liver was lyrs greatly injected; watery effusion at the blackish; it appeared composed only of colour; invagination of the small intestines; sistance to the floger: where this weak re-apleen voluminous and pulpy. the consistence of this jelly, for the blood appeared effused in its tissue, which resemhied a pair mass. The intestinos were in-famed in several points, and each infismed portion corresponded to some knots of worms, which were still allve. The lungs, the sploen, and the stomach, were healthy.

> Case 9.—Autopsy: hopetitis, pnsumonitis, peritonitis.

Joseph Totti, horse-doctor, of a sanguine bilioos temperament, strong constitution, was accustomed to go down every year to marshy situations, to direct the workmen in scedtime, or at the barvest, which occasioned obstructions in the spleen and liver. In 1811, In the time of larvest, being then aged forty, and working with great activity, he was affected with an intermittent fever, and which continued without using any remedies till the third paroxysm. At last he returned home; the fatigue of the journey procured for him a very short aloep. I saw him when he was affected with his fifth paraxyam. He was in the following state: agitation; impossibility of finding a position which procured him rest; pais under the right false ribs, mounting to the top of the shoulder, and extending to the left hypochondrinm; puins in the articulations; head heavy; tongue covered with a white crust, bitter tests in the month, vomiting; thirst; face livid; pulse irregular, neither soft nor hard; grest difficulty in respiring; urine red and clouded. He got an injection to lonsen the belly. He had little repose during the night, for the fever returned, preceded by a general coldoces ever all the extremities, and the pain in his side was aggravated.

6th day. A frequent cough, without expectoration. The emulsions had eased the thirst; had no appetite. The hitter tasta in the mouth had disappeared. A pound of blood was drawn from the arm; the congulum was almost soft; the serum was livid. At the return of the fever the cold only attacked the extremity of the feet.

7th day. The pain worse and worse; the difficulty of respiring still greater; frequent scuotations; uriue always the same. As the tongue was white, and as he had no stools after the levement, he took 3j. of manns, which produced a hillons stool. In the night he had no sleep; deliriom.

8th day. The petient felt the least return of the fever; the pain of the right side became fixed in the hypochoudrier region,

and sugmented in violence; the fementa-| constitution, was affected with a simple tions were found of no use in diminishing tertian fever since the 24th Juno, 1822, these pains, which every ovening, howover, On the evening of the 7th July, be was presented a well-marked spouteneous remis-seized, secording to the report of his parents, in the prince in the prince rents, with an accession of the periasious, was more shandant. The patient large commtons intermittent. It arrived at the drank some soup, nomited a per account inspiration the moraling of the 8th July, and mstier.

moteorism; belly always con-spored. The bent and contracted; pulse 112; convulsiva nourishment did not oppose the sinking of trembling of the fingers; logs stretched and the strength; he took? drink a solution immoveshie; sensibility overy where. They of nitre. He could not support the touch made him awallow three ounces of bark in of the hand upon the right side of the belly. six bours. In the evening he became delirious. No sloep during the night; he raised himself the feet.

frequently to make urine.

10th day. Severe pain is both hypochondrisc regions, so much so, that he could ful come; he hears but does not snawer, alneither lie upon his back nor npon either though he looks ; two hours later, pulse 93, sido; ho sat up in the bed; the agitation very full; several anness of bark. produced aweating; he had no repose, but when he supported bimself upon his olbows and knees, the back being turned upwards; but soon the cough destroyed this rest; passed a very painful night.

111b day. Same state; nrice clear and

ready to putrify; Isvements repeated; s blister applied to the right hypochendrium produced na relief. He could not even support the weight of the bed-clothes. Delirium in the night; after a short and agitot-

od sleep he became worse.

12th day. Vague shiverings; pains in the extremities; pulse small; anxioty; diarrhors; face downcust; a watchful night.

13th day. Respiration slight, interrupted by sighs; very disagrees ble night.

14th day, in the morning. He could not rest himself in any position, and as ho was raising himself to speak to his confessor, he

expired.

Dissection .- The body affered nothing remarkable but a teosion of the belly. in the sbdomen, there was a sauloon effusion, mixed with a little blood. The liver was patrid and tuberculous; this offection custmenced towards the convex port, extending the concave part ; nevertheless, the grentrior face of the disphragm was erysipelatous; of water; the spleen dauble the ordinary aixe, and of a black colour; the exterior surface of the right lung was covered with a white crust, the inferior part adhered to the pleura costalis.

nitia, enteritia, aplonitia.

setter.

9th day. Pulso soft, week; festrating; cubitus on the back; face red; fore arms observing; helly always ages.

At 2 o'clock. Pulse 100; sinspisms to

9th, in the morning. He is in a sweat; remission of the faver; pulse 88; n watch-

Evening. Pulse full, strong, 96; pro-found come; resisting stiffness of the right arm; he canuot show his tonguo; skin hot, and always molat with awost. To make him swallow the bark, it was necessary to pinch his nose, and hold his mouth open with a key; afterwards water was poured in, which he kept in his mouth, and finished by rojecting it. His has taken asvan nunces of bark through the course of the day.

10th, in the morning. Pulse 140, strong and full; coms; fisceidity; general immohility; mouth open; blood was taken from the jugular; respiration stertorous. Died towards mid day.

Dissection.-Injection of all the vessels of the arachaoid, even to the vary amallest ramifications, and on both sides; but an the right side, and upon the enterior lobe, it was of an intenso red, without any diatisction of vessels; when it was torn away from the convolutions, the pie mater was also removed: it adhered so intimately to the stacknoid, as to resemble one mem-brane, red, very thick, and in the tissue of which blood was effused, which appeared immediately to congulate: little water in itself on all sides, and descending towards the ventricles; the brain of the ordinary consistence : when it was out, there apest destruction was os the convexity; the peared a grest number of red points, which rest was engaged and inflamed; its volume manediately became the sent of large drops was natural. The gall bladder contained a of blood; the arachnoid of the constitue was little thiu, clear hile, not viscid. The infe- also highly injected; the consistance of that organ was natural. Stomach gray, exterthe stomach and small intestines were full inally, contracted, slightly infamed; small intestines presented two invaginations; a portion of this intesting white, transparent, distanted with gas ; the rest grey and contracted: In three places all the circum-ference of the tube is red, both within and Case 10. Stay in the bospitol from the without, occupying the space of three 8th of July to the 10th. Autopsy; erachinehes in length; all the large intestina is nitla, enteritia, aplonitis. white, &c. &c. Liver gorged with blood; Dominique do Merco, mt. 30, of a good splean weighed between two and three

pounds, and reduced into a grey, pulpy | for it was not a simple injection, which state.

Casz 11.—Stey in the hospital from 6th July to 7th in the avening. Antopey; arach-

nitis, gastro-onteritis, solocitis.

Paul Tossini, et. 30, of a good constitation, was taken no the morning of the 29th June with a forar, which commeoced with heat, and which returned avery day until the 6th July, when he arrived et tha hospital. He had had thirst, bloody etools, teonsmus, enlarged apleon; and ha had takeo cooling drinks and a purgotive. He is now to the following state: his eppear-acce is atapid; someoloses rather then come; general pain of head. The patient unly eppears to be drowny, for he is assily awoke, cud he understands sufficiently well what is eaid to him; decubitus on the back, the knees are drewn up, but he cancot exteed the thighs, without axperiencing pale; during his slumbers the right eye is partly open, the left shut; it is impossible to depress the lower jaw, without producing aufferlog, when the commissars of the lips ia drewo e littla more to the right than left; the tongue is dry, red, covered with a black occasional remarks on passing avents, affords crust, which extends from the point to us the malencholy pleasure of finding in you wards the middle, the breadth of which is a fit spistelary ambatitute for our departed not more than ball en loch; the tongue is frieed. As editors, like ather moo, are draws a little to the right; at lotervals, pulse 120. When the right arm is antended, the flexor muscles contract, end the patient seems to cuffer mach paio; but when once extended it continues a

In the olghs, bloody dejections, extremely fortid; declination of the peroxyem, which returned no the 7th lo the morning; at seven n'clock the patient complained of culd. I did not see him till siz o'clock io the evaning, when the peroxysm was beginoing to decline: the skin was hot and moist; the lips were encreated; the pulse pain was produced; proservation of sensihility avery where; sometimes the right eye a little open, the left being shut. He had several convalsiva movements this morning, and towards mid-day. He took kinn before the accession, at the moment when he al-ready fult the cold. Increase of come; died at half past seven o'clock in the evening.

.- General is jection of the arachnoid, particularly that part which covers the cerebellum, and the lateral part of the commesosment of the spicel marrow. The lojection of the right side was a little more intense

merely shows the smallost vascels. The arachnoid was of a deep red, as if all its tisque were panetrated with blood. hash presented nothing remarkable. The intestines were injected in the same man-oar, from the examples oven to the annos; their which thickness eppeared to be impregnated with shood; they were not other whose the same contents of the same contents of the same contents. thicker than fatural, oor contracted; on the contrary, they was distended with flatna. Spleen welghed from eight to ten pounds; when it was put upon the table, it became fat like e hladder half filled with water; ite tissuo was reduced to a pulp.

TO JAMES JEHNSTONE, M. B.

"Precept" and "Example."

Deas Juenstanz,-The retirement of Dr. Copland from public life, to whom you may recollect we were in the habit of addressing mortal, it is with ciocare satisfaction we alight convalsiva movements of the hands; have seen the "mantle of the prophet" dopain of belly upon pressure; skie bot, dry; scend oo yno, in whom we therefore bail a worthy representative of the talents and attaioments of that illustrious iodividual. Wo abould here willingly expetiate on the virtues and premature fato of our lamented correapondent, but that, is obedience to the inspired maodate, which says, "let the dead hary the dead," we are called from the conceros of death to the more important affairs of life. Though not personally interested in the present address, its title may possibly intimate to you the natore of its contents, without a prefatory explanation. Assisted was not to be folt; respiration hurried; the hy your knowledge of the singular occurtwo forearms bent, when it was wished to renews of the medical world for some time axtend them, above all the right violent back, you can scarcely fail to anticipate our intention of examining some contemporary publication, in which the concordance of procept" and "ozample" has been most happily manifested for the last twalve months. That periodical, your critical sagacity must all at ooca convince you, can be on other than the "Subscription Humbug, or ghost of the Medical and Physical Journal, conducted by your estremed friend and ally, Dr. Roderick Macleod. The post-ponement of this comparison of practice and profession, you will immediately perceive, on refloction, presents many advantages to compensate for desciency of novelty, and then that of the left, although it was other-wise us vivid as it is possible to imagine afterrescence of feeling which usually secompanies disputes of a personal kind, has Doctor Roderick probably took the bint naw partly aphaided, leaving the ingredients from the Dean, and, in his gigautic vision, of axeltament at the buttom, in a stete fit for time, London, Guy's Hospital, medical att-the objects of analysis. From the quality deats, and all, dwindled down into a sort of of the materials left in the cauldron, writing now estimate the character of the megician by whom this storm of the passions is been conjured into as intence. Deprised by time of the voil of darkness, in which his spells had shronded bim during their operation, he may be followed throughdrin depository of his labours before us, sa the serpent may be traced by its slimy impressions in its nonvo-

inted progress through mud.

This preface furnishes us with a convenient standard, by which his subsequent conduct may be understood. He there informs us, with all the seeming of sincerity, that the "Charity Excreacence" is to be carried on "with the utmost degree of judg-ment, knowledge, and good feeling!" We head of " judgmont" may, we think, be eye. reduced, his upinions on the important quest dical from the manner in which he treats an exthe following passage :- " A few werks ago, bor" of them present; they were but "studying medicine," and of course could

pigmy eresting, like the Lilliputians in the eyes of Gulliver. We have not the feast doubt, that if the narrator's person bad been in proportion to the microcosm, into which ha reduced this meeting, but he would have extinguished its inflammatory proceedings, as Gullivor quenched the configration of

the royal city of Mildendo.

A passage from another "leading orticle" applies us with a specimen of the Doctor's " fearning," while it confirms what we have been advancing with regard to his "judg-mont." "We have," ha says, " in a for-mer urticle, expressed something like an upinion, that if medical education in this country be not the best in the world, it is, perhaps, the heat for us." Polypherons, in shall, for the sake of arrangement, assume one of his fits of unwieldy gallautry towards these qualities as beads to which our illus- Galstes, reckoned, among other personal trations may be referred, and which we take odvantages by which he hoped to subdue the at random from the first volume. Under the beart of the fair nymph, his having but one bead of "judgment" may, we think, he eye. The legical Cyclops of the "Mereduced, his appaiens on the important quest dical and Physical," does not, indeed, tion of medical education. His seal for pro-being that object, may be fairly inferred to whom he is making love in the proceding passage, that he is absolutely a monepression of public feeling on the subject, in culus; but he tells her what amounts to nearly the same thing, that ha sees but one a number of young men, who are studying side of n question, for which she happens to medicine in London, sasembled at a debat-ho interested. The fair impersonation of ing society at Guy's Hospital, and made the corporate systems must be hardhearted speeches, the hurden of which was, that indeed to resist the impassioned advances medical education is very deficient in Engof a Scietor, who, for her sake, con discover
lund, and very inferior to what it is on the
so much perfection is the florplat "NepoContinent: this farce was reported in the line" of London, the "Dubbing" at Edicdeily newspapers." The diminished proburgh, the "Apprenticing" in Dubin, the
portions of the picture conveyed to the
"Pust-office Diplomas" of Aberdeen, and
mind through this narrative, are perfectly in all the other virtuous and consistent reserved in every part. Thus time itself schemes of education over which she prepreserved in every part. Thus tumn that it accents an enterpreserved in every part. Thus tumn the Coninsignificant "few days ago;" the students tisent he finds nothing but defects and dewere but "young men," and only a "num-formity. No wonder Cupid has been paintable to the control of the preserved by the control of the preserved by the control of t ed blind, when the venerable awain of the "Subscription Excrencence" can convert the know nothing of how thin actence should be imperfections of his mistress into a theme taught; they assembled at a "debating so- for admiration. A classical vein runa ciety," and, like all whn frequent such through all the Doctor's editorial smnure, areas of foolery, only "made speechets." Ha not only makes love with the blind dethe import of which, like the draws of a votion of the ancients, and strays his favour, was but a "burden;" and, by an if its with all the charms of a perfect Vests, easy transition, next torus out to be "a but would add in her beauty the attributes farce," which, by way, wa presume, of ag. of a Minerva, by imposing on her the strict-gravation, was actually reported in the jest silence, which, among the Greeks and "daily newspapers!" By a similar pro-formen, was occuprented of wisdom, and of descriptive inversion, the pyramids mother specimes of his "judgment," wa might be reduced to a play-toy, and eternity find him, in one of his leading articles, itself to a span. Johnson (not you, deer writing thus:—" We deny that the medical Doctor,) remarks, that once the idea of big officers of our hospitals can, with any proand little mea occurred to Swift; the com-position of the voyages to Brobdigneg and public imposition. We dony that the treat-tive live in the state of second in a delay that falls under

the concismes of the poblic judgment of any description, who carry on their trade ought to be brought under their netiers, for the purposes of profit, to deteriorate The Doctor is so justices of the accomplishing that they steal by bad English, are any meets of his mistress, that he is indignant of the particle, the profit of a submitting them to the vulgar; the lainter's resit to prodoce effect outrans gaze of the poblic through the mirror of the lainter's resit to prodoce effect outrans gaze of the poblic through the mirror of the profits of the poblic through the mirror of the lainter's resit to prodoce effect outrans gaze of the poblic through last predictions in silent fruition, and confine the however, a supposed, from its plausibility, inspection of her temples. The mobing statement, long; it is a sow well known, statement, long; it is a sow well known, shritish empire, was to derive a knowledge ition as any one of the Waverly Nevale. It of their profession through her silence; it, therefore, not a little amusing to limit of their profession through her silence; it, therefore, not a little amusing to limit and the profession of the profession through her silence; it, therefore, not a little amusing to limit and the profession of the profession through the sanctuary gine, with what a smile of contempt these

of their profession through her silence; in, therefore, not a little amusing to Imased oo voice issuing from the sanctuary gine, with what e smile of contempt these was to inform the public whether her rites a poliated lecturers must have read this were duly performed. All har affairs, like poetical correction of their grievances, althe mysterics of the "Bose Des," were to be conducted it darkness and testuraity!

We must, however, be content for the present with these examples of "koow clasgrined with his frieed, Dooter Maeleed, edge" and "judgment," for the purpose of being detailed in our selections of the "good feeling," In preportion to the quantity of that sticle in the volume before us. difficulty lies in compressing it within a single of the supposed to have been the joint [Laxcer: "The two, taken together, arbitroduction of a Cleasteriel and a Howard, bit e mooner and e method is lying, which to the very page to which the profession of can only preceed from loog experisence and it is not usual, we believe, with reshess of we say morel,) who has raised a confingre-

to the very page to which the profession of ean only preced from loog experience and a good feeling." was made, we find the constant practice. The paper concludes following delicate and current statement:— with a passage worthy of what pracedes it, "But a few years ago, a set of literary and which shows that the writer has a heart plands are the passage which where here the precedes it, planderers broke in as the peace and quiet; and an imagination filled with the foolest of the profession. Lecturers, who bed spent images sed the darkest passions." The their lives lo collecting knowledge, arrangbest beautiful illustration of " fine feeling" disjung it for communication, and acquiring the played in these remarks, coordiness as the produce of if the writer had only a text worthy of his their lives snatched from them, and pub- octural disposition, he would certainly be lished for the profit of athers, with the the first commentator of the ege. Like a additional contribution of finding what they good critir, who sometimes points out bese-had taken so much pains with, disfigured ties of which the writer was unconscious, by bad English, and ridiculeus or mischer; the Dostor is so theroughly imbeed with a veus bluoders." It would be a matter of horror of impropriety in diction and senti-some difficulty to determine, whether the most, that he is inseenably led to find it ingeauity of the truth of this passage is where it does not really exist. His tact in most to be admired. By what hir. Shiel the discovery of ievisible immorality, is would call e "rheterical srifice," the im-puted offence is magnified to excite the his chastisements. That species of punishputed offence le magnified to excite the his chasticements. That epecies of punishmore commiseration for the aggrieved; ment inflicted by the production of proof, is while the circumstances of the aggrieved; ment inflicted by the production of proof, is while the circumstances of the aggrieved; ment in solution is operation to satisfy are, is their toro, magnified to oxcite the his median of justice; he throws Looks and greater horror at the offence. Thus, with logic saids, and finds, lo liltingagate, a more cat any mediation seatigation for "fool images," are represented to have committed a regular properties as the properties of the London heater properties the said of the London heater proms, who spent to a late duel, he says:—"It is one among their lives (poor small) in the acquisition to delive the included machine medical of preferational property, nod the eri of oral resulting from that depreyty of the medical lastracing h. What a hard case! One could press, which has set man in hostility to almost weep for the neverity of their lot! man; a system hebitually carried on for in one point only the picture is described; the profit of a meral incending, (observe, the new point only the picture is described; the profit of a meral incending, (observe, THE LANCET.

their cooldence in his statements, and thicks they might arr, unless he concluded

tion which, it is to be feared, will only be while his pen was dripping this apurious quenched is blood." In addition to the content qualities of the Dostor's style, we against mee guilty of no other crime than hive it here assuming the prophetic for his guiden at this stepid presentious, turned Having runbed at once to a conclusion; that begger when they made him a literary imbodied it, in the usual way, in a nick lame, bankrupt, and received the sympathetic methods the additional of the literary of the sympathetic content of the prophetic of the sympathetic content of the sympath without the assistance of a single-fet, his almost Mr. Render for the accomplishment funcy, takes five, and he furnished us with of his detestable purpose. Bahl " good as an aninguished conferration which, the way, has never since Julian quenched, grace, a follower of design, an istensity of aither by blood or water. This aplended suffice, in this combination of beggary and creation of rhetorical figrotechey was, no charity between the spite worn peuper and doubt, brought forward for the purpose of his patron, which makes one loathe. Bet, reviving the recollection of a libel, for which you, dear Johantsone, but to pay the band some sum of six or seven hundred pounds. Illily "of your atomach, wa will not finish some sum of six or seven hundred pounds. Illily "of your atomach, wa will not finish some sum of six or seven hundred pounds. Illily "of your atomach, wa will not finish our friend, hir. Wakley, would, no doubt, the sentence; for, is imagination, we be reflected look vastly comical in a cericature, warning last not reatrain your diaguat, deluge like hands before a comfortable blaze of these creatures is no accutation of indiguated for the form of the form the finish of the form the finish of the finish pluy of Fythagorus, makes appears spring from the patrid marrow of human bonas. It is made to be in the fertile fancy of the ancients would have of Goldsamith's connecties, who discovers a loud to the sircumstance as appropriate plot of "blood and ernor" in a love-letter to this discovery of blood and fire in the pages of action, after rectiling his sentimental predictions. reviving the recollection of a libel, for which dear Boctor, knowing the " morbid sensibidiscovery of blood and fire in the pages of action, after reciting his sentimestal prelogee, than, ie a sort of harlequieads of the One other specimen must conclude our heart, he threws saide the garb of becoveselection at this sitting; it is es follows :- lence, and appears to his estural character "Thomas Wakley stands convicted of fulse- of vitaperation; while all his kindness, like hood before one of the most impartial judges that waters of the Choaspes, which flowed that aver ant on the bench; and his name is for the exclusive beverage of the kings of recorded in the two farts courts is this kings. Frames, is reasrred for those who hold the dom as a libeller." Had the Doctor beed same opinions as himself. In shart, there made e crier in one of the said courts, he is not an opithat remarkable for its content would have been quite at home; for one can neas; a noun, which has been excluded mearcely help thinking, while reading the from all decent composition; or any other triumphant announcement, that he is not part of speech which could be made subsetlistening to that ushelel personage exercis-vient to his abusive purposes,—that this ing his lungs and his functions through the "man of feeling" has not pressed into the judicial triumph. The Doctor, indeed, is survices of detraction. It is worthy of renevar satisfied to leave his renders to deduce mark too, (and it cannot except the most conclusions from facts; he naturally distrusts careless of his readers,) that blicatacks one their coofdence in his statements, and emectically different from those which disthicks they might arr, unless he concluded tingoish every other literary writer. Other by proclaiming his opponents "incandia anthors are actisfied with attempts to prove " " libeliars," " liars," and " black, their own esperiority over as opponent; in guards." Thus, Junius informs us, "essay; allow that he may be in error to the line of common dauber writes rescal and wifinin sanduet which he pursuen; they confine under his picture, because the pictures their strictures to his compositions, and themselves have evider characters not rethemselves have heart. The sentimental

We have thus, deat Johnstone, taken a
have held sacred in their soutestaken, grange
have being notes at tradeon, of the " ner- is none, mith I helias forestive, the heart, the we never tame, next seminates, inner or varies ascrete in mericonvisional, graphs for macriment, at random, of the "pre-jet one, with Indian forestly, the heart of copts" and "examples to of your esteemed jits vecisal, and tates it with the "feelest contemporary, Dr. Maolood's "good feeling," limages" and the "darkest passions." And You will allow that they are wastly of one against whom, and for what crime, head it the whose heart was gangeoned with hatred, lamage simporation bear expended? Against an individual on whom similar intelligents are really heatile. On the contrary, they unable to fix one moral atigms in the largest are men who would not only not permit the reintions of life; against one whose conductors are not as the property of the contrary, they conducted to an unparallaled from the constant of the contrary that had the originality to favour a system of condition medical institutions, but who would had the originality to favour a system of condition reform in medical affairs; the present of carry it an against every against every against every against every against every against every against originality to favour the proud satifaction of seeing its full accomplishment. These were merits and objects whom they have put forward, and his complishment. These were merits and objects whom they have put forward, and his complication, at least, in the minds of the candid, might compensate for any trivile errors compared to more publication, has been gravanised into mitted in the working of a movel engine, a one publication, has been galvanized into Great moral and physical powers are difficult to manage, particularly without the axperience of previous application. The light-ning which parifies our atmosphere of its a reassinated felos for a while, in another; no slows qualities, may occasionally, in its course, amite an uz or its owner; the rary death by the sympathies of revenge, satirist, who szhibits vice in its naked has sold himself to become the szecutioner sauras, who axhasts vice in its baked bas sold himself to become the axentioner form, to reader it the more disgusting, may, indeed, genetimes offend the delicate and tetion of sentance, in consideration of perths innoceat; but the philosopher, who forming detics still more degrading than sees is all sublusary arrangements, still in those for which he had been condemned, separable from good, looses sight of the This is the pure, suspected, unshabled minor inconvenience, in contemplating the agent, who comes forward with the whine general result. While are disclaim the impossible attribute of impeocability, we con- of bate in his heart, and the wages of tend that the most unjust means here been taken to magnify the imputed faults of this Jonruel, sod to afix a dangerous character calumnistor of the writers in Tas Laxer; to the excitement which it has so part pro- who, to the impulses of woonded pride, deced. The agitation, of whatever kind it adds the last of prospective lacre, an may be, is certainty not anclusively that work of The Laner; for had the system, which it has so snoossfully assailed, been a sound one, how little would its attacks have availed !-- just as little as a political writer, who could have the folly to write against the principle of trial by jury, civil representation, or any other assential part of the British constitution. But when the structure is rotteo, a touch will make it tutter tu the foundation. This was manifestly the case with THE LANGEY, and the medical corporations; much less vigour than it has displayed, would, we believe, at the time, have produced this effect. Causidered, therefore, in a just light, the complaint of excitation is but the confermion of the comacious weakness of the supporters of this system—the crash of a corrupt and worn relifier, rathing in its rettenness to the ground. Were the man who have op da Journal persons who, while they agraed this Journal persons who, while they agreed freeder of them must come to the generat but he is leading object, but deabted, through mistaken notions of propriety, of the superdiseary of the caura it has puremed for this and a helf, there has not been a single operation, they would be antitled to a degree in trapped which has not been conceded to them: You are well aware, herevory, that is is not no much to the means which Tax is is not no much to the means which Tax Lander has employed, as to the very principle which he also takes it made in the degree of the work that them we have he to point that he has not takes it made in the third that he has not called in the help in the supplier of the work that them we have he to principle and object of the work that them were held in the times against expourts. Paint

slander in his hands, as the chivalrous aveager of an iosulted profession, and the still the list of prospective later, was not obligation of servitude to a faction, to stimulate him to the performance of his merceary duties. Look to those "leading articles" which were to have formed a portion of the "ideal mode!" of his publication of the "ideal mode!" of his publication. tion, and what is their tendency !-- to palliate the old abuses of our institutions, and to faster the generation of new. Examine this reviews, and how has he dispensed criti-cal justice 1-by rendering partiality useless to his friends by its fulsomeness, and censure harmless to his opponents by its stupid malignity. Take the surers called "lettern," which have been published by him, and what do they contain!—complaints from mock atudents, that their masters have been too ettentive la the discharge of their duties, and the menters themselves the next weaktemplinessing their obsequious pana-gyrithi, stead his "hospital reports," and how are matters conducted here!—the reader of them must come to the general but imphable conclusion, that, for the last year, out one passage, on the other hand, in to sain, of the introduction of the finger which an opportunity presented for the probability of the introduction of the same action of the exposers of ubuse, that he has not swilled himself of it; in which are pisode against the moral character of ber, the Editor of The Lancer and its confibutors could be possibly interwoves, that he had concede that we are wrong in Joking on his journal as the most singly composition are ryet published, heavy it is the only forts, the operator was at lest obliged to do one, we believe, that my made the systematic calumination or the mutices of a contemporary, the exclusive grounds and object, a smaller calculus was found at its uptempurary, the exclusive grounds and objects of its existence. Honce its aspent is as drawy as its purposes are detestable. Every page is darkened by the nightshall of the beart-every column saddened by the rank Insuriance of the hemiock. dear Juliustone, know the man, and have been honnured with a personal insight luto his gloomy, honourable, and "charitable" occupations.

#### HOPITAL BEAUJON.

flamed. A sound being introduced into the wounds, and he pussed a quiet nightfrom its contraction, or the size of the stone, pulse, Journ. Hebdom. could be made to contain but a small quan-sity, the skin was divided by a longitudi-onal inclaind, about two toches in length, and known, we will take care to lay it before the lines albe opened to such an extent, as

der, a amailer calculus was found at its upper part, and easily estracted. The attumpts at removing the larger stone were now renewed, but were as fruitless as hefore, although an assistant with his fager in the rectum, and another with the steff in the arethra, andeavoured to roise the atone, and to sasist the action of the forcers.

M. blandis, being now conriuced of the impossibility of removing the stone by the upper opening of the hludder, determined, with the usanimons advice of his colleagues, upon the immediate performance of the recto-vesical operation. He accordingly introduced his finger into the rectom, and, farcibly pressing the hladder, from the hypogestrium duwnwards, divided its neck, the prostate gland, aphincter sui, and perineum, in the median line. The stone, being nuw felt by the finger, was grasped by the for-CASE OF STONS, IN WHICH THE RIGH, AND AFFLEWARDS THE RECTB-VESICAL OFF RATION WAS PERFRUMED.

CASE OF STONS, IN WHICH THE RIGH, AND CEPS, and, while an assistant dapressed the caps, and with his hand in the upper wound of the bladder, was, at last, with great diffi-A now, fifteen years old, was, un the 1st of oulty and exertion, extracted. It was of an December, admitted into the hospital under ovel form, two inches in its largest, and an M. Blandin. He stated, that for the fast inch und a quarter in its smallest, diameter, ave years he had been subject to pain in the of very firm consistence, and woighed two region of the bladder, which was consider-ounces. Although the operation, of course, shly sugmented by welking, and the evacu- lasted a considerable time, the petient did stion of stools and urine, and which extend- not lose much shood. The wound of the sd from the bledder, along the orethis, to bypognetrium was united by a handage, the glass, where it was most violent. The sixtern ounces of blood were taken, and a peols was cautionally in a state of semi- small quentity of opinu was giren. In the steetion; the urinu was discharged involume svenlag, slight fever acceded, but the patarily, and the anus was prolapsed and in- tient was free from pain, escapt in the famed. A sound being introduced into the wounds, and he pussed a quiet night— urethrs, was arrested at the neck of the Ou the following day, the fever was much bladder by a solid, and, as it appeared; isn. increased, and he complained at ragun moreable body, which was also very sasily pairs in the obdomen. The bleeding was falt by the finger in the rectum; the siting repeared, and a large combinent publice cance of a large stoom in the bladder were were applied are the hypograticum. On the clearly escentianed, and the patient being second day, when the report was taken, much exhausted by his continued sufferings, he had violent pain in the hypogratic re-ths high operation was decided upon, and glost, though not in the part of the abdomer; performed on the 7th of December, is the his countenance was very pale, and expra-following manner. A mischaginous fluid give of anxiety; he had vapated sayers. having heen injected into the hindor, which, times, sed had still names, and a vory small

## THE LANCET.

London, Saturday, January 17, 1829.

Wz have received several communications from members of the Westminster Medical Society, nonquacing their datetmiontion to secode from a body, whose "Hole and Corner" preceedings are calculated to diagrace and degrade the profession. The Society is, in fact, folo de se, as far as all purposes of professional or public utility are ochobrasd; it has accomplished, in effect, its own destruction, and its actual dissolution will, la ali prohebility, soon fellow its virtual disorgenisation. For what is the stowed principle upon which Mr. Lanzer has been excluded from their body? What is the ground unblushingly assigned as a fit reason for expalling one of their ablest and most efficient members? Mr. LAMBERT has given publicity to, jostead of screening, the failure of one of his professionel brethren. This is the unprofessional conduct, as it is termed, for which Mr. LAMsant has been declared unworthy of continuing to take a part in the proceedings of the Westminster Medical Society. If, indeed, the report of Mr. BRAVEST COOPER's operation, communicated by Mr. LAMERT to this Journal, had contained a tissue of false statements, there would have been some ground for impuguing the moral character of the writer, and for contending that the author of such a report ought not to hold a seat among the members of a scieotific body. But all the material facts in that truth is established beyond the possibility impority, usworshy of belonging to it. of contradiction, by the report of the operation just published by Mr. BRANERY Cooper similar disgraceful proceeding on the part that gentleman in order to increase his Hasham has atmosphed his determination had it been published before the trial, must That gentlemen has declared that he will have rendered a verdict in his favour im- not sanction, by his presence in the chair,

possible. What, then, are the sum and shatance of Mr. Lampunt's offence in the of the members of the Westminster gal Society 1 Is it the colouring, the form of the report, which has pointed out to them the necessity of sitting. in judgment spon Mr. Lametar, as arbiters of taste ? Or is the mulies which Mr. Lamagar was chared with having enter-, tained towards Mr. BRANERY COURSE the ground upon which they have deemed it right to animadvert upon his conduct, as ceasers of the marality of the profession? Ne, no, no! the alterne of malica was suite: cessfully rebutted by Mr. LAMBERT in his candid and manly speech. He showed that a friendly intercourse had long subsisted between him and Mr. BRANGER COOPER; that they had had indeed their alterestions and reconciliations, but that be bad never entertained soy thing like a bostile feeling against him. It is not the bad taste, it is not the alleged malicious colourios of Mr. Lam. grar's report,-it is its truth, its waenewerable, its admitted truth, which has rendered him chaexious to certain members of the profession, who care. nothing for Mr. Lambert's motives, or Mr. BRANSBY COOPER's reputation, but who dread every thing for themselves. Persons whose interest it is that the blumders of unskilful members of the profession should be screened from the public eye, naturally hate and dread the man by whom such blunders have been faithfully recorded. When the majority of a society consists of such persons, it is an honnurable distinetion to su able and independent member report remain uncontradicted; vay, thate of the profession, to be deemed, by that

It is in anticipation, we presume, of some hierself-a report svowedly withheld by of the London Madical Society, that Dr. obance of obtaining a verdict, and which, of retiring from the office of President. n proceeding which he cannot but regard were living on terms of friendship, and sover with disgrace all who have the mer to acknowledged. The short but touching ness and the folly to participate in it If reply which a Scotch serving-man once such a proceeding were unjustifiable before made to his laird may teach you to reflect the publication of Mr. Baaweay Coopea's with abame upon your conduct. The laird, own report of his operation, -- sport which on the ave of his departure from the house fore the trial,-it will Je still more base whether he had packed up all that belonged and unwarrantable, if persisted in after Mr. to him. 'At less, your honour,' said the BRANSEY Cooren's publication, which estab- careful steward of all, and more than all his lishes, beyond all doubt, the truth of Mr. master's property. How different has been LARMENT's report. We du not hesitate to your conduct! You have published the affirm, nor can any professional man who reads Mr. Bannar Cooren's uwa report of his operation, deny, that there are many parts of that report far more unfavourable to Mr. BRANSBY COOPER'S surgical reputation, then any thing which was stated in Mr. Law-BRAT's report. If, then, the London Medical Society be as ambitions as the Westminster Society of bastening its own dispolution, let it bring a aubstentive charge egainst Mr. Lausaar, and boldly put upon recurd the retain e seet within Its walls. Let it nut effect e fastidious disapprobation of the bad taste which could assimilate the real butcheries of a hospital uperating theatre to the fictitious carnage of the stage-let it not outrage common deceacy by pretending to feel for unakilful operators a sympathy which is really due to the victima of their unskilfuluess-let it nut add hypocrisy to meanuess, but sudeavour tu atone for the cowardice of expelling a man, whose talents and indexibility are his real uffences, by culpably supine; for apon whom will tha frackly avaning the true grounds of his on tresponsibility rest, if it should turn out that pulsion-let it tell him, "You have exposed the mastomists of this metrupolis have been to the eye of the public the failure of one of supplied with human hodles, during the last your professional brethren, whom, if you formight, from the same horrible source believed him to be incapable, it was your which has supplied the surgeons of Edinduty to have acroened. You have been un bargh ! Until the Legislature shall have professional enough to get the life of a pauper, placed the supply of our enatomical schools and the scenity of the public, in competi- with subjects, under due regulations, the tion with the reputation end the domestic dissecting rooms in this metropolis ere pub-

with unqualified disgust, and which must be lose urbanity of manners is universally the operator did not ventupato publish be- of a friend, inquired at his serving-man, truth when it was your professional duty at less to have suppressed it, and when the calls of friendship should have etimulated you to e generous chuse of the confidence reposed in you. Yus are too scrupulous in the use of means by which you may serve a friend, and screen professional imbecility, and wa therefore reject you from our society.

The public will bearn with disgust that, ground upon which it deems him nufit to nutwithstanding the late burrible disclosures at Edinburgh, un steps whetever have been taken to subject the operations of the dissecting rooms in this metropolis to any sort of control, and that the traffic between anatomists and reserrectionists,probably between anatomists and Muausaeas,-is still carried on, in defiance of all lew and decency, and with a hrutal indifference to the present excited state of the pablic feelings. Why, we ask, is the Government thas culpably supine ! We say comforts of a gentleman, with whom you lie nuisances, which ought to be abuted; and, if no steps be taken to ebate ther shall feel it our duty to enter into such details and disclosure as will probably compel the teachers of enatomy to pay some respect to public opinion, and some regard to peblic security.

Natural Theology, or Evidences of the Existence and Attributes of the Deity, collected from the Appearances of Nature. By WILLIAM PALRY, D.D. Illustrated by a Series of Plates, and explanatory Notes, by James PACTON, Member of the Royal Callege of Surgeons, London, Second Edition, Ocford: J. Viccent, t828. I vols. 8vo.

Trans volomes have, most deservedly, reached e second edition; and, if they are eppreciated to their full extent, thay wil; occupy a place in every library to the kingdom. Few readers of Paley can avoid seeing the advantage his Netural Theology is capable of deriving from engraved illustrations; to no book, addressed to men of all classes, and not to the professional men in particular, could the arts more properly be devoted. Conviction carried to the mind through the medium of the eye, is not only quicker, but infinitely more permanent than that derived from any other sense; and we are well satisfied that, olear and agreeeble as is the Natural Theology of Paley, it will be understood and remembered now, by many who were previously insensible to its beauties.

The test itself will hardly admit, or, we should say, will herdly nead, quotation, aither for the parpose of informing the respecting that creature, reader what this edition is, or to recommend it. The former has carried its nwn recommendation for a quarter of e century; sod, though the learned men of the Quarterly Review can afford to devote foer or five flosen pages to so well-knawn e writer joinings, chinks, and roughnesses. It hooks itself by this claw; remaine suspended by this claw; remaine suspended by this hold; takes its flight from this position; which operations compensate for the decre-

a | we might as appropriately ait down to rejew " Butler's Acalogy."

Mr. Paxton's labours we will however. words. The present work is an exdelegant repriot; the designs of the plates are hof them original, " obtained from the most antibatic sources, and " (independectly of the qualifications of Mr. Paxton, as a professional man , have been submitted to the critical examination of the most competent jodges." The volumes contain about forty plates, comprising some hundred distinet objects, and the interest of the reader is insensibly secured at the outset by a familiar illustration, which the engraver has given, of the mechanism of e watch, io support of the argument which Paley has, in his first chapter, so ingeniously stated; the simplicity, to which the work is now reduced by e like attention to avery object mentioned, renders it as enclaioing to the reader as the most vivid romance. In runniog through the pages, one object in particular caught our eya, though it did not present to the engraver so many points of loterest as it might here done, had he been a medical mao. Io Paley'e hands, even "THE BAT" is made to contribute to the general proofs of design in the creation. A few words of extract will serve to show the mode io which the text, the illustrations, and the explanatory ootes bear on each other Io Chap. xvi., under the head of " Compensation." (of which Paley says, " it le a species of relation; it is relation, when the defects of one part, or of one organ, ere supplied io the structure of snother part. or of snother organ,") the following occurs

"The hook in the wing of a nar la strictly a mechanical, and also o suspensating contrivenes. At the angle of its wing, there is a bent claw, seartly in the form of e book, by which the nar attaches itself to the sides of caves, buildings, &c., laying hold of crevices,

pitude of its legs and fact. Without the latterer late the comment. When my hook, THE OAT Would be the most beightest thing was introduced into the throat, violent all soimals. She, (save Paley, oddly cooper, convaluive efforts were occasioned, notif the after opening of it is the neuter. Can whole that had been introduced was ejected, neither run upon her fact, not raissectively and which cause ways principally through in winged animals. A s quired a singular substitu

hand, and an interesting thing, or, as hir Astley Cooper would say, " a review thing it is to see." for those who de not know the form of this enimal, or the situation of its book. The editor adds the following note

" Osteologically considered, the wings of the bat are hands, the bony stretchers of the membranes being the finger-bones extremely alongated: the thumb is abort, and armed with a hook neil, which these enimals make use of to hang by and to creep. The hind fret are weak, and have toes of equal length, armed also with hooked nails; the membe constituting the wing, is continued from the feet to the tail."

The engraving we assnot give, but the anxions inquirer will have no difficulty in obtaining a sight of several sars, even in this busy aity, if he he desirons of beholding such interesting objects.

Wa taka leave of the editor, with an aurnest recommendation of the work to medical atudents, and to all other persons who wish to obtain a vast fund of information most agrosably aommuoicatud.

LONDON MEDICAL SOCIETY.

January 12, 1828.

Mr. Davaoals, Vica President, in the

Dr. Hastan not having appeared a few minutes past eight o'clock, Dr. Blick moved that the Vice President do take the Chair. The Miuntes of the last Macting having

The Regists as reads paper on two cases communicated to the Society, by Mr. Edward Hallum, of Walworth, of children who had had a cul de see in the pherynz, which

safer speaking of it is the neutrinose made in the properties of t of November, and died on the night of the As excellent engreting of a nay is close at 19th. The preparations of the morbid parts, as well as n drawlag of them, were exhibited to the Society.

Mr. Callaway observed, that Dr. Bluedell having heard the cases were to be brought before the Society, had elso sent a preparation of a similar case met with by Dr. Haighton, and which he begged have

to show to the Society.

Mr. Salmny considered It extraordisary that in the one case the child should have lived for nineteen days. He coaccived that it could not have been originally fat, and that the circumstance altogether threw much light on the physiology of hunger. Ha believed that so once was on record, where an individual was known to live longer, without any nourishment, than twenty days; and that was in the case of a father and son, who were condemned to be starved to death, and where the former survived the latter nine daya.

Mr. DERMOT considered that the child must have been fat, and that the sole nutrimeet of the child all along must have consisted in the absorption of the fat.

Air. Sunnaugy stated, that there were many instances where patients in typins fever had lived a fortulght or three weeks npon nothing but a little cold water.

Mr. Dennor considered that in these cases there was an inactivity of the system altogether, and that there was oot that expenditure required for the assistance of soimai life, that in other cases was pecessary.

Mr. Perriquew said, there were also cases of typhus fevur, where there was an

inordinate degree of expenditure required. Mr. Bnows had been attending a child that had died on the former day, eight weaks old, and which had lingered even from birth. Having heard the relation of two cases that had been read, he had been induced to atere. that apparting of a similar kind, though in a much milder form, existed in his case, and that for the purpose of accertaining tha fact, he should avail himself of the opportunity of making a dissection. While addressing the Society, he could not help ontering his veto agaioat Mr. Salmon's doctrine, that phthisis pulmenalis and a diseased rectum ware necessarily dependent upon, and were associated with, each other. Dr. nhatructed the passage of any nourishment. Farr had also stated to him, in a conversation,

that his auperiones had not led bla

Salmon's conclusions.

Mr. Salmon's conclusions conclusion wiscomes of which has wonderful light struck were necessarily dependent on each ather, a related the second of the second conclusion of the second conclusion of the second conclusion of the second conclusion of monther, that therefore the doctrins was to be considered by the prafession as unacound. He himself had attended a case with 17r. Fair, of assists, with a diaccased rectum as the exciting cause, where eased reetum as the exciting cause, where eased rectum as the exetting cause, wheria Dr. Bilick wished to correct a statement in had been requested by the Doctor to tap that had said on the use of the ergot of rye, of the rectum. Mr. Salmon, however, cured upon the discussion of Mr. Lord's late case, the patient of a stricture of the rectum, the The person who had made the attenuent had aymptoms of asolites subsided, and the passigned himself R. C., or R. S. What he tient got perfectly well. He attenues went (Mr. Blick) believed he had really said on to Dr. Farr under a sort of disgnise, who this medicine was, that he had given it in prescribed for him as if he had here lubour many cases where labour had taken place ing under an affected liver, without reeni-siterwards, but that he did not believe in lecting ha had aver seen the mun hefure. Inbour was the result of the ergot, leasunch On one occasion, Dr. Farr had expressed as it was not invariably the consequence himself thus :- " I have a great liking to ace of it. you succeed in your prafession, Mr. Salmon, and I hape you will, but I trust you will nat aplit on the rock you have been setting up to me. I have never seen a diseased reetum in the course of 40 years' experience." Mr. Salman enquired if ha had aver looked for one ? The Doctor replied, " I do not know that I have.

Mr. Baown was sure Dr. Fair bad never assmined a rectum. unless in some case or cases where he had been required to do so by the surgoun, from the surgoon having had doubt as to the nature of the melady.

Mr. SALMON considered it highly impropar for any gentleman, from anch very lisaited personal experience upan this auhject, to impugu the doctrine of aunthor, wha had made the diseases end examinations of these parts the great purtion of his study and occupation. Post-mortem examinations of the rectum had been very much and blame. ably overlooked by the profession.

Mr. Sheanery cordially concurred with Mr. Salmon in his last observation. Far his own part, he had hardly ever seen a rostum exemined, and he believed that very few madical men ever thought of examin-

ing it. Mr. PROCTOR cutered the Society at a late hour, and by an observation he made, showed that he had split on the same rock against which Mr. Brawn foundered, namethe rectum were necessarily associated.

Mr. avmpathy axiating between it and other

Dr. Bucs wished to correct a statement

#### DR. HASLAM'S BENJUNATION.

## To the Editor of The LANCET.

Fra,-Feeling, under existing eircum-stances, I have un security that the following letter will be divulged to those Gentlemen whom I wish to address; and as I desire my sentiments to have the utmost publicity. I solicit their promulgation through the medium of your impartial and widelycirculated Journal.

Your obedient servant. JOHN HASTAM.

15th Jan. 1829.

TO THE MEMBERS OF THE MEDICAL SOCIETY OF LOYDAN.

GENTLEMEN,-When the wholesome and protecting laws of a community are subverted, in order to facilitate the banaful intrusion of human pessions, there is a natural inference, that its existence will be of very limited duration. In your printed book of Statutes, page 9. chep. 4, which treats of the duties of the President, It is expressly ly, the assumption that Mr. Salmon had laid down,—"He shall sammon all extra-maintained, that disease of the lungs and of ordinary meetings of the Society, and cuforce the axecution of their Statutes." On A further dodging sort of discussion took this subject, as your President, I have never phase on the subject, in which the sustemy been consulted, nor has my suction been of the restum, the physiciogy of its action, given in any such proceeding as is contained the power the mind has over it, and the in the following notice:—

" Sre ... I am instructed to loform you that e Special General Meeting of the secrety will be held, oo Monday the 19th instant, et sight o'clock in the eveolog pre-sisely, 'To take into consideration the conduct of Mr. James Lambert, and to take such measures as shall then eccupat. such measures as shall then ecopy

" I am, Sir, "
" Your obedient arvant, " JAMES TELO, Registrer.

The time appointed is therefore as illegal se the purpose of the meeting; and if, on this actitious summons, I were to take the chair, I should expect to be saluted with a merited volley of grouns, blases, and the various vocal issues that convey score and detestation. By what authority the Medical Society of London proceeds to inquire into the conduct of its members, must be unfolded: the book containing its laws is wholly silent on this point. By what no-heard of matemorphous e medical Society can be transformed into e tribunal of criminal judiceture, remains to be explained; and enficient ressons must be adduced, before the medical assemblege io Bolt Court can be considered a " court of eme to the Old Bailey." Had Mr. Lembert been convicted of any flagrant crime, the laws of his country would have ewarded the degree of punishment; and the record of such dis-grace would be sufficient to exclude him from the society of all gentlemen, profinsional or otherwise, and an ample justification for erasing his name from the list of your members. At the meeting on the 5th iest., I had the honour to preside, and when the paper, which is e copy of the animons for the 19th, was indecently incinuated to of the Society, I saked, "What has Mr. conveyed by any set of his to his ey Lambert doue ?

" Meruit ano erimine -Supplicium? Quis testis edest? Quis de-

and impartiality, in addressing me, said,liasted to the conclusion. Do assured a charge from the eyes harraway, so that from the shall ever retain a grateful sense of the the uterhar gradually disnished, though it bonours you have conferred on me, and I had never entirely stopped. It was with have uniformly felt, that the many sad use the utmost difficulty Mr. Lawrence accommitting discharge of my duties would be careded in obtaining e view of the source of the purest acknowledgment and most satisful the eyes. The discharge so exactly re-

" Medical Society of London, Bolt Court, factors estura for distinguished and acquired the second of reluctance end regret. Of morel nourage, I possess sufficient for all the honourable purposes of sivilized society, but I freely confess to you, that I am a stranger to that cold-blooded diplomacy, that enables a hu-man being to become the presiding minister of injustice, and I want nerves to witness the character of an inoocent person, mangled and lecerated by his own brethren, as an expistory secrifice for a disastrous operation.

I em, Gentlemen, With profound respect and grateful impressions, Your very obedient servant, JOHN HABLAM, M.D. 15th Juonary 1829. Hart Street, Bloomsbury.

#### ST. BARTHOLOMEW'S HOSPITAL

VIOLENT CONCRRUCAL OPERALMIA OF BOTH BYES, SUCCESSFULLY TREATED.

SAMUEL SEGAR, mist. 20, footmen in a gentlemeo's family, was admitted into Henry the Eighth's Ward, noder the cars of Mr. Lawrence, on Wednesday, the 5th Nov., 1828, with generaberal ophthalmie of both eyes, a partial alough of the right cornes, opening ioto the anterior chamber of the eye; the left corner unaffected, sod chemosis of the conjunctive of both eyes. About e mooth ago the patient had gooorrhou; the interruption of the legitimate business was sure that none of the virus had been though he can remember having wiped his face with a towel in the course of the week, on which there may have been a part of the discharge from the urethre, before the infiammation to the eyes appeared. On the Thurs-To this question the whole phalanz was day morning preceding his admission, felt mote; there was not an individual that had on uncasiness in his left eye; in the eventhe courage to occuse him. One of the ing it began to discharge pus, eed on the Council, who oppeared to speek the mante following day he was unable to see with it, most acotiment of that cullected wirdom On Sunday morning the other eye became effected in a similar way, and in the course "Sir, we hold him insecret at present, and of Monday, or the following day, the night of he will have an opportunity of arrantace both eyes was completely gone. When himself." This Christian sentence, I presume, require oo comment, and I now eyes wen very considerable. As the distance to the conclusion. He assured I charge from the eyes increased, as that from sembled the thick yellowish spinors left eye, but which is not likely to produce of that from the ureters, that the mention much incomminance. Apply the extract of which makes the parts, were all belledoms above the left eye, and common distinguishable; Theograph there was excerted along the margin of the pulpebra, sive distonaion of the conjunctive of the right eye, yet, as is governly in these cases, the disease was most extensive to the aye that was first affected; great intolarance of light common to both eyes. Leeches at different times, to the number of two dozen, had been applied in the neighbourhood of the eyes; s letion, and a blister; which Mr. Lawrence considered by no means adequate to the argency of the case. A practitioner, ha said, could not be eware of the very deatructive affects of this disease attacking the eyes, who did not meet It by the most prompt and active measures. The prognosis here was very onfavourable, the great probehility being, that night of both eyes would be irrecoverably lost. Pulse 108, full and hard. Ordered to be hied from the erm ad deliquium; \$4 leeches to be applied round the eyes in the evening; poppy fomentations afterwards; 5 grains of calomel and 15 of jalep fimmediately, end, subsequently, the saline mixtere, with a drachm of the solution of tartarised antimony every air from the arm, hours.

- 6. Thirty-six ounces of blood were yesterday taken from the arm; the first was befied and supped, the next less so. Feele much relieved. Swelling of the syelida diminished; inflammation of the conjunctive partly subsided; tougue white at the bese; pulse sharp, and 76, Repost the 24 leeches, and calonel and jalap, a hister to the neck, and the lotic saterni to the eyes.
- ?. The ieflemmation of both ayes diminishing, but the profuse discharge coetine-ieg. Pulse 88. Repeat the application of the leeches, and continue the lotion. Mr. Lawrence new regards the right aye as
- 8. The chemosis and swelling much subaided, so that a more perfect view of the eyes can be obtained, than could be since admission. There is a white apet and partial elough observable at the inner side of the left cornes. The pain in the eyes and across the forehead lessesod. Pulse 95; tongue brownish. Repeat the leeches; omit the saline mixture, with satimony. Apply a poultice to the eyes, and take every mix hours an ounce and a half of the mist. meath, sulphuriel, c. suiph, mag. a drachm.

#### 9. Apply the leeches again.

10. The pain gone, Can distinguish ch-junts with both ayes. The chemosis of the conjunctive has almost disoppeared. amall ulter perceptible on the corner, with adhesion of the iris at the inner side of the

. Kaep e sloth dipped la the lotio satural constantly over the eyes, and thu pating in as dark and quiet a situation as

- 12. The homosis and discharge of the right eye entrally disappeared. A small excavetion seen the luner side of the cornes. The conjunctive unpaterally vascular. Some chemosic of the conjunctive of the left eyn still visible. A clear vesicle in the aituation of the pleer, occasioned by e small portion of the iris slipping through the opening.
- 13. Vascularity of the conjunctiva of both ayes increased. Pulse sharp and full. Apply sixteen leaches.
- 14. Much the sems. Take twenty ounces of blood from the temples by cepping. Omit the beliadonna.
- 15. The renewed inflemmation, in part esbaided. Take tweety-four cences of blood
- 16. Has been relieved by the bleeding, but still there is inflammation of the conjnective.
- 18. The vascularity much diminished, and the swelling gone. Can see objects clearly. Let twelve leeches be applied about the left aye.
- 19. The temour in the corner of the left eye, eppeare to be about the size of a split pea, end is approximing toward and Pelse 90, and soft. A small discharge from ea, end is approaching towards staphyloma. the urethra still continees.
- 29. The discharge from the orethra has cessed. A slight fresh attack of inflommstion of the left eye. Apply six leaches, and take the mixtere ordered on the 8th.

Dec. 20. The patient has gone on im-proving, with alight interruptions. The right eye is now quite free from inflammation, and the ulcer of the corner is gradeally healing. The left eye is of the netural colour; there is yet alight staphyloma, bet which is diminishing, and does not meterially interrupt visiou.

23. Discharged cured, and with perfect sight of both eyes.

Thie is so edmirable instance of the beneficial effects of activa treatment in cases of this description., Had a few hours longer been suffered to have elapsed before the adoption of this treatment, in all probability the sight of both ayes would have been irrecoverably lost.

# WESTMINSTER HOSPITAL

WOUND OF THE ASDOMSH -- PROTEURING OF THE OMENTUM.

THOMAS FAWSES, aged 35, a muscler bypogestrium estending along the dorsum sanguineous man, admitted into bakes ward, neder Mr. Guthrie, November 10, jother parts of the abdomen; twenty 1828, with a ponetrating wound of the belly. He is a butcher, resising in funico, and was went to carry his slavies kuife in his afformed by the lecches. It was avident, lug, the point of the kulfe pierced the abdo-men, just below the left inferior rib. A inches of omentum protruding. He attempt- | morning of the 14th. ed to return it, but did not succeed. The putinat was brought into the lespital at midnight, and Mr. Lant Smith, the houseaurgeon, aftersome trouble, rostored the pro-truded part to its proper situation. Thu external wound was about an iseb loog, but that in the peritoneum did not exceed half an inch; the edges were adjusted to each other, and secured with a anture and atrapping. He was put to hed, and drank some warm lea. At six a'cleck arat morning, his pulse was 100, full, and strong. Conaiderable pain of abdomen, aggravated by sach inspiration, tension, and tendernass on pressure. Forty-five ouuces of blood were shatracted from the arm, which produced a swoon. Os coming to himself, he falt bettar; pulse 1t0, small, and feeble. A bolus of calomul and opium was pre-

place from the howels.

Mr. Gathrie. As hour afterwards, Mr. Under these encounsistees, the consiste Guthrie found the symptoms unabated, and of surgeons resolved that an amputation of

Epsom salts to be taken avery he'. hour in peppermint water. Thirty reches repeated. Nov. 13. Has slept a little; pulse 116,

small, and hard; hownls open; pain of

coat-pocket, but getting dank this avening, from the patient's coustenance, that he was he forgot to put it into a scalabard, and fall-moribund. The irritation increased, as the io- strength diminished; perpetual rotthing;
A a constant desire of micturities, and general general practitioner of the unlighbourhood restleasuess, preceded the last atruggles of was forthwith called in, end found five departing life. He went off early in the

Examination twenty-sight hours after Death.

A caraful serutiny was made of the whole alimentary tube, in the expectation of meeting with an epurture; the transverse arch of the color was accidentally punctured by the gentleman who conducted the uzamination, but no other solution of continuity was found. The peritoneum, both visceral and parietal, was slightly luftemed in petches, most considerably in the transverse maso. colon, and the plies spleois, which were mioutely injected. Adhesions of the omentum had taken place round the margin of the woned. The other viscers of the abdomen, and those of the thorax, were sound.

DISSASS OF THE ANCIE-JOINT-OFFRATION.

A' bolus of calonul and opines was pre-acribed directly, and a clyster of gruel uvery dling size and good symmetry, admitted into John's Wurd, under Mr. White, 3d Two, P.w. The palu in the abdomen September, 1828, with disease of the right having returned with sonsiderable violence, askle. This joint was officeted with in-pulse 110, full, and strong, he was bled to famination about three years ago, which statem ounces; an oance of easter all lustating from the law that the pain was allested by formentations. The pain was allested by these massa.

Four, P.M. Mr. Guthrie saw him for the the information was not checked, sopposite first time, and recommanded thirty leaches ration followed, and, two mosths before his to be applied about the navel.

12. If e clept during the night. At day, liself. Thus a sinus was left, leading into break, pain of a collect, kind occurred in the she joint. On admission there was a convicionity of the wound; pulse 112, small, adderable disclarge of laudable pus from and compressible. Thirty more leaches were the would; the purulent discharge deterioapplied. Copious evacuations had takes rated from day to day, and, notwithstanding the sesiduous onl judicious use of alteraplace from the howels.

At one o'clock, r.w., Mr. Guthrie visited tives, speciauts, and tonies, tha health of him. The whole face was pale and lag; the patient gradually declined, and the gard; lips exampuous; expression intently countenance began to assume the heetion ansions, marking excessive nervous linitation. A number of shouses were formed tion; respiration hursied; he complains of round the joint, an extensive series of the severe pains over the entire belly. A pound tarsus sainted, and nearly three counces of following the himself of the presence of issuican sainted, and nearly three counters of the fact that the presence of issuican sainted, and nearly three counters of the fact that the presence of issuican sainted by the were delight enormal.

directed him to be cupped to eight ounces; the limb should take place the \$9th Neaftet this the poor fellow was caster. A wember, Mr. Harding accordingly preformed

the suppurative process extended through under the hands the surgeon.

The theatre was througed with spectetors, but very few were so fortunate as to see the operation; because, on these ocwith people, whose heads constitute a barrier impenetrable to the visual powers of the studeots. A number of neighbourpile heve sooght redress, in vein, for these abuses. Oe hir. White's days they are ourried to the greetest pitch.

A few of the more forward pupils like.

wise thrust themselves ioto the scace of was not inspected. action, and add to the general emberrass. pent. It would be becoming in these gentlemee to retire; and Masses. Edwards and Tabbs might leave the floor, without detriment to their own modesty, or to the suc-

sees of the operations,

November 50. The pariest passed a tolerable night, occasionally troubled with subsultue; pulse 100, full, and errong; tendermeas of the bypogaetriam; he was bled to tee ouncee; thin crassameetum was buffed, and cupped.

Describer t. The symptoms continuing. he was bled to to eunces. The crasmentain this day was only slightly befied; the un-pleasent symptoms disappeared. He was ordered, now and then, an ounce of castor,

oil, mixed with the yalk of an agg.

7. Secondary hammerhage occurred; Mr. White separated the flaps, and scooped out with his fleger a lerge congulum, which emitted a putrid smell; the sides of the would felt as sold as marble. The atump heving been bathed in warm water, and all the irritating congula removed, the larmer-rhage grassed; 16 sunses of blood were lost. A cordial draught was administered, and ha

tering the hospital, homorrhage took place Hospital, it shall never have my consect."

the double-flap operation; six are were egaio. The stamp was immediately untaken up; there were a good deal of "your dressed, and an active several lestituted for humorrhege. Mr. Guthris took charge of the bleedieg poiot; but the blood appeared the tourniquest. The mee, being touch est to flow from the general surface of the bassed, a gll of vine was given to him bump. Mr. White shewed sway with a on his heing put to hed.

On a zamining the limb, the cartilege; they are given to him which covering the socket of the this and fibris in toknoing it. Not mere than eight ousees was settirely shoothed, and the passeous surface of his diverse in the man gradually face cerious. Small dots of discoloured surface, and the surragame, and the surragame.

### Inspection twenty-four hours after Douth.

The whole body presented a beautiful appasiess, the floor of the theatre is crowded pearance; thu skin was of the most delicate texture, and the symmetry was perfect. On opening the thorax, the luege only partially collegued; they crepiteted at their bases; alight adhesions existed between the proper ing practitioners, dobbed " ennuel gover- alight adhesions existed between the proper note," by subscribing three gaiocas, arro- and reflected plenre. An iocinion from the gate to themselves superior privileges to spea to the base of each lung, exposed a pupile who have paid tweety guineen; mass of taberclesefdifferent ages, but none pupile was nave past twenty gusters, in a state of suppuration. The macoes member by likewise possess a voice potential to in a state of suppuration. The macoes member geveroment of the issitution. These brace of the bronchi was tieted of a pale geotlemen are the object intruders to the red. The heart was small, but perfectly area of the eperatice thestre. The po-healthy. In the abdome, the capillary system appeared quite empty; the villeus coat of the stomach and small intestines were inflamed in irregular spots, the vessels having a brown arboresceet appearance. The head

When Sir Anthony Carliele came to the Hospital on Saturday last, Mr. White was examining a man's eye is the surgery :-"What! de you expect to swe fully year." What! de you expect to saw that the Knight. "Why! It's considerably better," replied Mr. White, " and that whish can he mede better, may be made well." After enemining some patients in Mark's Ward, (present Mr. Lynn, Sir Anthony, Mesars. White, Guthrie, and Harding, and about 30 pupils,) Mr. Guthrie pre-sented Sir Anthony and Mr. White with a pamphlet each " for their amassment on Sunday." Sir Anthony observed, " I shall read it with a great deal of pleasure; but I decidedly object to these things being so mach brought before the public; I object to the publication of the evidence before the House of Commues; 1 do oot epprove of meking the public wind, if I may so term it, familiar with such thioge; they should be strictly private. There is a superstitious reverence for the deed among the public generally, which I would by se means do away with; it would be destroying one of their the most well is the aight, awake, re-would by no means allow the paor people freshed, this marning. About two clock who die in liceptule to be given up for diesting the themsels. Last as Mr. White was un-section, and while I am arrest the management of the section of the sec "Had we not better speak of this in some | s dis "Hof the hast joint, which had oppu-other place," said Mr. White, in an under reg. "destroyed the last phalanz. I we tone. "No! Why!" replied Sir Anthony, "fatures were applied to the bleeding ves-l wish them (the patients) to know it;" and sale, and the divided parts were brought there the conversation dropped.

### **GUY'S HOSPITAL**

Easty on the forenoon of Tuesday last, the operating theetre was crowded by a large assemblage of students, to witness the operation of lithotomy by Mr. Bransby Cooper, which was announced in our last. minutes past one, the patient, e shild be-tween three and four years of age, was brought into the theatre, and sounded in the ussel manner, when all of the surgical staff declared their belief of the existence of n sery large stone; and, during the operation of sounding, the striking of the instrument against the atom could be distinctly heard at some little distance from the operating table. The patient was then bound, and the operation commenced by cutting through the perinsum, in the usual way, into the groove of the staff. Urwasna ny roun MINOTES elapsed, however, before Mr. Branchy Cooper could clearly satisfy himself that the point of the knife was fairly in the groove of the staff. The knife was then carried onwerds, and the staff of the same time depressed. A small gush of trine followed. The operator then passed his anger through the wound in perinau, and ascertained that the opening into the bladder was not sufficiently large to extract the stone. The knife was therefore carried a second time along the groove of the staff, and the wound in the bladder dileted. The finger was then again introduced, and upon to be eitnested at the back part of the hisder, was very readily laid hold of, and in a few seconds, by an elteracte mution of the for-ceps from side to side, extracted. It was a mulberry calculus, of an ovel shape, and nearly as large as a common walnut. patient was immediately put to bed.

DIBEAGE OF THE FINOLE-AMPUTATION.

An elderly woman was then brought into the theatre, and the middle finger amputated at its junction with the metacarpal bone, for into contact with outures and adhesive straps, end e bandage encircled the fingers, to keep them in epposition. The patient then quitted the theatre.

The operator then proceeded to emputate a second finger. The patient, (a young healthy-looking fellow) had, some time previously, lost the ring and little fingers of the same hand, by being caught in some machi-nery. The accident had also occasioned severe compound fractures of the metacarpal bones of those fingers; and subsequent inflammation had produced anchylosis of the metacarpal bone of the middle finger. On this account, the fore-fieger and thumb were rendered comparatively useless. The operation was performed by cutting into the joint on the exposed (mer) side, then in-elining the kulfe upwards, and forming a flep from the radial side of the finger. This flap was brought into contact with the smutated parts with two or three sutures, and kept there by adhesive straps.

After these minor operations were con pleted, Mr. B. Cooper turned round and addressed the students as follows :-- ' Gentlemen, as there here been public misrepresen-tations of operations performed in this thestre, I think it my duty to etate to you my reasons for introducing the knife a second tie into the bladder. The first time I carried it along the groove of the staff, I not only divided the prostate gland, but also opened the bladder. Upon, however, introducing my finger into the bladder, I found that the uponing was not sufficiently large to admit of the extraction of the stone with safety to the patient, and also that my finger was closely embraced by the divided portions of the prostate gland. I therefore deemed it more prudent to dilute the wound in the bladder by a second introduction of the knife, then to run my risk of terring the seft parts, by attempting to extract the stone, which I felt confident was much larger than usual."

#### HOPITAL ST. ANTOINE.

THEATMENT OF THE COLIC FROM LEAD. BY ALON.

1. P. FOURNIAN, mist, 45, a painter, of a robust constitution, was, os the 22d of Sep tember, admitted into the Hospital, under M. Kapeler. He had been eight times effected with the edit, and was treeted in the Charité end liétel Dieu, but never recovered his health, and even at the time of intermission was affected with oustiveness, pain in

<sup>·</sup> In nur report from the Hospital last week, it should have been stated that the child effected with meetrs is about the ege of ten weeks, and that the boy on whom Mr. Morgan performed the operation of amputation, is sped lifteen years.

the belly, and a paralytic affect on of the left wrist. At the beginning of Sep. there is to ten cases, in which alam affected e he was seized with violent solic pain, the was seized with violent solic pain, the was seized with violent solic pain, the work of the reporter states, that whose, sicksess, and astresse lessitudes a M. Kapeler, after baving for thirteen years that be was unable to continue his work, On his admission, the abdomen was violently contracted and painful; the pain intermitting, and reliaved by pressure; he com-plained of mokness, sour tests, axcessive thirst; entire loss of eppetits, heedech, rettlessness, tenesmus, and costiveness, of five days' standing. The tongue was white and moist, the pulse very slow, the skin dry and cold. The antromities, aspecially of the left side, were in a constant convulsiva motion; the left arm was completely paralysed and insensible. M. Kepeler ordered muci-lagicous potions, an amollient injection, and a drachm of alum daily. On the following day, the patient was considerably better; the diminished; he was free from sickness, the convulsive movements of the axtremities were less violent, and not so frequeet as before; he had slept for some hours. The bowels bad been moved several times, and the tenuemus was much dearease Under the continued use of alem all the symptoms gradually dispressed; the bowels became regular, the abdomeo free from paio, the trembling of the limbs ceased; the left aide only was for a considerable time beoumbed and weak, but at last also regained its former strength and seesibility.

2. C. Baudin, of a feebla constitution, 31 years old, a putter, was, on the 26th of Fabruary, auddenly seized with abdominal pains, so violent, as elmost to render bim delirious. Being on the 27th carried into the Hospital, he was found in the following atate :- the limbs were in a constant convalaiva mution, sod almost iesensible; he compleioed of the most exerusiatiog colio pain, which could only be somewhat apseased by forcible sompression of the belly ; the nyes were bright eed glassy, the face iedicative of great pain and distress, the tongue dry and black, thu bowsis costive, the pulse vary small and slaw; a few hoers after ble edmission, he became delirious, so that it was necessary to apply the straight weistcost. He was ordered an emphison glyster, mucilaginous potioce, and a drackm of alum. On the following day he was to the same state, in constant pain and delirium; two drachms of slum were ordered, and an olsaginous injection every helf hour. On the aveoing of the 28th, he recovered his senses, after having had three conious atook; the paid was much diminished, and the abdomen soft. Under the contineed

speedy ours, and the reporter states, that M. Kepeler, after baving for thirteen years dopted this method, prefers it by far to the un of narcotics and drastics, which, order the name of "Truitsment de la Cherité," are almost invariably employed in the other Parisis hospitals.

HOTEL DIEU.

. ASCITES.

T. LECOUTURING, metat. 44, habitually in , the patron was commontanty series; the best of good health, had been the was 120; the colic pain was much the esjoyment of good health, had been thinked: he was free from sickness, for some months effected with indigestion, loss of appetite, frequent costiveness, hectio fover, great emaciation, and, latterly, with awelling of the abdomeu, and dyspoca on the least exertion. When admitted into the hospitel, under the care of M. Borie, be exhibited the following symptoms:— The ebdomen was seemously swalled, the skin vary tense, the umbilices prominent, and the acrotum infiltrated. There was distinct fluctuation, but on pain on pros-sure, nor sould any tumour be discovered. The face was of a sallow leteris hue, the tongue red, ekin hot, urine scenty and high-coloured, the bowsle very contive. Ha somplained of loss of appetite, great dyspanic and the some state of the sound nose, dry cough, fever, with cocturnel nxscerbations, restlessness, and great thirst, The abdomen being puoctured, eleveo piats of an inodorous limpid serum were evecuated; saline and oleaginous operionts were given, sod the abdomen sompressed by a bandage. The petieot was much relieved by the operation, and, on repeated examiaution, the abdominel viscers were found in a healthy state. Four days after, thu swelling having reguloed its former size, and all the other symptoms, dyspnoss, restlessness, &co., having re-appeared, the tepping was repeated, and no less than fourteen pints of floid were avacuated. In a week the ewelling returned a third time, without, however, arriving at its former size; and, under the ose of seline aperients, mercurial frictions, and astringeot fomentstions of the ebdomen, the patient was perfeetly cared.

#### ANGINA PECTORIS.

Josephine. Vals, mtst. 34, of e florid comum of alom he rapidly recovered, and was pleason, was, on the 14th of November, ad-displayed perfectly sured after eighteen mitted into the hospital, having been about four months before, without my known pre-

found that he could not close his mouth the wi again, and it gave him great pain, having again, and it gave him greet pain, naving the same mining of what occurred on himself. When I sew him, the mouth way the leading place, and that the account pulsabout half closed, and a little thrown to the leading place, and the Charity Expressence is an inright side, and the mlive was flowing fro-fessiy from his mooth. I coold not, av first, discover the nature of the accident, for reaclascover the asture of the accident, for rea-sons attack shove. The two conducts of the jaw were in sid, but they would not permit of motion readily. However, on putting my ingers into the mouth, I wind that the co-ronsid process, on the left side, was brought forward, and that it was laying on the check hone. Such being the case, I immediately depressed the jaw, and at the same time sed it inwards, and the parts regalend their netural situation, and he had the free use of it instantly, insumuch that, sithough I had tied the jaw ap, he returned to me, in the nourse of ten minutes, with the same socident. I reduced it again in the same manner, and, beving tied his jaw morn securely, with a charge not to open his mooth so wide, I dismissed him.

I am yours obedinatly;

# LECTURES

ON THE

DISEASES OF WOMEN AND CHILDREN.

BELIVERED AT OUY'S EGSPITAL BY

DR. BLUNDELL.

LECTURE XII.

RESURING the subject of the preceding morning, Gentlemen, you may proceed to sak what is to be done to those cases of retroversion of the uterus, now end then to be met with, in which a reduction of the retroverted position is ettempted, indeed, but cannot be accomplished. Why, your treat-ment here must very, according to the effects of the pressure. If the urine can be drawn off by the cetheter, or passed by the ordinary efforts, and if the userus does not compress the restum with that degree of force which may prevent the discharge of its contents, it is unaccessery that you should interfere, (a medite midwifery is bed,) but you should rather trust to the antural powers. As the wemb enlarges, it may rise out of the pelvis more or less completely, and thus, day after day, the compression may become lighter and lighter, until, at last, it is removed altogether. It does out follow, therefore, because e worsh remains retroverted, that the woman must necessarily die ; and, consesently, in attempting reduction, you much to be careful not to use the higher digrades force, as the ease is not sufficiently desperat p justify it. But it may now a appea, where the world namely vertiel, that under the principle which it makes on the contiguous parts, neither the section can be elected of their continue, nor

be done, otherwise rupture of the bladder, and death, may be expected. In such cases it has been proposed that we should tap the bladder; and, now and then, this practice would seem to be proper enough, and may, perhaps, be the only effectual mode of proceeding in some cases. It has been proposed further, if the reduction of the womh is prevected solely by a deficiency of room, that we should divide and open the symphysis pubis. Cruickshenk, I think, recommended a measure of this kind. I am not aware that it was ever done in well chosen, I can conceive it might be of use to the patient; at all events, it would render the introduction of the catheter more easy, and the room in the pelvis somewhat more capacious. Alarming as the operation is, it is far from being o fatal operation; nevertheless, as I have never myself seen this operation per-formed, and, indeed, know of no case of re-troversion in which it has been attempted; I do not venture to recommend it. In a ca of retroversion, where the catheter could not be introduced, nor the rectum amptied, I should myself feel inclined to consider the preprinty of tapping of the uterus, which might, perhaps, he found, on the whole, to be as desirable an operation as the tapping of the bladder, or the dividing of the symplectic publs. I should not take a greet trocar and canula, as if I were going to tap in a case of eacites, wounding a great many ver-sels, and perhaps occasioning death; but I should prefer an instrument of a very small size, by which I could perform a sort of sempuncturation, which I am told has been tried upon the hearts of animals, withat necessarily endangering life. Perhaps an instrument, contrived on the principle suggested, might be introduced into the morus wishout much danger; and then, if a contrivence were fixed upon the other end of it, so m to bring away the fluid by a sort rectum sen he eleared of their contents, nor of equation, it may be that a good deal of the the blubber, as in Dr. Cheston's costs, liquor small might be drawn off; and if the sociated in a fermi leature. New, if the segmention of the blubber is complete, and there would immediately be a considerable the accumulation of uring large, it is no reduction of its bulb and parhaus, at length, as reduction of the bulb and parhaus, at length, and parhaus of uring large, it is precompletely necessary that accumulating abouth of respection of the orum; the womb might

100

i

In retroversion of the nterus, it would not, perhaps, be impossible to introduce net, permans, see impossione as into die some small, yet atrong fastrument, into die cavity of the eterus, sieng the mouth and neck, so as to bresk up the structure of the evam, and, in that way, to give rise to its axpulsion. It is very easy to conceive, that if the os uteri could be felt, and if an instrument coold be carried into it, with which the ovum could be moken to pieces, a expulsion of the evum might come. All these expedients are, more er less, hazardous; they are to be had recourse to only in those cases where there is no ether hope; the woman's bladder being in danger of la-ceration, and this it is which justifies us, in making attempts not without risk. But besides retroversion of the uterus,

which I have here been considering at large, and which is the result of pregnancy, it new and than occurs either independently of gestation, or with circumstances very different from those which we have described. In the earlier menths it may happen, that the womb becomes retroverted, and so if may continue throughout preg-nancy; so that in the and of gestatioe, when delivery commances, the retrover-sien may continue still. Well then, what is to be dene in these cases? Why, a re-troversion of this sort is recorded by Dr. Merriman, n vary solid and prudeet practitioner, and the result of it is to prove, that the less the accommon interferes, the better. When first we examine internally in these sases, we find no os oteri whatever, for it lies above, out of reach, and the to; but if the practitioeer ander the wogradually more and more expanded, and, he it enlarges, the inferior limbus appreaches mearer and nearer to the brim of the pelvis in front, till at length a segment of it can t enlarges, the inferior limbus approaches aunt. Of course the replacement of the feasier and nester to the him of the pelvis wamb leaves the origical disease of the factors and nester to the him of the pelvis wamb leaves the origical disease of the factors are the region of the symphysis pubis; Again. In different women the womb values segment descending and selarging more rise such in its virgin bulk, for in some it is and more, till at length the child's head, there times as large as in eiters, varying in hot without much difficulty and pain how—magnitude much in the same monner os the case, decad it ill some, probably, if het in the same monner os the fact without mach difficulty; from all which it spiritudes and the child is born, probably, if het is present that the womb is very small, and all eases, dead, the mother escaping, though the the than place which it occupies; that is a retroversice of the uterus, since may be an inconsiderable, that the neather in the earlier or latter months, it ture of the secifical remains misuspected; does not necessarily follow, that you ought i but when the womb, though unimpregnated. does not necessarily follow, that you ought hut when the womb, though unimpregnated, to distrust the externi efforts.

Again. I have considered found a retrosupecially, the polvin is small of contractud,
version of the vicros occurring after defrontier robbins and on the whole, that accident,
we are first led to investigate its mature in
though not pertupe very frequent, may, consequence of the feritation and obstruchowever, easily occur, for after delivery the tion of the hovel and the bladder, when it

he tapped either from the vagies, or the rec-womh is nout as large as the heed of a full-tum; vaginal tapping would, I conceive, gre- fortas, and where the hielder has be preferable. But I wast experience here, I a suffered to become everleaded, after foctus, and where the bladder has shorious labour, for example, it is liable to become retroverted. The case being ascar-tained, introducing the calleter, yen may draw off the trice, and at the womh is hecoming less and less every day after delivery, and making a continually decreasing pressure, of conrec it is not necessary that easy thing should be done as long as no symptoms press. If, indeed, after emptying the biadder, you can replace the womb with little effort, this eight to be dece; but then, if your attempts to reduce the uterus fail, content yeurselvés with emptying the hlad-der when needful, watching the symptoms with vigliance,

Replacement might, perhaps, be obtained, as in the ordinary retrovarsion, by plac-ing the patient on the knees and pibows, as formerly recommanded, but the propriety of this practice during the first few days after delivery may admit of a doubt. Further. Whee the womh is enlarged from

scirrhes, pelypus, mole, or hydetida, and by the twe former, more sapecially, it may acquire the size of the feetal head, and become retroverted; and thus you may have a retro-version of the wemb, independently of pregnancy eccurrieg, is unmarried wumen. In this case, however, ewing to the slow growth of the uterus, except in cases of hydatide, the symptoms of pressure may supervene ie a very gradual mannar, there heing much irritation about the bladder and rectum, jeieed with obstruction of the urethra, more or less complete, ned this perhaps for weeks or months together, before the nature of the disease is ascertaiced. In these cases it first impression made on the mind is, that will, of course, he yeer main ebject to re-tha Cesarian operation must be had recourse place the uterus if this can be effected; and to, but if this practices another than the place the uterus if this can be effected; and the personnel of the you must proceed in the replace the retrorarted womb when preg-

chances to be of large size, and when, more

is soon recognised by the characilization be-fore given. The treatment of litherage pendently of Programmy. saust proceed on the same principles about of retoversion, associated with gentation. Lastly, the nterus, when in healthy posi-

tion, is placed obliquely, as stated in a for-mer lecture, with its fundue forwards, and its mouth posteriorly, the fundes lying a little, and but a little, shove the level of the brim, and the mouth and neck a little below it; this I have observed in the living women a hundred times. Now, it is said that suisversion, that is, a supposed change of posi-tion, in which the fundua comes forward and the mouth receives, may take place; but, the truth in that the weather similar takings and terted, ... dequantly the fundas is pasted down helow the symphysis, pubis. often, in making examinations, have I per-ceived it in this position, between my fingase; so that these auto-versions of the utorus een scarcely be looked upon as extreordinary and morbid. I might say, with truth, that they are perfectly healthy; and notwithstanding some one or two cases which have been put upon record, I look on this as a variety of disease on which it is nunecessary

Prognesis.-With respect to the prognosis of retroversion, I have to remark, that where the womb is replaced, the petient in the general does well enough, provided you proceed on the principles prescribed; yet it is not impossible that miscerriage may taks place after a reduction; in two or three instances I have known this. Information of the bladder of the scuter kind may occur, and you may have a chronic disease of this organ. Where there is a good dear of infinamention, your patient-may die of subsec-tion; and you may find thet-some officious hand has threat a catheter through the back of the bledder into the peritoneum, and then the escape of the urine into the peritoreal der, he some two Cases, may be hund open, as in the preparation before you; on, as is one case which I saw myself, the owny may be dropsical and raptured, and this may although these retrovessions are, on the whole, by no means very dangerous, it dear and always follow even when the shall is replaced with skill, that the woman will replaced with skill, that the woman will ultimately de well: Those cases are more dangerous and unfersumide, where the retraversion of the steres is connected with ne other disease, whether enlargement by hydatids, or scirrhosity, or polypes, for when you relieve the retroversions, you me ouring festion still continues in all its force.

Is the polvis, we sometimes find various growers of different sizes, some as big as a believ's egg, and some as big as the head of a full-grown feetus; those tumours I divide into two kinds, the recto-veginal, and those Which are not situated between the vagina and the rectam.

Respecting these tumours which are not situated between the rectum and vagina, and which come independently of prog-nancy, I have few useful practical observations to make, and therefore I shall pass nver them lightly, observing merely, that they grew sometimes from the promonency of the secrum, sometimes from th scietioligements; he as to obstruct parterition, occasionally from other parts, which may delivery, the difficulties and management of which I took occasion to consider at large, when treating of the anomalous labours.

But more generally, where tumours form in the pelvis, they are of the recto-vaginal kind; and water, intestines, and, above all, the enlarged overymay ledge in this part. There are various causes from which the overy may become cularged from dropsy, for example, from scirchus, from extra-uterine gestation, or the like; and when the overien enlargement takes place in that manner, the tumour falls down between the rectum and varine. I think I may my frequently, and may give rise to much inconvenience. If it make but little pressure on the pelvis and bladder, it may not require much attention, and even when the woman is very uncary, and greatly distremed by it, if it become larger, so as to get its bearing above the brim of the pelvis, a spontaneous ours of all the symptoms may the pelvis is small, and the overy large, and the parts initiable, the tumour lying in the latitude of the socrets, between the vagine lamine at the service aymptoms may be produced; and those symptoms, of a assuma-lose kind, may be worthen little study from us. In the first place, there is a great deat of irritation about the rectum, and your pa-tient may be supposed to labour nuder Assertation; then, too, there may be a good deal of obstruction in the hinder, so that the urine may be intercepted, or may pass with difficulty, a cathater being required. Nor must I forget to mention, that there may be a great deal of central pain felt in the back, and about the symphysis pubis, together with a shooting down the thigh; a reliese the retresessions, you we would be relieve the retreses which depends pain, remains, perhaps, in two course, by that part of the mirror curval, and the part of the mirror curval, and the great solution still estalmars in all its fires.

The patient may be parathe justical saying that she feels a ripping

lytic in the lower limbs, and one limb may be weaker than the other. I will not usy all show you; when it hecomes retrovert-muscular power goes from the leg, het the legit of the muscular power may be redeced; in diffe-themses, but, then, the symptoma produced rent cases, the degree of paralysis varies; if are considerably less may be so alight, that the patient scarcely I here show you a preparation of a nerus promises it, or it was he as considerable lessed from asterbacker, and responses. may be so slight, that the patient scarcely perceives it, or it may be so considerable that she is obliged to lie on the sofa, and to he lifted the lift. be lifted to bed. Now where you have these symptoms occurring, want of power in the lewer limb, nervous pains, ebstruction of the hladder, and ebstruction of the intestice, there is good reason for suggesting that there is some tumour ar other in the pelvis; and if you make a carefel examination, of course the disease is secertained easily enough.

Treatment,-In cases of recto-vaginal tumous, it should be your first chject to press the swelling above the hrim of the pelvis, if this can be accomplished without much effort, and you must proceed precisely on the same priniple as in the case of a retroverted womb. If you cannot place the recto-vaginal tumeer above the brim, yeu must leave it in its si-tuation, palliating the symptoms, hy keep-ing the bladder empty, and edvising the patient to use that sort of food and drink which will not require much execustion. In these cases, I knew of no effectual mode of relieving the paralytic symptoms, or the pain which the patient has in the lewer limbs, though the latter may be pallisted newhat by means of bleeding anodynes. When those recto-vaginal tumours become large, they not unfrequently rise sponts-neously above the brim, so that the disease cures itself; and so it sometimes happens, that se recto-vacinal disease has been advancing, though neither the sufferer nor her adviser have known what was the matter, the disease has given way. I have more than once seen patients labouring under much ab-dominal in timescence, and an avarian dropsy, whose first symptoms, though attributable to this cause, have been clearly misunderetood. This, therefore, you should mention, hecause it is e great encouragement to patlents; the larger the fumour, the more likely it is to quit the pelvia, er, et all events, so to alter its bearings, that the symptoms arising from compression may be effectually relieved.

Let me add here, that it is in the highest

I here show you a preparation of a nterus enlarged from scirrhosity, and retroverted; it produced all the symptoms of the disease, with this difference, that they came on more gradually, because the growth of the scirrhus was not so rapid as that of the uterus under pregnancy.

For the preparation here shown you, I am indehted to a very excellent young gentlemen, the late Dr. Cox; it is a epecimen of tubercular schrhes and polypos comhined, and such a womb becoming retroverted, must give rise to the symptoms of

the disease.

The next preparation exhibits the ease of the pelvis removed, so that you see all the viscers, in their different situations, with respect to each other. This preparation is well calculated to throw light on the bearings produced by retroversion.

Hare is another preparation, of the same

parts, on the large scale.

Here is e very beautiful preparation, which shows the retroversion of the uterus, with disraption of the bladder. The uterus is as large as a child's head; above the retroverted uterus is the bladder, which has been ruptured. It is remarkable, that in this rupture of the bladder, which has prisen from its ever-distension, it is not the frontthat surface of it I mean, which has no peritoneal covering—but it is the posterior aurface, invested by the peritoneum, the back part of the body, which is the region of the rent. New it was this, -and I may mention it here, lest by any accident I should be prevented from making these observations erenfter-lt was this which first led me to propose, that where a rupture of the hiadder takes place ie any case, but especially in a retroversion of the eterna, wa should not give the patient up for lost; for if there is reason to believe that the bladder is burst into the peritoneal eac, we might make an opening into the peritoneum—say shows the symphysic pubis, by which we might discharge the urine, and then injecting dis-tilled water, of the temperature of 980, Let me and nere, that it is in the highest thied, waster, of the temperature of '90', dagree dangerous for a women to become we shight waste out the vincers, so, perhaps, pregnant white she blooms under a lings is to provent a general peritoditis; this recto-vaginal tumour; if she does, the high done, we might draw the bladder up to the probability is, that both berself and the child upon the sugle, there will, of by ligature. This operation I have performed ourse, be little danger; if married, she is done are remarked in the abloader out, the if it height to be upon her guard, abethence in the several rabbits; in one at two expansions the second of th nugat in se upon her guard, aneansense i riments a crosspot and and another of it, ways in which she might chark against vis, the whole of the funders, and the saintail pregnancy, but which i do not think it proper publicity to insention; but this delicate sub-period to the funders, and the human just I have touched on before. I should be inclined to recommend I should be inclined to recommend in I pleasure. It is believed that this requires may remark here, that since I have but in no ther care but that of the servants, and, of gested this method of closing the hlader source, the children, being kept in motion. by ligature, a surgoon of eminence (Mr. As they increase in age, their exertions are Travers) has performed the aperation un increased, and the scooes in which those ex-the atomach. There was a allgut wound in ertions are made, are extended to walking, to the organ; he boidly tied up the sperture; the thread came sway, and, as he told me, the case did perfectly well.

I request you all to read the excellent paper of Dr. Merriman, On Recto-vaginal Tumours. You will find it in one of the earlier volumes of the Medico-Chirargical

Transactions.

When we meet again, I shall proceed to a very important class of diseases, those which depend upon the descent of the polvie viscers.

MUSCULAR ACTION, AND ON THE CURE OF DEFORMITIES.

# By Mr. SHELDRAKE.

On the most effectual Method of Instructing Young Persons in these Exercises, that will mprove their Perumal Appearance, and render their Forms more perfect.

Tura aubject may be arranged onder two divisions. First, that which may be practised in avery geotlemso's family, hy those who are naually employed to take care of young children in the surlicat periods no their lives; and who, indeed, would he more beneficially employed in the practices that will new be recommended, then they are in performing the duties that are commonly laid upon them. The second consists of years persons, who are so far advanced in life as to be the subjects of professional attention. I shall, at present, confine myself to the first class.

Young childree, in the families of gentla-men, are generally well managed while they are in the norse's arms, because the anxiety of parents, and the attentino of profession men, who are, at that period, mach employed, prescribe a rational course of treatment, and compel the nurses to follow the course that is prescribed. It is in the me-ceeding stages that the mismanagement be-gins; and this is too often carried to excess at is productive of lasting injury.

ertions are made, are extended to walking, to running about, and engaging in such other exercises as the discretion of the servants shall direct; for the management of children, at this period of their lives, is believed to be so simple and at easy, that it may be safely entrusted to the case of that class of servants that has the least knowledge, and has b the least experience. Let us now inquire into this fact.

The persons who become nursery-maids are usually the daughters of cottagers, or of persona in some inferior stationa ie life : they have been brought up among their naturni relations, and, as persons of every class of society have poculiarities which distinguish them from all others, these servants carry the peculiarities of their own class into their new situations. As man is an imitative animal, the servants, who teach the gentleman's children to du whatever they are employed to teach, instruct them, by showing by their nwn actions, what is to be deco. The sonsequence is, that the gentleman's children learn to imitate the habits sod mannors of the servants, instead of those of their own class. This will happen when the utmost caution is used; but the want ni care, and, sometimes, weres motives, induce those, who have the care of children, to de them very serious injuries, without having soy fixed intention of doing so. Of this kind of misshief I have known many very atriking examples, but shall content

myself with giving one.
A man of business, of the first class, who lived in Pall Mall, had a family of young children; the nursery-maid was regularly employed to take them, for air and exercise, into St. Jamos's Park ; but was ordered, on no secount, to extend her walk beyond the length of the Palace-garden wall, so that she might certainly be found, if wanted. One of the children was not shie to go aloso, and of course must be carried; the other was a girl of five years ald, and very wall able to walk. After some time this child become unhealthy, and weak, her knee boot, herancles were distorted, and she became a patient of mine, to have that defect remedied. Na antiefactory account could be given of the cause that produced this unexpected alteration in the health and form of a child that had been so healthy; at last the servent was dissisted for some other fault, and then the whole The children are given to girls, or very truth became known. This girl had a little young women, that they sequire the power of using their limbe, to gire them exercise, and then the whole that they sequire the power of using their limbe, to gire them exercise, and to meet, were when she was sen which, it is supposed, may be increased at walk in the Park with the children.

than, with one child in her arms, and the loung acces, are compalled to remain fixed other running by her side, made the best of 1° life place for hours together, with looks her way to Chelsee, and, when the purposes demans, and book upheld, they are said to for which her assignation was made wase he in good order. It will now be proper to sted, she returned without being missed, notice some of their employments. as her mistress, taking it for granted that trouble to see if she remained in her appointed place. The child could not go on long in this manoer without feeling its coosequences; she was fitigued by this es-cessivo exercise, and cold as she walked, or rather ran, along the read; she was being thus intimidated, the poor child went dies were provided.

In this course of education, if it deserves the preparatory achool, or some private the same reason, but for the pertinently with course, in which provail as preparatory schools, attention, and intruded as being worthy of see adopted. In the first course, as it has general adoption, and to supersode descript, been described, if the children acapped the laws healthy as well as pleasureable certainties to which they are liable, all possible else; as it has been shown that they are means have been used to make them active, highly injurious in svery respect, they corrobast, healthy, and high-spirited; qualitatively ought on avery account to be discontinued of which, in the next stage of their thored. oducation, much trouble is taken to deprive After having given this rapid sketch of them; they are taught to remain confined the practices which have been adopted to to their seats for many hours in the day; to improve, as it was thought, the persons of "beliave pretty," as it is called, with arms young people, it will be proper to point out folded, demare faces, and eyes fixed upon one peculiarity which pervades the whole, their books, to learn their appointed less the practice of every stage, as I have called sons. In this stage of education, all possi- it, is onleulated to counteract the offset of his means are used to deprive them of those | that which immediately preceded it: thus, qualities, which it was the business of the | in the first stage, the object was to give as arst instructions to teach them.

dene se attampted. I shall context myself and the inside of her great toe upon each lara with pointing out certain printings, if and close to the cetaids of the line; she will which, if adopted early in life, and steelight, then be able to place har feet upon the followed, by persons even of ordinary in ground firmly, and also will be able to religiones, will emble them to give to latep or stand still in the most edvanyoung children the power of using their tageous menner. When this position is limbs with firmness and precision; this will become familiar to her, she about he discount familiar to her, she about the discount familiar to her and the discount familiar to her about the discount familiar to her about the discount familiar to her and the discount familiar to her about the discount famili become natural to tham, if they are well grounded is those practices in the analy period of their lives, and will enable them to atsuding upon one leg, while she lifts the acquire any other exercises they may have occasion to learn, at any future time, with more facility then they could do if they had not been previously so instructed.

These exercises should be begun as soon as children can walk firmly alone, and un-derstand any directions that are given to them; they should begin with the simplest exercises, one at a time, and not prooced to a second, until thay are completely masters of the first. After having mastered the most simple, they should proceed to those that are innre difficult, and so on progres-sively, till they are musters of the whole, which they should then practise earefully and regularly for a certain portion of time every day. If all children were justructed, and required to practise these exercises, they would grow up with a power of using their limbs, sed a freedom from personal defects, to which so many children are subjected at present, and which are so often injurious to them in the course of their future lives. The iongest room that sae be set apart for this practice should be preferred; upon the floor, make a straight line the whole length of the room; a second line should be made parallel to it, and the two lines should be connected together by a raturn at each and so as to make the whole one continued figure ; these lines should be nne inch wide in the whole of their length, and should be painted upon the boards, or described and laid down in any other durable manner. If the room is carpeted, a white tape, or web, may be fixed on the curpet to sanwer the some purpose.

The child that is to be instructed must be made to stand quite erect, still, and firm, upon both feet, with the heels close together; the spine must be kept firm and erect upon the pelvis, and the pelvis equally firm

manuar that has been described.

When the child is familiarised to this position, and is able to stand in it for some

rected to remain in it, (without moving the body, or any member that is standad to it,) attaining upon one seg, wasse and restained the photologists have; in this position she should remain for a few seconds, at first, then set we down in the place from which she raised it, and raise the other in the same manner; after standing upon the second foot for the same time as she stood upon the first, she is to return that to the ground, and raise the first in the same manner again : thus changing har feet, and standing upon each in its turn, till she has acquired the power of standing upon either foot, and changing from our to the other, without changing her place. She should repest and vary this exercise, till she is able to stand for a minute or more upon either leg. When she is quite familiarised to this exercise, she is to stand firm on one foot; while she raises the other by bending, at once, the knee and the hip joint. Having stood for a a short time is this manner, she should straighten the knee joint, by which the foot will be moved forward; which should the moved forward in the same manner, She is then to be placed upon the line, an rected to move gently forward till she as may be found convenient or practiesble.

The use of this exercise will be very great; it will, without any improper exertion, enable her to direct her feet to any perficular point, to walk evenly and firstly, habits which, when once acquired, will evere afterwards to lost, nuleas by the grossest negligence. As the children, for whose use this practice is recommended, belong to that rank in society which gives much attention to the education of its nifspring, it is not to be expected that when the importance of this practice, simple as it appears to be, is understood, it will be omitted or neglected. The only danger is, upon the peivis, and the peivis equally area appears to be, is usuaratood, it was so upon both logs, but without being digid in a constitted or neglected. The only danger is, still position. While the child is in that the still neglect it, for it is the practice of hodge will be child to the similar parts on growence to neglect or despise what applies other, and this beed mant and will be pears to be simple: the authority of parties upon the spine, for it is quite lapour rents to compel the proper use of this practice of applications of the proper use of the prope

Its evident utility will recommend itself.
The child, when lustracted to walk in
this manner, should be directed to look at time, any a minute or more, let her abad its feet, and see that it places the la-upon the line with her heels cluse together, side of each foot exectly even with the out-

thus all to whom this practice is rendered arrested .- News. Bibl. Medie. finalities very early in life, will have laid o notified on the extraorium up a mile-reson persons in the more advanced periods, when their time and etter son should be directed to abjects of a different neture Some objections, which have little real imnoe, may be made to beginning this practice so early in life, because it may be said that it will fatigue the child's attention, and It may be added, that It might be learned qualty well et a later period; end if the d prejudice is revered, it may be said, that it will be better to let Neture, as It is called, take its course. In all this, the plain answer that ought to be given is, that it requires no mental exertion in the pupil to practice this exercise; it occasions no restraint or measurem. As children must have appreins to keep them in health, It will be better for them to use this exercise, which must have a beceficial effect, and which may be so managed as to have much the character of surusement, and will be better then to have them run about in what has, erroneously, been colled the natural wey. Persons who talk in this mannor will be surprised to learn, that for huisan beings there is no natural wey of moving about: all practise locomotion, but every class of beings move in a wey that is dictated by the behits they have acquired, there is no resemblance between them, one place to enother. The country labourer walks in one menner; the labouring artisan in another, and the gentleman in a way that differs from aither of the preceding,

WITH THE CAPSULE OF A PREMAMENT

M. Over lately communicated to the Acedémie Royale de Médécine the case of a child of five years and eight months, in which, on extracting the accord moint tooth of the lower jaw, the capitals of the perma-nent tooth was extracted. It was between the roots of the tooth, but not attached to them, and its external tubercle was almost complete. It seems that there is no denger of this eccident in entracting the incisor and canine milk-teeth, the copsule of which lies behind the simple roots, while that of bicuspids and mular tecth is situated between the roots of the milk-teeth; even in the latter case the capsule of the secondary tooth is so very seldom extracted, that the possibility of this accident has been altoge-ther denied. It is at all evants not sufficient to deter the practitioner from extracting a milk tooth, whenever caries, oblique porition, &c., render it necessary,-Bullet, des Se. Med.

### REMACRACLE CASE OF STORE IN THE BLABBER.

dictated by the behits they have acquired. The enhiert of this abservation is a young and differ so much from each other, that Sicilian, who from his infancy exhibited symptoms of stone in the bladder; in his more than the simple fact that they all more minth year he was examined by Dr. Assalial, themselves, hy some luberest power, from who found a stone of considerable size, and accordingly proposed lithotomy; but when about to perform it, the stone could not be found, and the operation was put off. From this time the patient suffered much, during eight years, from chronic cystitis, etrangury and lachary; he became much emacieted, Acc, till he was at last preceded in M. Porus, who found him almost in a dying state, a large shacess laving fromed in the perisasses from infiltrated urine. An fecinity was immediately made into the issuer, from which with the urine a steep of the size of a been was removed. The DELLADOUNA.

Phorason Canveillers has lately used the beliefonant in philistic with great success, in the following minuter: the fresh leaves were infused in a strong solution of opinus, and then dried up like tohace's; the white conviction desired up like tohace's; the philips solution of a very large stone, decided upon persual patients begun by spoking two pipogs and and the quantity was gradually increased to make pipes. In neveral cases of confirmed when it was with some difficulty extrasted,

a parties of hard florest manforms wround moving the deformity, which was indeed so hereat to it. The state had an uneven sur-face, was yellow, very hard, five facks long, better, then leaving it in such a condition. face, was yellow, very hard, fore taches long, and two teches and a half thick, it uniqued from suncer and a half, and committed of dybtle oxyde, aric and oxisies acid, and entinal substance. On examining the bladder, which was very large, a round atons of the size of a filbert was found, and assily cotracted, The day after the operation the patient was greatly exhausted, but the fever was moderate; the urine passed through the urethra, &c. On the third day the wound had saiddealy taken a gasgresous appearance, and on the sixth day a large exchar had formed, which being easily removed, was found to communicate with the cavity in the bladder; from which there was also thrown of a large portion of gengroupus membrane, containing a small stone. From this time the wound ressumed a healthy appearance, and within two mouths the patient had perfectly re-

SINOULAR ACTION OF ARBENIC ACLD ON SEVESAL SORTS OF SUGAR.

A southrow of the arsenic seid and common sugar being mixed, the fitted, after a few hours, assumes a beautiful purple colour, resembling that of respherry syrup; if in-stead of common sugar that of starch is used, the same colour, but somewhat brighter, is produced; the ougar of milk assumes e red-dish brows colour; manua becomes of a brick colour; disbetic augar and the saccharine principle of oil, as well as gum and pure starch, are not changed at all by the arsenie acid. Caustic potash and ammonia, have no power of destroying the colour of the above-mentioned liquids; sitric and murintic acids render it brighter; sulphuric sold changes it late a dark brown colour,---Schneigen's Jakrbucher.

DIVISION OF IRREGULARLY UNITED PRAC-TURE OF THE THICH-SOUS, AND PRE-PACT BECOVERY OF THE LIME,

A child, about five years of age, broke his left thigh, three mobes below the great trachenter; in consequence uither of sog-lect or had treatment, the fragments unlast in push a namer as to form a tight ungle, the lower parties of the limb being turned lowereds and appeared. The child being true esticity disprived of the time of his limb, was, Chitage whether offer the frequency housing to Dr. Wainerfuhr, of firstin, when 

The chances which this method offi were very doubtful; an artificial fracture of the callus scarcely appearing practicable, even in case it should be possible to apply mechanical violence sufficient to break the hone, without materially burning the self parts. It having been found, on reposted examination, thus the callus, from its thick-ness, had pushed the muscles towards the unterior and posterior surface of the limb. Dr. Wasserfuln thought it would be possible to lay it bure, by a transverse division of the soft parts over it, and then to saw through the hone sufficiently for it to breek at the place where it was necessary, without any greet violence. For this purpose, he had a truncated pyramid made of wood, which, being fixed with its best on a board, waren, veriginass with its seaso of it course, which support the concerne part of the callus, so that, on forcibly depressing the two extremities of the bone, it might break at the place where it had been kroken before. Having communicated this plan to several of his colleagues, it was carried into expenditure that the colleagues, it was carried into expenditure that the colleagues, it was carried into expensions at the colleagues. tion on the 9th of January, 1821. A tre verse incision having been made through the skin and muscles over the calles, the soft parts were pushed upwards and dear wards as much as possible, so that if callus was laid here, sufficiently, for the a plication of the saw. One-third of the callus heving been sawn through, the wooden pyramid was placed in its concava angle; but the attempt which was then made to break the bone having fulled, the operator was obliged to epply the saw a second time, after which the hone easily broke over the pyramid. The operation lasted only about five minutes; very little blood was lost, and fracturing the bone appeared to couse much less pain than the pressure of the pyremid on the soft parts. The recovery, after the operation, was very tadi-one; the limb was carefully kept in a straight position; an ahondant suppuration took place at the would; excoriations and ulcers formed from the pressure of the bundage; and large abscesses formed around the wound, which had a torpid edimentous appearance, till, at last, several pieces of bone exfoliuted, after which the cure pro-ceeded very rapidly.

On the ninetieth day after the operation,

### HOPITAL BEAUJON.

The stone patient whose uses we reported in our last Number, died as the third day after the operation, opporently with all the symptoms of violent peritonitis; on examination of the body, the abdominal cavity was found filled with purulent seram, the intentines adherent to une another by false membranes, and the pertoneum injected and thickened; the su; rior wound of the bladder extended from the fundan almost to o promise gland; its parietes were very arm and considerably thickened; its mescalar membrane was of a fungous appearance and livid colour. The perment incision comprehended the skin, the aphiseter ani, the anterior part of the rectum to the autent of me inch above the sphlocter, the lower part of the bladder, the prostate gland, and that portion of the urethra which is au-rounded by it. The neak of the bladder was thickened and very firm : the prostntic action of the urethra eshibited a large diletation, corresponding with the size and from of the stone, so that there could be no subt of its having been armly ladged there. The colleter tissue surrounding the bladder was influented with a purulent matter of sons smell, the proters were enlarged, the ineys softened and atrophic; their culiers and polves at least air times their nauel size.

#### HOTEL DIEU.

### PALSE AMECRICA OF THE REACHELL ARTERY.

T. Arguere, mint. 32, having been al. mitted on account of cerebral congestion, was several times bled; in one of these bleedings the brackful entery being opened, a great questity of blood was effect under the fasein of the forcarm; the hamorrhage was arrested by compression, the extraresaled blood began to be absorbed, and the wound of the vain completely healed. Six weeks after the accident, the sherrytion weam actor the accument law superprint appeared to make no farther progress; the tandout was then of the size of an egg, and had so obscure polastion, which counsed attagether when the arm was held in a state had as obscure polarition, which counsed as together when the arm was held in a state as, an consideration, could not but be due of extending, or when the breshid artery was comprised. the internal margin of the bicapa, through the skin and aponeurous; on raising the edge of the bicapa, the artery and nerve be-came visible, and M. Dupuytrea was going to separate the median nerve from the vessel by means of a probe, when the patient fainted, and the arterial pulsation having completely disappeared, the further progress of the operation was arrested, until after about half an hour, when he recovered his senses, and the pulsation of the artery returned; it was now readily isolated and tied in the would manner. The pulsation in the tumour and of the radial errory immediately disappeared, and the truspersture of the arm become accuse that lower, but iscreased again after a few hours. On the next day slight erysipelas appeared round the wound, and the patient was somewhat feverish, but the tumour had collapsed, the temperature of the arm was natural, the pulse at the wrist sould be distinctly felt, and the movements of the arm were perfectly free. In about a week the wound had healed, and the patient was discharged cured .- La Clinique.

### GLASGOW ROYAL INFIRMARY.

Fotnar, January 2, 1829. On entering the illuspital to-day, we found a notice of "an operation," which, from the reseases of its occurrence for some weeks past, was by no means nawelcome. On arriving in the operating theatre, the benches were, as usual, already occupied, but the gentlemen seemed to have hastened themselves thither, quicker than occasion required for, after waiting patiently more than half an hour, and depriving ourselves of the opportunity of peating by the phy-sicious visit to their patients, no operator made his appearance. At length, after much noise by some of the less judiclose and impations part of the audience, Mr. Orwan entered, and told us, " that a m nute's time wet really not his owe, and it certainly was only an occasion of an argeot nature, which could detain Dr. Couper from the heights!" He concluded by hoping, "that such disturbance would not be repeated, of the impropriety of which, all of us, an consideration, could not but be ton-

A woman, aged 31, was admitted Docum-trecovered, he began to complain of pain in her 27, with a tumour situated over the his grow and acrotum. He was bled to 30 right eprove, of the size of a horse-bean, lunces, end an extensit made to reduce the soft spongy feel, and purple colour. Blood hernie by the taxia, but without success. A was constituted discharged from its sur; consultation was called, which mes at two, face. There was smother situated immer; a.c. Ordered the petient to be put int distaly shove the former, but more flettined, the warm both, to be bled ed deliquism, and and firmer. The skin covering it was nearly insother eitempt made to reduce the stran-of a natural colour, but superiorly, to the ex-tent of belf an lash, it was of e dark brown again taken, and when the patient became colour, and eround its margin there were three hard small tubercies, and over the the taxis tried, the without suscess. external canthus, one still smaller. It was Mr. Cowan, under whose care the patient tander when pressed, and moved freely was placed, now estered the operation room, under the able. The disease was of long and told the students, who were waiting in standing; but for two months previous to the expectation of an operation, " that it for admission, the right persid gland had was the opinion of the consultation, from an nor semission, the right paronts guan and was the present of the companion was made to draw its edges togother, which, from its proclimity to the upper cyclid, nosic, is divided doses." He slee informed would very probably have produced lagophthalmos.

After the patient had left the theatre, Dr. Couper handed the diseased substance letion. to the students, remarking, "that he found asme difficulty it giving the disease e name, that he was straid it was of a malignant us. patient was found restless, still complainture, and naly remembered our case which ing of severe pais, and although the turn it resembled. In that case the tumour was at its lower part was soften, its framess as-nituated immediately under the skin on the periorly had increased. The hiscop was obdumen, and shortly after its removal, also more severe. The operation was now although the wound healed kindly, hardened resolved ne, and performed in the common strings were found extending towards the manner. Ten inches of intestine, of a red glands in the saills. The case ultimately colour, were found strongulated, terminated fatally." The disease in the ture was sinusted at the external pearence of actribus, and was cookned to but the edge of the transverse muscle pre-the skin. The patient has been doing well, sented another obstacle to the retern of the

#### BOYAL INTIRMARY FOR CHILDREN.

# To the Editor of Tun LANCEY.

Sta, -- Unwilling as I am to prolong the discussion of a subject, which has already occupied so much space in the pages of your journal, yet I consider it my duty to attempt the removal of every erroneous impression which might be detrimental to the interests of a public charity.

In alluding to the letter of " One of the Monthly Committee," of the Royal Infirsary, I wish not to withhold my entire belief in his anxisty for its prosperity, however I may regret that the mode be has adopted is so subversive of the desired end. It is a manifest injustice to some forward before the public with one meeping charge of neglect against a whole medical cutablishment. If such he allowed, it must lay an ley finger on that professional enthusiasm and iabour, which, for their reward, look equally towards a consciousness of the performance of a philanthropic duty, and the guerden of a merited praise. But when such charge is greended on circumstances erroneously regraended on circumstances erroseously re-ported, on a case from which false inferences may be drawn prejudicial to the professional reputation of the Informary, he is a tacit enemy to charity who shrinks from a reply. It happens, Sir, that on the Friday, when the author of the letter writes, "No phy-sician, no surgeon," my own notes, and the withers of our Homes Surgeon testifica-

evidence of our House Surgeon testify my having been at my post; but the child not being a patient of my own, was not brought to ma, in submission to that sort of profes-sional atiquette, which custom has no strangely established; but which, in a pracdical sense was, I am convinced, productive

of an evil in this case.

It was unfortunate that as unforeseen homogrisagic tendenty should have inter-vened after the incision of the gums; but we have many instances (when such a state of the vaccular Bystem axists,) of a fatal of the vaccular hystem axiets,) of a fatal result from the axirection of a tooth, or avan from a much alighter lesion. That the imputation of male press should attach by inference to the treatment of the gum, in most superstated. We are told a displace was applied to the gum for the appreciation, contained in the foreme explanatory of humorrhage; the encentive institutes a resultance by such a mind, may be at least as hindy addressed as this cause of death, as the alight main after the president of the surgess, whose main after a president of the contained in the contained in the property of the automatic of the Committee, and even captured in the property; but it is, at least, as fluctuation of the lines.

I isolate his property; but it is, at least, as fluctuation of the lines.

I isolate in fluctuation of the lines.

Sir, the Royal Infirmery for Cle, was indifficulties, which I should not be ad dry; in relating. By the labours of philanth were and mainly, I would add, by the exert the of its excollent treasurer, a heavy buildland dabt has been most materially reduced, smis a plan for its ultimate liquidation matered. It is now shaking off the trammels which have oramped its energies; it will prove that the braised reed will not be broken. As the intimate bleague of the immented founder of that Institution, which I have made for more than eight years my most interesting field of comparative study, I confess I cannot look with indifference on any statement calculated to injure its inter-eats, or to cast the slightest stigms on those who deserve it not. The letter states that since Dr. Davin's death," the attendance of the medical officers has been less constant." Sir, I challenge the proof of this assertion : I fearleasly challenge the proof of my doreliction of my duty, during the years of my professional attachment to the Royal Infirmary.

On these feelings, Sir, I ground my spology for thus troubling you, and I must yet beg to rectify a slight error in our letter of the 29th ultimo. In the resolution of the Committee regarding the signature of the sames of the medical officers, an insertion of the time of arriving at, and of departing from, the Infirmery, is not required.

I mm, Sir, Your most obedient Servent.

WALTER C. DENDY. Upper Stamford-st. Dec. 5, 1829.

P.S .- The insertion of a second letter from Mr. Wood is Twa Lancer of the 17th inst., renders it essential that I should add a very brief postscript to my latter, the omission of which you acknowledged in the abova Number.

Is the letter of the medical officers, the defence against a charge of neglect on their parts, referred to their practical, and not to their political duties.

collecture would prompt me to obtain their and farnished with medicines by the house aumiments, and indeed, their auquiescence sorgeon, without idelay. in the measure, without which so indication signature would be invidious, and not tend to any practical advantage to the lustitu-

In justification of this feeling, I henitate not to add, that were the interests of the Institution, to which I am so much ettached, endangered, I would never allow profesulonul, or even private friendship, to draw me from the conscientions Cicharge of public Jan. 20.

H. C. Davoy.

### ROYAL INFIRMARY FOR CHILDREN.

# To the Editor of THE LANCAT.

Sis .- is my answer in your 276th nun her, to a correspondent to your 273th, who signed himself "One of the Committee," I concluded with hoping that to "the neat communication ha favoured you with, he would have the conrage to affix his name, This hope he has fulfilled, for in No. 281, is a letter from him subscribed Charles Wood, Poppio's Court, Fleet Street. Thia, Sir, is as it should be; it is open and manly, and like a true Englishman. But to the question :- speaking of a resolution passed by the Committee, on the Sist of March, 1828, relative to the physicians cod enrgeons signing their names, &o., io a book, Mr. Wood observes, " they have told you, Sir, in their letter, that the motion was treated by them with the respect it deserved," viz., not one line has over been written in the book by ther of the goutlemen. In answer to which I beg leave to say, that they have not done so because they considered it, (at least the majority did) as derogatory for gentlemen, d members of a learned profession, to be placed on a torol with minor clerks in offices, or porters in a warehouse, and this fealing was openly and manfally expressed by the junior physician, and I believe by the sector sorgeon also, at the graceal secting, in May 1828. The register-beck of the house surgeon is e" proper benk," though Edward was written, to a burry, for Eliza, and though the physician and surgeon under whose names patients are deterred, may on thou-days, baspen to be shown. Mr. Wood sake "Do the medical officers state that the mother (of Elim Cole) did not assedd from eleven o'clock till nearly four !! One me dical officer, and he pee outnes to consider himself such, will state that we mather over "That the emerged damages should de-sensined at the Informery from above till poud on the light in which that subject in four. Now patients who come before a vicens for which demeges one country to quarter to teroire are always passacious for deed, a very important piece of inform

sorgeon, without delay.
When I offered myself to the notice of
the Governore of this Infirmary, it was in consequence of an advertisement headed than: "To Striobons, Apornacasius, and HALF-PAY MEDICAL OFFICERS;" my " own proper office," therefore, is not only to furnish the patients with medicines, but to prescribe for them in the absence of the hysician or surgeon, and in the discharge of that duty, my valued friends the physicians and my on less valued friend the senior sargeon, as well as the relatives of the pa-tients, will, I am sure, most readily and willingly acknowledge, that I have given them fell and entire astisfaction.

I remain, Sie, Your obedient Servent. JAMES WOODHAW, House Surgion.

Royal Iofrmary, Jan. 90, 1938,

### CHARITY RODERICE.

To the Editor of Two LANCES.

Sin,—On porusing an article last week, in the Excremence, on your late trial at the Court of King's Bench, I found myself to such a quaguire of bad grammar, ignorance, and absurdity, that I really cannot resist the inclination I feel to solicit the attention of the warthy Editor of that concern to a few poluts, which certainly would never be allowed to pass corrent in a schoolboy's exercise.

We are, with gravity, informed, near the beginning of this ever-to-be-admired article, (for there are no less than from 14 to 16 notes of admiration in it,) that " they have heard it said, and they believe it to be the general fealing, that the amount of da-mages ought to have been larger; but that this would depend entirely on the light in which the solvect is viewed." Now, this is scally important information; a information which should be communicated forthwith to every jurymen in the country. Note also this, 'ye editors of journals, and marvel at the molesty of the Encressions; there ectually is not a note of admiration after this rectified spirit of a aentence.

" By avery impartial men, nequalated

of the most expert and skills burgeous are not always crowsed with success till after much anxiety and delay." Why, thou infallible tineture of inconsistency I thou redoubted encrescence I dout thou out tell us, a faw lines on, "it is impossible that any one but the operator can adequately judge of the difficulties of the case."

"To all reflecting men it must be matter of actions apprehenciac, to think what the consequences may be, if the difficulties and fastful responsibility attending capital operations, are to be yet further locreased by the consciousness, on the part of the sergeon, that there are present those who, iostead of participation in his auxious efforts, gloat with fiendish delight," &c. Iostaad of participating in his anxious efforts! Why, thou laveterate blunderer, if the 200 person who were present at Mr. Bransby Cooper's operation, had " participated to his anxious afforts," there would have been 200 fingers in the patient's perisoom. Shouldest thou mean participating is his anxiety, canst thou not say ro! Indeed, indeed, my talented Editor of the Excrescence, thou revilcat others for menning what they say, whilst thou, good Lord I sayest what those dost not mean.

" The character of Mr. Conpar has been aulijected to the severest scrutiny, and the result has proved, beyond the possibility of doubt, and only his general skill as a sur-geon, bot his derivity as an operator; asveral competent judges having aworn that they had frequently seen him perform, not anly lithotomy, but some of the other most difficult operations, in ac admirable macner."-His dexterity, os an operator, proved by this trial!!

Prince Hal. What's the matter?

Falsoff. What's the matter? There he four of us here have ta'oo a theursaid pound this morning.

Prince Hal. Where is it. Jack? Where

Falstoff. Where is it? Taken from us it is: a hundred upon four of us.

Competent judges have seen bim perform operations is an admirable manner. Admiruble? What! in the score of having power to excite wonder !

to exite wooder? In the next sentence, while meaking of Tax Larger, follows this:— What an exposure of deep-laid contrivates, of ranking sently, of implectable revenge! By what a sat of ignorest here harryed, and, the public deleted.— Wanter thier of the Exercionac death when he parented or wrote this sentence, that he absult death for the such a

with the subject, Mr. Couper will be re-garded as having met with one of those diffi- schemed by ignorant men, is in heaving suit and perplaying cases, where the efforts new. Doctor, Doctor, you must him day; of the water areas and hilled homeoners that were

your wig awry.
"We would willingly threw a voil a the vital interests of the community that the should know something of the character of those who have assumed the office of medi-eal dictators, and that they should see in what maooer the reputations of honourable moe have been deficied for the revenge of one misoreent and the luore of aucthor."— New, as I should perfectly agree with what is inferred by this sentence, might I so stitute half a dozen words for others? Let us see how this sentence will reed with my substitutions.

We would willingly throw a voil aver the odious details, hat that it concerns tho vital interests of the community that they should know something of the character of those who have assumed the office of hos surgeons, and that they should see in what manner the diseases of the poor have been trested by the attention of one and the mat-

tention of another.

In speaking of the witcesses brought forward by you, Mr. Editor, on the late trial, this sentence occurs :- " Such are the men who have dared to pass their judgment on an operation which only one among them ever performed."—Wby, what can the Editor of the Excresornee say, then, of those hospital surgeons who came forward to speak to the skill svinced in an operation which they never saw ?"

Thee again, talking of " papils forgatful of the modesty which becomes their age." Becomes their age! Heavena above! Why, where it becomes their ago, it does become it; and, becoming it, is not forgotten. Forgetful of the modesty that would become their age, you buogier. You also speak, my learned Doctor, of the "absolute contempt, but parfect good humour," with which Sir Astlay gave his evidence. If I remember right, you will find, by reference to the Pharmacoposia of common sease, that these two articles are incompatible. Really,

Doctor, this is not at all professional.

After calling the defendant in the late trial all norts of names, the learned Editor of the Excresçõese save :-- From this we turn to 8 more grateful subject;" and immediately sommits mother egregious blander. It is substants quotier very executivy feed of that which their minds on compans with feel-lity. This, I outpoot, is the case with the Doctor, and the reason why he terms blen-

Mr. Partridge also is requested not to repine, because he spoke the truth while he was upon his cell,

during a grataful subject, - The blunder is this --- "The generous sympathy in Mr. Cooper's furthers, which has been evinced by the students in the Berough."--- What! on that which is in Mr. Cooper be evisced yothers? "Heaven forefand!" You blunring blockhead ! do you meae the generous sympathy with Mr. Cooper's feelings, which has been evinced, &c. ! If you do, why can you not say what you mosa? But I am

tired of correcting.

Praising the pupils, training their opinion of Mr. Cooper's skill by their luter, and the cooper's skill by their luter. tion of presenting him with a piece of plate, and speaking, at the same time, of their inexpetency to judge. Fough!
Regretting that I have occupied so much

space on so unworthy a subject,

I remain your obedient and
humble servent,

A Public of St. Bantholomew's. 24th December, 1828.

RICHMOND SCHOOL OF ANATOMY.

To the Editor of THE LANCET.

Sin,-In your last Number you have published a second letter by Leenox, the worthy author of a refuted libel on Mr. Carmichael. Although the character of your correspondent renders him unworthy of a reply, yet I re-quest you will do me the favour of inserting the following ubservations upon his recent production; they are probably the last with which I shall ever trouble you on so dis-

gusting a subject.

The letter begins with a flourish of ponny trampets, and the voice of the literary warrior chaunting his own mighty deeds; telling abroad emong the nations, hew he has fought, how he has conquered! how he has pointed his pop-gau with uncerring precision against the great toe of "The Hero of the Richmond," and with a single discharge of that deadly weepon scattered his dust to the wind, not to mention the dispersion of some thousand pounds worth per annum of practice amongst the ucedy "Filii Æccu-iapli," "the heegry sheep" that "look up and are not fed." Mercy upon us | what and are not fed, "Meroy upon us what furious beings in our wrath use we agrib-blers! Oh, how we pippins swim! The ladierous affectation of courage, with which the steepment Bieller plumes himself on his serdeus exploite, reminde me forcibly of the similar achievements of that escient worthy,

Tangue the Tory, Who, to his great and endiese glory, Out of a bush a short fet Sy; Who, to make a shift fet sy; Out of a bould a shift fet sy; And killed a men that passed by A.S. La was expliced high?

Qued Dil bene vertikt! May the onest be propitione! May a similar reward crown she virtuous labours of Lesson and

lds honourshie compeets !

I know not but I am offering comething like an insult to Dr. M'Dowel, in at all she at like to the rows, as a factories of defending life from the work asperators of Lennox, a sear whom your correspondent Richmond has convicted, beyond the power of reply, of lawing published in your Journal a tissee of malicious falsehoods; one argument, however, I shall venture, in order to show in what assimation such productions as those of Lenson are held by the medical public. Notwithstanding the ettacks made by him, and that other kindred spirit "Filius Esculagii," on the conductors of the Richmond Hospital and School, the class there is now nearly by a fourth more nasecrous than that of last year. If this be not sefficient to convince Lennox that he and others like him are despised, as they should be, I have an expedient to propose for the purpose, which if tried will, I promiss, we successful. Let him announce his real name, let him own his productions, let him come into the theatre of the Richmond School, and declars himself the author of the precious letters in THE LANCEY, and if he does not read in the countenances of the class the most legible expressions of those feelings, which falsehood, malignity, and cowardice like his, are calculated tu produce in every bonuurable breast,-if every gentleman present do not shrick with disgust from the contact of a thieg so louth-some, if they do nut leave him, like Catiline in the Roman Senste, to steed alone le his vileusse, then I am ready to submit to almost any penalty, eye even thuseh it should smouet to the infamy of acknowledging his acquaintance.

As if Lennox had eet enough to de on his owe aucount, in digesting the severe reproof of your able correspondent "Richmond, he must needs step aside to afford his high protectice to his injured brother "Filius Æsculapii." It seems the reply of "Filius l'atlandici," to this person was an " engue-tlemanly hirade," and himself a "apalpoon," for whom the blush rises upon the eloquent cheek of the secsitive Lesnox. Wheever the author of that raply may be, I connot but congrutulate him on having southed the samilty of your correspondent, and if I know the former at all, and do not judge him particity, ho is not altogether unweithy of such us becour; to you will see, hir, him you in history; to you will see, my, from the sketch I shall give of him, in negative insches, where the manner of January, Impelials, then, he is a 'yest the server shaulters of miss be deser, but openly confront. He has never brought, to say the heat of it, a just share in the mean and heat of it, a just share in the manner and heat of it, a just share in the manner and heat of it, a just share in the miss of manner and heat of the confidence and hidependent men, nor visited upon him as a off him, and insemble, not answering with unprevoked melice, sought to injure the fortunes of a young man of respectable habits and acquirements, by a sweeping charge of prefessional incompetence, the truth of which he was from circumstances

he has sucked in the venom that alone re-deeme him from insignificance. Certain I deeme him from insignificance. Certain I am, he had it not from the distinguished and amiable man, under whose suspices he and amiable man, under whose empress no and began his professional studies, and whose from t lamented death transferred the viper to the breath care of him, whose kindness he has required in a sunner so congeniat to his na-i clock tave. Let him continue his dering work of injury. defenation, the public will judge between him and the honourable men whom he slanders, and of whom it is no more than negative preise to say, that they have nothing in common with the coward and the ruffan, nothing that can move the regard of such s being as Lennox.

Your obadient servent. Dablin, Dec. 12, 1828.

SEMARKAGUE CARE OF PRACTURED CRA-NIUM WITH EXTENSIVE INJUST TO THE SCALW.

Treated by Enward Henon, Esq. of the Irish College of Surgeons.

Pat. Nuttey, watat. 11, of aleader hebit, on Saturday, the 30th of October, 1828, hev-ing quarrelled with erather boy, received in his hand a round iron instrument, blunt at the extremity, which enfleted it. Shortly after, he was ettacked with vomiting and nauses, which continued for that and the states, whose occurred to the new thick work in the evening, and did not complain of my thing among the nauses, and that his eye was heat in hoxing, the hids healty block. On the automoting day his became a little debictors, and completes of or prin in his high all the history in the common of the completes of or prin in his high debictors, and completes of or prin in his high debictors.

wilful neglect of duty, what was but the when apoken to; his bresthing was in-necessary result of siokness; he has not, creased and difficult, attended with heaving of the chest; his skin very hot, and dry; pulse frequent, and lead; the marks were somewhat dilated, but contracted upon the application of light; the tongue was dry, and he had slight difficulty of deglatition; his or manualis, as by nature he was careless, urins and issess were passed in relumbrily; of ascertaining; finally, he is nut one, on the had no paralysis, but was constituting; the bean indelibly affixed.

I now take my leave, I trust for aver, of auto inspection, affaires of wound or injury this wretched sorribles. I know not whence the bean cased in the versum that alone. could be seen, save a slight scratch on the integrameets of the lower lid. He was bled from both arms, and got purgative medi-cines, and, in the evening, his symptoms ant being mitigated, some blood was taken from the external jugular vein; but his breathing, which was the most prominent symptom, became severer, and he died at 10 a clock the third day after the receipt of the Post-morten Econination .- Ton hours after

death I examined the head, and, even then, could not discover a wound between the nyn and lid; but upon raising the brain off the orbitar process of the frontal bone, it was discovered that the instrument had passed between the eye and orbit, and entered nearly et its apex, making an opening in it about half the size of a sixpence. The instrument ran into the brain, and up through the body of the lateral ventricle, and into its enbetance, for at least three inches. The brain, in the track of the would, appeared se if it was broken up, and very similar to brain that had alonghed, and the ventricla was filled with bloody serum.

This case is remarkable in a threefold point of view. 1st. As it shows that an ex-tensive injury dann to the brain, and aven at its base, may not be followed by any perticular symptoms for some time, or even known to the putient bimself, and that, even under such circumstances, life mey be pro-longed for a considerable time. 2dly. That an injury, the particular nature of which he longed for a considerable time. 2dly. That was not conscious of. His antagonist held an isstrumant, even of a good size, may pass between the arbit and the eye, without the least trace of e wound being seen ; so that, as in this case, the brain may be asverely isjured by a wound inflicted from without. and yet no trace, during life, by which it made its antrance. Sdly. That, ie this case, the symptoms were doubtful as to the nature of the case, the appearance of the patient be-ing rather like one in the last stage of tyous, and completed of pels in his plant own own me he set stage of tymed the flay following he became inhis. Afficial lattic was then sought by
his percelle, but being service of any
percentage jie socious for it money. I
me, such his symptomic were as follow:

# THE LANCET.

den, Saturday, January 24, 1829.

The Bats and Correptioniats are endesyouring, but vainly endeavouring, to make the same use of the late trial, which they attempted to me of the case of Rolfe v. Stanley, that memorable case, wherein a hospital surgeon and teacher of anatomy was amerced in damages for having mistaken a place of flint, of about an inch in diameter, and at the distance of mearly two inches from his patient's ENTIRE pasella, for a portion of that patella. If, it was argued at that time, hospital surgeons are to be exposed to loss of money and reputation for accidents of this description. how much worse must be the situation of the general practitioner! If the heads of the profession are not exempt from legal reaponsibility for their occasional mishaps, what is to become of the members of a SOBORDINATE department of the profession ? It is ovident that, if there were any ground for the hopposition on which this argument is founded, namely, that fow as the mate of knowledge nutoriously is among the persons styling themselves the heads of the profession, there is a still lower degree of and Edinburgh, after they have tried to exintelligence and professional information among the great body of medical practitioners, such a atata of things would of itself demonstrate the existence of a vicious system, and the necessity for medical reform. I have atudied at Edinburgh, and been ot founded upon a false and insolent assumption. The mon who call themselves the heads of mio I synn mano or it!!" Such was the the profession are, in reality, as we have worthy Baronet's answer; and we are bound uniformly maintained, and repeatedly proved to believe that answer, for otherwise we in this Journal, at the sait of that profession, should be guilty of a libel by insinuating They have, for the most part, obtained their that the worthy Baronet had committed an situations through the influence of a corrupt indictable offence, for the sake of obtaining system, and are decidedly worse informed, a vertice for his nephew. Buch; then, was less conversed with pathology and there- the worthy Paronal's confemion; and what

which medical solence has made in other countries, and, consequently, less worthy of baving the health and lives of the public confided to their care, than the majority of that respectable and enlightened class of practitioners, which they have insolently denominated " a suboantsara department of the profession." Oca of the most bane. ful results of the system of napotism which prevails in the putronage of our public hospitals is, that all prospect of improvement, all chance af calling forth the vigorous efforts of unpotrooised talent by the encouragement of free competition, is completely cut off; if the root be rotten, the shoots must be feeble, knowledge will be transmitted in a decreasing ratio, but ignoranco will descend from sire to son, or from onels to nephow, like an heir-loom in a family.

" Alas parentum pejor avis tolit Progeniem vitiosiorem."

What can more strikingly illustrate the truth of this position, than the confession of ignorance—though the possibility of such ignorance is scarcely conceivable-which we elicited, at the late trial, from the mouth of Sir Astray Courte? When we asked that worthy Baroout whether he was aware that it is the practice of surgeons in l'aris tract the atone in vain for a certain time, to send the putient to bed, what was his answor? We entrest the reader's attention to this auawor : " I bo NOT KNOW OF THAT PRACTICE : But the truth is, that the whole argument is Paris repeatedly, and seen operations there, and never saw the circumstance occur; non position; then unqualisted with the progress are the focus ? Who practice of unlish hir . Astract Coopen swore that he had never haver seen, or heard of an operation perheard, was known to Franco in the seven-formed from the seventeenth century down teenth century—the operation en deux tens, to the present time, by the best French which Sir Array Coorse swore that he surgnons - If Sir Array Coorse stands had never sees nor heard of, has been suc- self-convicted, upon his oath, of this degree cessfully adopted by the French and of ignorance, what security, we ask, has Scotch surgeons from that period down to the public for the knnwledge of the juniors the present time. The practice of ant per- of Sir Asyley's family, holding official sisting to estruct the atom after o certain situations at Goy's and St. Thomas's Hostime, when perseveracce in the attempt must lead to the almost inevitable destruction of the patient, and when, by prudence and furbearance on the part of the operator, thu patient's life would, in all probability, be saved, is insisted upon as well by ancient as by modern authorities. The books are full of cases illustrating the soundness of this practical rule, and the auccess with which it has been soted upon, when surgeons here been mors solicitous for the safety of their patients, then for the éclat of being considered dexterous operators. The practice is distinctly detailed and recommended by all the best writers on lithotomy, both ancient and modern, by Celsus, by Albucasia. by Francu, by Calot, by Saviard, by Tolat, by Louis, by Heister, by Haller, by Campen by Percy, by Deschamps, and by Carpuo. Yet Sir Astery Coorse swore that us had TI TO GEARB BEYER Mr. LIZARS. of Edinburgh, less given publicity to many succrasful cases of the operation eq deux tems, as performed to conformity with the rule laid down by all the best authorities. Yet Sir ARTLEY Chopen swore, that HE HAD PEVRO HEARD OF IT

Now, if Sir Arresy Course, the paterfemilies of the surgical family at Guy's and St. Thumas's Rospital, be, upon his own confession in a court of justice, Imagent to this extent, what must be the natural inforence, as to the knowledge of the inniur branches of that surgical family ! If Sir Assets Coores has never beard of a precties laid down by the best authorities, both ancient and modern, on the subject of part of the supposed libel in the plaintiff's lithotomy - If Sir Asrter Coores has

pitala? What security has the poblic that Sir Astlay's nephew, Mr. Kay, of Gny's llospital, will be butter informed? What security has the public that his nephaw, Mr. Tysnett, of St. Thomas's Hospital. will be better informed? What accurity has the public that his apprentice, Mr. Travasa, of St. Thumas's Hospital, will be better informed I What security bes the public that his gudson, Mr. Gazza, of St. Thomas's Hospital, will be better informed? What security has the public that his sporentice, Mr. Mosoan, of Guy's Hospital, will be better informed? Finally, What seedrity had the public on the melancholy occasion which produced the late triel, that his auphow. Mr. Branser Cooren, would be better informed?

The system of sopotion that prevails in the distribution of patronage at our charitable institutious, is " foul, and stinks to heaven." iluman life is sacrificed to it; medical anisace is sacrificed to it; the oharacter and respectability of the profession are sucrificed to it. We repeat, that the infullible contrausnes of such a system is, that if there be unsoundness in the root, there will be weakness and rottonness in all the breaches that derive their nourishment from that root.

We were not permitted, at the late trial, to go into the details of the corrupt agatem. prevailing at Coy's Hospital. Although the affection that Mr. Basser Coored owed his situation at Gur's Hospital to corrupt Induction was deplaced upon as a declaration; and although we evinced our 化四醇 经存储证明

readmont by a maintaining office to justify phow of Sir Astrar; but these were the that allegation, and could not, in fact, very allegations which were charged against have answered the whole of the plaintiff's us as libels; these were the very issues declaration without justifying it, yet the which we were bound by our plea of jus-Court held, that the question of corrupt in- timestion to substantiate. Be that as it suence formed no part of the issue. When may, law threw its shield over Mr. Buxwe called upon Mr. Benjamin Hanauson Jamin Hanauson and over the system that to state, upon his cash, whether he would prevails at Guy's Hospital. The charge have elected Mr. Bransay Coopen to the of corruption, though declared upon as a office of surgeon, in preference to Mr. Car- libel, and justified by us in our plea, was LAWAY, had he not been the nephew of Sir held to be irrelevant to the issue. The cor-ASTLEY COOPER, he avaded the question, and the Coert would not compel a direct territory, from which we were warned off, answer. Let the reader look at this part whenever we attempted to approach. It of the evidence, as stated in Mr. BRANSEY Coorea's own report.

" Mr. Wakiey. Would you have elected Mr. Branshy Cooper to the office of surgeon only to the lestitution, leaving the anatomical school quite out of the question, if he

lied not been the nephew of Sir Astley?

Lord Tenterden. He says, I cannot tell what I should have done in other circum-

Mr. Benjamin Harrison. It is quite sufficient for me to attend to the duties of my mitmation."

Again, when we called upon Mr. Bunsa-MIN HARRISON to Say, whether he believed Mr. BRANKRY Coorse's surgical skill to be superior to Mr. Callaway's, he avaded the question, and the Court again extended to him its protection.

" Mr. Wakley. Do you believo Mr. BRANNEY COURS'S Skill in superior to Mr. Callaway's 1-No spawer.

Mr. Wukley. Mr. Harrison, I sak you, on your oath, whather you believe Mr. Bransby Cooper's shill is superior to Mr. Callaway's ?- Anner. I think he was a person peculiarly calculated for the office.

Lord Tenterion, You are not bound to

draw comparisons; it is the most invidious thing; suppose they are both of equal skill."

. An invidious thing! Undoubtedly it was an invidious thing! It wer an invidious thing to question Mr. BRAVERY Coopen's capacity to fill the office of surgeon to Guy's Hospital, or Mr. Hannison's fitness to fill the office of Tressurer, or having elevated Mr. BRANSHY Conren above the shoulars of his senior, because he was the ne-

rupt system at Guy's was a bit of sacred was a sort of pomerium, a dark place behind the wall, within whose precincts our unholy footsteps were not permitted to intrude.

But, though law threw its shield over Mr. BENJAMIN HARRISON, and over the system that prevails at Gny's Hospital, was justice, was humanity satisfied? Or, rather, did not enough transpire, notwithstanding the technical trammels with which we were approunded, to satisfy the public that the system of patronage pursued at Gny's Hospital, 35 A CORRUPT SYSTEM? Mr. Benjamin Hausson stated in his evidence, that Sir Asylay Coopen was appointed consulting surgeon to Guy's Hospitel; Sir Astler's nephew, Mr. Brawsay COOPER, surgeon, and Mr. Callaway atsistent surgeon, on the 4th of May-all on the same day. Now let the reader look at the following ovidence :--

Mr. Wakley. In Mr. Key, the senior surgeon of Guy's, the nephew of Sir Astley Cooper ?

Mr. Harrison, Yes, I believe he ist he serried his niece, Sir.

Is Mr. Morgan one of the surgeous of the hospital !-- Yes.

Whose apprentice was he !-- The appeartice of Sir Actley Cooper.

Mr. Key was the appreciate of Sir Astley Cooper !-- He was, I believe. Whose appreciate was Mr. Cellsway !--

The apprentice of hir Astley Cooper, to Is Mr. Culturay the senior of Mr. Branchy Cooper?

Here Mr. BENJAMIN HARRISON MOUNT. and we shall not easily forget the impression which this peace of Mr. Benjamin Hanni- | the governors, under the present system. son made upon our minds. He could not, ap- are more ciphers. We were not allowed parently, answer the question from recollection, for he referred to his book, and having referred to his book, he replied :

Yes, Sir, ho is.

Mr. Wakiey. He is ? Mr. Benjamin Harrison, Yes. Mr. Wakiey. Had you a consolting surgeon at Goy's before the 4th of Mey, 1825?
-No, Sir.

You had not !-- No. Sir.

Now can any rational man who reads this avidence doubt, that the three simultaneous appointments on the 4th of May were o job, or that Mr. BRANSSY COOPER was pot over the head of his senior, Mr. CALLAWAY. not on account of his superior talents, but because he was the nephew of Sir AsrLET Coorga? The transaction would speak for Itself, even if Mr. Benjamin Harrison had not evaded our question as to the comperative merits of Mr. BRANCET COOPER and Mr. CALLAWAY, which question we maintain, -- notwithstanding the observation that fell from the Court, -and whatever the law might be, every men of common sense must agree with us,-was most material and essential to the fair trial of the issue on which the jury were called upon to decide. If Mr. Brejamin Hannison believed that Mr. CALLAWAY WAS a man of greater professional ebility then Mr. BRANSBY COOPER -and it is evident that he did believe so, or he would not have ovaded the questionwhy was the public, why were the sick poor, for whose benefit Mr. Gur left upwards of . QUARTER OF A MILLION in the reign of Queen Anne, deprived and defraoded by the system, of the advectage of Mr. Callaway's superior taleots, or of the talents of many who are, perhaps, superior to Mr. Callawari We might may by Mr. Haunison, for it is attorious that be alone governe the hospital; he slone distribules its patrousge; he slone possesses all the power, and all the luthence belonging to the justitution ; and that though the forms of co-specation may be kept up, the rest of person who can give information!"

to develop the workings of the corrupt system at Guy's Hospital in a court of justice, but will the public consent be hoodwinked? Did the Parliamentary Committee show the same indulgence to Mr. BENJAMIN HARCISON, which was cetended to him in the Court of King's Bench? Let any impartial man and the evidence given by Mr. Benjamin Hanaison before the Parliamontary Committee oo Austomy, and the analysis of that evidence in the 264th Number of this Joornel, and then say whether this gentleman does not come under the description of a sky witness. That Parliamentary Committee, with a gentleman. et their head, whose active mind is ever on the alert to promote objects of public utility, and whose multifarious, yet accurets and profound information pre-eminently entitles him, if we may be excused the pedantry of an expression, for its peouliar appropriateness, to be distinguished among public men, as makumades wares, -that Parliamentary Committee showed no indulgence to Mr. Benjamin Hannison. Ha tried in vain to set up his official character as a claim to the immunities of concealment, and he was raked sufficiently to prace his ovidence under a more disadvantageous aspect, than that of any other gentleman examined before the committee. It may be truly said that more equivocal, not to say equivocating testimony, was never published in a perliamentary report. Of Mr. Benjamin HARRISON'S pilvate character, we have never heard coything that is not in a high, and even in an entravagent degree, encomissie; ho is one of those persons whom

If his, Rowcontomers, he is therefore incompetant to LANO STARS SMEON, the Trensurer of St. Harsuperlatend the surgical department, and tholomew's Hospital, had stood in a witnessapply the immense revenues, of that institu- box, before his true character was datacted, tion: We have nothing to do with his pri- the same shield would have been thrown over vate virtues; but we denounce the system him against a searching cross-examination. which he has pursued as a public officer of which was autended over Mg. Benjamin Guy's Hospital, as injurious to the interests | Harrison. Yet who shall say, that if corof the profession and the public. For thirty rupt laftuence in his capacity of Hospital years be bee reigned, in effect, the sole Treasurer, had been charged against Mr. despot of the hospital; nearly every Rowland Sturmannon, before the detoes Governor has, by this time, been elected tion of his appropriating propeosities, it by his fat; ha has bed the power, if he might not have been highly expedient to

concealed. We have each a hala athletic abdomen, by the protrusion of the head of man, who supposed that he had stone in a chopping boy. Another Hospital Eurhis bladder, onter as operating theatre, goon, to whose turn it recently fell to rewhere he was sounded with such violence, move an extensively diseased testicle, made that he was incapable of returning to his his first incision over the sound testicle, and home. He was put to hed; violent lefiam- the patient would probably have been emasmation came on, and he became delirious. His bladder, as it was afterwards discovered, the error. This maninds us of the surgery had been plerced by the sound; the serotum? the abdomen, mortified; in ten days after the sounding, his sufferings were terminated; and who heling required to amputate a man's the hospital seend, and hale, and healthy, to seek advice for a complaint which existed only in his imagination, was dead, and perhaps dissected, before his family knew what had become of him. Such are the exploits of the men, who style themselves the heads of the profession. Asother hospital surgeon mistook a pebble for a part of a man's knee-pan, though the man's kone-pan was entire, and noarly two inches distact from the pehble. Yet the same Hospital Bats, who swore the other day that an operation which they had not witnessed was scientifically performed—the same Hospital Bata, who are always on the slert to wing their way to a scort of justice, when a colleagua's skill is questioned—the same Bats, who, like Day sed Martin is the advertisements, are " ever sexious" to present exposure-awore also, in the public case, that the patient had been scientifically treated.

Some of the blunders of these hospital functionaries are of a less serious description then most of those to which we have advarted, and partake of the nature of tragicomedy, or farce. Of the purely farcical description, was that memorable specimen of diagnostic skill, exhibited by Dr. HEWETT, who insolently domineer over the great the Cambridge Professor of Medicine, who bedy of the profession ! What, it has been pronounced a case of preguency to be one saked, must the priests have been in a of severe peritonitis, and who, after diligent country, where the god was a monkey? If fomunitation, was only restrained from the such men were at the head of the profession,

herniss." These things shall no longer be application of forty leaches to the sumefied culated, if a dresser had not himself detected of a gentleman of the sister kingdom, who and the integuments at the lower part of once held the situation of assistant surgeon on board one of his Majesty's ships of war, and the unfortunate man, who entered right leg, dismambered his patient with great dexterity, but unfortunately discovered, when the operation was completed, that he had removed the left leg. This achievement was supposed to afford evidence of such singular nectouess, that his friends recommended him to quit surgery, and betake himself to the bar; where we know not whether he has ever found his match in law, though in anreery, and the exact sciences, he may scrtainly fied his equal in Sir James Scanleyr. Another suppose has had the misfortues to perform the operation of lithotomy, when there was no stone ie the bladder, not once, but le repeated instances. When a French Abiguil has had an effair of the heart, and has given an infant to France, sha is said to have had her meiheur, and the acoident, so far from deatroyieg her character, is considered rather a guarantee for her future prudence ; but a repetition of these misfortunes will ruin eyon the reputation of a French Ahigail.

Nullum Namen abest, ai sit Prudentia; nes te Nos fucimus, Fortuns, Deam.

Such are the men who style themselves the heads of the profession I such in the rare of hospital apprentices, wereys and noedles, repeat, that the highest degree of professional knowledge and skill, as well as the disease was suppord by using the Chloride greatest amount of intelligence and setivity, of Lime plentifully in his stables, and is to be found smong that enlightened, washing the neutrin of the horses with it. though hithert and highly requestthough hitherto degraded class, which has a she coach proprietor of this town, has been been adjustised by the corrupt few, as a blinkmants, with marked advantage to the indirects department of the profession. who style themselves the heads of the profession; above all, avoid the metropolitan hospital physicians and surgeons!"

A Compandium of the Medicinal Properties of the Chlorides of Line and Soda; and of their uses in destroying nexious efficies, and preserving the health on board ships, and in worm climates.—By FRABBAIC FINCHAM. London, Richardson,

Turs pemphlet is neither more nor less than an advertisement of the Chloridos, as " prepared by Fredoric Fincham, manufacturing chemiet, Manohester." We are induced to notice it, however, as a composdium of much that is valuable for the professional man to be esquaisted with on the subject of the Chlorides, and if Mr. Fischen really properes them better than any other oliemist, we see no reason why the profession absuld not know it. Several "testimonica" from medical men, as to their efficacy are included; and a few hints on the application of the Chlorida of Bods, for the prevention of hydrophobia, are thrown out. In concluding his compendian, Mr. Pinchem adde the following remarks, which are worth the attention of veterinary aurgeoms.

who could be at its tail? The truth is, we | "I have been informed by a friend who In conclusion, we carned impress it as a few years since, he lost above one hundred rule of conduct, cobject to a few, and very horses from the glanders; and the disorder few exceptione, on all whn value the health by fumigating his atables, and washing the and lives of those who are near and racks and mangers, with the Chlorine gas; dear to them: "So long as the present corrupt but he was, of course, nbliged to remove all his horses, at a considerable expense. Sprinkling the stablee, and washing the racks and mangers, with the Chierido of Lime, ie equally efficacious when the disorder rages, without removing any of tha horsee; and by its necessional use at night, to purify the sir of close and confined stables, end mixing some with the white-wash for the walls, this and other infectious diseases mey be prevented. It has also been beneficially applied to the greese to horses, the fool in bullocks, foot-rot in sheep, and mange in dogs." P. 31.

> Portrait of John Abernathy, Esq.; Engraved by Turner, from a Painting by Pagean. London, Turner.

Ma. AREANETHY, or, as he has been appropriately styled, the "chair negotistor," is drawn in one of his most oney and agreeable casts of expression; the position of the body, and limbs generally, is entirely free from restraint. The afforts of the artist, as fodoed they always abould he, have been objetly directed to the face, which is admirably executed, and presents a most striking likeness of the eccentric original. Apart from the face, some parts of the picture are not so well executed as we could have wished ; but upon the whole it is ducidedly the best portrait of Mr. Abernethy that has appeared.

- 10 X

Upon the Employment of Gold in the Treatment of recent and immercate Syphilis, and of Syphilitic Eruptions; upon the Inefficacy and Denger of the Administration of Maroury in the Treatment of the same Dissure; with a Dissertation upon the Astiphiogistic Treatat. By ALEE LEGRAND, of Amiene, M. D., &c. &c.

### [Communicated by Mr. J. Bannerr.]

Tax object of the aethor of this work is shown in the title-page, viz. to procure the introduction of the preparations of gold invented by Dr. Chrestians, of Montpelier, in the treatment of vaneraal complaints, in place of mercurial preparations. Gold, says Dr. L., like mercury, has an especial action upon our economy, and tends to remove from our frame a malignant virus which infects it. But, in the present day, there are many practitioners, partisans of M. Broussals, who deay the existence of this virus; the inevitable consequence of this opinion is, that it is not necessary to conoteract syphilis by specific medicines. Dr. Legrand, who considers this opinion as absolutely erroneous, has thought it necessary to coun-teract it: and, in the second obspter, ha has brought forward feets to prove that syphilia, although latent, exercises a deleterious influence over jodividuals and their posterity. He has, at the same time, en-deavoured to prove, that this disease, there-fore, is hereditary, and that it is specific. This point being autablished, we must uscessarily have recourse to a specific medicins to counterest syphilis; and Dr. Le-graed proposes the pharmaceutical prepa-rations which have gold for their basis.

only spoken of the efficacy of gold in the the dangers of the emoney or given in the treatment of epoblis, and inquired into the dangers of adopting it. He next constraint in the dangers which accompany the administration of mercury. But, in most of the sases in which mercury is injurious, it is asked whothat the disease, or the medicine, has produced the mischief. A very simple means exists, to remove every doubt upon the sub-ject; it is only to study the effects of mercury upon persons not affected with syphilis. The author of the work before us, has gone into the minss whence metal is dug up; ha has visited the workshops in which it is wrought; and he has been able, by these means, to point out the horrible accidente which mercury, by its presence, may have upon the most important organs of our frame. When, says be, we see the same accidents happen to persons who taks mer-oury as a medicine, there can no longer remain any doubt of the deleterious action which it suercises over our sconomy. But Dr. Legrand goes further; he has proved that, in a great number of cases, the administration of merenry has not been followed by success; that sometimes it does not. in any degree, mitigate the disease; that very often, after having effected a partial cure, the disorder breaks out again with increased severity, under a form much more hideous, after an interval of time, in duration infinitely variable. To prove this just assertion, the author has cited facts, and quoted the testimony of authors the roost favourable to the employment of mercury. Having stated thus much, Dr. Legrand's work goes to prove the superiority of the preparations from gold over mercurial prerations which have gotd for their slicecy therapeutia method, which comments before minutely pointing out thair slicecy to posing all vanareal symptoms, by the apin this case, he has thought it necessary to posing all vanareal symptoms, by the apin this case, he has shown phication of warm water and leephes, and parations. After a faw remarks upon the therapeutic method, which consists in opprocurs the preparation from gold, at pre- new method, which is called the antiphlosent employed in medicine, and those he gistic treatment, he has given 150 examples applied. He then states the ples of cures performed by gold, in cases effects produced by these same preparations, when they are introduced into our rary relief, or been absolutely inefficient. accomy. He afterwards proves by 230 When mercury could not evadicate from cases, many of which were under his own the economy the syphilitic virus, and especases, many or white west states and only the secondary forms of syphilis, many of almost every coherry, that gold radio of which were truly hideous, mercury, only cures resent and investerate syphilis, which had permitted their development, After having stated the excellent suti-syphilis and where every other usually adopted little properties of gold. Dr. Legrand in anti-syphilitic medicine had proceed inefquires with the strictest impartiality, if the finacious in the treatment of these disgust-peoplessions from gold may aver be ad- jeg affections, guld perfectly dissipated satisfected in vairs, and if the administ them. In the last chapter, which is testion of it is subject to accidents. He epitoms of the whole work, Dr. Legund reas to here shown, incontrovertibly, sommerates all the advantages of the systhat the former once most be extremely term be advocates, and all the inconverses, and that very serious accidents and pieness and dangers of the mercurial moves happen. Historic Dr. Legrand has method. The most remerkable passages of this chapter, are, undoubtedly, those is laney, no operator can be cheused for either which he specifics the great superiority of wilfully or ignorably torturing his victim; gold over mercury, in thoroughly destroy- for supposing him occasionally to succeed in ieg that influence which the apphilitie terring away a tooth by the clumsicat of all vivus exercises over men and his posterity possible means, such success will afford (noticed ie the first chapter). Se that the man or the womae who has hed the misfortune to be taieted with apphilis, once cured by gold, may marry with perfect secu-rity; they will have healthy children, which they could not hope for, but they been cured by mercury. The moman, infected during pregnancy, would derive the same advantage by the treatment with gold; whereas mercury would not exempt her from bringing so infast into the werld, having all the symptoms of hereditary syphilis.

ness, let my epponents try to do that which ful operator. I in wain attempted before it went ferth to tha world, let them unalyse it, and expose the arrors, proceeding paragraph by para-para, has never been disputed, vis. the possibility graph, a mode calculated to have more efectracting "hundreds, may, thousands of weight with those persons who are in the teeth with a pair of forceps;" most judiweight with those persons whe are in the teath with a pair of forceps;" most judi-habit of thinking for themselves, themself clously switing dilmsoif of a saving clause the evesive and unsupported assertions they may feel disposed to indulge in.

Your observation, Sir, that every men who attempts the extraction of teeth, " has a fishion of his own," in, indeed, bot too 44 has true, and a very had fashion it frequently instrument, he merely speaks of using for proves to the unfortunate antierer, as thoumands could namently testify; bet, as with all tooth axtraction, there is decidedly a right method and a wrong one, since the medus operandi doss not da pend opon mere affect to a most indicross extent.
The subject under discussion is not more.

very little consulation to the next unfortueate patient, who is probably deemed to be minerably mangled by the use of a hugo pair of teegs; when a judicious operator would have relieved him with the utmost

facility.

Although notbing has been advanced by year correspondants in the alightest degree affecting the facts set forth in my first communication, still for the information of thosa who may imagine they knew something of the subject, it may be thought incumbent on me to advert generally to your correspon-dent's observations; one of whom, while he concurs with moin giving the preference to the key instrument, oridently misunderatands me when he contends, (very properly) that " in some eases the forceps are indispensable, as in the removal of the inci-

sors."

Sir, it has not been asserted by ma, that Wune my paper relative to the Extrac. ferceps are to he for ever excluded, and tion of Tenth was offered to the public, never to be used in cases of minor importthrough the medium of a work so extan-lance; this will be seen by the following sively circulated as Tox Lancer, he as-centract, "the use of such an iestrement sames, Sir, that it was not subjected to the (In allesion to the forceps) is highly obcritions of thomsands, without due deline-jectionshie in all those cases where the key ratios, without they have greater than the summary continues and the summary of the summary continues and the summary of th point was established on too firm a basis, to speaks of the breaking does of the alvaolar he shaken by any stacks that might be made process as a matter of course; but no referupon it. ence to the diagram, he may be convinced. Far the better elucidation of those argu-that the lateral action is not so great as he mands, to raise them beyond the reach of imagines; indeed, with the majority of with sommon attention they might have been sometimes adhere to a tooth, baving its understood by persons of the meancat caps. Image considerably extended, or curved; oftp, provided it satisful their purpose to combut such is the elasticity of the boos, that, prehend them. If my reasoning evinces so much weak- cident rerely occurs with an expert and care-

Another of your correspondents contents limself with merely affirming that which with reference to the moisr taeth, which ha very inganiously specifies in a separate pa-ragraph, where, without venturing to notice: the proportionate number of failures apperienced in making the attempt with such an that purpose a "larger and stronger pair of forceps for the molar teath," but, owing pro-bably to an error in the manuscript, or in the prieter, the size of the forceps is mag-

ly whether we can operationally succeed in

<sup>\*</sup> Vol. I. page 80.

extracting a tooth by means of the forceps, capable of drawing the following general but whether they be superior to the kay instrument, the award being in favour of that which has been attended with the greatest number of ancoessful operations, niways supposing the experiment to have been made with an equal number of cases; with this view of the subject, let me ask, whether any of the advocates for perpendicular extraotion (as they are pleased to term it) will venture to submit to such a trial as I now propose, having first attentively read my attatements, and being allowed the extensive privilege of using any instrument whatever that grasps the tooth between two edges, or claws, will they consent to divide with me, equally and equitably, a givee number of patients requiring the extraction of moler teath, however decayed they may be (but not loose), and will they agree that publicity he given to the as plague, small-pox, &co.; and even in defeat that must inevitably await so hope these disorders are to be considered as acciless on attempt ?

As to those scielists who are not yet infallible pincars, if they expect to succoed, their first object must be to contrive, that the teath of the rising generation shall be so improved, both in their form and texture, that they no longer cliog to their sockets with such persevering tenseity, nor cooti-nue so provokingly brittle, as to present the hitherto insurmeuntable barrier to their

darling enterprise.

I remain yours, &c.

. J. P. Dr La Fons.

14. George Street, Hangrer Square.

ON EPIDEMICS.

By Dr. FORETER, of Chelmsford.

To the Editor of The LANCEY

Sin,-Observing, in a late Number, some ibservations on the peatilenes at Alexandria, and also on the epidemie raging at Paris, I liasten to communicate to you some remarks I have made an spidemy in gensral, as they may serve so h hint to halp the inquirles of the medical committee now engaged in an investigation of the subject at engaged in an investigation or the suggest as the first in a present present tended miscallony. After a laborious investigation of the progressive graphoma and topological listory of epidemic and passillantial discourse; which have for many years engaged my attacking. I find I am Chelmaford, January, 1820.

conclusions :-

1. That apidemie disorders, including a very large class of complaints not kitherto reckoned epidemica, owo their origin to peculiar conditions of the atmosphere, which happen at incolculable periods, from time to time, in every part of the world, having a particular range and term of duration.
2. That the above is the grand satisfies

cause of pestilence and apidemy of every aort; while the circumstance, that it is only a pertion of the population on which the epidamie hane (the ra sees of antiquity) fulls, leads me naturally to look for the predimment cause precessry to the discuss, in posuliar conditions of the individual constitutions of the patients. Centagion and inoculation, as adjunct means of propagation, only apply to a few varieties of epidemics. dental, and fueble sources of the spread of the disease, compared with the irradiating awakened from the delightful dream of their progressive motion of the etmospherical axcitant over oxtensive districts,

3. That this atmospherical poison, various sa it is at different times, is alosely connocted with electric changes perper going co in the air, but which are nided and modified by innumorable forms of malaria, which constitutes a sort of interventional medium, through which the morbific power of the elactrical excitant is enerted.

bare by me, an immenae and authentic cutalogue of epidemica. To the development of the existing relation between the arciting and the predisto, I have devoted much time; and I bad, in your Lancer, suncunced a small work on this subject, which owing to a trilling delay in the printing-office, arising from my bad caligraphy, (or, rather, calegraphy,) is not yet reedy for publication, but which will appear in a week or two. In this I shall fully develop the truth of my opinion reapenting the atmospherical origin of four, the inflammatory nature of the predisponent; and while I can show that, for the letter, the autiphtegiate treatment is the only rational one, it will uppear that Hippocrates and the ancients were right, in relying on shongs of air as the permanent remedy. Meanwhile, as there is an inquiry going on of so im-portant a nature, I feal disposed to anticipate thus much for the use of those who have more time, means, and ability, to puraug it, then I have at present.

Yours truly,

T. FORSTER.

# LONDON MEDICAL SOCIETY.

Monday, January 19, 1829.

Tuene was a tolerably full attendance of members this evening; but the proceedings were of the same " hole and corner " character as those of the Westminster Medical Society a fortnight since. Our reporter having been refused admission, we can give no particulars of what too, place; but we have been since informed, that after a protracted discussion, e ballot was taken, and Mr. Lambert was expelled, although he had not been furnished with any notice of the charges brought against him.

# ST. THOMAS'S HOSPITAL.

REMITTENT PEVES, WITH DISEASED LUNGS.

, admitted under the care of Dr. Elliotson, about three weeks ago, comlaining of considerable weskoese; it was likewise discovered, after his admission into the heapital, that he was labouring under e remittent form of favor; and, on being questioned, stated that he had alept at Grocewich, the night previous to his admission, io a damp bed (but it was with the greatest house physic two hours after, and this difficulty he was made to understand eny question put to bim, being very desf). Sulphate of quinios was prescribed, which removed the febrile symptome; but be still complained of great weekness, and to this was added a frequent cough. On epplying the stethoscope to the superior part of the right side of the chest, the respiratory sound appeared distinct, end percussion elicited e sound similar to that produced on striking the leg or srm; from these symp-tems, Dr. Elliotson thought there was chronic inflammation of the lungs; but, io consequence of the difficulty of either making the patient speak, or understand, on correct diagnosis could be formed; nothing particular was done, and he continued in this state till Thursday, the 9th inst., when he died rather suddenly.

### Enmination of the Body.

On opening the cavity of the chest, there was a small quantity of lymph rifused on the convex surface of the superior lobe of the right lung, which was likewise hepatized; and, on making an incision into it, and on exceeding about four inches speeds, presented, very beautifully, the appearance Bowels open; miles 80, small, irregular described by Lacanec, "the infiltration of Functions. Mr. Band gave sage, and tubercular matter into the broughin," or the four sunces of part wins.

" gray hepatization" of another sather; it was likewise adherent to the middle lobe of the same side, which was tubercular | there was likewise a diletution of one of the brottchial tubes, which communicated with a small cavity filed with tubercular matter; the left lung was tubercolar, and both bags of the piura contained e small quentity of Suid. The kidneys were rather salarged, and presented a remarkable lobulated appearance, but, on cutting ioto them, sppeared healthy. The liver was paler than natural. The arachnoid membrane of the brain was rather opaque, and the letaral ven-tricles contained a small quantity of fluid. The man was very much addicted to drinking.

### WESTMINSTER HOSPITAL.

STEUCCLE BETWEEN OCCTOR, APOTHECASY, AND OSATH.

THOMAS Gerr, meet. 17, of sound countitution, e groom, admitted 1st December, 1828, under the care of Dr. Ros, lebouring under synochus, accompanied with an ery-sipelatous io fammation of the right leg. Ho had been ill elsven days, and ascribes his sttack to baving drank cold water when basted efter oxercise. Pulse 90, full; tongue furred; bowsls constipated. of 5ve graios of calomel and teo of cathartic oxtract, to be swallowed directly; a dose of draught thrice a day :---

Sulphate of quina, 21. j. Infusion of rose, one cance. Mis. Fomentations to the leg. Speed diet.

2. Passed a reatiesa night; howels well open; faver absted. Venesection to 12 oz. Discontinue the quice. Three grains of caloust, and a grain of opium, overy night. A purge to be taken occasionally.

3. The bowels freely acted upon by the sperients. Pulse 100, small and feshle; has so oppressive sense of debility. The crysipelas of a deeper colour, and extend-ing up the thigh. Mr. Bond ordered sago and wins.

4. Dr. Roe countermanded the sage and wine. Fifteen leeches to the inside of the thigh; fomentations, and this misture :

> Epoon softs, three drachms; Tertrate of antimony, one grain Tertrate of potass, one draches; Water, eight ounces. Min. One ounce thrice a day.

-8. Bloughing her commenced above the

10. Countenance fluched; skin hot and | nion from drinking ordent spirits, and havdry; toegee covered with a brown fur; ing accidentally entangled himself in the pulse quick and small. Dr. Ros ordered traces of a dray-cart, the horses took fright, the wins to be discontinued. Fifteen leaches and the chain, which was colled about his the wins to be discontinued. Fifteen leaches and the chain, which was coiled about his to the knee; poultice of linesed meal and leg, completely brake it at the first motion bread; five grains of the inspirested juice of the horses.

90, feeble; tongue clean; appetite good; bowels free; pain and aweiling in the left riad. knee-joint. Low dist.

22. Much reduced in strength, and emsclated. Ordered wine and sago, by Mr.

Bond, the Apothecary.

23. The patient has all along continued taking bis salins and antimonial mixture. In the evening, he complained of much Dr. Roe countermands the stimulants given pain, subsultus of the muscles. Palse 126; yesterday.

50. Daily reduced in strength; appetite draught at bedtims :lost; face heetic; tongue brown, dry; poise 80, tremainus and wask; sixteen lesches, fomentations, and afterwards poultice to the kase. .

31. Tweive leaches, fomentations, and

the following medicine. Wine of

Erum mitt, 3 drachms;

Spearmint water, 6 ounces. Mix. One hours in peppermint water. onnes every four hours.

Ros present him wine and porter, and nntrient dist !

5. No favourable change in the general health; slough appears disposed to separate; suppuration lessened.

7. Died this morning. Permission was not given to exemine the body. Thus DEATH was the conqueror, though merely a looker-95,

It is fourt; judies '19, small, oud hard; tougho large lemon, opparently firmly connected white, but moist; bowels open. Take to the head and upper part of the fibals. away 10 mooces of blond, by supping, from There is a degree of elasticity is some parts between the shoulders. Leave off the form There is a degree of elasticity is some parts between the shoulders. Leave off the form of it; but, in all other parts, firm ond hard, mor modicines, and take eight grains of the decided response foringer hexadeder. There it octure of digitals in on onuce and a half of almoud mixture every six hunters. 22. Expectoration will considerable. Has enlarged on oneb side. The pulse is quick, a constant cough; pain not so violent in tinguo clear, and the patient is altogether the chest; pulse frequent and hard; bowels favourable for the operation, which Mr. relaxed. Toke 12 ounces of blood from be-He, however, requested that Messrs. Vin-24. Ins been relieved by the copping, cent and Earle should see the case. These but coordines to complain of pain in the gentlemen look upon the nature of the dischest. Every time he breathes, supposes case as doubtful, and recommend that, at he feels a portion of the sternum projecting | feast, the tumour be ponctured, that its inloto the chest. There is now no irregulaternal structure may be ascertained, before rity ascertainable of the sternum. The belt the limb is removed. Mr. Vincent suggested, whether, if it were malignant, the cir-22. Easter and better on the whole. The outsference of the tumour being very well expectoration still purelent; perspirations marked, its removal, together with the upper part of the fibula, might not be seffieicot.

20. The patient having consented to the not take a deep iospiration. The expecto- operation, was this day brought into the operating theatre; and after puneturing the tumoor, and finding it such as to call for the operation, Air. Lawrence, assisted by Mr. Skey, performed the ampatailus at the lower thirst of the thigh. Three minutes were occupied in the recursel, and tax in the taking up of five ressets. The operation was neatly performed by the circular iu-cision, but there seemed to have been a greater flap of the integuments made than

was measury.
On examining the merbid parts, which
Mr. Lawrence did in the prescuce of Mr. Jaja Baker, est. 37, a slender healthy Mr. Lawrence did in the prescuce of Mr. women, admitted date Faith's Word, ander Earle and those around him, immediately after the operation, the tamour was found to preced directly from the miserior and upper part of the fibula. Just below the axternal integraments, the parts that were hard to the tessels, were bound down by the facin; the soft parts had formed their way through some the facts. A section of the tumour pre-sented a modulary appearance; but from its being firm and solid when pressed upon and a spicula of bone, to the extent of a inch, growing from the head of the fibula and penetrating its sub-tunee, Mr. Law rence was induced to kild spon it as an instance of seter-seresme, and therefore the more favourable as to the future state of the petient.

In the course of the operation, Mr. Lawrence had to request one of the dressers who had rudely taken his stand close to the patient with his hat on, to take it off. This reprinted gave general satisfaction.

# TO THE READERS OF THE LANCET

Many complaints having reached us reletive to the irregular delivery of this work we can only say, that if orders be transmitted to our office they shall be immediately placed in the hands of Newmen for whose dispetch and punctuality we pledge our selves. THE LANGET MSy be in the possession of every Practitioner, within the Two-penny Post District, by mour o'cloca OF SATURBAT MORFING.

## TO CORRESPONDENTS.

The papers have been received from Manchester.

The writing, of the reply to Mr. Shute is not legible.
"R." must wait a little; the whole affair

shall be asposed in due time.

We have returned the papers received from Claphem Rice, to "Mr. A."

The raport mentioned by "Anicus," is a groundloss extempt. There is, no action pending against Tax Lawrer, nor against

may person connected with it.

The paper of " S. V. M.," commit be inseried. He must allow us to gratify out
own tasts, and also to employed our own publi-

cation is one own way.

Mr. Chershill, of Park-street, Gressenes souten, his been elevate surpose to the Royal Infrastry for the Dissesse a Children.

DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT GUY'S MOSPITAL OF

DR. BLUNDELL.

## Lecreae XIII.

Descent of the Pelvin Viscora.

Wasn the pelvis is large, and the vagice les, and indeed from other casses particularly acted hereafter, the viscera is the pelvis ere ept to descend, and the vagina, the hladder, the womb, or the other viapera, sometimes come forth. In different degrees, the descent of the parts within the peivis may occur, end sometimes you find them lying is sight between the limbs, (as in the casts before you,) forming a large awelling there as big as the closed hand, or as large as the head of a foll-growe feetus; io other cases, they descend merely to the periesum, on which they rest withio, occasioning this part to awall, and form a rounded tomesome, when the patient urges; and sometimes the descending parts lie considerably above, the mouth of the uteres eicking merely two or three inches below the level of the brim; the viscers of the polvis, generally, or the neares to per-ticular, pushing towards the outlet of the polvin, without, however, getting a hearing

whether this arises from musous dischaor from floodings, or from frequent child-birth, or from other causes, this dilatation contributes greatly to the descent of the viscera; for the smaliness of the vagina is a principal security against these troublesome displacements; and, indeed, the naturalist might, I think, reasonably enumerate the small size of the human vagina, as compared with that of many other of the mammiferous females, among the indications that our race was designed for the erect posture, and has not usurped this position in the way that some epeculators have contecded. Add to these causes, an elongation of the broad ligaments, which may become atretched so far as to allow of a more extensive merement of the womb, which they ought to retain in connection with the sides of the pelvis. Add, moreover, a certain aptitude of the serte, acquired by frequently descending; for if the woman have once laboured under procidentia of the hladder, womb, or vagine, the descent of the ports, often repeated, seems to form and adapt them to the change of position, so that for a length of time afterwards, if not throughout the remainder of life, there is always more or less tendency to yield to the impulse. So that among the more immediate causes of this descent of the petvic viscers, you may enumerate these three as of principal and proximete ope-ration; the conformability of the parts, derived from a frequent descent, the clongation of the broad ligaments, and the relaxation of the vagine, especially when they are acting in co-operation with an over-largement of the paivie.

If the womb becomes heavier, this, no peivia, without, however, getting a hearing on the externel parts.

It is to a excistly of causes, operating a weak, accordingly, when the womb is assemble or less is combination, that these depoints may be attributed. Where a points is admired from the purposal state, (being large such that the viscotic may some down it but they caused in the accordingly from a circum, polytost in the point for the best of a state of a full grown fortus, it is pure of those very bulky openheuse which its pure of those very bulky openheuse which its pure of these very bulky openheuse which its purposes of the vegins, and the interest of the control of the cont

lapsus of the aterus.

ing in co-operation with those already couthey become very obnoxious.

miscarriages and floodings have a tendency particularly in those women who have borne many children, the relaxation of wenk health, may all operate, more or less re-motely, in producing this discose—more common ofter the age of twenty, or five-and-twenty, but from which children themselves are not altogether exempt. But to pro-

cerd.

In a view to our further observations upon this obstinate and distressing affection the descent of the pelvic viscers, may be divided into different kinds,-those in which you have a descent of the bladder, those in which you have a descent of the womh and viscero generally, and those cases in which the vagina descends; not to mention here some other varieties of prolapsus, of amaller interest.

You sometimes meet with a great deal of relaxation of the vagina, and slongstion, so that this part may come forth, laterally, in front, or posteriorly; the rectum or bladder respectively landing with it, more or

the fourth, or fifth, or sixth day, complain, bulky as a pullet's agg, for example; is more or less, of symptoms indicating a pro- the earlier stage, the tumour is very small, perhaps as large as the ball of the apex of When the pelvis is large, and the softer the fore finger, forming, at the back or front parts are greatly relaxed, independently of of the vagina, og laterally, or in all the three any very atrong setion of the abdomins muspositions at once, protrasions by no means
cles, procidentia unri may be preduced; uncommon; and which unless they axceed
but a priocipal cause of these descents, actin size, may be looked upon as natural to the part. But these tumours may show a dispomerated, is the strong action of these mus- sition to increase, and then they begin to colar parietes, to which wany women, from attract attention, and, as the patient convarious causes, are subjected; vomitings re-peated, and much coughing after delivery, she is very often afraid that it should be the with urgings produced by the discusses of commencement of some other more formle-the rectum or of the bladder, all have a sole disease, of causer particolarly, on tendency to bring on the descent of the which account it is important you should be womb; so where women, as io the lower ablo to know it. When, from the descripcircles of life, are accustomed to carry great tion given, it is suspected that some graver weights on the head, or ure employed in disease is forming, you ought to make as washing, wringing, basket or tub-lifting, examination; and where this is carefully in or the like, prolapsus is a disease to which sticuted, the nature of the affection may be aufficiently oscortained; yet I may remark Now, on the principles here laid down, that, when the vagina comes down but a you may exploin the operation of various re- little way, farming a tumour not larger than moter causes in producing this effection, the first joint of one or two fingers, you are After flondings and miscardinges women may liable to averlank it in making your lovestibe very liable to the disease, become these gation. A woman says there is a swelling, which she conceives to be polypus, or proto relax, and lay open the parts. In like lapsus, or scirrhus; ot all events she is manner, early rising after delivery, coughs, satisfied that there is tumour, and you vomitings, and urgings during the pnerperal examine, and soy also has none; still your state more especially—a life of labour, like patient is dissuitafied, and you examine that of the block population in the West again, but find none; the reason of which is, Indies-pregnaccy of the earlier months, that if the examination be made somewhat auddenly and carelessly, and particularly where the woman has had a large family, the protruding part may be pressed back uoperceived, as it yields readily ander the entrance of the index, and in that way tho deception may arise. If you are, therefore, incompetent to the nice investigation of these points, and ore ant on your guard against this particular fallacy, the existence of this protrusion is liable to be overlooked; but if the investigation be conducted with all doe core and cantion, the nature of the affection may be easily ascertained.

If the vagiou come down in a greater degree, so as to give rise to an obvious awelling as large as a pullet's egg, I believe the only, or the most effectual mode of giving relief, is by means of an egg-shaped p this form being by Nature destined for suc canals—sequere naturem. In the lower ranks of life, an egg stailf, hard builed, and properly supported, may be introduced, or you may recommend one of these belloon perbecomes considerable, and then there pro-tious and at first, the descent at beight maries, invested, I believe, by a very inge-becomes considerable, and then there pro-tious practitioner, Mr. Potuter of Canden-trudes a nort of Mushy music, and which; town, and sold by Thompson of Little Windstill examination is duly made, you may sep-pose to be polypies, or the result of a da-scatt of the womb or the bladder. It is only well depend for the purpose. If the where the disease has been of some count-you may their disease to the dis-nuance, that it forms tumours of larger size, and washes of various strength, but I fear a small sound into the uterus, renders the that much is not be expected from them. diagnosis still more complete. If the dis-If there is much inflammation, leeches, fomentations, and positioes, will afford tain the various characteristics here ename-relief, and I would fain persuade myself, that rated, you may distinguish it with facility in some cases of delivery, if the woman is conficed to the borizontal posture atrictly, may for five or alk weeks after partebe obtained, for under this condition of the genitals, the vagina is very prona to con-tractitself. In making this observation, how- was before describing to you. But I don't ever, I may remark, that I have one patient who has isboured under the savaror form of this disease for a considerable time, and whe has been delivered two er three times, without obtaining effectual reliaf; it is true that also has never submitted completely to the discipline of the long-continued herisontal; but I neeld not percaive, in her case, that the state of the vagion after child-birth produced any obvious tendency to constriction of the part. In diseases of the vagius, handages and compresses may be of service.

The next disease to which I request your attention, is the descent of the urinary bladder, which may occur is different degraes. In some extremer cases, the bladdar lies forth between the limbs of the patient, fermisg a tamour there, larger when the bladder is fall, smaller when it is empty, and generally about the aise of an orange, admitting the ierroduction of the catheter icto its cadegree of this disease may be readily discrimleated; the tumour varying in bulk sccording to the quantity of the secretion, sed admitting the outbeter into its centre. A cast representing this tomour noder its usual aspect la here on the table before yee. It then no tumour lies out under the eyn, but effectual support. there is merely a tumenr in the back part of the symplysis pubis. When the bladder is full, this swelling is very iarge, blocking the vagion up; and when it has been emptied by the introduction of the cathater, it becomes much smaller; and if you pass up the instrument, you may distiogulabil withis the cavity of the swelling (an ascellent character of the disease,) and under widestary urging, the swelling is found to increase considerably is its size; and by these marks the disease may be easily known. Someand introduce the eatheter, and if you then acceptly acceptly acceptly the level of the push your axamination further, you may distinguish phipoldy a very hard substance, a relaxation. I have seen several cases in

of alum, sulphats of sinc, preparations of which, by its feel, its form, its aimstion, copper, and of galla, according to the effect produced, to be used as injections the uterus; and the cautious introduction of ease is carefully investigated, and you ascerrated, you may distinguish it with facility from all other affections; but if you make your inquiries in a very careless manner, you are liable to con and the descent of the rition, a radical cere of this disease might urinary bladder with the descent of the eterus, with inversion, with pelypus, or was befere describing to you. But I don't pretend to teach diagnosis to those who yawn over disease.

When the bladder descends a great way, so as to form a tamear between the thighs, the only effectoal mode of relieving the discase is by introducing something into the vagina; an agg-ahaped pessary, or even the capseity of the dilated parts, sacertained by a trial of instrumenta of different diameters. If the bladder have not pushed down, so as to make its appearance externally, a pessary may not be necessary; and in married woman aspecially, it is desirable that this instrament should not be used. When the descent is beginning in this menner, it should be our principal iedication to keep the bladder empty, and to tell the pa-tient to abstain from all urging, a rule to be observed with the utmost strictness, as the infraction of it must increase the descent, vity. New by these characters, the higher Lotiesa of slum, of sulphste of sine, of sulphate of copper, of galls, and so on, are recommended, of various strength, according to the effect produced; and if a patient becomes pregnant, I should recommend, as before, that she should be confised to the horizontal position for a few weeks after sometimes imposes, that the descret of the delivery, in order to allow of the vagins com-bladder is in the alighter degree only, and tracting itself, and giving the bladder a more

As women are liable to the descent of the vagies and of the budder, so also they are still more frequently liable to a disease of which you have eften heard, ne doubt, I mean the prolapana of the aterna, and sometimes it lies out ander view, as is the coats, and some-times it comes down searly to the eatlet of the pelvis, and occasionally it prelapses one or two lackes only, lying but little below its ordinary level, yet not unfrequently occasioning the most troublesome inconvenience. and hence the disease has been divided into the integer may be sainly known. Soons are person to a measure and need network thems, too, insided of its more depend of these varieties: relaxation, prolupsas, and the bladder, invaried by the vagins; you providentia—whee the womb protrudes, laste a descret of the uterus simp; so the disease is called procidentia; when it that if you animalse the bladder in front, regains at the outlet, prohapses; what it isn't involve the carriedy asheddes below the laval of the

which the vagina has been forming a large | to hern a well-adjointed anspensory bacdege, oyst, which lay forth between the limbs; for the purpose of supporting and prevantities cyst containing not the womh merely, log celargement of the swelling, because but is part the bladder, the small intestines, if it is left for years without a suspensory the ovaries, sod perhaps the rectum, for where you have procidentia, it very rarely happens that the womh only descends, generally the other vasors come with it, is larger or smaller mass. A case of this kind, if you are icompetent, you may mistake for polypus is a second oter; not to mention a large descent of the bladder only; but when you examine the tumour with care, you will frequently discover on its surface the rugs of the vagius more or less conspicuous; you will find, also, that you can introdoce a catheter into the tumour, provided the bladder be cems down; and perhaps, on passing a finger into the rec-tum, it may desceed into the back of the cyst, and, above all, at the lower part of it s os uteri mey be found. Semetimes the os oteri le so conspicuous, that you can spe it at first glance ; but you ought to be aware that at other times it appears under the form of a very minute sperture, the usual tubercle being wanting. If you are doubtful whether this is or not the aperture leading into the cavity of the uterus, (suspecting it may be oothing more than a mucous fallicle,) take a blunt-ended probe, and, with gentlenear, alide it along the reputed opening so as to ascertain the fact. Now if you have all these characters, or e great part of them combined, you need be at no loss to ascertain the nature of the disease : a large tumour formed between the limbs, consisting of the various parts mentioned, more or less ragous on its surface, admitting the catheter if the bladder have descended, admitting the finger somewhat when it is introduced into the rectum, and containing the oterus, which may be felt often very distinctly at the lowest part of the tumour, the os oteri being more or less conspicuously observable in the most dependent part, containing an orifice which leads into the cevity of the womh.

Io procidentia of the steri, it is remarkable that the health of the patient often suffers very little; indeed it has been observed, with truth, that the general health is often much worse to those cases in which there is a more relaxation, than io those cases of procidentia which we have just been considering, in which the vegina and nterns lie forth under view.

When procidentic uteri is clearly ascersaiced, it ought to be your first object to replace the perts, if this be safe and possible, but this cannot always be accomplished. Now, If this practice be leadnissible, you had better have some defence, or shield, in

support, it may become increasingly larger, till at length the patient can hardly sustain the icconvenience. There is a good deal of excernation not cofrequently observed, and which, I apprehend, arises from the irrita-tion of the ories. Much acceous drick, hy diloting the urine, might probably meterially palliste this inconvenience; but a more offeetnel relief le derived from the oan of the catheter, or by passing the fluid while sected in a warm bath. The peticet may learn to pass the catheter for herself. The principal impediment to the replace-

meet of the uterus in these cases srises from the ieflammation which may be occasioned by reduction, when they have been lying forth for meethe, or years, and where, se in cases of large and invetorate hernis, the perte above here got into e state to resist thum, Sometimes, too, as Dr. Clarke has, I think, acutely observed, when loflammations have been going on in the different parts, adhesions, internally, have taken place, so as to form bands, and entangla portions of intestines, so as to obstruct and give rise to the symptoms of incercu-rated hernia. In general, however, when you have procidentia of the nterus, you may replace the parts easily ecough, You place the womao io the recumbeot positioo; you edminister the catheter; and you get e general bearing on the tumour, and press it ack ward and upward, as if you were urging it opes the promontory of the sacrum, for If you press it directly opwards, you will bring it to hear on the symphysis pebis, se this demonstration shows. Then, after the parts have been replaced in this manner, a pessary is introduced, in order to provent a second descent, and, perhaps, the most convenient form of the pessary, io these cases, is the glebuler, or oviform; it gives to the descending parts a very considerable bearing, by means of its broad surface. But you find, somntimes, after ou have replaced the eterus, that a great deal of pain and fever are produced, so that you begin to be alarmed lest obdomical inflammation shoold seess. Now, if these symptoms he considerable, you lied better take away the pessary, eed let the parts come down again. Bleeding from the arm, leaches to the abdomen, fomeatations, poultices, relexation of the bowels, in a word, all the ordinary remedies of the milder in-Assertations, eppear to be lodicated here, If symptoms are slighter, and the pulse do had better have some defence, or alield, in not rise above 100, or 105, in the miouta, order to sover the tumour, and to prevent it I should then feel inclined to suffer the pes-from suffering jointy from a hlow, fell, or any to remain, taking once to scopty to other violence. Moreover, the woman ought bladder, and keep it empty, so that more

room might be last for the uterus. As before, you foment the abdomen, apply loacbon, and, perhaps, take away a little blood from the arm. If the symptoms arising from the peasary have been so violent that it should be deemed necessary to take awey the pea-sary, and suffer the parts to come down again, I should not therefore totally shandon my attempts; hat in a faw weeks afterwards, perhaps, I should resort to tha pessary again, leave it in for two or three hours, or till the same symptoms began to appear, then again removing, and introduc-ing afreah, after they had sabsided; and thus applying the peasary longer and longar avery time, I should hope to bebitunte the parts to receive the viscars, so as in that manner to effect a permanant replacement. In most cases where the difficulty arises from want of room, the parts have been descended for years, and where the parts are lying out in this way, under sight, thay are sometimes, affected with a grast deal of in-flammation throughout, with fever, and with deap seated pain. It is asserted, that alougha heve takan place, and that women have recovered after losing the aterus; nor have I much difficulty in believing this, though such cases are in a manner unique. Wara I to meet with an inflammation of this kind, I should treat it the same as an largely from the arm, giving digitalia, fomenting the parts, and, perhaps, applying leaches, which you might very conveniently do, the womb lying beyond the external organa; topical cold might be of service. By all these, and the ordinary antiphlogiatic means, in-flammation might be got under; and then if I found the womb could be replaced, so as not to give a great deal of puin, as if adhesions were torn through by the operation, I should endeavour to repisce the parts.

You will often, in these bases, as observed before, meet with excoriations of the tumour, perhaps in three or four places, to be attributed to the urine irritation. By keeping the arine from the narface, as hefore recommended, and general means, and by applying some atimulant and astringant remedies, such as are used is eutanoous diseases, cures may, I believo, in goneral,

be enally obtained.

#### LECTURES

OK

MUSCULAR ACTION, AND ON THE CURE. OF DEFORMITIES.

By MR. SHELDRAKE.

On the most effectual Method of Instructing Young Persons in those Exercises that will improve their Personal Appearance, and render their Forms more perfect.

ALL the different modes of walking, or moving about, have been produced by those habits which have bean fixed by the pursuits in which the parties who use them have been organized. If an isdividual is en-gaged in the same pursuits during the whole of his life, the aniform continuance of the same habits will impress upon his person an indelible form. It, at some period of his life, he changes the objects of his pursuit, the change of his habits will produce a corresponding change in his per-son, greater or less, according as the occapation that he adopts differs from that which he has quitted; but as the object we have in view is to enable persons, in the inflammation of any other viscera : bleeding saperior ranks of acciety, to acquire whatevar perfaction of form and action can be attained, it is surely better to begin in the right way at the very earliest period of life, than it would be to leave every thing to chance in the oatset, and have, afterwards, to employ much valuable time in correcting the errors to which carelessness and ignorence had given both origie and stability.

The real object of this instruction is to giva, at rha earliest period that they can be communicated, atrength to the ligaments of the joints, upoe which their power greatly depends, and activity to the muscles, by which they are rendered more obedient to the will. The whole process that will be necessary, during what may ha called this first atage of instruction, will be, first, to obtain the full power of direction the feet alternately, and then to practice walking carefully and steadily apon the line, for as much time as can be conveniently devoted to it every day; in doing this, it should be strictly required that the child should knop her eyes upon her fact, to see that abo places her foot exactly against the line at every step; this will give a firmuses to her movements which will afterwards be of the

greatest cousequance.
This course should be carefully followed till the child is five or six years old, and may be continued afterwards as opportunities may offer. As regularity of proceeding, and certainty of effect, are always to he deat once, add to their health, their strength, the notions that have been described, every and preserve the natural regularity of their motion that can be required is any of the form. The manner of using their legs, which has already been described, will

upon the lion, as has been already directed. The pelvis, and all the parts that are below it, are to be kept firmly, but not stiffly lu their original position; she is to look quence. It is to word this, that I recommend areadily at some ubject that is placed directly these exercises to be practised by the pabefore her; she is to extend both her arms tients themselves, ander the direction, inin a straight line, and womout altering their dasd, of those who are competent to direct position afterwards, with respect to the every thing of the kind to the greatest ad-body, she is to turn the body itself round yantage. By proceeding in this manner, all upon the pelvis, till she points with the the sdrantages that are required will be obfore-finger of one hand at the object on tained, and no injury be indicted in the purwhich her eyes have been fixed; the other suit. Patiants who are in this situation, hand is, by this setion, thrown es much may be induced, under the direction of backwards, as will be necessary to keep the skilful advisers, to do all that is necessary

time, (s few seconds at first, and the time to be gradually increased as the enercise becomes familiar to her,) she is, atill keeping her eyes fixed upon the same object, to turn her body round, so that the band which pointed before, is made to point backwards, and the other to point forwards at the same tima. She is to repeat this, still standing, till the practice is familiar to her; she may then begin to walk upon the line as has been already directed, and, at the same time, axercise the body and the srms in the mauper that is now recommended,

Another desirable exercise will be, to procure a chair, with a flat seat, and made of wood; the back should be higher than the patient's head, when she is sented on it: upon this chair she should be seated, with both her feet firmly pressed upon the ground; her back, shoulders, and head, should be pressed ugainst the back of the chair: while ahe is in this situation, her arms should be extended horizontally in a line with each other. When she has taken this position, she should, without moving her feet, or ber seat, ur taking her aboulders or her bend from the back of the chuir, or altering the position of her arms with re-speet to ber body, bend her body sideways, till she carries one of her hands as near to the ground as nomible; the other arm will theu be proportionably raised in the air. When she has been in this state for some time, she should raise listself into the erect position upon her sest, and after remaining so for a abort time, she abould reverse the former position, by pressing downwards

actions of ordinary life, when It is not a life which has already been described, will of cosrse labour, may be performed with form the basis of it.

The scholar or petient, whichever it not carried beyond that point at which may be called, abould stand quite upright the greatest strength of the joints terminates; if carried beyond that point, da-bility, and other mischief, will casus; and distortion, in all probability, be the conesquence. It is to svoid this, that I recommand two aims on a straight line with each other. (ar their own advantage, but not to exceed
When she has been in this position some
time, (s few seconds at first, and the time extended. These exercises are intended to eosble thosa who are interested in the welfare of young parsons, to bring them forward with the greatest advantage, and, at the same time, to avoid the danger of distarting or disfiguring their persons, so many effectual methods of duing which being continually offered to their notice, in the most inviting manner. What has now been offered for consideration and adoption, is by way of prevention; when distortion has been produced, a different course of treatment must be pursued to get rid of it, and that will be a subject for our next investi-

## FOREIGN DEPARTMENT.

EFFECTS OF SUDDEN ENGTIONS OF THE MIND.

BARTHER relates the case of a female, who having let her infant fall from her arm, was suddeuly struck with paralysis of one of the upper extremities. M. Hellis, of the Hotel Dieu at Rouen, bas lately witnessed some similar eases. Agial, about 12 years of age, being present at an execution, was so terrified at the moment whou the eriminal's head fell, that our of her arms suddenly became paralysed; also was brought in the Huel Dies, where also remained during three mantle, but Without receiving my benefit, though her general health was undisturbed. that band which was first raised, and sice In another case, a girl of nine years being attacked by a dog, was so frightened, that Whoseer naderstands the structure of the she fell down in a senseless state; when human body, and the action of its muscles, examined at the Hotel Dien, the pulse was will perceive that by alternately performing found quiet, the skin perfectly sensible, the countenance the tire of excitement, and dage was applied, to being the dismited the eyes staring; she had fully recovered parts together, the lag being still kept her senses, but had no power of motion, the antended, and the thigh somewhat bent muscles being in a state of rigidity, and deglutition was very difficult. An ematio, and the application of leaches to the neck, were without any effect, and she died suddealy on the fourth day. On examination of the body, the dura mater and arachneid, as well as the brain, were found bealthy; the lateral ventricles coetsined a small quantity of limpid serum ; the corebellum, spinal cord, and other viscers, exhibited ne morbid alteration whatever; the pherynx only pre-sented some traces of ioflammation. Hiblioth. Medic.

#### RUMINATION.

M. Riche, physicina at Maubenga, has communicated to M. Broussnis, the following case of rumination. A young many about seventeen years old, af middle atature, and a strong constitution, has, from his awallowed; this process is accompacied by neither picasant nor unpicasant sensations; has an entraordinary oppetite, and likes vegetable as well as suimal food, although he shows some predilection for the latter; observed when the distance was increased, he asts very fast ; and a long time after dinnor, there remains a bitter taste in his mouth; he suffers ecessionelly from colic pain, and has a slight prolapsus ani; his drieking, brought up and awallowed a second time .- Ann. de Med. Phus.

#### RUPTURE OF THE LIGAMENTUM PATELLE.

Cathar. S., twenty years old, of a weak constitution, being in danger of falling from n atnirense, involuntarily contracted the extensor muscles of the right leg with such violence, that the ligament of the paterin was ruptured. At the moment when this took place, also heard a noise like the cracking of a whip, and felt violent pein on the iener side of the knee; she instantly fell down, and could not rise again. On being egamined, the rupture was easily recognised by the protrusion and retraction of the patella, and the very considerable hollow below it; the leg could not be moved, and avery attempt at bending it caused excessiva pain. The joiot being much swelled, cighteen leaches were applied to it, and the leg kept entended; after two days, the in-

upon the pelvis. After forty-two days, the apparatus was removed, and the parts were found united, but still very tender; the pa-tient was, however, able to get up, and to walk with the assistance of crutches; after a few days, the whole limb having swelled greatly, and become very painful, the circular handage was re-applied, and under the use of this, and cold affusions, the patient perfectly recovered after thren menths. Journ. de la Suc. Roy. de Mer. et Chir. de Teuleure.

#### VALOCITY OF SCOKE IN WATER.

In the Annalca de Chimie, some very interesting caperiments are communicated, which M. Collodun has lately made, relativo to the sheve subject on the lake of Geneva. The sound being produced by striking on a bell which was suspended in the water, was and a strong constitution, has, from his heard by a person under water, and placed ninth year, found that half an hour after at the distance of 45,000 feet. The water dinner, the food, being midigested, secenda contained with of saline particles, was at from the atomach into the mouth; and have 40° Fahrenlicit, and of 1,00015 specific ing been sgain mesticated, is a second time gravity. The mean velocity of the sound availenced; this process is accompagied by was 4,708 in a second. M. Celladon chserved, that when the sound of the bell was neither pleasant nor unprensous warmens the beard at some distance mover which is beard in second of the food, a very painful sensation [gularly differed from that which is beard in second of the food, a very painful sensation [gularly differed from that which is beard in second of the food, a very painful sensation. He is the atmospheric air, and was very short, resembling that obtained by airiking two knives against one another. The same was and it wos then impossible to determine whether the stroke oe the bell was strong sed distant, or weak and near. The bell being repectedly struck at short intervals, digestion is good, and be enjoys excellent the strokes could only be distinguished at health. Fluids are also, a short time after the distance of 600 feet; at a greater distance they coalcaced into one continued sound. Another very remarkable circumstaucs resulting from M. Colladon's experimenta is, that the sound is not propagated from water to air, when the direction of the vibretions form a very acute augla with the aurisce. The bell being atruck at the depth of six feet six inches, the sound was distinctly heard over the aurface of the water; at a distance of 656 feet; at a greater distruce it ropidly diminished to intensity, and at 1300 or 1400 feet was not heard at all. The movement of the waves exerted no influence on the velocity, duration, or intensity of the sound; some of the esperiments were made during violent storms, but gave exectly the same results as those made in culm weather.

## ON THE WOUNDS OF THE BEATH, AND THE DIVISION OF MESTER.

M. Flourens, of whose researches respect-Samuation beving subsided, a circular ban- ing the nervous system we have spoken in a former Number, having recently made some as too, coulee, and cake a and after the further experiments of the same nature, was beadle has presented easil Ceesor with a led to the following result:—1. The brain few cakes, folded up in white paper, in acand spinal cord, when wounded, ere sus-ceptible of re-union and cicatrisation; and after the heeliog of the would, their functions are perfactly restored; 2. After the transverse division of a nerva, complete reunion ensuss, and if the narve is afterwards again divided below the cicatrix, the divided oods will perfectly noite; 3. The ands of diffarent nerves can also be made to unite; s branch of the eighth pair for instance, with a branch of a cervical nerve. In these sames, the nerve thus united, sometimes, though rarely, regains the power of transmitting narvous iofluenss.

An Expenition of the almost total Uselsame of the Examinations of Apothecaries Shops by the Censors of the Royal College of Physicians, and Wardans of the Company of Apothecaries.

By a Fellow and late Censon of the Col-LEGE of PRYSICIANS.

Year few of the medical profession know in what maoner the oxeminations of the shops of epothecarisa, in this city, are conducted by the College of Physicians. With a view, therefore, of glving every neeful information on this subject, but more especially with an anxious desire to have it condusted sficleutly, and as it becomes gottlemen, I submit the following partisulars to the medical community.

No long time ago I was sleeted Cansor of the College of Physicieus, and, by virtue of that office, became an Exeminer of Apothecarica Shopa; and it is with regret that I feel myself bound, from the great on-willingness on the part of that respect-shls hody to whish I heloog to elter their abourd predilection for old customs, to show inspection of drugs in the shops of the city of London for more thon a centery past, or, perhaps, to speak more sorrectly, from the first foundation of the collegs, is the memorable reign of King Heery thn Eighth.

There are only three inspections of apothacgries' shops made unuosily by the College, and these, I think, generally take this husiness are the four Censors, accomthis husiness are the four Censors, accom- pelther the cintment nor the pil. hydragyri, paniad by two Wardens of the Apotheogries was to his satisfaction. Where such im-Company, who ere, I helieve, by some old portent services as the pavy, East India sharter, or ect of Parilament, obliged to Company, and where public charities, such give their satisfaces. All these worthy per-jon Greenwich Hospital, &co., depend on this ages ment, et a late hour in the morning, et medical corporation, it is of vital laportance the mension of the College of Physicians, to here avery erticle of medicine of the best where, after partaking of refreshments, such quality, especially those of a mercurial na-

cordance with immemorial usage, and to save them, I suppose, from the temptrations of hanger, the whole march out, ettended by the headle and porter of the College, to take their seats in two hackney seaches. It ought to be mentioned, that the beadls, who is somewhat of a decent person, with the Censor's book, and furnished with the names of some dozen shops, to be axamined, takes his seat inside, with the two junior Censors and one Wardes, whilst the portor mounts beside the coashman driving the other coach, that soutsins the two senior Coesors sed the other Warden. There being eo isgal power giveo to the above persons to inspect shops either io Middlesee or Westminster, which is much to be lamented, considering that the greater number of them ere situate io those parts of Loudon, the ere situate to those parts of Loucan, the city of Londoe. The first place examined the first day was Apotheories' Hell. Here the Master of the Company was is waiting to show the shop and laboratory. Naither myself nor colleagues, efter looking at several of their artisles in the shop, had any cannot be adjusted with what we had reesoo to he dissatified with what we had seen. Notwithstanding all this, I sould not but fool a degree of aurprise, sud I dere say the sams feeling pervaded my solleagues, when they sateted the place where the preparation of erticles is supposed to be sarried on, to find it quito deserted, save ons or two men, who appeared to heve little or nothing at all to do. The only signs of pharmacy observable, were the formation of mercurial olutment by steam; the aublimatice of bseaulo acid; one or two extracts making; and some spoegss, which were anid to be on the eve of being incinerated. These last seemed very good, but I cannot belp confessing, that my doubts are strong that they ever underwent the above operahow entirely uselsss is, and has been, their tion. Some mercurial cinturent was chowo us by the master, who was furnished with a magnifying glass, and who, I believs, thought the sample of this ointmeet fit for use; however, it happened to he, on close inspectico, unusually full of metallic glohules. There wes also here, I think, some mercurial pill inspested, which seemed to lege, and these, I think, generally take contain more than the usual proportion of place in the month of August, or hottest live mercurial matter. The worthy Mester season of the year. The persons chosen for of the Hall very candidly owned, that

ture, otherwise he intentions of practition- don, and knowing, as I do, that several of an must be own defeated. I now object, the shope had been inspected by the Centrougly, to the little appearances there some of the preceding two years I Instruments of many articles being prepared by late the number of shops altogether visited the Company themselves. The medical profession have, indeed, a right to expect, that this Worshipful Company will not only ma-nufacture the medicious usually manufac-tured by respectable chemists and druggists, but that they will give the College of Physicions on opportunity of judging, at the inspections, that they prapare what is expected of them. The three visitations which were made when I was Cansor, certainly did not impress me with the idee of much work being done in the laboratory; it seemed, indeed, on those days, as if it were quite holiday time with these good folk. I do not know that the Company of Apothocaries have much interest in appointing persons to sesist our College quite uest for the office; this certainly was the case with the two Wardens who secompanied us; they were men worn down with ago and infirmities, and seemed without moch knowiedge of the genuineness of the erticles they were called on to inspect. One was of short stature, with imperfect vision, through natural nearness of sight, and the sons senilis havley made great encroachments on the cornes. If my memory do not deceive me greatly, be told me that he had lost, or had a congenital defect in, two of the most useful organs of the external senses, namely, those of smell sed taste. How, in the name of decenoy, is a person, with a total obliteration of those organs, and a perceptible decay in all the others, fitted for the duties of inspector of drugs? What could possess the Apothecaries' Company to elect for such an office a man anoble to discover the sensible, and perhaps the physical properties of substances? The other Warden, his invaluable condition, was of respectable beight, hat he had lost the symmetry of his legs through unsightly swellings, and from the peculiar pallidness of his face, I judged them to he of the dropsical kind; there was all that torpidity of mind and body helong-ing to hydropic disease. Those two individeals, at each shap we stopped, took up a great portion of our time, through the difficulties they experienced in descending from, and returning again to, the hack-ney coaches, which I beg to say were of the dirtiest description.

The time epent cach day in visiting ahops may, on the average, be reckoned at four hours; hence it will be seen, that the duration of the whole year's inspection, includ-ing the loss of time through insetleity of the two Wardens, does not exceed twelve mockery of examination is carried on; for considering the number of shops requiring to the Censors and the two Wardens of the

in a year, is much bolow 50; and in each of them, perhaps, a dozen of articles are examined

I shall here describe what was done when we entered on the ground of visitation. The headle, after staring shout for some time, without previously knowing where the shops were exactly sitoated, much iess the number of the houses, at last pointed to one, and we followed hand, as the door was opened, he quickly introduced us as the Censors of the College of Physicians, and Wardens of the Apotheonries' Company; our entrance being once effected, the seuior Consor began by inquiring if there was eny Pharmacoposis kept, if it was the latest edition of London College. Next came the inspection of weights and measures; and sftsrwards the Consore individually asked to he shown soverel articles, such as aromatic confection, tinctures, particularly of the earminative kind, scammony, rhubarh, &c. In more than one shop, I observed several pieces of the last-neured drog, which, when looked at earnestly, as if doubting its goodness, I was surprised to hear it stated on two or three occasions, to have been purchased at the Hell. As soon as this enswer was given, it had a posing effect, as we had not the means of proving the truth of the essertion by investigating the accounts he-

tween the Hell and the epothecary.
The profession have no ides of the bad state of some shops; for iestance, we met with one which, in addition to the want of almost every requisite for business, there was no calomel, and the proprietor said he never osed sny. Is mother there was hardly sny thing medicinal, not even scammony. owest, when asked to account for this, excused himself by observing, he lived near a druggist's shop, and he could at ony time send out for this, or eny other thing he

wanted. Though the College are empowered to throw into the streets, or otherwise dearroy modicines of bad quality, still they rerely set thes; and though they might effect much good, by sending a written caution in name of the College, to venders of inferior pharmacenticals, still I am not aware that my thing of the kied has ever been dono; the consequence is, between one visitation and another, the different shops hardly ever undergo any change for the better.

It is not without much expense that this is this in the least degree useful, sumptuous dinners are given by the College examination in such a metropolis as Lon- worshipful Company, and as our courtly

pagoe, and other good things. It will be in two of the cases, I send you the maxillary inge, clong with aundry items, for three days, oscoot he much under 50%. This monoy seved by the College for three or four years, woold enable it to place in its now and aplendid library a bust of the great Dr. Jeuner, whe, within a few yeers in this country slone, by introducing vaccine incenlation, saved more lives than all the presideous, fellows, and Mentintes, of our Royal College ainco its first fouedation. No compliment (preh puder) wes ever paid by the Landon Cellege of Physicians to the werldly saviour of millione.

Before I finish the history of the examinctions of epethecaries' shops, I must eny that the cooduct of the entire party was not of the genteolest order ; for where a shop door heppensd not to be epeedily opened, the bell occasionelly received a most violent ring. I sew more than one spothecary offended et our intrusion, and, instead of receiving us as gentlemen, went out of the house, leaving ue to find in the heat way we could the objects of our examination.

Concluding this subject, I freely own that I was most heartily disgusted with my office; and nuless something is done towards its effectual improvement, I should be sorry, on a future occasion, to undertake the duties of a Censor. To have an active and useful iospection, the Censors and Wardene, of more youthful deys that those de-scribed, ought to divide themselves into twe bodies. Thus two Consore and a Werden might be engaged in one district, whilst the other Censors, with their Wardes, might, on the same day, be employed in en-

The Apothecaries' Company, I ought to mention, here their own exeminers for London; hew does it occur, therefore, that there are apothecaries prectision for years who have nover been visited by them ?

CASES OF DOUBLE-FISSURED HARBLIF SUC-CESSFULLY TOCATEG.

By CHACLES FIXOTT, Eqq., M.R.C.S., Jersey,

· To the Editor of THE LABOUT.

Srn,-Awore of your readiness to give publicity to improvements in the practice of surgery, allow me to introduce to the netice of your readers, a brief account of three cases, in which I have encessfully operated for the curs of double-fissured harelip. My mode of operating differs from

president, with the treasurer and registrar, success will, I trust, shows in great supermeke part of the company, they could not of rierity over every other. That you may be course be well treated without come Cham-fully convinced of the extent of the deformity seen, that the expense of tovern proceed- processes which were removed, and you will observe still ettached to each the tuberouler eppeedage, or lip-like process.

You perhaps may coosider it etrange, that I chould have dolayed four years in making this subject known; but I am sorry to asy, my account of the operation was read at the Medico-Chirurgical Society about three years ego, when either owing to the disunion thet existed in that body, or not exactly understanding my meaning, the peper and pletes remained in the hende of their council more than e year, ebout which time I thought proper to recal them,

As the first part of the operation may not be rightly understood, I have added four drawings, dolinosting the whole prooras. I hope this improvement in the mode of eporating will be favourably received, and I shell be astisfied in heviog been useful to the profession. Believe me, Sir,

Yours, most respectfully, Cuartae Figory.

Casa 1 .- Jano Le Groe, mtat. 15. Doublefiscured harelip, protaberant maxillary process, with three teath and tubercular eppendage, or lip-like process, projecting half an inch beyond the symphysic of the inferior maxillary bons. Was eperated on the 7th day of April, 1824, and cured in fifteen daye.

Case 2 .- Edward Lo Feuvre, mtat. 25. Double-finated harelip, tabercular eppendage, maxillory projection, with two teeth extending nearly half an iooh beyond the inferior maxillary aymphysis. Was operated on the 2d day of November, 1824, and oured in three wooks.

Case 3 .- Peter Chevalier, setet. 17 ; donble-fissured barelip, tubercular appondage, and maxillary process, with three teeth prejection three-quarters of an inch beyond the lower jaw. Was operated on the 2d day of lower jaw. Was operated on the 2d day of Navomber, 1824; peletine fissure very large, Cared in three weeks.

The palatine feature in the above three cases, has considerably clused. The patients retain their salive, articulate much bettor, and are not a little proud of their improved appearance.

## Mode of Operating.

Having placed the patient in a shair, with-out previous preparation. his head reating on the breast of an essistant, and his backs secured by another. I take the external

<sup>·</sup> Application of sticking-planter a fertthat usually practised, and its complate night before, to bring the cheeks forward,

edge of the intercular appendage between of the appendage is so wide as overly to the iodex floger and thumb of my left head, close the costril, I take part of it off on (vide Plate 1,) and divide the appendage such side, theo turn the remaining contra leterally upwards into two portions, to the cartilage of the nose, (Plete 3, letters b, c;) then turning the edge of the scalpel inwards, I pass it round the maxillary prominence to dressed as in ordinary cases, and Louis's denude the bons, which, with a mutacarpal bacdage applied; the dressings are removed saw, I take off in a line parallel to, or corresponding with, the fissures, that no sperture may be seen below the coatril efter the until the case obtains a perfect cure. This operation; the external tubercolar half of operation could be cickly performed, were the appendage, or lip-liks process, being it not for the humorrhage filling the patient's the eppendage, or lip-like process, being turned in the latter part of the eperation en the divided cartilage and mexillary bone.

2dly. I take a piece of pesteboard, two inches wide, and shoet six inches long, io my left head, which I spply ander the lip on each side, and, with my thumb ex- The lip here is perpendicular, more even, tanded, and pressing the lip apon it, I cut a portion of it from above dawnwards, as represented in Plete 1, letter c, using a fresh scelpel to each side. The divided edges are then brought to cuetast by my as- remains, onless you abserve closely, that an sistant, when I apply two twisted autures.

Salv. If the external tubercular portion

oo the divided septum and maxillary bone, pressed by list, and secured from below upsards with adhesive straps. The lip five days after, and the pins withdrawn; the same dressing is continued every other day, mouth. The advantages of this mode of operating are, I conceive, very great; let. They do not present that deformity which must actually result after that practised in all parts of Europe to this period. and is operated upon at once; 2dly. Union is perfect in a fortnight or three weeks; the patients retain their salivs, articulate bet-ter, and masticate well, and no appearance operation has been performed.

Throughout the whole paper, there is a laboured endeavour to persuads the reader, that Nuble's acquaintance with these prinaiples is of long standing, while, at the same time, every page convinces us that be never advocated them before. For instance, the following remarks, with which he dismisses the expansion above, if not attributable to ignorance, which charity leeds us to suppose, point be ascribed to in-testional misrepresentation.

Page 49. "But unfortunately there are two insurmountable objections to the use of these shoes. First, because they cannot be applied to the foot, without the use of nails; and, secondly, they improperly give expansion exclusively to the toe or fere-part of the foot, which, by Ita remote aiteation from the beels, where the dilation should take place, causes its occurrence at the very point where nature has not intended it to be. It also appears to me vary doubtfel, whether the joint-shoe will erpand at all, when rivatted to the foot with eight or nine mails."

Nuhia has previocaly essured ua that, like

Nimrod, he bas "atudiously sought for intelligense in avery quarter likely to obtain it, the closet, the kanckers, the riding-ackers, end the road," has "ridden many miles, and spent many peends in search thereof." Yet if so, it is to be regretted that he bad not also resorted to the very best school of ioetruction, the forgs, where baving once taken up a foot having on an expansion ahoa, be would have seen the foot separeding with the shoe, and no longer have base doubtful on the subject. But this it plainly appears he has never dese ; yet he takes upon him to deaide on its merits, without ever having seen it in operation. If Nubia ia, as he states, coovinced of the truth of Mr. Brecy Clark's

doctrines, it is siegular that during avan one day only in the years of his pretended esperisuce, ha had not examined, when it is applied to the foot, the shoe which that gentlemen recommended after years of trial. The scientific world will not believe so readily, that he who has been all his life insisting on the necessity of expansion to the foot, should recommend a shoe that will not expend at all. Nobia's second objection, that this shoe copends at the toe and not et the heels, is a further proof that he has never seen it on the foot; it is fully as erroneous as the first, though not quite so absurd; indeed the objection is sopbiatical enough, I am sorry to say, to be abarished by many in the veteri-nary profession. They are not awars, or they do not know it appears, that the foot being fairly cleft beyond its centra to within

an inch and a half of the toe, leaving a

triangular exace which is occupied by the

,:

and of which he is doub.ful, whether it will yielding alsatic frog, open from the front around at all. sion of the foot so much spoken of, it can never take place unless the too, nay, the whole foot, la et liberty. Elasticity is therefore, lu some respects, a bad word, since it is not wholly soft materials, but a cloftdivided foot, which most sepand by halves like the sew's foot, as it were, or not all. Nuhis, and all other objectors, who for want of n better reason, and without accounting anetomy or common seese, have urged this simple argument, might just as well and as truly maintain that the boof of a cow, or any other cloven-footed animal, does not open at all at the toe, because the joint is situated behind, et the heel; or that a door opens not et the latch, but only et the hinges.

Uneware of this, many writers on allowing, eed elso many practical mao, have attached great importance to driving the oails as far forward as possible, that the heels might bave room to expend; bot this the eacoot do, if the quarters are confined. They can bend inwards, but from the inflected atracture of the part, they cannot dilate outwards without unnatural force. In proof.—Does this mode of nailing pre-

vent contraction? Certainly not.

In the nast place, Nuhia objects to the use of nails, calling them an "insurmonetable objection," though he dalgas out to tell us why they are so. Nails are employed all ovar the world for this purpose, (secapt perhaps in Japan,) and in the present age we cannot do without them, maither is it at all nacessary that we should, for they ere no impediment (as I have just shown) to the free actioe of the foot in se expansion shoe. The fact is that Nubis, not understanding so mech as he ought to de raspection the action of the foot, though well aware of the necessity of liberty, in of opinion that this con ouly be maintained by shore ottached in some way less rigid than by nails. This is hinted at is many parts of his long article, and in conclusion we are plainly informed, that were it not for the lamentuble state of ignorance and prejudice under which the world at present labours on this subject, he would "present us with a netward defeace for borner' fact, without the eid of the white-smith;" from which I infer is meant a re-memble slee or slipper of some kind or other, Turkish, or Persian, parhapa; but of what material it is to be sunde, we are to remain in ignorance. New if this bashfulness in advantising his alippera, or jointed cloga, or what they may be, does not originete in fear, why not be more applied, and give to the public and the borses, the advantage of this discovery; indices he with, peradvan-ture, expecting perjudice to be bandhed from the earth.

This idea of a removable shoe is by no

means new; ... Broy Clark spent four from their present degraded condition; years in making and fitting these, and appearant which has been attributed, with justice, to do have enhanted the principles or which the constitution and government of the it might be done, concluding, at last, that Royal College of Surgeons lo London, the exre, difficulties; and, above all, the azzeros of unch shoots, would preclude their leisure, will oblige the gardeness at whose general introduction in the present state of mechanics. Still, if this slipper which Nebis has in pate, this undedged thing of tender reputation is easy, durable, and sheep, he is unparlounable in withholding it; but we doubt this, or the possibility of any practi-sable slog or alipper. The expansion shee being, in fact, as cheep, as insting, and sin-ple, as common allows, and, withal, prevent-ing that securge, constaction; practical ob-jections against it are now nover heard, and us to such blundering scribblers as Nienred and Nubis, who about to inspect the thing they write against, their real or peageneral is troduction in the present state of mechanics. Still, if this alipper which Nebis thing they write against, their real or pre-tended ignorance shall not acree them from the rebuke, which wilful misrepresentation deserves. It is singular to look back at the opposition that has been raised, step by step, to Mr. Clark's dootrines; and now when the veterinary writers in The Sporting Magazine are forced to admit the necessity of an expansiva dalence for the preserva-tion of the foot, they invidiously attempt to percuado their readers, that his shee is fotile and inefficient. These gentlemen have at length consected to scknowledge, that they have hitherto been " on the wrong scent," but they cannot allow that Mr. Clark has been right. The objection is not, as I said before, to the measure, but to the means, and its proposer.

Hatfield Street, Stamford Street, Jan. 15.

### SORGICAL REFORM-CINNER TO MR. WARLEY.

Mr. Paty to Mr. Wekley.

33, Bouvorie-street, Floet-street, Jan. 24th, 1829.

DEAR Sts .- The gentlemen who nodertook the arrangements connected with the resolutions, adopted at a public meeting in the Freemanona' Tavarn, on Tuesday, Dec. 23rd, 1828, (a copy of those resolutions having already been transmitted to you,) have requested ms, as Chairman of that missting, to inform you, that, should the day out your convenience, they consider the 18th of Fabruary next, the most proper time to beg the favour of your company in the main turner, at a public dinner. I bag leave to state also, that their reason

I beg leave to state also, that their remon-for naming that day in preference to any other, was, that it will be the anniversary of the beamstatement of these proposedings which, if misteasity partition, with the con-tinued assistation of a Free Madical Press, will tend to raise your professional in others

request I write; and slao, Your most obedient Servant,

JAMES PATY.

Thomas Wakley, Esq.

## Mr. Waking to Mr. Puty.

Bedford - Juare, Jan. 24, 1829. Dram Str.—I need actrocly say, that I feel most sensibly the very flattering testimony of approbation, which my public conduct received from the large and respectable meeting, over which you presided on the 23rd of December, at the Freemasons' Tavara. My exercious in the cause of a Frea Medical Press, sed Free Medical In-stitutions, have, at least, beco honest, and honest exertions the public of this country oever full to appreciate. I am acuable slao, that the late trial has contributed greatly to strengthen the hands of public writere, by the important docision given at the outset of the cause, in favour of Jeurnalists who feel that they are in a situation to justify an slieged libsl, and also to epen the eyes of the public to the corrupt system which prevails at our hospitals in the distribution of pstronage, though I was not permitted to enter fully into this pert of the case. Bot, Sir, greatly as I deprecate and detest the system of nepotism, to which, I believe, Mr. B. Cooper is indebted for his situation, I entertain, squally with yourself, and the gentlemen whom you represent, ne kind of heatility towards that gentleman. On the contrary, I respect his pri-vate character, and I would rather net, vate character, and I would rather net, therefore, at present atteed a festival, which, though lastituted entirely upon public grounds, malevolence might perhaps construe into an act of persecution directed against his private interests. If the object of the festival were to egistrate the triamph of surgical reform, I should be proud and happy to attend. But theogh the victory is, I believe, in our hands, the battle is still to be fourth. hands, the battle is still to be fought. I trust, however, the day is not far distant when we may meet to celebrate, not the virtual defeat of a few individuals, but the com-plete and final overthrow of a corrupt system. In complication, permit we to express my

deep seems of gratitude towards yourself, and the grademen with whom you are acting, for your very fattering and distin-guished approval as my efforts in the noble and thriving cause of Surgical Reform. Your obliged and obedient Surant, Tromas Warlett. els no

Junies Puty, Esq.

## THE LANCET.

. London, Saturday, January 31, 1929.

Tue late borrible murders in Ediaburgh still engage the public mind, to the exclusion of almost every other topic. The state of the law, which, without qualification we may say, led to those structties, hes been freely canvassed, by all the thicking part of the commucity. It seems to he new universally conceded, that the legislature must interfere, and, by some judiclous enactment, provide bodies for our sestomical schools, and protect ledividuals against the risk of being murdered for the value of their corpses. We have witnessed with much indignation and disgust, the chilling spathy with which the greater number of our teachers of enetemy, have and the reckless indifference with which the v | oultivation. have kept open their dissecting-rooms, for the reception of stolen, and prebably, of murdered bodies. Public epicion, however. seems at length to have awakened a faw of them to a scese of their duty, sed it is with lature of their country. meeb satisfaction we are enabled to state. that humae dissections are discontinued in and of town, in those of Sheffield, Bristol, and Liverpool, in one of those at Manchester, and in that at Birmingbam. In the latter place, the Magistrates, and Physicises and Surgeons, have severally beld meetings, to take the matter ieto consideration, sed the result bas been, that they have resolved te petition the legislature for ite interference. The following are copies of the Petitione:

. " To the Hon. the House of Commons, &c.

"We, the nedersigned acting Magistrates of the town of Birmingham, convinced of the urgant necessity of some measures being adupted for the protection of seato-mical pursuits, and to relieve the feelings of the public from procedings not unfre-quently brought before as is our magistarial capacities, which are outrages to all de-cency, and opposed to the laws of the

realm, humbly presume to be the attention of your Honourable House to the annured Patition from the Physicians and Surgeons resident in Birmingham, and to solicit the adoption of some legislative exactments relating thereto, as your Honourable Hou may deem expedient. And your petitioners will ever pray."

## " To the Hon. the House of Commune, \$10.

"Wz, the undersigned Physicians and Surgeons, resident in the town of Birmingham, respectfully implere the ettention of yeer Hecoursble House to the necessity of speedily adopting some measures to remove the existing impediments to the cultivation of enetomical knowledge.

The want of legislative authority, to cul-

tivate a science pre-eminently connected with the most important interests of auffering bumanity, has caused public faciling to be entraged, and enormities to be committed, diagraceful to a civilized country, and repugnaet to avery moral and religious

feeling.

In verious parts of the contleent of Europe the atudy of anatomy is protected number of our tesaners of enstomy, mave by the respective governments, and avery regarded the late unparalleled disclosures, facility afforded for its extended and liberal

Convicced that this is the only true basis spon which the Medical Science can be fneeded, a sciance which must be considered one of the most essential of all human sequirements, your petitioners presume to solicit a similar pretection from the legis-

Year petitioners presume not to dwell upon the advantages to be derived by the public service of the couetry, by the sick two of the schools of matomy at the wast and injered poor, and by society at large, from the cultivation of Madical and Chirurgical keowledga, and your petitioners mest corneally implere your Henourable Heesa to take this subject leto its serious conaideratine, aed to adent sech messures as to its wisdom and justice may seem fit. Your patitioners will ever pray."

If surgery is to be practised with success. and as a science, the atudy of anatomy most be ancoeraged and promoted. That the dead must be dissected, or that the living most be mutilated, is quite certain. It is for the public to shoom between the two. Nothing can be more ridiculous than to seepese, that the members of the medical perfeesion generally, uphold the practice of hisman dissections, either for their benefit, or for their antinoment. On the contrary, it is a process which they regard as most re-

to be often most fatal in its consequences. Mr. Lawrence is appointed to the Surgical Nothing but a laudable desire to sequire Chair in the Theatre of St. Bartholomew's that knowledge, which shall enable them to Hospital. He will deliver his Introductory discharge their duty, conscientiously and Address on Monday evening next, at seven beneficially to their patients, could induce o'clock. them to undertake it. Far different, bowever, is it with many of our teachers of anatomy, the nature of whose commerce furnishes an explanation of that cold-blooded and monatrous indifference, with which they have knpt their shoulder open as temptations to Burkites, during the late feverish and psinful state of public excitement. From these men we hear little or nothing relative to the difficulties of procuring subjects. No! They enjoy a profitable monopoly. Hence their aversion to an alteration of the system. They may be denominated human carees butchers, and regulate their scale of charges to the plundered and impoverished student, by the demands of the resurrectionist and murderer. as does the cattle butcher by the demends of the farmer and grazier. This is their plan. They are supplied with bodies, or portions of bodies, from friends in country hospitals, infirmaries, and work-bouses, at no other nost than that of package and carriage. The body, or piece of a body, thus procured, is than sold to the unfortupate student, at the resurrectionist's or murderer's price! One lecturer told us that be had taken a burial-ground, and a small house adjoining. From this place be said he nbtained a famous sopply, and that it was altogether a "very good thing;" for an it was a secure and "comfortable resting place," as the saints have it, he could charge pretty handsomely for hurying a body there, and afterwards get from his pupils from eight to twelve guiness for taking it up again! Such is the profitable traffic of the human careges butcher; a traffic which has led, in some schools, to the disception of thrice as many hodies as were required for the purposes of selence.

volting in its nage, and one which they know! We have great pleasure in stating, that

# Edinburgh Medical and Surgical Journal. January 1829.

Tun universality of the sons of Eria is truly wonderful. Had Parry discovered the North-West Passage, or Sadler succeeded in reaching the moon, there can be no doubt, such is the diffusibility of this singular people, but colonies of them would have been found there. They are, to the rest of the world, what the Greeks were to the Romans in the days of Juvenal, administering to the necessities, the pleasures, the vices, and the instruction of mankind. In killing or curing, lecturing or lampooning, mixing mortar or manufacturing magazines, they are without competitors. Wellington at Waterloo, and Burke at Edioburgh : Mr. Abernethy at St. Bartholomew's, and Dr. Shiel at the Freemason's Tavara; the cootributors of wit to the press, and carriers of bricks to the buildings of London; these give us som ides of the versatility and omnipresence of the inhabitants of Erin; in abort, wherever we turn we are aure to see the national genius in some abapa hovering before us, like the manes of an auburied corse, through neglect or persecution at home. We thought, however, we were sure to lose sight of this ubiquitous phantem in taking up the present number of the "Blue Journal," for Scotchmen are jealous of admixtures; but even here our hopes were disappointed, and we found, in its very first page, an Irish samyist disguised in feelsoop and lamp black, in the person of Dr. Stokes, of the Month Hospital, Dublin. He promises, too, to be miler a formidghie customer to the critics, having all the manner and method which

characterise the diffuse sterility of the class | most severe in the cold at of writers to which he belongs. Once that one of them has acquired the craft of composition, there is no limiting his lucubrations; the facility of setting them in motion, and of providing materials for their manufacture, is so great, a bint on any subject is quite anficient for the purpose, Dr. Blood, for example, an original in his line. asserts in print, through four or phrensy, that there is outhing like bleeding io thu cold stage of ague, and instantly all thu lancets in the empire are unsheathed, sod all the intermittent patients phlebotomised to ascertain the truth or falsehood of the Doctor's opinion. The experiment, after making e tour through the profession, at length appears, to the dismay of the Reviewers, in a thousand shapes in the Jouroals, bringing the remark to bear, with double force, on these secnodary agents in the advancement of medical science, which Pops applied to the Commentators on the poets :---

" One fool in verse, makes many more in prose."

Thus Dr. Stokes informs us, that he was put on the scent of bleeding in intermittents by the omes published, some time back, by Dr. Mackintosh, of Edinburgh, and, to do him justice, he certainly set to work very systematically. To escertain, with precision, the efficacy of this treatment, he tried bleeding alone in the cold stage of the disease, exhibiting evan purgatives only when necessary. The quantity of blood ebstracted in each instance, the rigour being at its beight, averaged about fourteen ounces, but the operation was seldom performed more than once or twice in each case. The following were the symptoms with which his patients were affected :-

" The local symptoms which occurred in the cases under my observation, may be reduced into two classes :- First, Those which occurred during the puresysm; de-cond, Those which continued during the istermission, but which were aggravated in the perezyan, and which were generally ricerditic, and passes

first were severe pain in the loios, great headach, violent cough, sensation of oppression, soreness in the presordial region, dyspuces, accelerated and small pulse, cau-son, opigastric tenderaces, and bilious vomiting.

In the following recapitulation, he enumeratee the effects of bleeding in the cold stage, on the patients affected with the precedieg symptoms :--

" The effects, then, of venescotion during the cold stage were checking the rigoar altogether; momentary suspension of the rigoer; checking the rigour after a certain quantity of blood was drawn; its reture in e milder degree; diminution of its intensity, hut oot of its length; relinf of local symptoms alone; prolongation of rigour, without dimioution of its intensity; so apparent effect; disappearance of the rigour on the fourth pyrexial day after the operation, but persistence of the symptoms, indi-cativo of internal congestion."

These effects are, of course, to be usderstood as occurring in different cases, so that, hy this summary of the consequences of this practice in the cold stage, it will be seen that they were of the most opposite charactar. Heving observed that he seldom saw the rigour cut short by the operation, he proceeds to state the effects of the practice on the subsequent stages of the disease.

" The affects of bleeding to the cold fit, on the subsequent stages, were as follow :--The hat stegn being rendered milder; hot stagn being not distinct; swesting rapidly succeeding; increased severity of hot fit; increased length of hot fit; aweating stage rendered milder; con-sppearance of awenting stage, or hot stage; oo apparent effect on aither stage.

Thus, in this stage of the disease, as in the former, the most contradictory consequeoces were produced by the use of the lancet in different instances. Hitherto, however, the effects secribed to this peactics have been, at least, innoxious, if not salutary. We shall now see, in the words of the writer, that these affects are not always of so harmless a description.

" The evils of bleeding were new local informatory symptoms, and law irritative fever; times were gratritle, bronchitis, peonia. The first of thes

isjurious consequences, the writer was in-formed, by a friend, that in a few cases which came under his treatment, the patients never recovered from the colleges con sequent on bleeding during the sold fit of the disease."

Dr. Stokes concludes his minute, and, we are sure, accurate, account of his pathological experiments, by remarking, that the most obvious and salutary affect of the practice was the removal of the local symptoms of the disease, such as pain of the lumber region, bronchitis, sough, and dyspame. In all the cases which he treated, he was compelled, sooner or later, to give quinine for the eradication of the disease, and thinks that the practice should be confined to those cases where there are obvious indications of congestion and inflammation.

The next article contains a series of very elaborate and protty apoculations, on the question, " Whether the blood be slive or not," by an Army, or e Navy, Doctor. A young gentleman, confined on board-ship. or in barracks, may be allowed the indulgence of speculation to kill his leisure hours; but we have neither taste nor time to examine, at present, the results of his imaginative industry.

We, therefore, hasten to congratulate Mr. Casack, of Steven's Hospital, and of Marillary actoriety, on, we believe, his second or third appearance in print, after a connexion of several years with one of the largest hospitals in the British empire! Siggular enough, too, that with so meny opportunities for the improvement of surgery, we should now be helped by him to an ossay on Puerperal Fever; but there is no secontiting for the eccentricity of genius, and . we have no right to subject Mr. Cueack's to the laws which govern the minds of humbler mortels. The contents of his comy are, indeed, as remarkable as the selection into three distinct kinds : the purely infer

affections, gus atis, appeared most frequent-ly and most severely. In addition to these mixed kind, attended with some of the sympamixed kind, attended with some of the symptoms common to the other two. The aymptoms, treatment, and pathological anatomy of each of these assumed forms of the discase, are all detailed with an amplitude of particulars, and an insensibility to the obvious fact that they were all known, for years, to the profice, which are truly surprisiog. Mr. Cusack, however, would have fully compensated for this commerce in common-place information, had the proposition with which his paper concludes been original, namely, that puerperal fever was no other than " diffuse inflammation of the cellular membrane of the contents of the abdomen;" but bere, too, the passion for simplifying pathology, by explaining the neture and cause of various diseases. by a single agent, has anticipated bie opiniona, for various writers have hinted what Mr. Cussck now boldly demands us to believe in the following peerage:-

"To visw the low form of puerpetal abdominal inflammation, or, as it has been termed, puerperal fever, in its true light, it seems proper to consider it as a disc whose essential character consists of a l inflammation of a peculiar nature, panied by fever of the lowest typhol as a disease by no means confined exclu-sively to puerporal patients, yet modified by the puerperal state; but, on the contrury, it may occur (and frequently does) in persons of either sex, produced by the ef-fects of bruisss, wounds, and anytical operations. Nay, it may arise idiopathically, or, at least, from causes by no means manifest. I must further observe, that this disease, if not the same, is at least a modification of that known by the term, " diffuse cellular inflammation;" and although, is this fatal disorder, the cellelar membrane is the seat of the disease, yet this circumstance is not always the case, and lofammation of a similar character to that which has its seat in the cellular membrane, may attack the peritoneum, the uterus, the overies, or other arts. It may be further argued, that the inflammation we are considering is not confined exclusively to the abdominal region, when it attacks purposed women, but may, and not unfrequently does, affect the cellular structure of the extremities, and then of its subject. He divides purposed fores produces a fatal disease, by some consider-into three distinct kinds : the purely interes of phiconesia delens. Lastly, it amedia-

posing and exciting causes of this low form of the disease, although apparently different, are of a precisely similar nature to those which produce cellular infammation."

Granted, in complainance to Mr. Cumck, that this pathological " hotch potch" was as consistent with itself as it is obviously incongruous-how far would it extend our knowledge of the disease in question? He presented to the Chairman, amongst whom starts in his cureor i specolation at the point, say, of healthy inflammation; runs through the various grades of that coadition of the system, assumes one of these statecalled " cellular," as a settled and explained fact, though it is any thing but settled or explained as the " Constitutional Irritation" of Mr. Travers, the "Irritative Pavar" of Dr. Batter, the "Diffuse Infermation" of Dr. Duncan, and the "Phlegmonoid Eryalpelas" of Mr. Lawrence, sufficiently attest; nest transfers this nosological phantom from the outside to the interior of the human body; then supports the propriety of this translation by a few inconsequential analogles; and lastly concludes the scene by securing us that this inflammation hitherto called Purperal Fever, is an inflammation " of a peculiar kind," for which piece of intellimese the profession abould be for ever his grateful debtor i Information of e " peculiar kind!" thank you Mr. Cusack; "inflammation is inflammation," says Mr. Cusack; " rhuberb is rhaberh," says Dr. Ollapod in the comedy. We therefore leave it to our readers to determine whether the Doctor or the Surgeon has edded most to our knowledge by his definition, for we have not space just now to point out et greater length the contradictions involved in Mr. Cusack's proposition, or the lamentable ignorance of obstetrical science, evinced in the concoction of this cock-and-a-bull

(To be constanted.)

MEDICO-BOTANICAL SOCIETY,

Sackville Street; Tuesday Jan. 27.

The Right Honourshia East Stannors in the Chair.

Sevanal visiters were introduced and was the Spanish Ambassador. The Secretary commenced the proceedings by anumarating gifts of books, opinm, and plants, made to the Society sloop the last meeting. Thanks were voted to the dooors. A letter . was then rend from Mr. Paul, stating the interest which his Majesty was pleased to take in the objects of the Society, and that, sa a mark of that interest, he was commanded to present the Society with a gold chain and medal, to be wotu by the Chalrman at tho meetings of the members. In accordance with his Majesty's commands, the noble Chairman was deporated with the royal gift. The thanks of the meeting were voted to Mr. Peel on the occasion. Their Majasties the King of the Netherlands and the King of Deumark, were elected Honorary Fallows of the Society. Mr. Hay, the Under Secretary of State, and several other gentlemen, were admitted as Pellows. The Earl Powis and Lord Mahone, ware proposed as Follows, and immediately balloted for, and elected. Sevaral gantlemen were proposed, and others belieted for, all of whom ware alected but one, who was black-balled by a majority of 15 to 8.

The Secretary proceeded to read two papers, one on the superior properties of the equisetum sylvaticum as a diuretic, and the other on several plants, &c., presented by John Hardy, jus., Esq., on the previous evening; the length and nature of which prevant our doing justice to them, by at-tempting to report them. During the reading of the latter paper, the ettention of some of the members was engaged in other directions, the Secretary noticing which, observed, that If it was not agreeable he should read it, he would leave it alone: he should like

The CHAIRMAN (to the Secretary)-No. no ; go on.

no; go on.
One of the communications sudgesty recommanded a medicical preparation of which
it treated, to the attention of the Sudgey, it treated, to the attantion of the manys, and all Europe, on account of itahinm—the. "Holy Alliance," considering that that would be a guirmates for its assessment any part of the world. Thanks were veted to the authors of the papers.

"Up to this pariod, considerable irregularity commend in the proceedings. The ballatings, proposals, educates, and introduc-

mutes of the meeting of Dec. 9th were read; the most important part of which appeared to be, that of a question which arese on the expulsion of Thomas Brown, Esq., occ of the Fellows. The minutes states, that a question was put to the meeting whether it ould be accepted or not, which being determined is the negative, it was proposed that he should be ejected in lieu thereof, and his name be erased from the list of Fellows; and this being carried, the name of Mr. Brown was erased by the Chairman accord-

isgly.

Earl Starmorn then rose, bet whether as the chairman, or a fellow, we could not on-derstand. In moving that the minutes be confirmed, he thought it right to make a few observations. He begged the meeting to consider, that he was not calling on it to epprove or ametion the proceedings of the seting to which they referred. sidered that the word confirmation did not ievolve any approval; it meant nothing more than this, that the minutes, as far as they reported the proceedings, were correct; taking it in this sense, he begged to move, that the minutes of the meeting of December 9th be now confirmed.

Dr. Siomond, with due deference to the noble Chairman, begged to echmit, that this was not the light in which confirmation would or ought to be taken; for his own part, he was desirons of moving that a revision of those proceedings should be made. Dr. Sigmond proceeded to arges, that the coolimation could be no other then a sanctioning of what had been done at that meeting, and quoted the practice of the Huuses of Parliament, on similar occasions, in support of his opinion. Earl STANDORE considered that it was

very irregular tu revise on one evening the proceedings of aunther. It would, for inatance, he extraordinary to pass a vote of thanks at one meeting, and to consider at the next whether it should not be rescieded; it would be the same if the expression of a meeting were of a contrary napression of a meeting worth a contrary never ture. If the proceedings which it was proposed to confirm had been hastily carried into affect, he would have been the first man for re-considering them. He most sincerely deployed the ions they had sectained, but stally course now was to submit a pro-

tions, reper the stopped the reading of the Hore previous notices of motions are repapers, which were heard with apparently quired by the laws. Here they had peculiar little interest. At their conclusion, the misperileges, and could do without it. He submitted to the iserned Doctor, whether he had not better take some other course; if he could show him that the proceedings of the late meeting had been of a hasty nature, he would soon evince his anxiety to retrace his steps; but he thought it due to the council and the meeting to deny that such was the case.

Mr. CHURCHILL could not refrain from saying a few w je on the present ques-tion, for the eyes of the whole scientific world were fixed upon the proceedings which had lately taken place in this society, end, as e first step, he should move, that the correspondence which had intely passed between Mr. Brown and the society, be read. This motion was not seconded, that

not being observed throughout the evening, but the Chairman put the question to the meeting, and it was negatived by a show of hands.

Mr. Cavacuata regretted the decision, and draw the attention of the meeting to the law on the subject of expolsion of membern, as it appeared in page 10, of the printed rules. He considered that the exulaion of Mr. Brown had been in direct violation of all law and decency, and, as far as he was concerned, he was askamed to belong to a society which had been guilty of such proceedings. Mr. Brown was one of the most distinguished men of the age. He had become a fellow of this society, which was angious to have his judgment in naming some plants belonging to the mo-seum; they were sent to him, and because he was not able to attend to them, and return the plants in a moment, a letter was addressed to him by the director -- " Please to seed back the plants." Mr. Brown felt hisself, as he well might, grossly insulted, and he replied by sending in his resignstion, as a fellow, with his diploma. He (Mr. C.) should have felt exactly the same. He did not know Mr. Brown, they were perfect etrangers, but he would not have his (Mr. C.'a) name identified with these proceedings oe any consideration, and he wished this opportunity of stating his sentimeets. Mr. Frost had written to Mr. Brown, requesting him to re-consider his resignation, and when he looked to the names and the rank of the fellows who had resigned, in consequence of piction on the subject to me meeting, in the dispressful expulsion of Mr. Brown, the haupi form, for the consideration of an other. Many of the fellows were not prepared for a dispansion this averaing and it was taking dawn by supprise to egitate it. He said their things with great response for Dr. Bigmond, but such was the opinion. He said the constitution of the property of the said the constitution of the property of the said the constitution of the property of the said the constitution. It was an inselt to the scientific mend dawn to be a displace on and those general days of Parliment was not in pilot.

was immediately done to wipe off the present stain, it would be no credit to him (Mr. C.) to remain in it. He threw out these hints for their consideration, though sorry to observe that gentlemen were ready enough, (alluding to the rejection of the motion that the correspondence should be read,) to hold up their hands against the question, which was \( \). driving the nail further in they led stready struck. He considered that it would be no favour to Mr. Brown to rescind the expulsion, for whereever science had planted her foot, there was the name of Mr. Brown known, and no act of theirs could reise or depress his fams.

Dr. Stomoun said, he hoped that the new council would take this question into consideration. He thought it might retrace the late steps, without cesting eny stigms on the old council. He was convinced, indeed he knew, that many of those gentlemen who had resigned, would egain enter the society, if this were done; and he hoped ea-right, therefore, that the planta should be lightened feelings would allow thom to applied for. It was not to be thought of, vetrace. This attention to the interests of that after two years had expired, and the science would add doubly to their laurels. Society saked for them, Mr. Brown should He had heard of the election of kings and noblemen into the society, with pleasure; but he did think that one man of real science outweighed a whole world of kings, much as he respected them. The acciety sould not repay the gratitude they owed to Mr. Brown. Whee those plants had been sent to him, he was employed upon rearches, calculated to obtain for him the thanks of the whole world. (Hear, hear.) His misoroscopic inquiries at that time were and employed avery moment of his time. "It was the duty of Mr. Front to have named those plants himself, or to have gone to some associate to have done it, nr to have waited the convenience of Mr. Browe; it was a perfect indignity to the society and to Mr. B, that he had not done no, and he hoped he might leave it in the hands of the new conneil to rescue the former from its present disgraceful situation.

Earl STANHOFE trusted he bad already shown the impossibility of dolog what was was ready to receive my suggestion for the sonsideration of the Society. In reply to the statement that the late President had this was not the seas. Left that it mose from would be very well, but all else was air, and causes totally different; and he should say, a waste of time.

that he (the laim President) could not be Mr. Choncust, said he would not upon said to have abradoned the Society on these this suggestion, and necoclingly mered,

actractific man, and unless it called back its grounds, without charging — with grounds, the considered it must die auticidal death.

No calogy of his could said to Mr. Brown's cert in his delerations on the subject. Mr. reputation, and he falt that unless something — he (Earl Stanhope) respected the solem as he (Euri Stanhope) respected the scientific acquirements of Mr. Brown, he must say, that he thought it ought always to be remembered, that this Society was a Medie-Botamical Society, end that it should be considered that it was not the interests of botany it sought to promote, but those of the medical profession. We are not e botanical Society; we ought not so far to infringe on the charter of the Lionman Society, as to say that we ere. The promotion of botany is not the end of our resentaires, but merely the instrument for acquiring a medical knowledge of vegetable productions, and I shall shortly express the import of the Society, hy saying, that its huainess is the extension and improvement of the vegetable materia medica. Application had not been made to Mr. Brown for the return of the plants for two years; and what was the Soeiety to do? He might have had no relish for the arrangement. They could not tell what was the cause of this delay, and it was take fire et the application, and retorn his diploma; and he thought it was hard upon those et whose instigation that had been done, of which complaint was made, (nod he erowed that he was one.) that they should now be required to lay blame of any kind upon themselvas. Mr. Brown had, of his owo accord, ceased to beloog to the Society; and he (Earl Stanbope) thought the Society was folly competent to decide on receiving his diplome, or ejecting him. If a of the most leborious and valuable nature, | thought the thanks of the Society were due to the Director for what he had done; cod when the letters were read which had passed, it would be seen that he had requested Mr. Brown to reconsider his resignation, and recal it. The Director was not accensory to the result of Air, Brown's determination. His wished to speak his mind on this subject with delicacy; but he must say, that he thought the courtesy of Mr. Brown was never equal to his acquirements, and he thought thet was the case now. lie certainly falt it e mistortune that Mr. Brown proposed; he felt the greatest respect for had resigned, but if he might weigh one the learned Doctor, and where it was right, thing against another, he could not but som-was ready to receive my suggestion for the sider, that the resignation of Dr. Auton consideration of the Society. In reply to loowlighted in its importance that, of Mr. the statement that the late President had threwn a thousand fold. In concluding his resigned in consequence of these proceed-about say, that if any specific pruposition ings, he had it from authority to state, that on the subject were submitted to them, it

that the minute of Mr. Brown be accepted in he begged to throw it out as a hint to the council, that they ought not to vote on the occasion.

The Noble Chairman rose to put this motion, where Mr. Churchill proposed that it should be ballotted, and not put to a show of hands.

Dr. Stokene moved instead, that the question be referred to the consideration of the Council, with a request that they would re-consider the proceedings of December 9.

Ms. Chuachill. withdrew his motion, and seconded that if Dr. Sigmond, having it " to the good feeling of the Council to redeem the character of the Society."

A gentleman thought it would be singular if the meeting separated without confirming the minutes of the late meeting.

Some further conversation ensued, which ended by the Earl Stanhope proposing that the minutes should be confirmed "as a context report of the propositings, and with a distinct understanding that the present menting did not pledge itself to an approval of the lets proceedings, sed no epinion be expressed as to Mr. Brown."

A gentleman thought that that kind of form or order ought to be observed which was named in recording minutes.

Earl NTANHOUS considered that nothing better sould be done then what he had proposed, and agaie explained his opinion of the word confirmation. The motion was accordlegly pat, and no hands being held up against it, the Chairman said, "it seems to me manimously adopted."

Mr. Feoer, the Director, rose and called the attention of the meeting to the specimens of the plents, &o, which laid on the table, and with a large leaf in one hand, and a flower in the ather, dwelt at some leagth on the promotion of medical hotany, and in the course of his remarks threw out, as he said, some hints to the representative of the King of Spain, and the Becretary of Stata for the Columies, and stated that the Society was promised a valuable densition of plants from the garden of Madrid.

A form, on the appointment of Vice-Presidents to the Institution, was read, and the meeting was adjourned to Fabruary the 10th.

Legours. In a foreign journal, another case is recorded, in which some leveles, which were amployed first on a symbilitio patient, and afterwards on an infast, communicated the disease to the latter.

MEDICO-CHIRURGICAL SOCIETY.

Jensey 27, 1829.

Mr. TRAVERS, President, in the Chair. The minutes of the last Meeting were read.

AMERICAN BY ANASTOMOSIC IF THE POSS-MEAR, BUCCESSFULLY TERATED BY THE APPLICATION OF LIGATURES.

Tan Secretary read a paper communicated to the Society by Mr. Brodie, on the successful treatment of assurius by enastenesis, by the application of ligatures. There were only three cases of this description on record, and Mr. Brodie was annious that the present might be the fourth. Treatment of this kield had been first noticed by Mr. John Bell.

A young lady received a severe blow on the forebead, in consequence of having run against a bed-post. Shortly afterwards a tumour, of about the size of a pen, was re-marked on the forehead, which rameined stationary as to size for many yeers. In the year 1821 it had considerably isocrassed, and a surgeon of aminence in London was called in, who attempted to cure the disease by pressure. Compresses were applied to the parts secured by tight bandages round the head. So far from this treatment being of any service, as soon as the bandages were removed, the tumour was observed to grow seuch quicker than before. Nothing further was done till 1824, when another attempt was made to eradicate the disease by pressure, but with the same effect. In 1826 the vessels were tied leading to the tumour; some relief from pain was efforded, which was of short duration. In 1827 the tumour was vary large; the poinful sensations were attended with excessive weight over the eyes, and great depression. The patient remained is this state, the tumour going on awelling repidly, till September, 1828. The tumour was now bigger then a large walout, it was situated on the right side of the forehead. When the fingers were applied to it, it appeared like a mass of flesh, the skin co-vering it being thin. When the scalp was shaved, large and tortunus arteries were seen at considerable distances, passing into the temple. On pressure being made on the temporal arteries, the pulsation of the sumour was a little diminished. The oufferings of the patient were at this period such, that she was willing to submit to any plan that might be adopted to effect relief. It appeared to De Bohartson and Mr. Brodin, that its attack to obliverate the arterios by means of condite, would be attended with advantage. To eccomplish the

removal by means of the knife, might be accompanied with hamorrhage, and the cause into the Ma. least frompital, on the context could not be attended with success. Mr. Brodie then suggested, and in that suggestion Dr. Robertson agreed, that an attempt of the could had been tied to the vision of the could had been tied to the could have been t tempt should be made to extirpate the diecase by ligature. There seemed to be no more effectual or safer method of proceeding left. A further consultation having been held with other medical gentlemen, and all of them agreeing in the propriety of the step, Mr. Bredie performed the opera-tion on Monday the C'h of September. A strong double silk ligature having been pessed through the base of the tumour, it was firmly tied at right angles. The awallieg at first assumed a purple colour: great pain was occasioned. In the evening, the pulse being exceedingly strong, and the pale very severe, some blood was taken from the arm. On the 17th, venesection was gain had recourse to. On the 18th, all the arteries extering the tumour not having crused to pulsate, it was concluded that the strangulation was not complete. Mr. Brodie then armed one of the needles with a strong double ligature, which was applied in the same direction that the other ligatures had passed. On the 22d, the slough had began to separate at its edges. On the 26th the slough came away. It the course of a few days the uleer had begun to have a good appearance. Natric acid was applied; the sore continued to heal, the polention in the arteries to diminish, and at present there was no more pulsation than

Mr. LLovo had had an opportunity of seeing a case of anastomosis under the care of Mr. Hodgeon, which was aituated in the ring anger. He believed, in one of the cases published by Mr. Lawrence, the discicatriz was elevated nearly half an iuch. Mr. Lawrence had endeavoured to destroy the disease by caustic, but without affect. The ligeture was then applied, and he be-lieved the return of the disease was to be sacribed to the ligature ant having been properly applied.

The Parsipsur thought the present a most interesting and valuable communication, and trusted it would call forth a lively discussion.

Mr. Hurcarson thought it was desirable that something specific should be known as to its diagnosis. Whather she strong paragion of the arteries wash be gentiored in that view. He had men many of these cases, and did not resignater to have observed the exterior more fortuous than ordi-

Mr. Anwoor and south two can which the orpoins had been tied, and failed. semblance to the disease now under disevenion, and he had no doubt if the ligature had been applied properly, it would have been successful. The case alluded to by Mr. Lloyd, he believed, was that of a child.

Mr. LLoyn observed it was.

Mr. Anuger said, he believed in that case he saw the operation, and certainly there was a small part ant included, but efterwards she tumour was completely tomoved.

The Parapant recollected, in a conversation before the Society same time ago, e gentlemen stating that only buil the tumour was lockeded in the ligature, the other half died, sed the effect was as complete could be. He believed the case Mr. Arnott referred to, terminated fatally.

Mr. A a norr observed it had, but death occurred in consequence of the jugislar veis baving been inflamed. There was another very excellent case, which had been related in the Glasgow Journal, where the artery was tied, but without effect.

Mr. Hercasson doubted whether Mr. John Bell was the first to notice the disease. Ha believed a Mr. Allison, of Llvarpool, was entitled to that credit. There was great analogy between this disease, and that of menus materious; there was one eiroumstance, however, with respect to nevus, which he might mention: children were often born with these marks upon their seeks, end other parts, and as they grew up they disappeared.

The Prampany remembered a case in which Mr. John Cueningham Sauedare operated, at Guy's Hospital. The mode adopted was excision, and the man lost a great deal of blood. If the use of the needle had been thus known, this might have been avaided. He had seen many came epproaching to navi, but compared with this, they were comparatively unimportant.

Mr. Laoro observed that the most sinular case of this description of discuss lad taken place in the practice of Mr. Language. It occurred in the leg of a child. The preparation was in his measure, sed might be seen by any of the

who thought it worth their while it. The tunous was expelled by the prin-sipal arteries of the leg, and the diseased structure was so cituated, as to raisder the use of the ligature impossible. The Panaunant lequired if it was con-

genital ? Mr. Liven cheered, it was,

The Paraster mid, the principle of in bringing on the action of the atsens. He treatment if this case appeared to him to was now constantly amploying it in pewder, by the dissolution of the seat of the dissons. Seat, because it was more heady; it might The tyleg of the front of the tumour was a be used apon the spur of the moment; severy ineffectual should of treatment. ## LONDON MEDICAL SOCIETY.

Monday, January 26, 1829.

Or our entering the room, we found the members very builty employed in discuss ieg the proceedings of last week, and the ral impression appeared to be, that Mr. Lambert had been very unfulrly dealt with.

Dr. WILLIAMS in the Chair.

The Minutes of the last Meeting were

Mr. Lagro and Mr. Prance made a few observations on their Inscouracy.

Dr. Briok, in reference to the minutes of the last Meeting, recollected perfectly what he hed stated with respect to the ergot of the other was a case of two rys, and it was his wish that it should be A Manusa inquired, at erally understood. The greet argument he had against the efficacy of the ergot, was simply this :- Every individual practitioner who had spaken of the propriety of using is, claimed to bimself the efficacy of its ac-tion, in reference to the form in which he beived. He only mentioned this, because he sheerred the Registrer had taken no no-the of it.

Mr. Wallen, in answer to what Dr. the fine ergot is all the three forms, nowr, infusion, and decotton, and he was well stated he had witnessed beneficial effects withing from all. With regard to the in-lation and the postdor, he sould speak posi-tively; but with respect to the describe-paring used from one, he could not. Still, however, he thought is might be reflect upon

an hear, was, in general, sufficient to produce the full of duce the full effect of the remedy. Mr. Walier also wishes to sek the members of the Society whether they had ever met with a particular tempur, situated in the neck of newly-born isfants, which was of a stony hardness, not very large in size, and which usually disappeared at the expiration of a few months, from six to ten. He was not swere that it had over been noticed by authors; but it was described by Bir Astley Cooper in the out-patient room of Guy's Hospital, as being produced by a rupture of the fibres of the sterno-cloids a cle. During the passage of the head of the child in the two cases he had witnessed, the presentations were unsatural, one being the breech, the other the foot, and, consequent-iy, during the passage of the head of the child, a little more than the sausi stretch was made upon the neck,

The CHAIRMAN inquired, whether the se referred to by Mt. Waller, had occurred in his own practice. He also wi know whether my thing like force had been used, the once being preternatural.

Mr. Wallen did not mean to say, that

so ferce had been used, but not so much an was mountly required in those cases, because the first was an exceedingly small shild, and

A Minusa inquired, at what period the absorption of the two tumours took place.

Mr. Wallan observed, the first was in ebout eix months; the latter was, if he

stight use the expression, now going on. Air. Callaway said, he had seen three cases like the one cow under discussion. Not practicing midwifery, of course it could not be expected he could speak with sacuhad administered it; some in the form of Not practising midwifery, of course it could dimetere, others in that of powder; if the not be expected he could apeak with seen where true created in the powder, then it was clear truey of the mode in which the tumours were those who had given the tineture had been produced. Is one of the sames, the child was about five months old; in the other two they were about ten weeks. In the letter others, the immours were much less than the first; but it appeared, as described by Mr. Walter, as if the three had been torn hrengh. In these instances the sheorption was very gradual. The only inconvenience that appeared to be predicted, was an inca-pability of histing she head moved to the op-posite side without, pain. He had never near the disease described by my author. Upon inquiring of Dr. Mandell, he had been industrial by idea, that he had seen such

ing. Mr. Warran said, in the two cases that occurred to him, the swellings were each infancy; when Dr. Ryan saw her, she was about the size of a wahnet, and as kard as a kabouring under infammation of the bowels, flist. In the first instance, this oblid was which caused her death in eight hours. so small, you might almost put it, to use so old woman's plurase, isto a pint pot; the outlet of the pelvis was very large. In the other case there were twins; the pelvis was well formed, and, therefore, little extracting power was mad

ing power was used. Dr. RAMADOS, thinking that Mr. Salmon would have been at the Society this evening, had brought several specimens of discused rectum, which he begged the Society to iospect. One was the rectum of a patient who had died of spoplexy, another of dileted rectum, and one where stricture had been supposed to exist, but which was found not to

be the case.

A conversation here ensued between Dr. RAMADGE and Mr. LLOYD, as to the coincidence of phthisis pulmonalis and disease of the rectum; the latter gentleman contending, that colocidence was frequent, and the former taking a contrary position.

Mr. Sucanty believed, that fishels in and

more frequently derived its origin from dis-

eased liver than diseased lungs,

Mr. CALLAWAY could not consider the diseases were occessively concomitant. Fistule in ane was not local, but, he thought, always combined with some organic disease. The age of the ligature had been too much neglected. It was true that, in some sees, the use of the knife might be dezirable, particularly where you could pass your bistoury to the seat of the disease. Several ampirios of the day had cared the disease by the use of the silver-wire ligature.

Mr. SHEARLY recollected a friend of his, a timid lady, affected with fistula in one, who did not like to submit to the operation : sho placed herself under an empirio of the same of Van Butchell, and he (Mr. Shesrly) certainly considered the means he scopted in using the ligature, as cotremely berrifying; it was the cause of the most exeruciating pain. How far this treatment would be useful, where fishels is one was stated high op, would be matter of further consideration.

Mr. Lrovo remerked, that he had not witnessed the paid described by Mr. Shearly, where the opening of the figure was situated near the anne; but that if it was applied where the opening was situsted at n distance from the anus, that then

the pain might be very great.

After a few further sheervations from
Mr. Lloyd and Dr. Rameilge, the subject

cases, and believed they arose from some woman eighteen years of see. There was injury which the child had suntained in passing which the child had suntained in passing. calarged. The patient hed dyapaon from infancy; when Dr. Ryan saw her, she was which cheese was pale, and there was no dis-colouration of the skin. Leeches were ordered to be applied to the cheet. The respiration was difficult; the pulse was much stronger than general in the last stage of enteritis. The lungs on the left side heiog cut into, a small quantity of pus

Mr. Callaway wished to know if there

Ves any syncupe.

Dr. Ryan observed there was not. The only information that could be got from the pareots was, that the petient had had dif-

ficolty of breathing from birth.

Dr. RAMADOS had seen several cases of this nature, and considered polypus of the heart a disease of frequent occurrence. He did not consider the present a good speci-

men of polypus.

Dr. Ryan had not introduced it to the notice of the Society as a good apaciman of polypus, but for the purpose of showing the

cases of the dyspaces.

Mr. LLovo was rather doubtful as to the

alleged polypus being organised.

Mr. Callaway felt surprised that his friend Dr. Remedge should have esated that polypus of the heart was frequent. He had always thought it of very rare occurrence, and believed he was borne out in that hy what had been etated by Dr. Baillis. He had never seen more than two or three wellmarked organised polypi.
Dr. Ramadon did not say he had often

seen well-marked organised polypi, but that he had seen e great many cases of po-

read.

lypl.
Dr. Ryan did not know what the disease
Many gencould be, colese it was polypus. Many gentleman had asso it, and were well sat of its being so.

Dr. Ramanos produced two excresesness taken from the hends and great toe of a gouty subject,

## WESTMINSTER MEDICAL SOCIETY.

Saturday, January 24, 1829,

Mr. Annorr in the Chair, Tun Minutes of the last meeting were

PERUMO TROBAS.

The Passibust said it was the intention Dr. Ryan begind to exhibit to the So- of a member to have related to the Society ciety a diseased meart, taken from a young this evening, an interesting case of pneume theres he had : such a case. It had been rendered more interesting, in consequence of the object of it having been a medical gentleman.

Mr. Cornish, a sargeon, residing at Milner Place, was affected with pusses theres in November and December last. The cause of the disease was ascribed to over axertion on the part of Mr. Cornish, one avening when called up to attend a patient. patient as soon as possible, had run for a considerable distance. The next dey difficulty of breething came on, which he neglected to notice for many deys, but followed the eother of the communication, who found with great difficulty. The pulse was hard, the cheak much flushed, great pain was felt to the cautre of the chest, and the petiant could only lie on the right side. The muscles of respiration were in violent action, therewas no visible difference in the sides of the chast. On applying the stethoscope to the left side, little nr no respiration could be heard, but on the right it was axtremely The heart was felt beeting rather to the right and middle of the steraum. The author considered the symptoms eltogather a cetremely unfavourable, and advised Mr. Cooke to take more blood from the petisot, nrdering digitalie to be given in powerful doses. On examining the chest the next dey, the sound was more sources than before; the polsation of the heart was more to the right, end the metallic tinkliog was now distinctly audible. He bad theo no doubt of the existence of pacumo thorax. Every means were used to the difficulty of breathing increased. On the 19th of December, the petient similar the difficulty of breathing increased. On the 19th of December, the petient similar expired with sufficient on. Pr. Walshman, engined from sufficiention. Fr. vvunnum, and varyeff rether medical gentlemen of eminence, were then celled in, the nature of the disease was awplained to the patient, and he was informed there was an chance of ratio, except from an operation. The patient, however, at this time, it was thought, the state of the patient, however, at this time, it was thought. was not rife for much a stop. The physician recommended the patient to name on

et with, but, in consequence | medical friend to act with him ; Mr. Lawthere he had get with, but, in consequence; medical rises to act wim num; are, Lawrence was chosen. He attended; found the ment of the menting, he had committed the patient breathing with the atmost labour; facts to writing, which would be read to the patient breathing with the atmost labour; facts to writing, which would be read to the pulse 140; skin cool; had had no sleep for many nights. On laying here the chart, before and after death, by perhaps more medical greatenen than had ever attended of a munical samplebox. The respiration of a munical samplebox. The respiration is the circle time. On consists was lood in the right lung. On consulta-tion, it was the opinion not only of Mr. Lawrence, but of Mr. Guthrie, and several others, that the patchet was so near death, as to reader the operation totally unnacessary. The attending physicies avowed that he felt satisfied of the existence of pneumo thorax. Under more favourable circumstances, an operation might beve-been warrantable, as the only meane of saving The might was extremely cold and foggy, been warrantable, sathe only meanenf saving and Mr. Cornish, in his enxiety to see his the patient. An anodyne was given, sod the medical gentlemen separated. The patient expressed great disappointment that an operation had not been parformed. The enthor esterwords accidentally met several his neual avocations. On the 15th or 16th of other of his medical brethren, whom he re-November, he was seen by Mr. Cooke, an quested to see the patient; end it was ultisminent practitioner residing in Bridge mately agreed, that the operation of persecutives, who considered sanguineous depletions time necessary. Oc the 20th of December, was made into the thorax, along the upper Mr. Cooks thought it necessary to call in adge of the fourth rib. Immediately a gualof air came out, almost anficient to exthe patient lying on a sofe, and breathing tinguish several candies. The patient ex-with greet difficulty. The pulse was hard, pressed the greatest satisfaction. No water then came from the wound. The relief continued for some hours, but ultimately the difficulty of breathing returned. On the 31st of December, Mr. Guthrie, Mr. Cooks, and several other medical gentlemen, visited the patient, and found him labouring noder considerable dyspama; the pulse had fallen to 120. On the next day, the medical gentleman were agreeably sur-prised to find the patient had had several hours of comfortable sleep, and that his-breathing was easier. He had got out of bed without assistance. Mr. Lawrence also eew him, end found him considerably re-lisved. A canula was passed in at the wound, and when the finger was removed, air, in a strong stream, escaped through the aparture. It was concluded that this phecomenon clearly indicated that there was considerable expansion between the branchi. and the cavity of the places, less hope was therefore entertained for the recovery of the petient. On the 2d of January he

expired.

Mr. Cornish being of the Hobrew perallowance of an examination after death; this, however, was altimately accoded to. Dr. Walsham, Dr. Hodgkin, Mr. Guthria, and many others, were present. On reising the sternum, the hourt was failed rather to the right of the median line; the left lung was collapsed; about nighteen ounces of serum were found in each pleasal envity. The | was no excethe right was very much so. The adhesions of the left lung, however, were considered of many years' standing. It was a very in-teresting question, to consider at what neumo thorax comm period the pneumo thorax commence Mr. Cornish himself had deted its con meacement from the period at which he had been called up in the light, and had run hard. There could be no doubt entertained of the supture of the pleurs taking place on that svening. There were no means of securining the existence of pneumo thorax, except by oscultation and percussion; and when those means were resorted to, ac doubt could be entertained of the existence of pneumo thorax. The author thought if the operation had been performed early, the life of the patient might have been spared.

Dr. GRANVILLE regretted that the author should have sauctioned the perpetuation of a mistaken a omenclature applied to this important disease. It was attempted to he described under an erroneous name he thought the more proper epithet woeld be purumatent thermets. He, however, considered, that the thanks of the Society were due to an eminent degree to the author for the pains he had taken in bringing the case to the notice of the Socisty in the elaborate manner be had done. Few cases had been watched and recorded with more assuracy. He entirely concerred in the manner in which the stethoscope had been applied; but did not quite concede to ervation, that the cure might have been effected, if the operation had been performed earlier. He lumanted that cases of this description were saffered to pass without endeavouring to ascertain the nature of the air that escaped. There was co doebt, in the present instance, atmospheric air was what would have been found

Mr. Tuoneson wished to know the exact size of the fistulous crifice which had been described; he understood it was a very small one. It would be also right to know whother it passed through the cellular tissue that united the lungs together, or through the lungs themselves

The Author of the paper having arrived, felt obliged to Dr. Granville for the sompliments he bad paid him, with respect to his having adopted a wrong name as applicable to the discuss. He confessed he had not taken much trouble to escertain its propriety. It was the name generally edepted, and he considered historial not answerable in having used it. If he had instituted a

aperture in the places was fistalous, and of segreely be detected; it was not larger than many weeks standing; the left long presented would allow of the admission of a berby-sub-since, but was not materially discussed; occi. Dr. Hedgkin had expressed it as his the right man manuscript. opinion, that there had been the contents of a small quantity of tubercles evacuated from this spot, through a small bronchiel tabe, and that this might have been effected by the petient, by sommon coughing. There was nothing between the end of the brea-chial tube and the cavity of the plears. He (the author) supposed the membrane had given way in the action of running, which had been described; that air had become extraverated into the pleurs, and that inextravasated nate the product farmulation of it took place. There was nothing but oscultation and percussion to gui them.

Mr. Twompson observed, that he thought it was necessary to have still further explanation. It had been stated, that the position of the heart had been altered. It appeared to him, that the cause of death in either way of looking et it, was different from that which was etsted. He had no doubt, that when the operation was performed, the heart returning to its original position was the cause of the relief beiog given. It would remain with him a matter of doubt, whether an operation under such circumstances would be proper, because it would afford only temporary reliaf. It ap-peared bighly probable, that in this case there was a secretion of air, and no escape from the broachial tubes.

The Author was serprised that Mr. Thompson should have overlooked that which had

been stated in the paper.

A sort of catechising discussion here took place, with respect to the origin of the air, between Mr. Thompson and several other mambers.

Dr. Gazcour was sorry that the valuable time of the Society should be occupied in discussing the origin of the air; there could be no doubt, as he conceived, a pos the subject. He thought matters of much greater importance might be discussed. The first point on which he wished information was, as to the frequency of the disease; secondly, as to its disgousis; and, lastly, its treatment. He confessed, that mail the explanation gives in the paper, he know eary little of the disease, but thought too much stress was placed upon the one of the stationsons. For his own part, after platfied stethoscope. For his own part, after what had been said, he believed he should he bide to discover the existence of the discouls as well. if not better, without the use of it. The alteration of the position of the heart was new name, highed no death he should have loss to know why, lested of using the knife, been considered or carrying the subject for a small paneture wide a troor might not that then measurery. The circ of the miles jump been made in the therax, and why, under any eir

in peneturing.
The Auruon was salemed to say so much but considered bimself called upon, in consequence of Dr. Gregory having doubted pe in the the necessity of using the stathosoo; diagnosis of this complaint. His friend, he was sure, had not heard the whole paper read, or be would never have thrown out such a doubt. If secultation were not prectised, there was but one other resource left, namely, perconsion. In this case there was not any difference of sound in striking the two sides of the cheat, and it was only by the use of the stothescope that my difference had been ascertained.

After a little further discussion, which was cotirely uninteresting, the subject was

dropped.

Dr. GRANVILLE said, as there was now a few minutes to spere, before the usual time of breaking up the Society, he wished to occupy it by reading a letter which he had received from a lady in the country, which related to that part of the profession which a certain Journal, that had bean rather noisy of late, had takee under its protection. The gentlemae to whom the letter related, and he should avoid using sames, was proved to be a contributor to that work. It would show, that a parson living not a hundred miles from London, whose name had appeared as the writer of cases

The Paratoent (interrupting) doubted whether he should be acting rightly in allowing the letter to be read; he was afraid it might be converted into a sort of privata feeling which it would be desirable to avoid.

Dr. GRANVILLE could assure the Chairman, that it was not intraded to reflect upon either the Journal or the individual, but it

was maraly to allow-

The Paratoant observed, he should trust entirely to the good sense of Dr. Granville.

Dr. GRANVILLE observed, the Chairman might depend apost him. The subject ra-lated to the making up of a certain prescripties, explaining to the patient why certain prescriptions could not be made up. The letter rao thus:-" I go ou taking your quining medicion as ordered; I have only

Dr. GRANVILLE was glad to say the let-

matances, there was danger nise never could have been given, but only a mixture of bark-

Mr. Nonre must again interrupt Dr. Gravville, and trusted the Chairman would not suffer any thing further to pass upon this subject. And thus the matter ended.

The CHATUMAN read a petition to the House of Lords and Commons from the Sodety, praying the legislature would take into its consideration some mode of incilitat-ing the procuring of dies for dissection; and suggesting the peering of a law to ena-ble the governors of workhouse, and other institutions. institutions, to dispose of the hodies of per-soul dying there, who should not be claimed within a reasonable period. The petition would remain for several succeeding nights, for the signatures of such of the members as felt disposed to support it.

#### WESTMINSTER HOSPITAL.

## PRACTURE OF THE ILIUM.

MICHAEL GRANK, aged 31, a stout wellformed man, came in on the 29th of November, having fallen from a souffold lifty feet high. He does not recollect the posture in which he fell. When brought in, he was once or twice in the columns of the Journal found in the following state: lying on his back with the anterior superior spines of the ilie io a line ; the right leg half an inch. shorter than the laft, and slightly everted; a flatteoiog in the situation of the trochanter major, which was ions prominent by an inchthan that of the opposite side; the distance between the auterior spine of the ilium, and the trochanter, half an ioch less than on the sound side; the glutei rather tumefied. The adductors and pecticalis awolleo and taose; the knees could not be completely approximated. The thigh could be bent on the pelvis to a right angle, with very little pais, and no crepitus; but the patient had scarcely any power over the limb. It could be ex-tended to an equal length with the apposite leg, but was immediately retracted; rotatino lawards caused considerable pain. When the fieger pressed on the tuber ischii, quintage movement to the process of 
in which the uterus is coming down but e of their being likely to be little way, say an inch or two into the pelvis, the astringent fleids, those before guamerates Naw in these cases you aften find your pa- are some of the best, slum and the sulphase NAW II 18606 Casel you much man your per me same or into user, same and see support into user, same and see support into term in table and nervous; they have for sine being the principal; always issues a great deal of dyspopaia, soldity of the jung the atrength and frequency, according atomach, inflation, amuses, womblings, and to the effect produced, otherwise you wor very frequently, too, the bowels are hore do not service. It might be week casel or less disturbed, and more especially inflations of the bowels are spit to occur; so not be of use, if they were introduced with thet if the women are married, they think a little care, which, perhaps, might be done they are with child, and ascribe it to pregion the patient herself; and I think this namey. Then with these symptoms of general relaxation of the "name, disorder of a very powerfel application. They would the advantage of him; in the vaging ness and pais in the back, ascribed to the more permanently then a wash, which reas ness and pair in the user; secrated to the more permanently then a wasti, which read upper pert of the sacrum, a sensation of off as soon as it is infused. In a case that bearing down, as if the interior part of the occurred or this Hospital, I made trial of body would pass every, a principal symptom, the read—the comman resin, in a very fine irritation of the rectum, irritation of the bladder, riting the rectum, irritation of the bladder, riting ten or twelve times a day, and aftern but of precidentle, and it was replaced after more or loss of a discharge of mucus from the epilication of the powder. Now it to the vagina, as if the patient were labouring certain, that the womb did not come down under the discease which I shall heranthar learn as accir, after the amiliantian of the under the disease which I shall hereafter again so easily, after the epplication of the describe to you under the name of lencer-resis, as it had done before; but whether rham, you can hardly fail to recognize the this arose from any effect that had been disease. But if there is a doubt, that doubt produced by the astringent on the part, or is to be set at rest by making eareful axi-where it arose from the more roughening mination; and where you fied the disease of the surface, was not clear. It was applied to exist, you will observe the apper part of in this way for a few days; it occasioned the vaging to be very much relaxed, and the neinconventance whatever, and the girl leavwomb to protrude; and where you introduce ing the hospital, no further opportunity was the catheter, you will find there is a ten- had of abserving its affects. dency to an abstruction, and a distortion of rethra. As before, the best timn for making this examination is in the evening, rather than in the morning, because if you are inexperienced in making those investigations, yen might be deceived, were you to institute e morning examination.

Where there is a relaxation in a slight dagree, oun of the first steps to be taken, is to improve the general bealth of the patient, for this purpose you may use blue pill in small quantities, laxatives, tonic remodies, more especially the lighter bitters, and nourishing diet; but the most effectual mode of relieving her will be, if she is an inhabitant of a large city, by sending her into the country, or to the senside as soon as possible, and after ahe gets there, har bealth will soon improve, and she will gat rid of the disease for a time, at least. In those cases, it is a great advantage to lay in the horisontal posture as muck as may be, without injuring the health, for all confinement, instead of improving the health, makes it worse. Further, as relaxations, where they we encouraged, are apt to terminate its proper in procedentia, or prolepsus, you should dis last resort. rect your patiest to electain from all forcing, It sometimes begann after debury, that for the more the forcing, the more the however, the state of the womb is coming force, and this forme a parts descend, and the more likely the is trainty of the disease that descree, remark, to have, is the course of a few ments or a Wises a prolumen, takes place, and the few years, a prolumes. Astringent remark womb lies out between the limbs, it fortill dies descree a full trial, for there is no doubt a large tention on long the limbs.

When women lebour under a slight descant, the bladder is frequently obstructed, so as to render it necessary to introduce a catheter; hut sometimes the use of this catheter may be supersoled, and especially when you are et a distance, it is very desirable that it should be superseded, if possible, by the patient lying in the horizontal position, with her hips a fittle related above the level of the shoulders, balf us hour, or more, and then trying to pass the water; or sometimes by getting a bearing with the finger upon the mouth of the aterus, the patient herself, if she is intelligent, may replace the uterus, and in this mannor ob-

tain a pessage.

If the relaxation, then, is of the slighter degree of the uterus, it should be your principal object to mend the general health, to keep the patient in a borisontal posture, in restrain all unnecessary efforts and forcings, and to use estringents actively. And as to the obstruction of the bladder, it may be religred either by the use of the cathet or by taking means to bring the nierus is its proper place. A pessary should be ye

men of in date

and it is we and it is well, simily known, by your manny, they on stoyl so large, that you sould pass your langer late it, the child's bend having just; planed through it; yet I have been table of two came, in which the practicemens were so ignorest; that they did not trong-nies the disease; in one case the womb was outsway with a peniraife, and the woman died from collapse; in the other case, there was a great deal of handling of the uterus, and this mound to ourselve death. The manner this bisomed to concesson occur. A ne summer of managing this cases of prolapses of the woman, of the blacker should discopited, the woman should be retained in the place, and the woman may be kept in the horizontal position, with the hip a little elevated, for six or eight weeks together; and if she submits to this, there is a fair hope of becoming permanently oured of the disease, at least in some cases.

When women are in the latter months of gratiation, the womb does not usually con-down, for it is so large, that it gots a bear-ing on the brins of the pulvis, and there is not room for it to descend; yet it does so happen sometimes where there is a very large pelvis, and the womb not very bulky, estation, the womb does not usually come that it comes down so far that the os utari may be seen externally. It is more common, however, and by no means infrequent, for the womb to descend in the first three or four months; and a case of this kind is very reedily made out by the ordinary symptoms; there is the sching in the back, there is bearing upon the rectum, a bearing on the bladder, with an obstruction of the prine, and when you examine it, the case is obpervable at once.

If the woman is in the and of pregnancy, or if the womb was to descond during delivery, provided the on uteri came into sight through the external parts, I suppose it would be your duty to dilete the on uteri with your fingers, end in this way accelerate the birth of the child as meeb as possible; but if it descend a little way merely, I should not meddle with it—meddlesome midwifery being bad-but would leave the woman to

If, in the latter months, the womb were lying externally and between the limbs—a once of this kind occurred to the illustrious Marvey-if it could not be put back, I

carily known, by your fading | the arm if she is in much pain, and, in the others of a few weaks, his womb become so large as to get in beating upon the bor of the polvis, and the displace is cared. woman was sent up from Gravesend to this kospital; I aramined her, and found the case to be prolapsus uter; she was obliged to he in the herisontal posture; she was in the third month of pregnancy; and as she lay on the bed in the hospital, the uterus erose, got its bearing on the botten, end, et the end of a week, the disease was effectually

curid.

It rarely happens—I never myself saw such a case-schar, in the descent of the earlier meaths, the womb remains in the pelvis, blocking up the cavity, making pres-sure on all the parts, and giving rice to symptoms of severe ubstruction. You relieve it by introducing the catheter; and when you have emptied the bladder, and not till you neve empuse the number, was not this then, you webture to urge the womb above the brim. This, I say, you should not do, till the bladder has been previously evacuated; for if it was overloaded, say with six or seven pluts, and you were to urge the uterus upwards in the first place, you might have a great deal of difficulty in pressing it backwards, and if you succeeded, you might burst the bladder.

It has becaute:
It has been saked whether a radical cure
connot be adominabled? and if it could, it
is certainly very desirable; but, in the present state of our knowledge, we are not possened of aufficient information to shable us to effect that cure. It has been proposed to cut into the vagine, and take the wond away sltogether, neither de I believe extirpation of the womb would siways be either impossible, or fittal, yet it is too dangerous an operation to be thought of for the purpose of ridding the patient of this disease; besides which if the prolapsed womb were troublesome, and were extirpated in consequence, the probability is, that other parts would de-scend—that the bladder or intentines would come down—therefore that operation pro-posed by the French, I can by no means recommend. In this disease, it has been proposed egain, to bring on an inflammation of the vagina, for the purpose of giving rise to constriction and cohesion. Now, every man of obstetric practice must be aware, Harvey—if it could not be put back, I man of obstatic practice must be sware, should recommend the bringing on of deflerey, by pushturing the membranes; and there, when parturition same on, I should, readers it impossible to introduce even a six-before, assist an idlating the on story. In sintheter, Now will then, even, it can happened to multipate the storys, but I sectionly profer the independent of the unsarried, and about the time of parametical possibility profer the independent winders, then the province is even in the section of the unsarried, and about the unsarried, then the province is even important to fave, and shout the unsarried, then the province is even important to fine the parameter of the influence of the ingline same induced; but we include the interest of the ingline same induced; but we include the significant independent in the interest of the ingline same induced; but we include the significant independent in the interest of the ingline same induced; but we include the significant independent in the interest of the ingline same induced; but we include the significant independent in the interest in the interes

inflammation by injections, and to have the tion take place; Dr. Hamilton had under satisfy you that the uterus being heavy, and care some two or three cases in which has the vagins relaxed, it is very apt to come made this trial, but without success. Io the down. This descent, of course, produces a other hospital, in a case of procidentis, I once introduced a pessary with large spertures, one that might be called the lasters mary, similar to that hers exhibited, bot not to be recommended to your use. This pensary being passed up, and there being a good deal of forcing, parts of the vagins were driven through the large, holes; a great deal of irritation was io consequence pro-duced and these parts alonged away; of course I removed the pessary the moment I observed this, and the woman complately recovered; hut mark, ootwithstanding there had been so much inflammation of the vagins, and though the patient had been con-ined to the horizontal posture afterwards, to give her a chance of a radical cure, no such cure was in that way produced; yet there is a case I think recorded in Burns, in which a silver peasary being used, a great deal of inflammation was occasioned, which brought about a radical cure. There-fore, to bring our observations to a point, in women past the age of the estamenia, it is very desirable that we should try to cure the disease redically; and I think, though io our present state of knowledge we do not seem to he in the possession of the means tures were considerably altered; the cheeks of accomplishing it, yet that this cure is puffed; the lips and tongue enormously well worth the consideration of a man of ta- swelled, but not painful, covered with sairs, lent and industry, for I san not without and very pale. The swelling of the tongue hope that it might be obtained. There is another mode in which a radical cure may he sttempted, and that is, by confining the patient after delivery to the horizontal posture strictly, for six or eight weeks; I su pose in the majority of cases this will fail but in some few cases it seems to succeed splendidly. Mr. Redfern, formerly associsted with this class, had the care of o lady, who, for four years together, had laboured uoder a descent of the uterus beyond the axternal parts, she became pregnant, she was confined to the horizontal posture, after her delivery, and for some time afterwards, a year or more, the time in afterwards knew her, she had no further appearance of the disease.

I shall now conclude the lecture by sending you round some preparations. The preparation I here show you, is a prolapsus of the vagion, the front and sides of it being disposed to come down, this is the disease in the slighter degree.

The next preparation is of the laceration of the perineum, which disposes to this descept of the womb, by Isylug the vagins

inflammation by injections, and to have the The preparation which folice a is of the parts replaced before adhesion or constrictures in the pusperal state, which will large tumour between the thighs.

The casts on the table also show you the

descents of the different parts in their diffact degrees; they are well worth inspec-

#### FOREIGN DEPARTMENT.

MINORIAS EFFECT OF THE HITZ OF A VIPSE.

Josephina Pogor, twenty years old, of a strong constitution, in the spring of last year, was bitten by a viper, at the naternal anels of the right foot. The would having been immediately cleaned with saliva, hy which the small quantity of blood covering it was wiped off, she began to walk towards her village, when abs was soddenly seized with a sensation of extreme dehility, violent pain in the epigastrium, and vomiting, and the tongue began to swell in an extraordinary manner. Dr. Mariaoini, who saw the patient an hour and a half after the accident, found her in the following state :-- The fearapidly increased, so that it at last almost filled the cavity of the mouth, and coused great difficulty of breathing; the voice was insudible, but the patient expressed, by signs, that also suffered much from pain in the enignatrium and stomach; she had frequent stracks of syocope; the pulse was intermittent, and very weak; the limbs were in s state of relaxation; the whole body was very pale, and from time to time agitoted by fits of shivering. The wounded part was neither a welled nor tender on pressure. M. Marianini endeavoured to admioister a dose of llqoor ammonia in peppermint water, but the sweiling of the tongue, and the continual flow of saliva, prevanted him from attaining his object, and he was at last forced to inject it through the nose. After an hour, the awalliog of the tongue and face having a little subsided, the vital powers being somewhat restored, and the pul having acquired more force, and in the a proportion the would baving begun to swell and become paluful, M. Marianini, accord-ing to the advice given by Morgagni, (Epist. 59, Art. 50,) applied a capping-glass to the open, and which may be set flown smoog the wound, and, after having taken about two causes productive of prolapsus.

The next preparation is of prolapsus steri. opil. The internal use of the amminis, wound, and, after having taken about two been continued for about six hours, the face and tongue regained their natural size and ppearance, and the patient felt an excessive inclination to sleep; she had not, however, slept more than an hour when the swelling of the tongue, and the general symptoms of dehility, returned with such violence as to place her life again in danger; it was therefore necessary to rouse her from her sleep, and to keep her awake; the above medicing being, at the same time, administered hand dose. The awalling of the tongue, is well as the general symptoms, then gradually disappeared, and, after perseverance in the use of the ammonia for about twenty-four hours, did not return again. The swelling of the wounded foot, from this time, increased to such a degree, that very active antiphlogistic means were resorted to; and after some weeks the patient was perfectly cured.

Swelling of the tongue has but rarely been abserved after viper-bites, and in the few cases on record, it was always caused by the patient's having sucked the wound, which, as may be inferred from its situation, was impracticable in the case before na, although the patient, probably, in moistening it with saliva, conveyed a portion of the virus to her mouth,-Repertorio di Medicina,

Torine, 1828.

ON THE CAUSS OF DEATH AFTER THE LIBA-TURS, BR DIVISION, OF THE PREUMO-BAS-Tale NERVES.

Professor Mayer, of Bonn, concludes, from numarous esperiments on this sobject, that in almost all the cases where the pneumogestrin nerves had been tied, death ensues from the blood of the lungs losing the pro-perty of remaining in a field state. "If, he says,) the animal dies soon after the ligature has been applied, the heart, as well as the erteries and velos of the lungs, are found filled with a dark-coleured enagulum, of little consistence; while, in those cases where death course twenty-four hours, or more, after the operation, the enagulum is firm, fibroos, of a white colour, and penstrates into the smallest voscular ramifications of the luege." These concretions, Dr. the proximate cause of death; they are proprived of nervous issuance, to separate to its constituent parts. After the division of the poeumo-gentric nerves, the tem-perature of the animal is either not dimicorrespond with the state of respiration.

with the addition of some npium, having effect on respiration and on the action of the heart; for while the number of respirations is diminished by half, two-thirds, or even five-sixths, that of the pulsations of the heart is increased to double, or even quadruple. This extraordinary difference, the anther infers, is owing to the presence of the senguinous concretions in the pulmonery vessels, which require an increase of force and frequency io the pulsations of the heart for their propulsion. Zeitsehr. fur Physici.

The Mediciel-Chirage Zaitung contains the result of some interesting experimants relative to the action of the gastrio jnice on the parietes of the atomsch after death, and to the effects of electioence on animals of different kinds. The gastric and intestinal juices never soften or dissolve the membranes of the stomach or istestines; their action is rather diminished then augmented during abstinence; and the proxi-mate cause of death by hunger is not inflammation of the etomach, as has been lately maintaiced, but general exhaustion. Carnivorous animals bear absticence much longer than harbivorous ones, end dogs die much earlier than cats; if, during abatinence, carnivorous animals are aupplied with water, they live considerably longer than those who are deprived of it; in herbivorous animals this is not the ease, and they hardly ever touch the liquid even in extreme hunger ; rabbits often die frem exhaustion, although there are afterwards some remains of food found in the stomach. and if, driven by hunger, they devour mimal food, they generally die very soon after-wards, sithough they have the power of digesting it, as appears from the contents of the atomach. In those animals who die from hunger, the value of the abdominal viscers ere generally found gorged with blood.

CARTILACINOUS DEGENERATION OF THE STRMACH.

A middle-sged female, wha, for twelve years, had bad a moveable, round, firm tomour in the abdamen, which, by several physicisos, had been declared to be a deof the luege." These concretions, Dr. generated avery, epplied to Dr. Dieffen-Mayer believes to form during life, sed to be hach of Berlie; who, after e cureful examinstion, was of the came upinion; and as the patient had never experienced any pain in the stomech, nanses, vamitiog, or any of the symptoms by which a scirrhus of the stomach is generally secompanied, was very far from suspecting disease of this organ. nished, or, if it be, the diminution dues unt The patient, however, soon died; and, at the post-nurtem examination, it was found The most remarkable phenomeson constantly that the tumouf was formed by the stamach, observed by the author, after the operation, which was in a state of cartilagicous deis the singular disproportion between its generation; its sotation paries was no inch thick; and, except a small purious of the and, after the recovery of her senses, com-posterior puries, the whole stomach was plained of palpitation of the heart, dimness changed into u firm, incompensable sec. of sight, and of a sensation of cold over the Direction, which, during the petient's life, right side of the face, which became pale, had been bet very alightly distarbed, must, while the left half retained its natural in this case, necessarily have been carried colour; all these symptome gradeally disconnected in the mechanical action of appeared within a few hours after the operathe atomach, Rust's Magazin.

# SURGICAL CLINICO PAVIA.

LIGATURE OF THE BIRET CARCTID.

Rusa Taccour, setat. 29, of small atsture, and lymphetic temperament, wea, at tha mercurial treatment of some weeks, the petumours having shortly siterwards increased agale, aed at last formed large shacesses, e returned to schmit again to the treetment, which she had so impredently intertien, was soon recognised as an accuriem of the right carotid. No informatine could be by which it had been produced; she eely related, that siece its formation she had felt a nonticual tiegling in the ear, and alight vertign; her sight had been impelred, Annal. Univers. di Medicie. Sept. 1828. and she had suffered much from pelpitation of the heart. The tumour was of the size of an egg, sheet se inch below the segle of the lewer jaw; it wes examined by Prnfessor Scarpa, who recommended the operation; and it was accordingly performed, ne the 23d of May, is the fallawing menner: an Incision, of about two inches and a half, terminating at the aternum, having been nade along the internal margie of the eternamestoid muscle; the sterna-hynideus, and aterno-thyrnideus, were pushed towards which has found its wey even into this the trackes; and the earnid artery herieg hyperboreac region; sed, foreign as its been laid here, was isolated from the jugu-ler vein and poeume-gastrie sprre, sed tied attribut. I read it with great interest and by a simple knot, between which and the pleasure, and rejoics in the good that it we wassel, a small cylinder of linen, covered dose, is doing, and is likely will to do. I with cerate, was placed according to the certainly never dramed of becoming a cor-method recommended by Scarpe. Imme-dictaly after the application of the ligature, Number for October 11, which I have just

tion. The pulse of the right radial artery was much stronger than that of the left side. The wound, except in its middle part, which contained the ligature, was bealed by the first intention. For some department of alight head-sin, the petient complaints of alight head-sch, some difficulty of availability and an nepleasant secasion of heaviness in the right arm, the veins of which awelled considerably, but these symptoms soon disoppeared, and, on the twenty-first day, the beginning of last year, edmitted an account ligature same off with the liean cylinder, of investorate syphila, the principal symptoms in the state of the which were vision near neutron pains, however, for a long time incomplete, and is a nectores on the right tibis, and indersted margins assuming se codematous fusgoid apligature same off with the lican cylinder. The electrication of the wound remaining, tumours of the cervical gloods. After a pecrance, it was suspected that the ayphilitle offeeting, of which there were still some slight tient finding her general health mech im- tracee, produced this effect; and the method proved, left the hospital; but the glandular of Cirille (consisting of frictions of the caymuriete oletweet on the soles of the feet) having been accordingly employed, the wound was perfectly healed at the end of the second menth. On the 1st of August the ansurisrupted. The closers eventually healed, and mal tumour was herd, free from pair, and the swelling of the glands subsided, but size of a filbert; the greeral health of the there remained a temeur below the engle of putient was considerably improved; her inthe lower jaw, which, by its atrong pulsa- tellectual faculties, as well so bearing and sight, were cot is the least affected, and the pulse was equally atrong at both wrists ; phtained from the patient, as to the cause the right temporal and facial arteries only had a weeker pulsation then those of the left side, and the right side of the face appeared ent so well murished as the left .-

> REPLY TO MR. DESMOTT'S COMMUNICATION ON THE MATERIALITY BY MIND.

#### To the Editor of Tun Lancor.

Sin,-Though a divine, I happee, navartheless, to he e reader of THE LANCET, the aneurismal tumour sensed in pulsate, read, impels me to request further informed and was reduced to a third of its former tion upon the important subjects to which it size; the temporal and external manillary relates, and which I hope the author of this also coused to pulsate; the patient fainted; article will feel it his duty to communicate. MIND.

583

In the articles which I refer, the author, how this conclusion is to be avoided, I G. D. Dermott, Eag., has, by e very profound physiological investigation, "elesty" established the following positions :--

1. That parception, thought, memory, judgment, and all other mental aperatioes,

are functions of mere matter.

2. That we have no conception whatever en to the neture of apirits, nor can any heman language sourcey to the mind eny just idee as to havir nature, or as to the pre-perties with which they are endowed; that, in short, we are neither language nor ideas to enable us to express the nature of epiritual things.

3. That material and apirituel things ore so different and incompatible, that the one cannot be the direct effect of the otherthat they nennot be existing in a state of intimate association, because they must be as different in nature as two extremes con

possibly be.

4. That the lower animals beve minds,

but that they have no mult.

5. That man, besides a mind, has elso en Immaterial and immortal soul; but that so long se organic life continues, so long the soul must remain dermant; but, on the other hand, as enon as the life of the body ceases, so soon the soul eeters into a state of development, or into a state of actual-it may be said sonsible—existence.

6. That there must be e great and almighty First Cause, or, in other words, an

omnipotent Creator -- a God.
7. That without education, there would be neither knowledge nor conscience, which are jest convertible terms—that it is education that forms the mind, or, what is nearly the same thing, calls It into action.

I mean not, at present, to incur the guilt nf celling in question the accuracy of any of these positions, es, besides being drawn from the dapths of physiology-a science of which I am, as in duty bound, must profoundly ignerant-most of them bear the of a very venerable entiquity, for which I have e great reverence. But as ell the doctrines which we divises ere nesustomed to teach, varish before these positinus, " like the baseless febris of a vision," I abould like, before antirely new-modelling every erticle of my aread, to apply to Mr. Dermut for some explanations, which I hope he will consider it a duty to give.

really cannot me : for " Bibles, revelations, ministers, religious," have nothing whate ever to do with the mental powers, since Mr. Dermoit above that the lower animals possess these powers, yet need seither Bibles nor ministers, because they have no souls. And, as far as I can see, Bibles and ministers can be of an little use to the a which does not begin to live till the body be dead. Why then should these articles he retained, on the pretense of preparing for futurity e sort which has an actual ar sensible existance; till it is far beyond their reach? Trub tremble far my craft, and so mey yen too, Mr. Editor, for yours. For when theology is beelshed from the world, I again ask what ere we poor parsons to do? We can neither dig nor beg, and I donbe ont that many of us will just turn physiciogiete, and crowd the already aver-prowded ranks of your profession. One of the nonconformists, who was ejected in the reign of Cherice II., said that many would have reason to mourn his ejectment; and being called to account for his words, said, all that he meant was, that be intended to commence the practice of medicine. Now, when Mr. Dermut has got us all spected from our pulpits, I feer meey will beve eause to rue it, and your profession hardly less than ours.

Ministers often complain of the inuttention with which they ere beard, and of the little good that they are able to do; and no wonder, truly, new tim secret is out. The soul, to which they ere addressing thamselves, in all the while enjoying a sound repear. This fact also necounts for e mode al' presching which bas become vary fashice chis, and with which, I confess, I heve bitherto been so ignorant, se to be net a little disgusted. I heve seen men-sed should you have hoppened in stray into a church, so probably here you-labouring in the pulpit like e querry men at piece work, with their erms gning like the sails of a windmill. And because eld people tika anke nearly as well as abildren, I have heard preachers highly praised for ne other reason than that they nut-heroded Herod, and " emened, indeed, the very facelties of eyes and ears." This I used to think totally inconsistent with the solemeity of the gospel, and opproaching even to profenity. I new acknowlege my mletake. These

Any neaterally very serious to know men, I suspect, are aware of the alcept of what is to become of us poor parsons, is the soul, and laudably endeavour, by the consequence of the new light which hes nation of velocent veciferation, and violent thus been poured over this happy age. If genticulation, to arouse it from its unpidity, men should conclude that happy age. If I now admit the propriety of special was absoluted to a second of the second o us, ministers, and religious," are totally much hunder than is at all necessary to be done in this present world, and own their distinctly heard, and that they who address existence to a more delusion, why then you the soal, have at much reason at the pricata more "Othello's compation's gene." And of Baal to Jeap, and to shout aloud. I

admit the propriety of the praise bestowed | factory, both to your profession and ours, if upon strength of lungs well applied.

" Some of the sermon talk, a sober crowd. And loudly praise, if it were preached

Yet of what nas, after all, can this tremendous bawling be, when it is quite olear that the soni cannot he accountable for any of the deeds done to the body-deeds of which it has no knowledge, and over which it can exercise no control ?

Again: Mr. Dermett over that I have an immaterial and immortal scal. As he says so, I cordially believe it. Seed to think that I could prove this too, but in this I find I was wrong. This soul has no operations or effects from which its axistence can be inferred. Now, as the fact of its existence is undeniable, and as Mr. Dermott has swept away avery argument by which phi-iosophers and divines, from Plate downwards, have attempted to prove that existence, I should like very much indeed to know, upon what grounds he believes in its existence. I confess I feel it vary awkward to carry about with me, and to boast, too, of possessing, a soul, when I am totally numble to produce the alightest evidence that such a thing exists. It is unpleasant to believe, one knows not why, exceptiog jost that Mr. Dermott hea said so. Now there may be folks foolish enough not to consider this a satisfactory reason. Will this physiologist, then, have the goodness to tell us in what part of the organic atrueture he has found it. Were it an active ture as has sound it. Vere it an accura-vital principle spread over the whole, and animating avery pert, this inquiry would be useless; but us it is dormant, it must have a local habitation; sideliest, a dormitory. Now accentific men, as well as divines, will surely be ourious to hear if Mr. Dermutt has, in the course of his physiological reassrohes, found out this dormitory—has detected the eleoper napping in its coll, like a toad in a block of marble, and canglet it while just beginning to oxereise ite new found powers, and to sheke off the slumbers of some threescore years; or if it make its escape from the body, ore his kulfe can reach its ebode, has he found, at least, the place where it lies recently baeu, jest as et thillingham Castle, in my neighbourhood, they show, in one of their marble chimneypieces, not the toad, but the cavity where the tood jay. As he has left us no other proof of the soul's existence, I hope he has ot a few apenimens preserved in bottles, bermetically scaled, and which, on being opened, will prave the correctness of his

wa know on what grounds we are antitled to believe that we have within na a dormitory, occupied by an insensible, immaterial, immortal dormitent.

Some people, also, may be sufficiently inquisitive to ask, for what conceivable purpose the soul is sent to sleep in a materiel body for some threescore years and ten, before it comes into actual or sensible existcuce? If it be alleged, as on the Pythago-rean system it may be, that the soul is lodged in a material held, on account of guilt contracted in a prevalue state of being, it may be replied, that according to Mr. Dermott, the soul, as we shall presently see, possesses no moral powers, and, thers-fore, can contract no guilt. And sopposing this difficulty removed, which I have no doubt Mr. Dermott cen easily do, it mey be further saked, why souls abould be sent to sleep in human bodies only? Woold not the organism of an ox or an ass afford as convenient a dormitory as that of Mr. Dermost himself? In the present state of my information, I can by no means prova that as animal has a soul, nor that every human body has one, which, you will allow, it would be vary desirable to do.

I would not, on any account, be guilty of doehtiog the unerring accuracy of any conciusion which Mr. Dormott has drawn from physiology; but when he enters on mataphysics, one may, I hope, without the guilt of hereay, venture to suggest the possibility of some improvement in his speculations, Now it appears to me, that in order to support the dignity of men, as the only poseasor of a soul, he has dealt somewhat herd measure to the lower animals. Happily, however, his argument in this case is not physiological, but metaphysical, and, therefore, not altogether beyond the range of a person's powers. He argues from the justice of God against the immortality of brutes. Bet he is dochtless aware, that a conslusion directly the reverse has been drawn from the same source. It has been said, that as the lower animals antier from the fell of man, without any guilt of their own, (this Mr. Dermott expressly admits.) the justice of God will provide some compensation for their guiltless sufferings, and that whee they have escaped the woos which man's guilt has brought upon them, they may expect

" Some sheltered spot in depth of woods embrae'd. Some happier island in the watery waate:

views, by more then realising all the freaks of the bettle-imp,—is discle bettles. I repeat, capable of will be allotted them. On this, thet as fir. Demont says that I have a soul, however, I do not funks, thing too sailous, I believe it; yet it would be more safe—at present, to obtain some definite informa-

tion with regardes my own soul, to feel very | we know nothing of spirits, and have neither deeply interested about the souls of the in- language nor ideas to express their nature,

1

ferior creation.

I feel very anxious to know what sort of entity this soul ls-what is its peculiar usture, or what are its characteristic proper-ties? Whiln it is in the body it is immeterial, insensible, inactive, without actual or common with that which stands in the ex-sensible oxistence, which some logicians tremity of opposition to them; and therewould consider no bad definition of mothing, fore can here no intellectual or moral But when this non-existent entity leaves powers, which are ettributes of matter, the body, and acquires an actual existence. Besides, if he were a pure unmixed spirit, what kind of beinging it then? I ottellectual he could not, according to the physiology and moral powers it stands to be which Mr. Dereigt has, on this occasion are attributes of matter, and cannot, thereoct only deignedule borrow, but te horrow fore, be the estributes of spirit also; for if even from a divine—be the creator of matmatter end spirit possessed these attributes ter. But if God would not be the creator in common, there could be no such incompatibility between them, as to render them inespable of even existing in intimate useneiation. That Mr. Dermott considers the soul as having no lutellectual or moral pow-ers, appears also from the language which he uses when apasking of spirit; for he talks of the properties with which it is not endued, be it observed, but endowed. Raw and ignurant writers are apt, we know, to confound these two words; but it would be profanity to suspect, that the philosophic Mr. Dermott uses the latter term from ignorance, or fur easy other reason than that it just correctly expresses his mesning. Now if the soul, while in the body, be to all intents and parposes a nonentity, and, when it leaves the body, be neither material, lutellectual, nur mural, I would humbly beg Mr. Dermott to give us some idea of what it is; or, if this be impossible, at least clearly to state the grounds upon which we can possibly believe in its existence. I hupe hu will here the humanity to drag us poor unphyslolugical wights nut of the manifold parplexitles into which his splendid discoveries have plunged us.

Mr. Dermutt has elso turned edrift all my previous notions as to the Supreme Being, and I am reduced to the necessity of hogging to be informed upon what grounds he be-lieves in the existence of such a Being. If I understand him rightly, he mosns to asy, that we learn this from the works of Natare, and that, let divines and philosophers say what they will, we shall never learn more from their works. Nuw I have always been accustomed to think, that from the works of Natura, neither philosophera mor divines had ever discovered even so much; for I know not of any Individual, of any description, who from the works of Nature discovered the existence of a God. To prove this fact, after its discovery, is no very diffi-

oult matter.

But what I on most surious to Isara at A purgraphrit he cannot be | because, though far more masterly manner than he has done.

yat we do know, that they are not only different from, but so incompatible with, matter, that they cannot even exist in intimete association with it. They, consequently, cannot possess any attributes in common with that which stands in the exof metter, were he a simple uncompounded spirit, neither could be be the creator of matter, if matter formed an essential part of his being. Then matter must be eternal; endf the question will be, what did this camipotent prestor oreste! Sleeping souls, perhaps. Then the soul must be a indeed, a third genius of the urder Sabstance, for the knowledge of which the world is indabted to the discoveries of Mr. Dermott, discoveries which, in this instance, throw those of ell former philosophers into the shade. I mey just remark that the good uld doctrine, which makes God the soul of the world, is quite inconsistent with his view of the soal; but, perhaps, he means to adopt the modern modification of that doctrine, which is exhibited in the scophecism of Persis.

In short, will Mr. Dermott heve the goodneas to tell us hapless, unscientific mortals, how we may prove that such beings as God and the human soul exist; and, as far as his discoveries have yet reached, what sort of

beings they ere ?

Mr. Dermott's positions suggest many other remarks; bat I am wearled with hunting this profound nonsense, the very rarity of which would redeem it, and embalm it, as e theme of laughter to the world's eud, were it not that it is as trite as the king's highway. When a man is safficicutly idle and ignorant to hasy himself in collecting the scattered obsurdition of overy ege sod clime, the exploded sbortious of every furguiten system of human folly, the very sooturkins of sciolism, and, packing them in a bag of precious funtion, comes sgain to pour them over the pages of Tue Lancer, do, I beg yea, let him know that be has altogether mistaken his publisher; that you cannot waste year pages, and choice your readers with the "crambe sexrenties re-socts" of such philosophers as the French Mirsbeso, the American Polmer, and the English Carlisle, all of whom have treated the poresent is, what kind of a being God is! sitions maintained by Mr. Dermott in a

drugged, same ad namen, by the worthies just mentioned. For what one physiologic cal fact has be brought forward, or what one folly has he inferred from his facts, that was not omnibus et lippis notum tensoribus, at least seven good years before his body began to exercise its mental functions, nr efforded a cradic to calceping pul? In him, inducd, there is assuredly something that is sicep-ing, snoring londly, and increasing wildly. But when these dresms find their way into so abiy conducted and so widely circulated a publication as yours, they may prove hurtful Esq., or the humbler criticisms of to some of the many years men who, in the course of an unfoished education, listen to the instruction conveyed through the medium of THE LANCET, with a respect to which, it is cheerfully admitted, their ebility has hitherto richly entitled tham. You, as Editor, occupy e highly responsible aitu-erion. It is your duty in guard against the admission af papers which, while they in-form the mind, may pervert the principles, of these young men, and, still more, to exclude papers which might do the latter, without the possibility of doing the former.

I am well aware that your task is no easy one, though many people will think it is; I would not, therefore, consure Homer very sternly, though he would sometimes cod. You, I funoy, like other Editors, sometimes take a trip to the seasonst; and, like other Editors too, find such excess, and, has other heaterdows. I take it for granted thet you were parifying yourself from the "ain, and sesseed smoke" of London, and getting braced, for the wieter campaign, by the breeze of Hasting, when the luckiess paper which has called forth these remarks, was inserted.

Physiniogy is a science equally delightful It is to be regretted that such sen as Biehat and Lawrence should have drawn from that science conclusions witish have no connoxion with physiology, and which it cannot be difficult to show that physiology does not sanction. As, how-neer, their writings are in the hands, and fitted unit for the perusal, of scientific men, the ovil in less. But when similar conclusions, in grosser forms, are adopted by men who have nothing of science but its parade, and propagated among young medical atu-dants, the mischief becomes serious, and the parents and friends of these students will naturally take the sistem.

In fiso, Mr. Editor, go on as you here begun. Maintain the respectability and independence of your profession. Stimulate the energies of the young. Leave no casage discover say thing is Mr. Dermett's the information of the young.

Indeed, had not his speculations found a | the light of day into the abodes of BATS AND place in The Lincer, nobedy would have Owis. Take cere of every thing relating to dreamed of wasting helf as hour in noticing the sciences which tood to promote the welabsurdities with which the world has been fare of our bodies, and leave us in quiet possession of nur souls, and of our God. If you admit papers which tend to shake our belief on the axistence of these, I doubt not that, from a sease of justice, you will admit papers in defence of these important artinies of faith. But the discussion of these subjects would by no means suit your work. Of theological controversy we have, at home, enough and to spare. Therefore, after in-serting this, as I take it for granted you will dn, let your randers hear no more either of the aublima insuities of G. D. Dermott,

Your most obedient, M. D-s.

Balford, 12th Dec. 1828.

#### ANEURISM OF THE AORTA.

SINGULAR PULSATION OF TOR ASTORIES-NECESSITY OF THE SMPLOYMENT OF THE STRTHOSCOPE.

By D. J. Connigan, M.D., Lecturer on the Institutes and Practice of Medicine; one of the Physicians of the Sick-Poor Institution, Dublin.

"Such, however, was the power of prejodice, that it is observed, by Hurvey, that no physician, past the age of forty, believed in his doutrine; and that his practice declined from the moment he published this ever-memorable discovery."—Medical Facts. Vel 1.

MANY of the profession still view with scepticism the utility of the stethoscope, in ascertaining the exact nature of theracic

I shell not ceter ieto any general discussion on the merits of the instrument. This is obvious, that those who use it have not unly all the information to be derived from symptoms, history of the disease, &c., which lie apponents enjoy; but that, in the instrument, they have a medium superadded through which to abtain additional knowledge, and they are thus enabled to come to the examination of thoracic disease, on it were, with increased powers of mind. A single well-applied fact may carry sonviction where remoning will not. Among the cases of thoracie disease which have been under my cate, one was so much in polot, so well cal-

refuge to fools or knaves smong you. Pour paper to justify this inference.—En. L.

culated to remove the scepticism above starrum, toused him into the air; he fainted, alloded to, at the same time that it accorded but soon resovered, was bled, and falt no so atrongly the necessity of employing the iestrument, that I should be sulpable were

I to allow it to rest in silence.

-e, a bullder, (Cole's Lana,) Mr. J. Dcalled on ma, for the first time, in the early pert of Juos. His complaint sommenced about four months before that period, with sense of oppression and straiteers in hischast, anecesded by sough, occasionally convulsive; the cough and oppression of chast always relieved by mucous aspectoration. lia might, at that time, have been selected as a man presecting the very vigour of health, ficaly made, foll to fical, of a forid complexion, and active in his limbs. He was daily eegaged at his ordinary husicess, which required much axertion; bet for his teasing cough, and atraitness of obest, he should not, be said, bave known what as silment was. After bevieg tried, without avail, all the usual domestic remedies, he bed re-course for advice to several emisseet practitioners le the city, who did not use the stethoscope. When he name to me, his breust was covered with the marks of recent cupping, and, between his shoulders. the back was here from a blister; in had been repeatedly bled. The obstinacy in resisting the exhibition of active remedies of what seemad, at first sight, so attack of elmpla bronchitia, attracted my ettection. Questionleg him closely, I friend that he occasionally falt pain in the left side of his neck and left arm.

On stripping him, the first remarkable appearance that caught the eyo, was a sieguler pulsation of all the arterial trunks of the upper part of the body. As his erma heog by his side, the whole tract of the brachial and cerotid arteries was thrown cet In atrong relief, et wech impulse of the heart, as if the vessels, from having heeo proviously comparatively ampty, had bethe middle sise, well-formed, and his chest made fully, ie proportion. On parenasion. the thorax, with the exception of the part midway between the left mamma and sternoclevicular articulation of the same side, sounded elecr; in this situatioe, there was great delness of sound. Respiration was pure, save in the same place, where, ie its atead, existed a most intense "bruit de souf-flet," scoompanied by Indiation pulsation. The action of the beart was ragular. Pulse about 20, full, equel, the same in both arms, they did all that could be done with the file haw of no immediate cause in which to manna which they possessed. One of them attribute his illness. About six months before its commencement, when satisfied his mest in removing some timber, one end of a last plant, from the opposite and of which its mobile diletation of the forepart of the support had been readed by pulled away, the cheet is most easily secretained by the caused specials, and, hitching mader his yes.

further ill effects.

I requested to see bim again at the end of ten or twelve days. I had scarcely a doubt as to the enture of the discuse; but before giving an opinion which, in his apparent state of good health, would have been so great e shock to bis friends and family, I was anxious to be positive of the securacy of my

diagnosis

On the second visit his symptome were as before, but somewhat aggravated. On placing him sitting apposite e window, and looking from behind, salant down bla chest,\* there was e prominance, sithough very slight, perceptible above the left mamma, where the sound was dell, and the " brast de amiffet" interse. I had now no doubt as to the nature of the disease, that there was ansurism of the ascending serie, and that the termination must almost mevitably he fatal.

As I am relating this case partly to prove the absolute necessity of barieg recourse to the methods of examination of Avenbrogger and Lacensec, in exploring diseases of the cheet, I may pause here to meet the objections of those whose prejudices may make them disbelieve in, or seoff at, the

stathoscope.

Such persons, la speaking of this case, woeld hring forward two objections to the instrument; first, that the disease could bave been discovered without it, therefore that its epplication was unnecessary; se-condly, that sepposing the disease to have been discovered by the use of the matrumeet, nothing was gained, inasmuch as the disease was fetal. To the first objection, instead of going into laughtened reasoning to prove that aymptoma could not have goided to an infallible disgnosis, I shall merely reply, that until my examination of Mr. D., there was not the slightest suspicion entertained by his medical ettendants of the nature of the discoss. To this, per-beps, it will be answered, "The persons onder whose care he had been were igno-rant." Of those who were in attendance on bim previous to ma, two ere men whose names, could I with propriety mention them, would be to this a sufficient answer; they atand at the very beed of their profes-sion. They brought to the investigation of the case, talent and experience, and they orred; I impute not the least blams to them;

presumption.

I met more than once in consultation on this its having, during life, it would be asserted. presented any symptom by which to discover it?

> I have made these observations merely as thay arose out of a single case; I might go much forther, but this is not the place. I

shall oow resume the details. Pain, which had at first been trifling, in-

A trite objection frequently made to the stethoscope, and which those who pot it would consider peculiarly applicable to this case, is the second. Granting that the particular organia le-sion were discovered by the stethoscope, the disease is inevitably fatal; what, then, la the use of the discovery? This is so nbjection that should never come from the lips of a man of science. In the pursuit of science every truth, every fact discovered, is of value. Wa may not, in every case, see its immediate application, or instant practical good result, but it is a step gained. Wa know not bow soon it may become important, or whather, although yet unknown to us, it may but be the way to a hitherto on-explored field of knowledge. It is only for these of currow minds to say, that facts, or messes of straining facts, abould be disre-garded, because there is not some immediate obvious practical result. In taking up the question thus, I am, however, allowing the opponents of the stethoscope more than I ought; but I am willing to give them every savantage in the argument. I have supposed the disease in question to be fatal in every instance. It is not so. Some few, although few, cases are known of racovery; ad while there exists a hope, no means should be left untried. It is scarcely accommany to may, that the chance for recovery depends altogether upon a plan of treatment quite opposite to that for almost avery other thoracic disease. There is, then, gained, a ust and steady practice, and an exclusion of leas of treatment which would almost certeinly hasten duath. Soppose, however, this particular disease to be in every instance fatel, is it nothing to shatein from torturing a patient with not aloon inefficient, but poforetell, and thus in some measure take from, the approaching esiamity? Is it nothing, iastead of giving delusive hope, to prepare the jodividual blusself for his inst great change, and that, in all probability, to be audden? Are all-these mutters of little consideration! Had this patient, whose tune I am recording, died (in making nome exer-

rery case. With a candour that does him

considered the case as bronchitis. I'n charge

these gentlamen with ignorance, or for any

one to say that, with only the same means

of acquiring information, he would not have

my, he acknowledged to me that he had

made the same mistake, would be arrogant creased in degree, occupying the left side of the chest, shooting out through the left scapola, extending down the arm and ap the alde of the neck, sometimes ancircling the throat. The nights were resulted, disturbed by harassiag cough, followed by museous expectoration. The prominence above the left mamma increased, although very slowly, in projection, and the finger pressed on it detected the "bruissment" described by Corvisart as a symptom of socurism of the ascending acrts. There was not, however, at my period, the "siffement" in the hreathing, meetioned by the same author, as accompanying the disease. Vasalva's treatment was the only one that beld out any prospect of relief. It was put in practica. Rest, absticence, frequent bleadings, with the axhibition of digitalis, were amplayed. Digitalia was poshed to the extent of forty drops three times a day, with very little he-nest. On many occasions the sofferings were aften more distressing on a night aueeneding the bleeding, than on any other. Thu digitalis at one time brought the poise down to 48, bot otherwise gave no relief. polse very soon rose agaio. The blood drawn was hoffed and copped, in every in-stance, with a firm coagulum. From the middle of Juce, to the 26th of August, when death took place, three symptoms were invariably present; remarkable pulsation of all the arteries of the superior satromitias; loud " bruit de soufflet" in the ascending sorts and trunka branshing from it : " fromingment" accompanying. It would not be in-atractive to follow up minutely this melan-choly case. The paica absorting about the ocak, cheat, and scapule, ware sometimes most agnoising. Leeches occasionally gave relief. Balladonos linimeot, io the proportion of half an ounce of the axtract to two sitivaly injurious manua? la it nothing to nunces of water, sometimes afforded case. This failed: then a plaster of extract, belindonom, emp. ammoninci, and powdered opium, applied, after lacebes, to the pained parts, alleriated the sufferings, but at last all failed. Towards the termination, the pains became so tortaring as sometimes to daprive the patient of reason, and sense of horrible sufficient on frequently came on at tion) from a rupture of the sac, which was night, making him bound suddenly from most likely to happen, say but twalve hours bed, and fly to the open window for breath, pravious to the examination with the sta- Two days before death, the free were sudstancepe, should we not have hed this added matters; pulse week; skis of this entire to the number on record of cases of internal hody of varying slades of purple. Mucous aneurism ending in sudden dasth, without and bloody stools were passed, and at

I axamined the body 24 hours after death, in the presence of Doctors Harkan, Ferge-son, Higgins, surgeons Adrien and Pechlas. The abdominal viscers were sound; liver gorged with blood. The lungs were also gorged, bat pervious through their whole axtent, and perfectly sound in texture. Slight effusion in the plears; three or foer ounces of blood-coloured serom in the pericardium. The heart was somewhat enlarged. The norts, from its origin to its arch, was dilated to the size, at least, of a pint measure; from the erch the vessel was of netural size. There were two or three trilling cartilaginous deposits epon the de-scending norts. The arteria innominata, caroud, and subclavian arteries, were of neteral size, and aprung from the termication of the sac. The ansurism was in front. attached to the aternum, (on which there were marks of commencing absorption,) and to the cartilages of the three superior ribs. Behind it compressed, between it and the traches, the pulmonery artery, which was, in consequence, dilated at its origin. The cavity of the sac was filled with blood, coagn lated after death. No appearance whatever of an attempt at coagulation during life. From the formation of the ansurism, this, indeed, could accreely have been expected. The diletation of the vessel was nearly equal all round, a little greater in front. It was not at all, hewever, in the form of a pouch on the side of the vessel. It presented, in the most satisfactory manner, all the characters of true securism. It was equally dilated, wank, thin, smooth un its internal surface, and the fibrous tenic could be dissinctly traced over the entire sac. It showed distinctly the error of Scarpa's assertion of the non-existence of true ansurism. The walls of the diluted vessel were so slandar, that it was a wonder rupture had not taken place. The tumner, by its bulk, had caused death, by pressing on the pulmonery artery, end thus impeding the circulation through the lungs. The axit of the blood from the right ventricle was obstructed; the return of blood in dee quantity, from the general circulation to the right side of the heart, prevented. Veccus congestion over the an-tire system, even in the lungs, was the effect. The subcataneous effusion, effealon into the cavities, mucous and bloody stools, were the efforts of the system to relieve itself from this congestion. From the ob-structed judmonary directation, imperfectly arterialised blood was distributed through e body. The brain suffered in its fearns; hence constant dreaming, and very frequently delirium, occurred, particularly after shop, when volition could not be exafter slipp, when rolition could not be ex-orted to maint by change of posture the re-hundred or two hundred times greater than

length, without any expectoration of blood, spiration and circulation. At length suffo-death by suffocation closed the scene. ontion put an end to a miscrable existence.

Laennec reckons anaurism of the norts one of three thoracic affections, which still remain in obscority, notwithstanding the

application of the enthoscope.

It is singular, that among the symptoms givan by Corvisart and Lacanso, there is ao ention of the visible pulsation of the arterice of the upper extremities, so remarkable in this case. Three cases of anourism of the accending norts, or its arch, are in my recollection; in each f them this was a prominent symptom. Ansurism of the sorta is not a common disease. I can scarcely, therefore, suppose that this symptom should have existed in all the cas that occurred to me, yet not in any of those that came before Corvisort or Lasonac, and I em forced to think that it must have escaped their notice. It will be found, I believe, a valuable pathognomonic sign of the disease. This peculier appearance of the arteries is noticed, for the first time that I am aware of, by the relatar of a case of ancerism of the sorts, in Dr. Macleod's Journal, vol. ii. He cites it triumphently, as a proof of the muscularity of arteries. To this we shall return.

Without having receurse to the assump-tion of a power of very problematical exist-ence in the arterial tunio, to any the least, a simple law in hydrostatics will afford us a

solution of the phenomenon.

Seppose on ancurism of the arch of the sorts; the pressure of the fluid on its internal auriscs will be as the area of the surface. The walls of the sec are not at all strong, In proportion to their axtent. same dagree of atroughl that enables an ertery, through its small dismeter, to resist a distending forca, is far from being sufficient for the sides of a cavity capable of containing a pint. The argenic contracsec (or immediately by it) pressing the main of fuld through the sides of the sac, and the mere hydrostatic pressure of the column of blood in the carotid, making, on the sides of the sac, a pressure, increasing, as their area, will cause a yielding ln its sides, which does not take place is any other part of the arterial apparatus. Hance the arterial branches, the subclavien, brachiel, &c., will, from this disproportion in the resistance, become, la some degree, emptied of their contained blood, by pooring it back on the cavity of the ameurism, after each systola of the bloot. If the carotid have the area of an eighth of an lach, and onatis bell an ounce of blood, it produces a pressure of half as ounce apon avery sighth of an inch over the interior of the use. If the inter-

solumn of blood in the carotid, on the sides of this sudden jerking out of the vessels, at of the sac, is permanent; end it may be the moment of injection, in the dead body; said the sac will, therefore, he kept con- as little reason is there to sesert that to startly et its fell stretch, and cannot dilate such a cause is it ettributable in the living. and contrast, which would be nonessary, in It may be taked why, (if the explanation order to cause the phenomanon described, offered here be correct) was there not pul-Such would be the case; but there is sation of the steries of the lower outremi-another distancing power, which is only ties? The pressure of a column of blood, momentary to its describe, namely, that such as that in the descending acts, even arising from the organic contractility of the in a lying posture, is always sufficient to arterial trunks, which converts the sac into keep its branches fully distended; not so in a bag, alternately diletion and contracting, in the following maneur.

sending forward a certain quantity of blood, The see cannot follow, peri hasse, io its dilatation the quickness of the impulse. same, sends forward a corresponding quantity into the arterial trunks. They are distended to their full celibre, as in the bealthy arterial apparatus. Thie, however, is only momestary. Immediately the overplus has been sent into them, they, by thair organic contractility or elasticity, re-act on it, and throw it on the sides of the eac, producing a dilatetion of the sec equal to what would be produced by the pressure of a column of blood of a certain height; and pouring back, of course, at the same moment, on the cavity of the sceurism, a proportion of the blood received; thus producing in themselves a comparetive emptiness, which could not occur io an arterial apparatus, to which such a reservoir was not eppended. This pressure can only be exerted on the sides of the sac, as long as the overplus of blood remaice; but the cepillaries ere open to receive it. It passes allently along into them. The sac resumes its original dimensions partly by its own alasticity, and partly by the electicity of surrounding parts, as the luogs, &co., compressed with it. The arte-rice, which have thus become comparatively emptied, and the sac which had resumed its original dimensions, ere then as before the action of the vantriels; the next blow of the heart filling again, for the moment, the semi-distended vessels, produces the phenomenos described.

What takes place in lojecting a subject for the dissecting table, sopports the expla-nation offered. The arteries are empty, and, of course, not at their full salibre, as in the living body. If the eye be kept on the nituation of evan comparatively minute branches at the moment when the injection is sent in, these vessels are man throws out in strong relief; presenting precisely the same ap-present which the larger tranks present

that of the base of the carotid, the pressure in a case of anancism. The arteries in oo the sides of the sas will increase in the the dead bodyfpresent it in a more marked the proportion.

The distending power exerted by the Noos will say that muscularity is the cause of this sudden terking out of the vessels, at

the upper half of the body, where, through the entire of some of the trunks, and a por-The blow of the left ventricle is quick, tion of others, the force of gravity and of pressure is in constant opposition to the current of the blood.

Whether this singular pulsation of the lience the overplus of blood received so arteries be a constant accompaniment of auddecly is sect forward, or, what is the ancurism of the ascending acrea, it will remain for further observation to ascertsio; but from what I have seed, were a patient to be presented to me with this symptom, with constact " bruit de souffet," and "fremimenent outsire" in the larger trunks, I would not hesitate to pronounce on the case.

Ware the ensurism false, with very thick periotre, half filled with congulum, or in a situation where the surrounding parts might efford firm support, the symptom would be less merked; but false accurism of the acrts within the chest is of very rare occurrence; and from the proximity to the beart, congulation to any axtent, ucless under very active treatment, is not likely to take place. From the relative anatomy of the norts, firm support canoot be efforded. The valor of the symptom is, therefore, considerably increesed by the absence of caoses which

might obscure it.
Two phecomeca, well known to the disciples of Lacoose, "bruit de soufflet" and "frontesment estaire," constantly accompany the peculiar pulsation of the arterice. They have bessed lequiry as to their cause. It hep-pened that I had had many opportunities of observing them under veried circumstacces. The present article has apun out so far, that I shall not enter into the consideration of them here, but reserve the result of my ohservations for snother number.

Whather my observations and opinions be disproved or supported, I shall be equally satisfied. Truth is the prime aimed the sand, in the context, there is at least this consolitor, that all the competitors may share equally the good attained.

11, Upper Ormond Quey, Jen. 1889.

P.S .- I may observe here, that the disseed parts, described above, are in my OF THE BLOCK, AND ACTION OF THE DLOCG VERSELS.

By Mr. R. Vinne, Demonstrator at the Votarinary College.

At the conclusion of my last sommunicatien, "On the Appearance of the Blood of Actuals under Different States of Excitement," I stated, that the lacted end lymphotic fluid of the horse put on different apjustances, varying under the alroumstacce in which the mimal was placed, and that in strong and healthy sobjects, if destroyed when in perfect health, and moderately ex-cited, it appeared of a white or strew colour ln those parts of the lymplistic system which are situated near the circumfarence end centre of the circulation; but, on the contrary, that in many of those which are destroyed, both when under great, as well as diminished, escitement, it commanly aneered of the same character as dark venous blood in thuse parts of the lymphatic system which are situated nearest the centre of the circulation, as the therecic duct, and second order of lacteals and lymphatics, and that this became syldent from the function of digestion being suspended, in consequence of severe pain produced from punctures in the feet, apen joints, &c. ; and alse from expesure to a law degree of temperature without food. I likewise stated, is a fermer commnnication,+ that from these causes the lymphatic glands contained red blood, and that on injecting the arterial system of the lymphatic glands, the injectine entered the vannus system, and also the second arder of lactesis which arose from the glands, thereby clearly proving, that the arterial system of the lymphatic glands, like the ar-terial system in other perts of the body, termiente in two arders of vessels, the first of which are veins conveying red blood; and, secondly, in veins which only convey white blood, and which are canally termed the lactuals and lymphatic vassels. The lymphatic glands may, therefore, be considered as forming a cectra point between those parts of the lymphatic system, situated noar the circumference and centre of the circulation, and their uses are to give origin and termination to two orders of lactaal and lymphatic vassels, those situated nearest circumference of the circulation being

the fair seder, and those nearest the centre the tender, and those nearest the centre flee tended.

On further investigating this subject, I have been sumbled to prove, that the lected and lymphotic remails (as they are moulty termed) are the minute or finer parts of the

venous system, corresponding to the minete and extreme part of the arterial system, and in which only white blood generally circulates; and that when the functions of digestion and respiration are duly performed, these vessels shouth the chyle, are new white blood, from the surfect of the intestines, and also return the white erolouries blood, from the minute end extreme parts of the arterial system, and that they likewise shorth the find deposited in serous and synavial exvities; but when the functions of digestion become summinded, these vessels then cease to absorb dayle, and proceed to remove the fat, &c., in the various parts of the body, and then, under these circumstances, the second arder of lasteals, by receiving an increased power from the arterial system of the lymphetic glands and surrounding parts, assume the same character as the veins in

general. The exterial system, therefore, in all cases, controls the action of the venous, or lymphatie, and not the lymphatin the action of the arterial, as it has been generally enpposed, for when the action of the whole arterial system becomes increased on any separate part, the action of the venous, or ymphatic system, becomes lecreased slac. And, again, when the action of the arterial system becomes diminished, in any separate part, the action of the lymphatic system becomes diminished likewise. therefore cocaider the vessels by which the body is supported to be only of two orders, vis., arteries and value, the arteries performing the function of numerous depositioes, and the veins that of numerous absorptions; thus the lacteals absorb chyle, or naw white blood, from the intestines, which, in circulating through the lungs, and by combining with atmospheric air, through the medium of the pulmenary vains, becomes converted into red blacd; and the becomes converted the delocd, as well as those conveying the white, (which are also those conveying the white, the beauty and lumphatic vessels.) termed the lacteals and lymphatic vessels,)
when the function of digration is suspended, absorb different parts of the body; this is evidently the case, as the lactests and lymphatics, under these causes of increased beorption, are found to assume the same character as the vains.

As regards the blood, I am new induced to consider it to be a peculiar vital, fluid, and varying its colour in animals, likewise in different parts of the body of the same squal; that the red celour is not produced from colouring matter infished in the darm of glabules, as is commonly supposed, but that it is a certain effect produced on the whole mass of blood, while circulating through the lange, in consequence of its combining largely with atmospheric air, and which, in combination with the chyle, is the true

<sup>\*</sup> Tax Laucer, No. 272, p. 401. † Tax Lixore, No. 157, p. 184.

source of the arterial blood, and this, when circulating through the body, assumes different colours, varying according to its de-grees of vitality; in the strong parts it ap-pears red, from possessing e high degree of vital power, but in the weak, or finar parts, it is white, from possessing less vitality. When the red blood enters the minute vessals, which commonly only convey white, or colouriess blood, as is found to be the case under various circumstances of increased excitement, either in the whole or my separate part of the booth; that then it is not in consequence of the coats of the vessels becoming dilated from debility, so as to allow the red globules to pass, but from the red blood being of a higher atimulating qua-lity than the white, and, consequently, pro-ducing a more powerful effect on the vessels, and this is to be seen in those cases where the lasteals and lymphatics (as they are usually termed) become considerably increased in size, and assume the same character as the veins. The blood, its vessels, and the body, therefore, act and re-act on each other by means of the excitants which support life, and when these are daily opplied, the vital pewer of the blood, its vesela, and the body, become increased; hut if gradually withdrawn, or carried to too great an excess, then the vital power of the blood, its vessels, end the body, will gra-dually become diminished; organic disease, or debility, may therefore take place, either from the causes which apport the functions being gradually withdrawn, or carried to too great on excess; the fermer may be termed debility from diminished excitement, commonly met with in the autumn and winter, in animals exposed to wet and cold, and allowed only a small quantity of food; and the latter debility from too great excitement, frequent in spring and summer, in enimals, when exposed to a higher degree nf temperature, and made to underga violant, or long-continued, exertion. Then, under these circumstances, as I bave proviously stated, (sea THE LANCET, Nn. 272, p. 401,) the colour and congulating property of both the vanous and arterial blood will gradually diminish, and this will be found to be the case by examining the state of it both at the sircumference and near the centre of the circulation, and it also gradually diminishes in quantity as well as in quality.

The blood, its vessels, and the body also, possess different degrees of excitement, varying according to the circumstances under which the saimal is placed, as the state of moderate, great, and diminished excite-ment, the power while the living body ossesses of receiving impressions fro objects by which it is surrounded, is see

monly termed its life.

Life, then, or this power of the body, has been termed, by Dr. John Brown, excitability, and by others, irritability, or vital principle; this vital principle of the body may be considered to be imparted to it by the blood, which derives its excitability, or vital principle, by combining largely with stmospheric air, water, and either animal or vegetable matter, the former through the function of respiration, and the latter those of digestion; from this it appears, that the living body is centionally deriving its excitability, or vital principle, from objects which surround it, and these, by enteriog into combination with the fluids of living snimal or vegetable bodies, thereby become living matter in a fluid form, termed sap, or blood; animal life consequently becomes vagetable life, and this, again, in return, becomes animal; first in the state of a fluid, but which afterwards assumes solid forms. The excitability, or power, which the living body possesses of receiving impressions, varies in different animals, as well as separate parts of the body of the same animal; it likewise varies according to the season of the year, for in the spring and summar the excitement is quicker and stronger, while in the autumn and winter it is slower and wasker, and this is constantly seen in the infammatory diseases of the horse, which vary in degree according to the season.

The excitement also varies at different periods of life; in the early stages it is quick and weak, and the blood will be found to coegulate feebly, in consequence of containing only e small portion of animal matter; but in more advanced, and in the middle, stages, and as the animal increases in strangth, the excitement becomes more puwerful, and the blood will then congulate quicker and firmer, from containing a much larger portion; but in the further advanced eriods, and in uld age, the excitement will e slower and weaker, and the congulation of the blood will be in a corresponding stats.

Royal Veterinary College, Dec. 17, 1828.

ROVAL UNIVERSAL INFIRMACY FOR COLLDRAN.

On Friday the 50th ult. the election of a Surgeon to the Royal Universal Infirmation for Children, Waterloo-Road, took place at the Institution, when Edward Doubleday, Eaq:, Blackfriers Road, was elected fato the office, by emejority of 184.

State of the poll at the conclusion of the

day, For Mr. Doubleday ..... Set Mr. Kent ...... 176

# THE LANCET.

London, Saturday, February 7, 1829.

t St. Bartholomew'e Hospital, by Mr. LAWtirement of Mr. Asunusray, Lectorer on terests of a public charitable Institution to Surgery et that Institution. The lecture is his private emolument, and to render an reform, marit the especial attention of our nephews and connaxions. Here, again, the LAWRENCE spoke in terms certainly not less for Mr. Assanguar's infant son. terminated, we, too, may perhaps be per- action—the femily feb, which was to conwithout the partiality of panagyrists on the the future surgeons of England to the infant one hand, or the resentment with which son of the late lecturer, to one who would the conflicts in which we have been an inherit the same of Abernethy, but no

opposed Mr. ABERNETHY, have been gained, whatever may be the feelings of that gentleman towards this Journal, all hostility on our part is et an eod. We maintained against him, in a court of equity, our right to Frankil nazt week present our readers with publish the Lectures which he dailvered in report of the Introductory Lecture delivered the capacity of a public teacher, and we maintained that right successfully. We awar, who has been appointed, on the re- denounced his attemn to ascrifice the incharacterised by the ability which distin- office, which should be conferred only on guishes all the productions of the eminent superior enrgical talent, transmissible in his individual who delivered it; end there are family, even as Sir Asrxey Coorse has parts of it which, bearing, as they dn, on contrived, by the aid of e corrupt system, the general interests of the profession, and to get the whole surgical patronage of the on the all-important question of aurgical Borough hospitals distributed among his readers. Mr. LAWRENCE has now attained afforts of this Journal have been successful; the station which his great talents preemi- for had we not denomiced this attempt, the nently entitle him to occupy; end the doty Professor's Chair at St. Barthelomew's of communicating sorgical instruction to Hospital, instead of being filled by Mr. the first medical achool io this conetry has Lawrence, would, probably, have been been appropriately coofided to the eblest and occupied by some obsequious, perhaps inmost enlightened anyseco of the day. Of competent, oreature of the late Lecturer, his predecessor it will be seen that Mr. content to hold the office as a lower tenent

honecrable to the pupil than to the object. Such were the public grounds on which of commandation, and such ea, whatever we opposed Mr. ARGENETHY, and such grounds for dissatisfaction at the conduct of here been the fruits of our opposition. If, the late Lecturer Mr. Lawnance may for- in the course of the condict, we have somemerly have felt to have existed, or whatever times resorted to arguments or expressions may here been Mr. Assumerur's errors to which the friends of the late Lectorer may his official capacity, can hardly be said to have deemed too atrong, or too unsparing. he inconsistently or antravagantly applied considering the teleuts, the reputation, and to a man of considerable celebrity, and of the age of our opponent, it is to be recolunquestionable talent. As Mr. ARRENE lected that we had to contend with a dis-TMY's professional life, or, at any rate, the case to which mild remedies would have official part of it, may now be considered as been wholly inefficacious. The fond transmitted to speak of him one studie rel ird, sign the instruction of a large proportion of gaged with him may be supposed to have portion of his experience, and parhaps not a inspired as on the other. Now that the perticle of his talent—these were symptoms public directs, for the sake of which we indicating a corrupt state of the system, which called for the exhibition of the most | quently the primary cause of local disease, energetic remedies. The event has justi- is also not unfrequently the effect of such fied the employment of such remedies; the disease, and is often a symptom by no disease has been exidicated, and we are as ready to bear testimony to the merits, as we have been, on former occasions, to animadvert on the errors, of the late Lecturer.

It is unnecessary for us to express our concurrence in the re hirable observations of Mr. Lawrence, on the intimate connexion between the two departments of the healing art, which have been absurdly seperated in practice, and on the identity of the principles by which the treatment of external and internal diseases must be regulated. because this is a doctrine which must be sufficiently familiat to the readers of this Journal. Mr. Angawarny has, undoubtedly, done much towards elevating the character of surgical practice in this country, by directing the attention of surgeons to the constitutional causes of diseases, for which, as the symptoms were external, think so still. The truth is, Mr. ARERNAwere supposed to be required in their treatcases that affect the human body. Detive segons, which demograment, if it he doo! La note:

means calling for the exclusive attention of the practitioner. Mr. ARRESTHY's doctrines, however, have certainly led surgeous, generally, to pay an increased degree of attention to the medical treatment of the cases which fall exclusively under their care, and which have co-operated with other causes to create a decided preference in the public mind for the advice of surgeons, in stace of which the treatment was formerly supposed to belong exclusively to physicians. With regard to the remarks which we have made from time to time in this Journal, on the Lectures of Mr. ABBRERTHY, there is nothing which requires to be qualified or retracted. When those Lectures were the subject of litigation between ourselves and Mr. Azzzwerny, we thought them unworthy of his professional reputation, and we topical remodies were all, or nearly all, that THY, with all his talents, was too indolent to keep pace with the progress of surgical ment. He has, indeed, pushed his theory science; and his Lectures, as they were too far, by making the digestive organs re- published four years ego in this Journal, sponsible for almost all the external dis- might, for any thing that is to be found in them as to the modern improvements, or rangement of the digestive organs is, no attempts at improvement that have been doubt, frequently the fine mali; but Mr. made in surgery, have been delivered, as we ARRESTET has dealt with accology as the believe they were, in point of fact, delivered, Roman tyrent wished to deal with his sub- twenty years ago. Mr. ARERHETHY was jects-be has referred all disease to one himself conscious of the defects of his course head, that he might have the pleasure of of Lectures, which he had never taken the cutting it off with compound calomel, or trouble to improve, or even to illustrate, by blue pill. Mr. ARENETHY has used the contemporaneous cases occurring at his digestive organs for the purposes of diag- own Hospital; and in the consciousness of nosis, as incontinently as Mr. Purr's morn- these defects, we believe, is to be found the ing you in The Critic was fired off by the true explanation of his relactance to the players, who, when they once get hold of a them published, with that minute fidelity good thing, never know when to have done which he attented by his eath; and the with it. Some practical cill may have so, true origin of these proceedings in the Court salted from Mr. Annuarur's enample of of Chancery, which, with the aid of pagereferring disease too indiscriminately to many postributions from Mesers. Builder, decongement of the stomeshand sther diges. The vane, &c., he instituted against Bux

abourdity of the certificate system, as a test of qualification for the medical profession, are well deserving of attention. Mr. Lawnanca is now a member of that body, which has long sacrificed the character, and reapostability of the profession to its private interests; and if his views of what was due to the honour and independence of the profession were not unaltered, and unalterable, his acceptance of a seat in the council might be regarded as an insuspicious omen by the friends of surgical reform. We felt sesured, that the step taken by Mr. Lawrence was dictated by the soundest policy, with a view to the final triumph of the cause of surgical reform; and that, pledged as be was to the support of that cause, as well by inclination. and all the tendencies of his liberal and enlightened understanding, sa by unequivocal voluetary declarations of his sectiments, as bieding as the most solemn asseverations upon an honourable mind,-pledged as he was, we say, by all these considerations, to the support of the cause of surgical reform, the hare insinuation, that in accepting a seat in the council, to which his telents and acquirements pre-eminently entitled him, he had deserted that cense, was an imputation upon his honour, to which we disdained to raply. The best answer to such an imputation will be found in the sentiments which he avowed in his Introductory Lecture on Monday last, and in the fact, that since he has become a member of the council, such is the shock which the system alluded to in the Introductory Lecture has received, and such the desire to avert, by attempts at conciliation, the fate which impends grar the surgical oligarohy, that one Surgion; has actually received the diploma of the College without the production of a single the profession of the state of the second

The allusions of Mr. Lawrence to the of which he has consented, for sound reasone and salutary purpose, to become a member, it may be found in a letter, written by the aspient perpetrator of the Oveterian oration, and published to The Times of last Tuesday. The lotter introduces to public notice a propositioe, worthy of the intellect from which it emanates, for the publication of hospital reports by hospital surgeons themselves; and it saverts in the following terms to the decided opposition which this proposition has received, in the council, from Mr. LAWRENCE. The passage is well calculated to remevo all apprehension from the minds of those friends to surgical reform, who may have been so far misled by the instructions and misrepresentations of Mr. Lawaunca's enemies, as to believe that any thing like cordiality, ar unity of feeling, on the question of medical politics, could aubaist between him and the members of the surgical oligarchy.

"I sebjoin an address to the hospital surgeons of England, and which I bave not been able to carry into effect, although I have laboured against its sluggish upponents for eight years. I am, therefore, at last compelled to submit the measure to public opision, under a hope that some public opinion, under a hope that some powerful influence may command its adoption. Many of your readers will be startled to learn that the most violent objector to those hospital reports, is the child and champies of sergical demagagues. gues 'that such reports would be uf no use;' that 'the hospital surgeons of England hate their own college too ardently to expect any co-operation from them; that the style of the address would be disgraceful to the Gollege; and, lastly, ' that such reports would only display the comparative mortality in the different hospitals,'—a fact which I consider to be of the utmost intportance to the public, the best security against nejustifiable surgical operations, and the highest incentive to h onourable competition. I am, Sir, your obliged ser-"ARTERY CARLINER. yeat,

From the foregoing extract these meanhem of the profession who have entertained . If further prope were wenting of Mr. any doubts as to the famores and consis-Lawaunce's firm adhesion to the cense of tency of Mr. Lawaunce, may judge of the surgical reform, and of his unaltered opi- state of feeling which exists between "the nions at to the general character of the body | shild and champion, of surgical system," as

that gentleman is styled by Sir Amthony, [as might be expected, the fortnight's Fasciand the oligarchy in Lincoln's Inn Fields. The Oysterian Orstor has, unwittingly perhans, let the profession into the secret of the distracted condition of the Council, and afforded them the means of judging between the accuracy of those calumnieus reports, which secribed to Mr. Lawsance a base dereliction of the prisciples he was pledged to support, and of the information which enabled us to announce, at the commencement of the present medical session, that "Mr. Lawrence remained staunch to the cause, and that when the members of tha College should again secemble for the purpose of petitioning Parliament for a reform of abuses, he would again be found at his post, ready, as he has ever been, to prove himself the firm and enlightened advocate of the rights and interests of his professional brathran."

One of our Correspondents inquires, how it hath come to peas, that during the last four months, not the slightest netice has been taken in the leading articles of Tax LARCET, of the quondam editor of a Quarterly Medical Journal, and subsequently of certain bundles of rubbish, which he called Fasciculi; to wit, one JAMES JOHNSTONE, alias Docton James Jourson, as he styles himself, by virtue of the fifteen pounds which he paid for an Aberdeen diploma, and of an ingenious alteration of the name, suphonia gratid we presume, under which he may have formerly practised upon the men and cattle of Carricklergus. The reason is precisely that which might have been anticipated by those who were aware of the Doctor's visits to the sitting Aldermen at Guildhall, before whom he presented himself once a fortnight, among vandous of blacking and browers of small beer, to make outh that his Fasciculi still found purchasers. This fact furnished pregnant evidence of the moribund state of the fortnight's Fasciculi, an

call have, in point of fact, been nead thes . three mouths. Since the death of the Pasciculi, this miserable scribbler made a desperate attempt to cutch a few stray shillings from unwary purchasers, by republishing the report of the Trial of Cooper v. Wakley from The Times newspeper, occupying thirty pages, appending to it eight pages of his own balderdash, and giving to the mass of letter-press thus ingeniously, we had almost said fraudulently, consocted, the title of " A. full Report, &c." The Doctor makes the following attempt at a Latin quotation, by way of motto to this despicable publication:-

"Falsos honor juvat, et mendax infamies terret."

He makes another attempt, at the conclusion of his pumphlet, to palm himself upon the public as a person acquaioted with the Latin language.

"Pudet hee opprobria nohis Et potuisse dici, et non potuisse refelli." We have, on a former occasion, admonished this wretched sciolist, that a blockhead who attempts to palm himself upon the public for a man of learning plays with penknives, and cannot choose but lay himself open to derision. He has, in this last attempt at quotation, got hold of the right number of words, but, with the fatality which always attenda him, has so dislocated them as to convict himself of ignorance. The same, however, of the first part of the passage which he attempts to quote. might convey to the Doctor a salutary moral lesson. It would be well if he were himself swakened by some feeling of shame to a sense of the disgrace which his venous. ous malignity, and his lamoutable figure rance and imbecility, as a writer, are calculated to reflect on the profession, which he has the effrontery to pretend to be capable of instructing.

Edinburgh Medical and Surgical Journal.-

If rarity of occurrence conferred a proportional degree of value upon a case, the next in order would indeed be invalumble, in which Dr. Threlfall, of Liverpool, informs us that delivery was obstructed by a calculus in the bladder, weighing nearly seven ounces. This stone, or rock rather, could be distinctly perceived obstructing the progress of the futus during isbour; but in consequence of no catheter heving been employed, the patient having made water freely, the stone was mistaken for schirrus of the ovaries. In a consultation, the apprehension of hemorrhage and of hernia, decided against the performance of an operation for the removal of the obstructing body. Embryotomy, however, had ultimately to be performed; some time after the woman unexpectedly died, when the stone was detected lying in the varine. It would not, perhaps, be fair to sensure the practice pursued in this case, without its details being laid more fully before the reader : but we may remark that the writer's defence for postponing the use of instruments, and not having made a more socurate examination, is by no means satisfactory. Hed the case been one of an ordinary kind, where delivery was protracted by natural causes, procrectination would have been justifiable; hut where a large unyieiding body was perceived to frustrate the efforts of nature, we doubt whether an earlier instrumental interference was not demanded.

To this case succeeds another very remarkable one, of imperforate axus, communicated by Mr. Miller, of Methvee, of which we shall present in abridgment.

"The patient was a child of about a day and a helf old, when Mr. Miller was called as its relief. There was no weetige of an anna relactor; the mecanium passed through the urethen, so that a communication between the rectum and the bladder manufacture. Assistable in formal from

Perth, Mr. Miller made an incision one inch In length and depth, in the usual site of the saus. On the third attempt to push a com-mon troom in the direction of the rectum, the meconium flowed through the canule. and gave immediate relief to the infant. The canula, and sponge lints subsequently used, had to be removed from the pain excited by them; and gruel injections substi-tuted; by the occasional employment of which, the wound or artificial opening performed the functions of the anus toler well. Contractions are commenced, w w commenced. which foiling every means used to prevent them the wound, we are told, had to be enlarge on less than ten times in eight months. one of those occasions a slight has occurred, which was stopped by the appli-cation of styptics. The child was now re-moved by Mr. Miller's advice, to the Edinhurgh Royal Infirmary; hut the practice emplayed here, (eponge tents to keep the passage open,) being abandoned from the pain it produced, the shild returned ho and took to eating coal cinders, which sticking in the passage, had to be frequently removed by uperation. In one of these operations, the bladder was unavoidably wounded and a communication established between the bladder and the rectum. Notwithstanding all this cutting and backing, the urchin throve well on the cinders, and possessed the complete power of a sphincter, natil a calculus of an extraordinary ma nitude, nearly filling the outlet of the pelvie, impeded for ewhile his thriving condition. Mr. Miller, linwever, by a successful ap-plication of mechanical means, such as drille, forceps, &c., relieved the little follow, (who hove the operation, we are told, with the fortitude of a young Spartan,) by re-moving the calculus in three pieces, after an exertion of three hours. The entire stone was so large as a turkey's agg; the sualysis of which, by Dr. Christison, of Edinburgh, presents some ourious results, which are well worth consulting by smatters in the mineralogy of the human hody."

Our readers, of course, will not be surprised to hear, that this industructible little being, whose vitality resisted all the efforts of neture and art to extinguish it, is still living, and doing well! To a young surgeon wishing to "feek his maiden blade" in living dissection, such a patient would be invaluable; as he might perform all the operations is surgery or him, without the least the of True Lawour or the Country.

through the urelies, so that a communication between the rectum and the bledder was obvious. Assisted by a friend from mal condition of the posterior, curioular,

Edinburgh. Three cases only of this kind credit on him, is perhaps the best practice were known to the writer : the first occurred | in this troublesome disease. in the practice of Pelietan; the second, is reported in this Journal, by Mr. Wardrop; and the third, by Mr. Muclachian, ie the Glasgow Medical Journal. Two of these cases being already known to our readers, it will be unnecessary to notice them here; but of Mr. Syme's we will proceed to give them a summary.

" In July last, he was consolted by a Mrs. J., aged 54, for a tumour over the matchid process, ebout the size of e goose-berry. He first thought this temour en-cysted, but finding that it might be emptied by pressure, and that it filled egain when the pressure was removed, the error of this epinion became apparent. On examining more closely ha also found the posterior articular attery enlarged, end polasting violently; and that when pressed, the tumour became flaquid. The patient first noticed the disease about ten years ago, after lying-ie; its progress, uetil of late, had been read, was gradual. Pressure had been recommended to her tand was pried but midden. mended to her, and was tried, but without any benefit. Considering the disease an ananism of the posterior euris, alr. Syme proposed an operation, to which she readily assected. On shaving the head for this purpose, the tumour was found to extend along the course of this artery; and also to have engaged the posterior and middle branchas of the temporal artery. Mr. Syme was now inclined to tie the earotid; but declined this step, on finding that pressure on the suria emption the asc, and stopped the polastion. He accordingly took up that vessel, (which he found as large as the radial, but thinner in its costs,) and applied e single silk ligature. During the subsequeet twenty-four hours there was a slight hamorrhage, and in a week a slight attack of srysipeles. Oo examining the wound ou the twelfth day, he found a small false anenriem et the bottom, aed the source of tha bleeding; the whole of which, clong with the ligature, was now removed, when they coppurated kindly. The operation, however, not having afforded the capected relief, Mr. byma, amisted by Mr. Balliegal, on the 29th Oct. dissected out the whola tumour; end; he informs us, with perfect socress, the would being now perfectly cicetrized,

and temporal exterior." by Mr. Syme, of Syme, which, though not novel, reflects much

#### BUNTERIAN GRATION.

Tun Huntarian Oration, is to be delivered by Mr. Vincent, in the Theetre of the College of Surgeons, on Saturday, the 14th icat., at four e'clock in the afternoon. Sir William Bliggard once more requests that the members will come without their hats.

LONDON MEDICAL SOCIETY. Monday, February 2, 1829.

Dr. SHEARMAR IN the Chair. Arran the Mieutes of the last Meeting

Dr. CLUTTERBUCK rose and said, he was desirous of bringing a subject of considereble importance before the Society,-tha publication of its minutes in the weekly Medical Journals. He did not alluda to the reports which appeared in any periodical in particular, nor to any recent occasioe, but to their publication to Tua Lancar, and all other works, and to the regular habit which it had become. He new rose to state his opinion, that the practice was open to many, and very weighty, objections. The Society was considerably injured by it, and it ought not to be allowed. These were private and confidential meatings, different, altogether, from those of a public body; and he conaidered it was extremely unjustifiable that the conversations of private gentlemen should be taken down by Reporters, and published to the world at large. He thought that the late President had given a license to the practice, which was hardly warranted by the laws or objects of the Society. It was ountomary for many gentlemen to atte-there, and state the cases which their tients efforded them, which they did not wish the world at large to know. If they stated many things which were creditable to end, he informs us, with perfect souces, the woned being now perfectly cicatrized, and the patient comperationly reliased. When the arterial degeneration can be completely included within the limits of a male operation, the plan pursued by Mr.

jections, he begged to my that these did forth with the comments of Editors, or with not, and could not, arise from any hostility, each itselfer as he had noticed; if they must on his part, to Tain Lancer, or any other his published, it should be fairly, and withwork, and especially from the former. He put remarks; yet, securate or not, they did

(Dr. Cintterbuck) had received from Taa in good, and eught to be discontinued.

LAMENT the most flattering epprobation and

He should ashmit a motion to that effect.

Dr. Williams ebjected strongly to the
The Reporter here ceased to take notes, in reports, and commented on some of the recommence of a meigrate required from the lattering of the former of a meigrate required from the

consequence of a private request from the marks of Mr. Ashwell. It was not the Registrar, by whose ticket he had been in- quasation whether the public were snatrially troduced, and who personally objected to benefited, as Mr. Askwell had stated; they had solving so. Dr. Chriterheof. continued to had nothing to do with it. How could be speak at some length, and, on concluding, the public, for inating, be henefited by the our Reporter, addressing the Chairman, publication of this report. He concurred in stated that he had been taking notes, but all Dr. Clutterheok's views; contraded thest had deep consequence of the lit was a review. Society, and that many had discontinued, in consequence of the above application from the Registrar, and as he should continue them if he remained, he thought it right to ask if he were

silow.

The Reporter explained that he was not taking notes surreptitiously; its lad dis-tinctly stated, on receiving his ticket, that he was about to do this in consequence of the absence of the gentleman who usually attended; he considered both the Registrar end himself exonerated from any imputation, and egain requested to know if he were at liberty to take notes, or whether he was to consider the meeting as private.

Mr. Answart made several remarks on the subject of reporting, atrougly advocating it; and replied, in full, to the objections of Dr. Clutterbuck. Wn regret that, owing to the Registrar not having withdrawn his objection, we cannot give publicity to senti-ments on the subject, in which far the greater portion of the members appeared to

Our Reporter, after Mr. Ashwell had concladed, stated, that as he had not yet re-ceived the sanction of the Chairman, he should withdraw himself from the admission of the Registrar, and request the favour of an introduction from some ether member.

Mr. Pursus was quite sure that the meeting would not wish that. The Chairman, he had no doubt, would at once grant life own introduction, without any abjection to notes being taken. This the Chairman

immediately did.

it was a private Society, and that many members, within hie own knowledge, had been deterred from axpressing their optat liberty to do so; if not, he should retire. jucts of discession; he was sure that, on the The Recurraca stated that he was igno-whole, the reports had been extremely prehad a very strang about to take notes; he judicial, and that they were a barrier upon lad a very etrong objection to the minutes the very principles of the Society; there being reported; in thought it extremely was a very wide difference between the wrong, and what the Society should not right to publish the reports of societies, and those of hospitals; it was, too, a very diffi-cult thing for reporters to be accurate; he thought it one thing for them to tell the trull, and soother for them to tell the whole truth; he had seen most inaccurate reports given; the speeches desit out in dishless, and with gross partiality, (cries of cleair, chair.) and ha thought the Society would go on manh hetter if a stop was not to these, or else that they should be published by a responsible effect of the Society.

A MENSER, whose name escaped be, theaght that this was a very irregular conversation; but on its being observed that there was a mution before the meeting, made

by Mr. Proctor, Mr. LLOYD rose and said, he for oue, should object to its being put that night, or on any future night, lie had always been an advocate for the pablication of the Society's misures, and he believed that much good had been done by it. He considered that the reports had been natremely accurate, and as for the good they did, it was fair to believe that that which was advantageous to beer apoken, must be benefinial to read; he should be against any proposition teeding

to prevent reporting.
Mr. Snaarry wished to know what difference there could possibly be between the publication of the Society's "transactions" and them reports; nothing could be fairer than the latter, for they narrated manageess. and them reports; neuting count we started the accession of the property of the partial of the property of the partial of the the advantage which country practitioners were disposed to talk too much, the report-derived from these reports. He had every ing induced them to abstain from it, and extensive connexion with them, and they much valuable time was thus saved. He had invariably told him that they derived thought no pain sould be given to patients very great advantage from reading them. If their names were not published. To the Owing to the axtent of these gentlemen's narrators names, their could be no possible practice, time would not let them refer to objection. Cases and opinions had no authoprecurse, the would not let them reter to objection. Cases and cannon man an analoc-tic badge which it afforded many others, and oxpress his opinion, that if the reporting they consequently depended on the periodi-leafs for all the current information that literally, no possible objection could be could be given. These reports become, urged against it. No comments should be therefore, of the ntmr : importance to the rofession, and he would give hie vote in avour of them.

Mr. KINODOW had little doebt, that if were doing. He considered, however, that nothing more than the conversatione themselves, and not the namee of the speakers, ought to be given; greater difficulties to auch abuses of reporting as had been mentioned, would then be prevented, partiality avoided, and equal utility obtained. He considered it was almost impossible, in gieing the reports, to do so without some colouring; and this colouring readered them to many members very painful, and if pain-ful, they ought to be prevented. Many should certainly eay, that the Society ought to feel obliged to eny Editor who would removal of the epeakers' names would pravent them from tracing their cases, as it was said they sometimes did. Ilis own putiente had often known their easee from the atthe suppression of the speekers' names.

Mr. Prises agreed that this was a sub-

ject of greet moment to the Society, end he considered that it ought only to be cotertained to efoll meeting of the Society, that satisfied that no harm could occur, bet very ports. great advantage, if fair and accurate reports Mr. Callaway was mach pleased were given. They came together as acten the neutiments which had faling from

made, and he thought that the Society ought to here some accredited agent from the publications reporting, who should be tangible to the Society; it could then take its fairly given, reports would be productive of own measures, if lecorrectness or unfairness good, and thought it was the daty of the occurred. No Editor could for one moment Society to let the world know whot they object to give in the name of his Reporter were doing. He considered, however, that to the Registrar. In conclusion, he thought the time of the Society could now be better employed, than in discussing this enhiest; a special general meeting should be salled, if more need he seid on it, sod all the membere ought to have the opportunity of hear-ing the area and come, and of voting. Mr. Nalmon could not enderstand the po-

sition which had been taken by those who objected to reports, nor could be see objections of any kind to it; he would give the reports his most decided support. He did not undermembers were deterred from deliveriog their stand the A.B. plan of Mr. Klogdon. It opinions. By his plen, all ends would be was the most useless that could be devised. asswered, and no man coold object. He For himself, he was useally plein and open should certainly eay, that the Society ought in his sentimeous; and on this, and all occesions, however interested he might seem, report their proceedings, if it were fairly he elaimed the privilege of being houset in dons. As to the objections of patients, the bis intentions. He decidedly objected to the suppression of speakers' namee. Looking to his own situation, for Instanco, he did not choose that other gentlemen should hear his opinious in the Society, end out of it man cues above a name and training of the first the state of the state He therefore refrained from mentioning et and each a plan, end he would never some cases, from the pain he thought it agree to it. He was not taking a supmight create. He should urge, very strongly, posititious case. It had repectedly occerred in privete life, that the opinione he had given io ous place, had actually been related again to him in another, as the opinione of others; end he would confess, without hesitation, that in this metter it it might not he cald, a few members had was his desire, as it was his doty, to preveot most together, without previoce notice, to injury to himself, and to obtain all the he-injure the publications elluded to. He was nefit be could from the publication of re-

Mr. Callaway was much pleased with were given. They came together as acteut the neutrants which have many no lay certain facts before the Salmon, ead he agreed with them all that Society; discussion was edicited which it was evident that Man. B. win thinking of tended to benefit the whole peblic. Dr. himself while he make. He (Mr. C.) was Williams had said, that many were detreed gratified at the liberal feeling which perform specking; own he (Mr. Peirre,) vised the neiting, but thought this was not thought it an excellent thing that this the right time to extertain the subject. A sametimes happened, for when gentlemen large moving should decide upon its. He had listened attentively to the discussion, | was; be had no desire to see his own name and he had not heard one objection to the figuring eway in the reports. Mr. Peirse's reports; not one that was satisfactory to proposition was an admirable one. his own mind. He should like to hear members state more definitely what were their very serious objections. He did not mean to allude to any publication in particular, but he thought with Mr. Peirse that the Society should have ascendited report-He l ad himself seen comments end Italies which he thought wrong towards in-dividuals; but he was quite of opinion that the reporting should be fully, openly, and freely allowed (hear). This opinion might possibly have more weight in falling from him than from some others, because he had made no secret at one time, that his neutiments were widely different; but he had since changed his views of the subject, and thought that when regarded, as it deserved, as a great public measure, these reports were of the atmost importance to the profession and the public. If the question were to be decided to-night, he should certainly vote for the admission of reporters, but he thought that timely notice ought to be given to all the members, of any discussion.

Dr. LEONARD STEWART, asked if there were suy specific motion before the Society,

as, if not, he should move one ?

The CHAIRMAN said, that there was nous; but that this was merely a conversation originating, (as we understood it,) in the Council, to ascertain how far the feeling of the Society would go towards the prevention the Society would go towarm or particularly accredited agent about us summer of raports. Ha thought that great mischief accredited agent about us summer of the proceedings, had been done by them, but considered that meetings to report the proceedings.

Mr. Suzazz complained of the report of the land of the land of the land. which would prevent any member, or any visiter, from taking notes and printing them afterwards; he thought, therefore, that the Society should have some accredited agent from the publications. The Editors could arrange with the Society that the reports should be scourate; but the Society could do nothing of themselves.

Mr. Asswert again expressed his deeided opinion, that there was ne real objection to reporting. On the contrary, the Secisty had very considerably increased in interest through it. He never in his life eaw a Society which had so benefited, both in attendance and attraction. Let the reporting he placed on a good basis, and the professional man must derive benefit reporting he placed on a good hasis, and the professional man must derive benefit the professional man must derive benefit the professional man must derive benefit the deliver, to express, in effect, his optimise for the public good, it must be done. He times had cause of complaint; as when, a learn that it into head dane, and great pain assisted; but this, he thought, was a necessionally to write the professional man and an experimental times had cause of complaint; as when, a considerable time since, a reporter used considery consideration; and ought to be proved the professionally to write the professional man and the first the benefit of the professional man and the first times had been derived by the professional man must derive be the chief. There could be not considerable time since, a reporter used consideration to after himself the man and the professional man must derive be the chief. It is a series to be the chief. It is a series to considerable time since, a reporter used considerable time since, as reporter used consi

The CHAIRMAN, on a pause occurring, referred to Dr. Clutterbuck for his inten-

Dr. CLUTTERBUCK said, that he had brought the subject forward as a duty, and if he had found that the feeling of the So-ciety was with him, he should have laid something specific before it; but that he found was certainly not the case. He should not urge it any further now, as the meeting lag was not large brough, and the subject needed more deliberation. He should be heppy if, by and by, there were a change of feeling to bring it forward again.

The CHAIRMAN thought, that the reports ought to be given in a more securate sh No person could avoid seeing, that in Tuz LANCET they had sometimes contained a great deal of spite, and endeavoured to throw discredit on some of the members. He had often noticed one speech well given, and directly after, because the reporter did not think the next of importance, it would be said for instance, " Mr. Lloyd attered some nonsense not worth repeating." Then there was some left out, if it did not hear on the case, while he (the Chairman) thought it ought to be given. He would propose that the Council should take the subject into its consideration.

Mr. Callaway rose and moved, that the subject of reporting be referred to the Council, for them to consider whether as

the proceedings on the night of Mr. Lamthe proceedings on the signer of Mt. Lan-bert's expulsion, which appeared in one publication. In that report some speeches were faithfully gives, but his own was most absmetally gerbled. He now begged to know who had sent that report. The reporter for The Lancer was not present, nor any other that he maw; so again, therefore, demanded, after the decision of the Success on the night in question that no reporter should be admitted, who had sent that report? He believed that it had been done by the Registrar.

The CHAIRMAN here interfered, to pre-

vant the discussion from going further.

Mr. Laovo took occasion, in concluding

The CHAIRWAN here put Mr. Callaway's metice, which was carried unanimously.

Mr. Patasa, raferring to the report of hat week, stated that Mr. Lloyd and himself had not impeached the accuracy of the Society's minutes on that occasion, but that they bad axplained some remarks made by them, in reference to Mr. Selmon's case of phthisis pulmonalis. His object now was, to excuerate the Registy

A specimen of tomour of the breast, Exemination of the Corper, sixteen hours after and of the coophagns and kidneys, with hydatids, were exhibited at a late bour to the Society, by Mr. Hooper, Dr. Ryan, and Dr. Ramadge, respecting which further particulars were promised at another avan-ing. A short discussion arose between Dr. RAMADON, Mr. LLEVED, Mr. CALLAwar, and Mr. Prinan, as to the invariable connexion of hydetids with the nutar surface of the kidney; but as the subject will, probably, assume a more regular shape on other occasion, we do not give the casual remarks which arose.

The REGISTRAR stated that he had a most interesting case to communicate from some person who was not present, and which, from the lateness of the hour, was postponed. The meeting then adjourned.

The Chairman, in conjunction with other nembers of the Sociaty, afterwards Inti-nated to the gentleman who took notes of the proceedings, their wish, that the easu-ing report in Tan Lancar should convey to the Editors of such Journals as were dealross of leaerting reports, the upinion of the Society on the subject of "sccredited agents." The above debate will convey that opinion.

# WESTMINSTER HOSPITAL.

CHRISTOPHER STANT-(Continued from No. 279 of this Journal, p. 444)

His health rapidly declined; the granulations became pale and flabby, and the muscles retracted, leaving the bonn protruding; pus thin, scenty, and spyroaching, in character, to ichor.

Dec. 28. General appearance table; eyes aunk; countenance ghastly; deep uleer si-tuated on the centre of the left cornes; a considurable quantity of pus effused into the anterior chamber, but the action of the iria unaffected; conjunctiva vascular; cornea upaque. He expectorates this mucus, mixed

trusted to his own character to set him with a large proportion of pus; has had one right, and he considered it generally the discharge of forid blood from the large, best way. hausted him; pectoriloguy distinctly audibin; respiration hurried; poles 130, small, and jurking; tongue deaky red; mouth and facces covered with sphthe ; diarrhose. The poor fallow grew gradually worse satil the night of the 3d January, when he was sud-dealy attacked with a violent spannodio cough, which induced an expectoration of about two pints of searlet blood; this flux put an end to his existence. Opium, foxglave, and pordials, were used successively.

death, conducted by Mr. White.

All the abdominal viscers were blanched. The liver presented a mottled appearance, and had secreted a thin, light-columned biln. The spleen was large, but of natural colour and consistence. The intestinal canal, from the cardia to the anna, was parfectly healthy. In the atomach was a quantity of coagu blood, which had been awalinwed. When the aternum was raised, the basis of each lang was found collapsed, of the natural neionr, and grapitation between the fingers; the middle and saperior lobes were com-pletely taberculated, and adherent to the sides of the chest; on the right side a vamics existed, of sufficient capacity to con-tain an ordinary-sised apple, having a thin cyst, and communicating with the right bronchin by a large aperture. It contained a small coagalam, but nu pus. The luner tunic of the laryax, traches, and hronchi, was redder than natural, and the ramifications of the latter on the right side were filled with black clots of blood. The plears contained about sinteeen ounces of serum. and the pericardium nuarly six ounces. The heart was fat, apparently bealthy, and of mean size. The head was not opened.

AMBURIEM OF THE ARTERIA IMMOMINATA.

Samuel Stank, as average-sized man, of dark complaxion, about 40 years old, admitted 6th February, 1828, under Bir Geo. Tuthill, M.D. After being axpessed to cold and damp, about a week before his entrance he was seized with pain in the throat, and difficulty of awallowing. The pain extended backwards between the scapulm, and tomards backwards between the scapulm, and tomerds the right side; he was relieved by a blister,

He naw complains of great pain about an inch below the sternal and of the right clavinle, where a pulsatory lambour of un oblong shape, and about an inch in width, is evidest; the pair is suggested at, each inhan-lation. Much dyspiess, wough, and expen-toration of a thick white succes; pair Ma-strong, and, vibratory; tongun whitish; bowels confined; akin cool; lips livid; vi- rent fins. Lungs, heart, and guilet perfectly large nazious. Cupping to eight ounces; e healthy; no effusion into the chest. hilster to the chest, and a mucilaginous and

enodyna mixture.

7. Cupping immediately relieved him, but towards evening there was an increment of pain in the chest, breathing difficult;

8. Crassamentum buffed; serum turbid; symptoms alleviated by the venesection;

pulse 96, full, but thrilling.
18. The symptoms continued without any material variation since the last note; in the inturim he was once bled with tempo- had once or twice emeunted to nearly a very advantage, and has taken small doses pint of blood and mucus. He had been of tarturised antimony. He now alceps bedly, complains of an acute paic moder the right bladebone, dertieg into the vertebral emn, and towards the eternum, segmented by coughing and deglutition; cough less irksome; respiration casy; lips livid; tongue cleen ; bowele upen ; pulse 92, vlbrates. Tartar-emetic cintmeet to the part

22, Cupped on the back to 12 ounces; pain relieved; takes an expectorating mixture of mucilage, paregoric clixir, and oxymel

of squille.

28. Respiration laborious; cannot awallow without bending the body forwards. The eccurismel tumour has grown larger, sed its pulsations are more powerfel; the patient cannot lie supine ; percussion educe a graver sound on the right than on the left side of the thorax; a constant achieg at the top of the sternum; slight cough and mucous expectoration; lips purple; face livid, and intently anxious; pulse 100, full. He is incepable of any exertion.

March 3. All the unfavortable symptoms

enhanced; the pulsations of the tumour the left side continues. Polse nearly nahave increased in intensity. Cupping to tural.

10. He was relieved by the cupping, but ite gradeally gave wey, and yielded to his sufferings this morning at four o'clock.

#### Post-morton scruting.

The arterie innomicate much distended, forming an ensurismal sac, capable of holding half a pint of fluid, and which contained several distinct songula. This was contiguus to the posterior surface of the first bane I thingsteroum, which constituted its roof. Between, which constituted its roof. ericateum was absorbed, so that the The pariosecut was absorbed, so that the smeall were washed by the ancurismal blood. Arch of the sorta natural. On the right side of the tracker, the presence of the of heedach; pupils rether expended; tumous land assessioned pertions of three bowele regular; stoole natural.

May 3. Makes a full inhalation without restraint. No cough or expectoration; the assurion and the tube of the tracker, sequetion and circulation makes.

S. Convalencent.

#### MEMOPTOR.

Juhn Graves, mtat. 66, admitted 16th April, 1828, under Sir George L. Tuthill, cough tiresome; pulse full and strong; ten M.D. He states, that having about six ounces of blood taken from the arm. weeks before been exposed to cold and weeks before been exposed to cold and demp, he was soized with a violent cough, and expectorated a thick yellow mucus, often streaked with blood. At times blood was expectorated more copiously, and the spets ejected in the course of one night, noder medical treatment, and partially benefited. He at present complains of pain over the whole body, which is most severe at the upper part of the thorax, and aggra-vated by cough. Expectoration—mass, mixed with strin of blood. Canast lie on the left side. Percussion elicits the natural sound. Pulse 90, pratty full; respiration easy; checks tinged of a pink colour; aklu cool; tongun clean; he has a taste of salt in the mouth; bowels regular.

Take of inconcuent 4 grains.

Digitalis, half a grain; in form of ill, three times a-day. Pill of map and opin on, 5 grains over night. A warm bath prescribe daily.

8. Pais of shost her a little shoted; cough tiresome; expectorates rotind mucoc sputa; respiration unconstrained; pulse 84; tongun cieta; howels open.

12. Considerable pain wader the right ciavide, produced by every act of coughing, which is frequent; inability to recline or

Tinct. of digitalis, 15 missime thrice a-day. la es nunce of infusion of rosse, ter ail occasionally.

17. Complains of pain is the left side of the thorax; sleep much disturbed by the cough; sepectoration mucous; pulse nearly natural; skin cool; tongue dry and yellowish; considerable thirst; continue the digitalis mixture. A solution of crosm

of tartar to be used as a common beverage.

19. Thirst slaked by the soid drink; tongun clean, but the cough is worrying. Controves the remedies.

29. Cough and expectoration have nearly disappeared; no pain of chest; complaine

MAMOPTON-DYSPHEA.

Richard Hobert, aged 59, admitted 26th April, 1828, under the care of Dr. Rowe, having a cough and a sensetion of tightness across the chest, which had existed two months. On the day before his entrance, whilst walking in the park, he, on a sudden, brought up about a pint of florid blood. Now complains of difficult respiration; coughs up a considerable quantity of mu-cus, stristed with blood; cheeks flushed; lips livid; saltish taste in the mouth; d dry; ( .ise 100; tongas s npen. Warm bath; veneclean; bowels apen. section to ten ounces.

Take of pender of mendow suffron-root, 5 grains every six hours.

28. Feels better; no hemoptoe to-day; breath easy; slight cough; pulse 80, mall | skin moist ; countenance natural, 29. The cough was troublesome during

the night; al pulse 92, soft. ht; slight dyspame, but no pain;

May 3. Cough rather irksoms; a little muces expectorated; pulse 116, very small; passes his urine with difficulty; tongue clean; bowels apen.

Take of ipsessum. 5 grains, three times a-day.

6. Feels easier, but the cough is still troublesome, and the respiration difficult. Palse 132, very thin; tongue dusky red; howels relaxed. Continues the lpecacuanus. A warm bath every night.

8. Dall pain under the sternum; respiration laborious; gargouillement; urgent cough; muce-purulent expectoration; pulse 190, exceedingly small; hande livid and cold; some tendency to come. A cordial mirture.

9. Passed a restless night; dyspnæs augmented. Died at night, a. m.

Sectio andaveria, thirty hours after death.

On apening the chest, the lungs were found adherent to the thorseis periotes, and existence, retaining the impression of the finger; an cutting into them, a considerable gorgement of bloody serum, which fresly flowed out, was sxhihited. The middle and inferior lobes contained a few tubercles, onn of them as large as a walout, and filled with soft caseeus matter. Some points of hopa-tisation were seen, and a small tuberculous cavity, communicating with the bronchiel tubes. The pericardium contained about two ounces of serum; heart fat; superior aurface of disphrages injected; abdominal organs comparatively healthy.

Joseph George, 36 years, ald, a drayman, admitted into Matthaw's ward, 13th Deadmitted into Matthaw's ward, 13th De-cember ult., under Mr. Prasident Carlisie, urine comes away involuntarily, both through

with hematocele. Early in the morning, whilst moving some bags of hope, he lost his balance, and fell natrids a beam. The perinmum is much discologred and tumefied : the scrotum apparently distended with blood forming a dark purple tumnar, as large as a melon; the testicles are tangible at the su-perior and back part. About tes minutes after his fill he passed his urina through the urethra, but with considerable pais. Howels open, In the course of the day (Saturday), he was seen by all the surgeons. Mr. Harding had failed in passing the eatheter, and a diversity of opinion existed amongst his colleagues as to the modu of treatment. Mr. Lyan recommended cold lotions and purgatives, which did not meet with general spprobation. Mr. Harding made three inciions of an inch in length into the scrotum, and a quantity of dark-coloured blood slowly escaped. House-physic, fomentations, and the part to be supported on a small cushion, 14th. Has passed no nrine since admis-

ion. Scrotum less tense; the fluid discharged from the gashes made by Mr, Harding, has the odour of arine: feels an orgent desire to make water; a sharp palse and dry tongue ; the bowels act freely. Mr. Harding made a second attempt at introducing the catheter, but not wishing to use force, soon desisted. Fomentations to he

constantly applied.

15. Hes passed no arine. The bladder much distended, reaching nearly to the navel. Another vain attempt with the osthether by Mr. Harding. About noon Professor Guthrie arrived, and with great adroitness, and little force, succeeded in passing the instrument. "La voils," axulaimed the operator expliringly, raising himself to his full height. Three pints of urine were immediately drawn off; a fiexible catheter was secured in the bladder; and an nunce of the following medicine was prescribed avery six hours :

> Arometic confection, 2 drachmis. Solution of acetate of aumonia, 3 on. Compher julep, 5 oz. Mix,

16th. Passed a good night; pulse soft and voluminous; bowels open. The urine infiltrates into the cellular tissue of the scrotum : tumefaction undimlnished.

17th. The urine passes gattation through the catheter, and dribbles through the fistale. Mr. Harding out into the periusum, and exposed the lacerated part of the arethra, into which a probe was pushed; the eatheter continued

20th Berotum much reduced in sine. Urine flows partly through the urethra, and partly through the fatule. The fabril symptoms have vanished. Middle diet.

moderate stress through the urethra; an occasional drop filters from the scrotum, which promises to heal shortly.
12th. The peptic functions formed. Convalencent.

## HOPITAL DE LA PITIE.

EMPLOYMENT OF CHICAURET OF SODA IS BURNS.

M. Lysynamo has intely obtained such secess from the use of the chloruret of sods for the scree remaining after hurns, that he refers it to any other application. The following case will serve to illustrate his

pian of treatment :-

A. Prevost, setat. 36, was on the 13th of August admitted into the Hospital, having ou the preceding day scalded his left arm with boiling water. During the first three days, emultieut positices were applied, but on the 16th the chloruret of sods was employed in the following manner:-- the detached epidermia having been remuved, the affected part was covered by a fewestrated compress, aver which some list, dipped into the solution, was retained, by means of a circular bendage. The whole was kept moist by repeated aponging with the finid. M. Listranu observed, that in order to obtain good effects from this method, the solution must be aufficiently alroug to cause a sensation of heat and alight pricking, and that it is better to make it a little too atrong than too weak, for the painful sensa-tion which in the former case is produced, aubaides within a short time. In the above case the solution was somewhat too etrong, hut after 48 hours, the burnt part had perfectly healed, and nothing but a slight reduess remained.

## HOSPICE DE LA SALPETRIÈRE.

TRIBMUS OURSD BY THE SETERSAL APPLI-CATION OF THE ACETATE OF MORPHIUM.

CASE t .- Maria Uralu, mtat. 28, of a serofelous diatheris, was admitted on account of a large uless at the external encie of the left leg, by which the tenden of the perceeus longue was decaded. On the 10th of June it was created by one of the pupils in much an evident invited the demander, that a violent irriteration of the demanded fundam with excessive constitution, had, for two years hafore her pair, accompanied by manual and combiner, admission, been subject to a constant pain the property of the property o his produced. An ficer atterwards, the pe- in the left side of the nose, accompanied

the natural and morbid canels; specient tient felt an itahing sensation along the af-medicine to be taken occasionally. fected leg, and complained of anomaly a debli-10th January, 1839. The urine flows in a ty and oppressive headach. These symptoms were soon followed by antire loss of consciousness, and great rigidity of the mus-cles of the jaw and neck. The mouth could not be opened, and its angles were drawn backwards; the eyes were staring; the shdomen very hard; the feet spesmodically contracted; the pulse frequent and hard, Twenty cuness of blood were taken from the arm, and SO lesohes applied to the anus, hut without any and. The warm bath for hnt without any eact. The warm bath fe an hour; mercurial frictions; a blister of the ueck, and the use of sudorifics having also produced un alteration, the acetate of morphium was employed in the following manner; the fourth part of a grain was mixed with a very small quantity of wax-plaster, and applied over the blistered part. From this time the trianus gradually subsided, and after repeated applications of the morphism, the rigidity of the muscles, contraction of the leg, &c., also disappeared, and the patient ultimately recovered.

CARE 2 .- Marguer. Broin, of a nervous temperament, and very weak constitution, having during five years been in the Salle des Incurables, on account of a herpetic affection of the extremities, was, on the 23d nf July, frightened at the night of a patient in au epileptic fit. She funted, and when, after having recovered her senses, she was guing to relate what lad happened, she was seized with convulsions, which terminated lu complete tetanus. The angles of the mouth were drawn towards the sides; the jaws were firmly closed and immove the head was drawn back, the neck stiff, and the muscles of the trunk very rigid. A small blister wee put on the neck, and removed after four hours, when the acetate of morphinm was applied in the manner above described. After three hours, the triamps had considerably ambaided, but the other symptoms continuing unabated, the application of the murphium was repeated, and proved so afficacions, that after three days the patient, with the exception of great dability, had perfectly recovered .- Lembert, sur le Methode Endermique.

# OPHTHALMIC AND SURGICAL CLINIC AT BERLIN.

CALCULOUS CONCRUTION IN THE CAPITY OF TRE HOSE,

by disposition to saccting, coryse, mucous discharge, and subsequent nicerations round the nostrils; these symptoms having contimucd for some time, the left nasal meatur became completely abstructed, and its parictes began to swell in such a manner, as tn compress the lachrymal duct, in consequence of which, the tears flowed over the cheeks, and the skin was very extensively exceristed. The continual irritation in the se induced the patient to use many efforts to remova the obstruction, hy blowing through the affected side of the nose; sh soon felt something moveable io it, and at last succeeded in expelling a calculous con-cretion of a considerable size. This was just before her admissioo. The pain and irritation had considerably dimloished aince the discharge of the stone; the swelling had somewhat subsided, and the abstruction appeared less complete. On axamining the affected side of the nose, no stone could be found, but the mucous membrane was ulcerous, and considerably thickoned, mid there was a constant discharge of purulent matter. To prevent a second formation of celculus, a solution of the carbonate of potassa was injected into the nose, and, after a fow months, the patient was perfectly cured. The calcoloos concretion which had been discharged from the nose, was of an oval form, eight lines in length, and twelve in thickness; very hard, of a greyish brown colour, and had an unaven surface. On heing sawn sounder, its nucleon was found to consist of a small cherry-atone, the kernel of which was reduced to a thin membrane ; round the nucleus the calculous matter was deposited in thin concentrio layers of different colours. The patient could give no information as to the manner in which the foreign body had entered the nose. On this occasion Dr. Graefe related a case which he had observed in his private practice:—A man affected with gout had a long time age experienced the same local affection as the above patient; on introdocing a probe into the disease aids of the nose, a deep-seated foreign body was felt, which, on attempting to axtract it, broke into small pieces, and these having been evantually discharged, all the symp-toms caused by the mechanical obstruction of the nasal cavity, and by the irritation of the mucous membrane, gradually subsided. -Gracie's Journal.

THE MINLAND REPORTED.—The country press has lately given hirth to a new Medi-oal Journal, published at Worcester. Wa have not yet had time to look through the have not yet had time to look through the contents of the three numbers that have been not from whence the intellect is derived—published, but we are glad to see the aftert, we have to do only with its operations, and and wish it all the success it may prove to these are under the demociate influence. deservs.

ON THE PREDICTORITION TO, AND PAR-VENTION OF, INSANITY,

" Felix qui potuit rerum cegnescere canan

To the Editor of THE LANCES.

Sia,-The subsequent is much at your service, if approved, for insertion in your respectable columns.

Believe me very much yours, W. Hosslay.

North Shields, Dec. 1828.

A practical exposition of the predispoaction to, and prevention of, immunity, being, it is presumed, a desideratum in medical literature, is, at this era especially, most deserving of professional, as well as public attention, seeing that prevention and not cure, which lamentable experience has taught us to be impracticable, (I speak, of course, of confirmed, rather than periodical or recurrent insmity,) becomes the fit and proper province of the physician.

That deranged circulation, ant organic affection of brain, is the parent of our manifold mental aberrations, both reason and experience, no less than dissections after

death, amply testify.

The predisposition to insenity usually develops itself on approaches to adult life, (I except idiotism, from natural defact of intellect, manifested during infancy,) when the circulation of blood, and that of the brain in particular, avinces an important change in the aconomy—a change, at times, fatal to the well-being of some vital organ, hitherto, parkaps, in a state of comparativo quiescance.-To illustrate. The lungs, from predisposition, doubtless, of organisation of ressels, take oo a atate of axcessive and consequent irregular action, and a faundation thoreby is laid for perplaxing asthms, or mortal phthisis pulmonalis, the appalling and most devastating endamics of our country.

Phrenologists, who contend for a "plurality of faculties and organs," must not lead us from the important business of cir-culation; the excessive excitement or irrarularity of which, local or general, of the brain, constitutes, in my mind, inscalty.

We are not permitted (doubtless for wise and benavolent purposes) a thorough know, ledge of mind; and materialists may not at nought, if they will, its phonomens founding, as they have hitherto propensity with intellect.

(asphysiology and experience teach se) of the

over, unceasingly. Hence its markid vascu- of insulty: a volume would not suffice to

fact, under its abernations particularly, these

Paralysis establishes the brain's prace-dency in the soonomy, and enough already has been said to demonstrate the amount and degree of its affection, somewhat under insanity. The prectitioner, therefore, would do well to bear in mlad the predisp osition of brain to which I have alluded, and by no means to content his nelf with the mere medicinel treatment of his patient, or assur-edly he will fail in the relief, not to say cure,

of his melady.
Our object, if my premises be st all correot, ie fourfold : first, to make less blood rather than heav ourselves shout the local or general abstraction of it from the patient. Secondly, to lower the temperature, an less than the vascularity, of the brain. Thirdly, to correct the secretions and facilitate the exerctions of the alimentary passages. And, fourthly, to have a due regard to the quality of the blood, so as to fit it for the valued purposes of arterial circulation, for which the venous le by no means adepted, without previous oxygenation. Regarding our first position, it may suffice to advert, briefly, to the abuse of animal food and four meets, from whence much of our susteannos is derived, and a superabuedance of nutriment obtained, provided especial regard be not had to the quantity of them. Animal foed (the red meets repecially) is well known to afford considerable nourishment to the system, and hemorrhages from the mose and luage, in early life particu-larly, are consequent upon the shuse of it. The finer preparations of wheat neurich full as much, but etimulate less, consequently are not quite so prome to create that extreme excitement of the blood-ves-

brais. To secure, then, perfection in the Under the second head, I have to call operations of mind, the brain must maintain, the attention of the predisposed to the habit-throughout, a freedom of circulation comtains, or abnae, of aerootics and strong patible with its varied function, and, more-drinks; without doubt most fertile sources. over, uncessingly. Hence its morbid vascularity, and excessingly. Hence its morbid vascularity, and excessingly. Hence its morbid vascularity, and excessingly, by parcotic subbrain, nor, another, their calerations effects
chancies to its fusction, and sendanger, as
substituted by the expected, its organisation.

Such the "rock wer split upon" in our
dealings with mind; cordials, and nourishment, are our "watch word;" when, in
fact, under its aberrations particularly, these
are most fatal to it.

Paralysis establishes the brain's precedence is the accounty, and anouer a resair to it.

Without strong predisposition, (call to it. Without strong predisposition, (call it hereditary, if you will,) something specific le required to sot upon the hrain, to produce even temporary insanity; the confirmed states of it being kept up by a per-manently deranged circulation of brain. Hence insanty becomes incurable, without total ebatinence from narcotles and atrong drinks. Some years ego an industrious arti-san gave himself up to inebriety, and become insans, for the first time of a long life; I had him put into an asylum, restricted from strong drinks, and he convalesced speedily. Resuming his occupation, and obstaining from liquors, he continued well for a series of years ; but of late, having hed recourse to them, he is, at this moment, in a fair way of establishing his insanity. His brother, it is worthy of remark, died of apeplexy, brought on, manifestly, by the ebons of strong drink. Had lessure and space per-mitted, I could have illustrated, to an almost indefinite extent, how epirits, habitually indulged in, foster a disposition to cerebral effection. Not a word more shout the soothing influences of opium. Know we not, that the repetition of parcotics has a powerful disposition to derange (yes, and permanently,) the circulation of the braic? consequently those important functions of the system, termed involuntary, on which we depend, mainly for our wall-being and happiness? The cares of life may effect much in the production of lasmity; but I affirm, generally epesking, that predisposi-tion of brain, aven without the aid of marcotics and strong drinks, will full to give rise to insanity. As respects our third po-sition, I would inculcate much attention on all, so passified unfrourable to the brain's mission and organisation. The predisposed passistion. The predisposed passistion. The predisposed passisty, therefore, sught to indulgs near-safe in amount from the predisposed, to digestion and examples. Since physic has become e demonstration in made; he far inconcent is really out of the question. In spite of all we can say or, do, they bleed, oup, or prescrain demonstration of the predisposed of th mineral water; without being aware, it

involuntary powers; and that functions of the brain. such vest importance in the sconomy, were not to be encroached upon, ever and anon, with impunity. Under predisposition to cerebral affection, mental or spannodis, improvident bleedings and purgings prove alike detrimental to the system; for, by deranging the circulation of the brain, they fester disposition to organic affection—fatal, not unoften, to life Itself. We ought not to bleed at all without the most urgent necessity for it, bearing in my I lts interference with the great business of circulation. Rearding physic, our abject must be to establish a regularity and sufficiency of fecu-lent avacuation daily, by alterative, rather than forced and drastic measures, correcting, at the same time, the secretions of the stomach and liver, with a view to the perfec-tion of digestion. Hence I would suggest the value of bren breed, (if pre-pared from whesten meal, with the whole of its bran in lt,) to the predisposed to cerebral affection, highly prous, as they generally are, to constipation. I speak with confidence of its disposition to keep with community was a correcting of the accretions; the plan hydrog, is com-hination with entiness test, will be found to prove eminently efficacions; regard being had, at the same time, to keep the howels soluble, by some approvad saline sperient, to prevent the mercury saturating the sys-tem. I advect, finally, to the disposition of the blood to be venous, rather than of arterial character, (opposed, dechtlear, to the well-being of the brain,) fostered not a little hy nur etimulant living, and refined domestic hebits, which comign us hy day, as wall as by night, to a most abnoxious atmosphere. In an easily, receetly, on phthiais pulmonalis, I have demonstrated, it is presumed, how escential is the purity nf the surrounding mediem to the circulation, and consequently, well-being of the lengs. That the brais, no less thee lengs, suffers ueder a deteriorated surrounding atmosphere, syncope amply testifies. But to render the blood to circulets throughout the inuter ramifications of the brain, it must be divested of its renous property, i.e. be purely arterial; and this can only be effected by means of the axygen of the serrounding medium. A fertile source of headach, it would seem, little imagined, is to be sought for in the surrounding atmosphere. Such the state of our habitations, of sesociation, and repose, which to ventilate, by night especially, would be looked upon as a special of temerity, bordering, I had elmost said, upon insanity!

As the surrounding medium becomes afterdeprived of its oxygen, we experience, in Orders for proportion, a diministion of those faculties set Oyscon.

is plain, that digration and exerction are which derive their immediate influence from

The predisposed, then, to cerebral affection, whether ie the shape of ineasity, pajelay, or spaleay, ou spaleay, ought, by might and by day, to herethe the very purest smoothers, as well as in a temperature greatly and that we are in the healt of induging, ie more refined life. I speak from my nwn personal experience, herving overcome a predisposition to apoplexy in myself, which the late Dr. Gregory, of klinkurgh, of acknowledged aminence in his profession, declared to be bremediable. The predisposed, also, should guard against a serious ravages apon the brain, first, by demarging its direulation, and a rentually, its organisation. I take leave, as rimsely, in conclusion, to awaken the attention of my professional brethran, to the anomalous importance of a due regard to fusctional deraugement, seeing that the organic affections of vital parts but "mock our toil," and set both regimen and mediative at defance.

#### TO CORRESPONDENTS.

We regret axceedingly, the disapphietments complained of in the letters from Edinburgh, Everpool, Leede, Exeterá, and atter places, and as it appears that nearly the whole of the weekly periodicals are departed from London by the coaches on Fairnay, we will accessed to make such arrangements as shall emphie us to resume the publication of The Lakers on that day. If this can be accomplished, we shall observable four the additional labour and expesse which must necessarily result. At all avents, nur best andearours shall not be wanting, to prepare a sufficient number of the Journal for the coach Fairnay avening.

J. M. will perceive that we have distitted the Table of Contents in the present Number.

We believe that cardificates of stendspes on the surgical practice of the Whayes Hospital, are not received an testimolifals for the diploma at the Colling of Surcount.

We have been favoured by Mr. Branchy. Cooper with a species of application; which formation a framement of case mechanic and indicrous, on the morbid state of his feelings. We change disable to this proceeding, but it may justifully be necessary to make upone observations on it here-

ON THE

DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT DUY'S MOSPITAL BY

DR. BLUNDELL.

LECTURE XV.

Of the Penery.

By peteries, Gentlemen, you are to understand captain instruments which are introduced into the vagina, with a view of sup-porting the uterus, the bladder, the vagina itself, and the parts adjacent; and of these instruments there are various forms and contrivances. Of the different kinds of pegseries which have been commended to use, the principal consist of the ring pessary, the ball, the sponge, and the pessary which is mounted upon a stem.

Ring Penery.—The ring penery, on which I shall first make a few remarks, consists of a circular plane of various material aliver, ivory, confictiouc, or box-wood, for example; thick'nt the edges, thinner toward the ventre, and containing a central aperture, being large enough to idmit the point of the re-linger; not larger, lest the uterus should e in dismeter; et to introduce the inintroduce the instrument. Having effected use, but for married women it is more en thin, he places by the hed-side some three civily accommodated, as it does not me or four of the passecies, which appear, on rially obstruct the regime.

comparison, to be bear fitted to the varias : and of these he selects one, lubricates it abundantly, places the woman either in the recumbent posture, or else, which is perhaps, on the whole, fully as convenient, (and more agreeable it may be to female delioney,) he advises her to take position upon the left side, in the usual obstetric posture. These preliminaries arranged, he lays hold of the pessary, and planting it in the pussendal entrance, with a sort of rota-tory motion, he rolls it upwards and backwords along the surface of the searum towards the promontory of this bone, with as little force and compression as may be; the plane of the instrument, at this time, lying parallel with the sides of the pelvis; and then, when he has reached the upper part of the vagina, he phoes the plans in apposition with the mouth of the uteres. which then rests upon it as on a shelf, and thus obtains an affectual support. Thes instruments, however, are very apt to turn adge-ways. If the pessery he too large, it can easily be removed at the pleasure. of the patient, and a small pecsary is easily replaced, when necessary, by one of larger diameter. When you pess up the pear you ought to tell your petient that the first size will not, perhaps, prove of fit measure for the vagine, and therefore she must not be disappointed, should a change become necessary. To remove the pressty is excookingly easy; you pass the inger into the vagina, lay it in the central aperture of the pensary, and then roll it downward, careful that you do not injure the vaginal orifice. The great micety of introduction consists in carrying it upwards and backwards, and not against the point of the pubic crob. I have said you are to carry it upwards and be wards towards the promostory of the se-crute; because, if you carry it discotly upwards, you will occasion a great deal of pain, and, at the same time, the instrum unsels for fact inches; a could arrantee not be introduced, to it must fall into a of the regional deviate them on he so calision with the symphysis public. In all lection, as a sufficiency for him to inferre manually with the part, in order to be a complete the instrument.

ary on which I propose to comment is the hall—of ailver, of ivery, of bex-wood, of various other materials—but bex-wood is, in sucral, preferred. By the turner it is holswed, ie nrder to make it lighter, and, at the two poins, there are spertures of small sine, perhaps the more numerous the better, to allow uf the discharge of the catameeis, provided the period of meastruction be not yet passed. With this instrument should be connected four ties of strong red tape, for example, which, piving a bearing, may facilitate its abatraffilm from the vagina. When using the ball, you ought to be provised with a succession of three or four dif-ferent since; then placing the women as before, either recumbent or laterally, the left side being the more describe posture, and the futtrement, at before, being placed in the vegical opening, roll it upwards and backwards towards the promontory of the a planting the sriftee of the vegins, but the cany as it advances along the canal, for, to I formerly observed to you, the vagins, in the upper part, is often far more capacious than helow. If you wish to remove this instrument, this mey be done by laying held of the tape and drawing down; but should the tape ere way mader your efforts, what are you es to do 1. Wby, in this conjuncture, you ly have recourse to the instrument which I have show you, and which I have used in the Hespital, to be managed precisely in the same manner as you would manage the obstatric forceps—the blades are separable, like those of the obstatric forceps; and they are to be applied to the ball, and they are afterwards to be brought into operation, in the way here demonstrated, by which mathod the ball may be more easily shatracted than by the action of the tape. These pessaries are admirably adapted to prevent the deseemt of the parts, because the parts get a bound bearing upon the instrument, which is of easy introduction. By the surgeon muong the black population of some of our plentations, these instruments are much layed. Thumpson, of Little Windmill Street, sells a passary, in principle like the hell, the contrivance, I believe, of Mr. Peinter, and which may be called a halloon peenry. It is longer in one dismeter than petenty. At 48-longer in one unsusers some in the othier. It consists in a form tex-ture, of a nort of onewest, covered over with common Indian rebber. This instru-ment is casily introduced and easily re-moved. If the runneral is obstructed, all

ery.—The next variety of pea- oil, which has a tendency to dissolve the

cacetcheec. Spange Penery.—A piece of eponge, is tro-duced into the vagina, may be used as a peasary; but tisless judiciously managed, it operates but budly, because, if it is not wall fitted in size, it tends to dilete like a sponge tent, so as to increase the original cause of the disease; but if the capacity of the vegina is well examined, and the sponge is out down, and formed into the oviform shape, it may be ecommodated to the cavity, and may be used in those cases more especially, where, from the irritability of the parts, the pressing parts com-mended cannot he employed. Heighten was partial to this variety of presery (ceedemned by some,) and thought that he foned advantage from it. He recommanded tapes to facilitate its removal, and was of opicion that some edvantage might be derived from imbuing the iestrument daily, with some astringent lotion, alum, for iastance, the etrength of which should he gradually intreased. With three or four of these spongious pessaries the patient nught to be provided, and every day the ose that has been in use should be removed, te undargo e thorough eblution, to be istroduced on some future day. If the vagina be prone to contraction, the peasary may be out smaller and smaller, with scissors. Dr. fleighton thought, by using the pessery is this way, we might not merely support the parts, se by the ordinary instrument, but that we might reasonably hope, now sed then, to produce some constriction of the vagina, so as to ehtein, perhaps, a radicel oure of the disease.

Seem Panary There is yet one other variety of peasary, which is sometimes used, and that is the peasary mounted on a stem, of which there are different kinds, for a ball, a riog; or any form you please, may be mounted in this meanur. Of the use of this pessery, I have seen very little, having advised it only in one or two letances, and those did not remain under my own eye, so that I could not fully observe the result. In the general, I know that sten naries are not needed, and unless egoded they should not be employed. The cases best adapted for their ase, are those in which the perincum is turn open, or in which the regime is relexed extraordinarity, incopeasary. It is longer in one character than the regime is relaxed extraordinarily, insection, of a acrt of convent, covered over Commonly, by the scindel ligatilets cline, a with common Indian rubber. That instruction and indicate support is given to the peasity in moral. It she rumwel he obstructed, all that is measure in the instrument, when it will college, and come away with case. Thempeon the peasity may be uniquely, by which is recommented that we should employ the gives of those possarior and influence of eggs for its labrication, in professions to Cf the different kinds of stem journalist.

by Dr. Clarke, and which I would edvine you to cassy. In using this pessary, the petient weare a bandaga round the hips, and there is a ball for the vagine; down from the bandage in front there is a stem, or wand, of metal, which passes between the limbs eed to the bandage behind, so that this stem becomes incurvated, sed when properly edjusted, pearse between the limbs, has a bearing in the lies of the pedendal opening, sed lies on the bell, describing e line along its inferior hemisphere, from pubes to coscyz, so as to yield it an effontual support; but lest the pessery shoold slide out on the one side or the other, displacing the wire laterally, there is a sort of staple fixed in the instrument, and through this staple it is that the wire sees. Now e stem peesary of this kind I have tried, and it suswered very well, one inconveniesce excepted, which was, that In the case referred to, much distress was occasioned in consequence of the cofter purts being apt to get between the iron etem, or wand, and the staple, causing e painful compression, and the rather, because those parts are very sensible.

I here show you another stem pessery, imperfectly formed, but which, tried on a different copacity of the vagina, and so putient of this Hospital, labouring under may require a larger and some a smaller procidentie, was found to enswer very well, peasary; when a bell pessary is to be used, It consists of a ball elevated upon a stom of the size required may be ascertained by pewter, and the ball may be passed up to means of herd eggs, or lemons, an instru-the os uteri, the stem being incurvated, and ment being efterwards above accordingly. brought up to the bandage before mun. The egg itself, designed by Neture for tioood, end fixed there et a proper clava- these parts, is not a had possary. The tale tion by meens of screw and cooket. This of Leds gives us classical enthority for stem may be adjusted in two weys, being their employment. The larger peasures are secommodated to the bandage, either in proper when intended to be of permanent front, over the symphysis, or between the use the smaller, when they are to be renetee behind. The great adventage of this moved, like a part of the dress. The small-sort of pessary is, that it may be adjusted to est pessary which will support the parts a great mosty, to the liking of the petient; if she wishes to throw it higher she cen do so; if she wishes to lower it, this may be may remain for years without producing done; sud if she is seesay in eay way, she any ill effects; had consequences, however, can more it from one sids to the other, or I have sametimes seen, and the following bring it from her person altogother; eli this obtoquionsness depends, mainly, on the flexi-bility of the stem, which, however, is so stiff, that while it obeye your pressure, it nevertheless retains the ourre you give it. From the trial given to this instrument, I have reason to believe, thet, on the whole, into the vagina. I once new a cease, in

perhaps one of the best is that recommended ferred, the pessary may be employed in the by Dr. Clarke, and which I would edvise daytime; and if a women is tolarably well, and more particularly if she is a married woman, it may be better to wear it in the daytime only; and it may be regularly introduced in the morning, and regularly removed is the evening, like a part of the dress. If your patients are wanting in intelligence, hering more heart than head, the bas you rely upon their skill the better; and I should, therefore, certainly prefer the use of e pessary, to be left for months to-gether. Where persuries are left in this manner, however, they ought to be matched; and if there ere pains end discharges, and other elarming symptems, which may ex-cite a suspicion that some other discoustie ferming, the instrument must be abstracted, and the state of the parts ought to be in-vestigated with bare. In such cases, sometimes the vagina is become infor irritated, and it seems not injudicious to confine the patient afterwards with atrictness for a few weeks, to the horizontal pos ture, as there is a reasonable hope th under all this action, the vagina may become constricted, so that a radical ours may be obtained.

The sizes of the pessaries vary with the le the best.

In the general, pesseries, if well adapted, are some of the more importanttioe of the bindder, obstruction of the rec-tum, bruises, infimmuations, ulceration, thickenings; insomuch, that the very walkiog of the patient becomes painful to her; hy niceration, the rectum has been laid open have reason to bettere, thet, on the whole, into the ragins. I once sew. a case, in this by no means a bad one.

Channel Reserts an the Use of Pararita.—
Whetever preservy you san, there are different reades in which they may be employed; and the patient say were them for years together, her manny. The ball possary, when the without removal desiring the whole term; large, may occasion much tumescence and four, landing the part well supported by it, sink becomes hebitabled to the instrument, passage, the cause of which may not be unitable to the instrument to the part well as the continuent of the parts below, but within the sink becomes hebitabled to the instrument, which have not be unitable to bear it with continuent or, again, when this is preBall pessaries are, perhaps, hest adapted to the unmarriad; ring pessaries to the suaried; the spoings to those who are very irritable; the stem to those cases in which oo other form of pessary will remain; larger pessaries used in the day only should be smaller, the smaller the pessary the better, provided the parts are duly supported; a compress and bandage will, in many slighter cases, supersede the pessary; the same contrivues may be a useful help ig; sopporting a pessary. Pessaries of a life well sijusted to the vagins may occasion pain during the first few hours, and ought not, on that account,

to be too hestily removed. Personies are very excellent remedies where they are well adjusted to the parts; but Denman has remarked, with good reason, that many women lose the advantage of the instrument because of their impatience, or because, to use a female expression, they become sidestry. If you introdoce an in-strement that does not exactly fit, they will not allow it to remain—they will not allow it to remain—they will not allow there to be tried—they are displeased, and petulant, and obild-like—for there is a good deal of resemblance between the temper of women and obildren, they fall into a pet, and as we can hardly forbear petting them, what with the felly of the patient and complimes of the surgeon, my lady pouts, and loses her advantage. Now, at the time when you propose the instrument, you had better tell your patient; at once, "This instrument is really an excellent contrivance, but I know it will be of oo use to you." "Of oo use to me ?-Of no use to me ?-Why?" "Why? why because you will oot allow me to try it sufficiently; there will be a little trouble attending it, and I know you will become fagetty, fall ioto a pet, and prevent a fair cassy." This brightens the lady's oye a little, gives a glow to the complexion reises a small emotion of indignation, and puts her on her mettls, to use a phrase of the manage; her heart is excellent at bottom, but she does love a little perverseness, and is determined that you shall prove a pseudo-prophet; and thus, thanks to your management, and a taste of Joho Abernathy, the instrument gets fairly tried. A squeeze of the lemon has sometimes a very agreeable favour. Recollect, however, that even the accomplished Ludy Townly occasionally gave a little too much.

#### YERY IMPORTANT.

"Dr. Scool more has been appointed Private Physician to the Duns of Northum-Barlawd,"—Morning Herald. Private! what does this mean?

# A LECTURE INTRODUCTORY

TO A

COURSE ON SURGERY.

DELIVERED BY

MR. LAWRENCE,

IN THE THEATER OF ST. RARTHOLOMEW'S.

Monday, February 2, 1899.

Gretzeran,—The serious indisposition which Mr. Abernethy has lately experienced, has left him cotirely incapable of doing that which he was axtremely anxious to do, namely, fulfilling his pledge towards you, of delivering this course of cetures. Hence the duty has devolved on me, at a vary short notice, of endesvouring to supply his place, and it is on that account that I have the honour of appearing before you on this occasion.

I cannot but be sware, Gentlemen, that I am subjecting myself to a very disadvantageous comparison with one whose original views and great power of observation gave him the highest professional obseracter, even et his outset to life, (great applause,) and led him to those philosophic investigations of disease which introduced important improvements in the practice of surgery; with one whose unrivalled axcellence as a teacher has long been universally acknowledged; and who has thus far outstripped his contemporaries, not only in original genius and the power of acquiring knowledge, but in the rare talent of commoniosting the knowledge thus acquired to others in the clearest and most agreechle manner. You will, I am sure, join me to the expression of an earnest wish for his recovery; and in the hope that, though he may on longer be able to continue his useful poblic labours, he may still enjoy his well-earned fame for many years of tranquillity and retirement in the bosom of his family,

With respect to the present course of lectures, I must appeal to your indulgence, on account of the circumstance I, here alimed to—the short notice at which I have undertaken them. It was only in Saninday week, Mr. Abernathy had finally made to reliaquish the shart he had so ably filled. I cannot say, however, that lecturing is altogether new to me; yes are probably aware that I have before selevaned lectures on surgery, hat it was mader electures on surgery, hat it was mader electures and arrangement, that the congestations then made are little applicable to the

present occasion. I shall not, however, en- at which Mr. Abernothy has been accuse exercised, to render the present lectures neeful to you.

Surgery, Gentlemen, considered according to the derivation of the word, means manual operations. Galen, speaking of the treatment of diseases, divides it into three parts, according as it is to be accomplished by diet, by remedies, or by meousl opera-tion, and he calls these respectively—dietetice, phermacoutice, and chirurgies.

Thus he uses the word surgery, not to denote a separate science, nor a distinct branch of practica, but merely to designate one mode of tresting disease. Custom has allotted to the care of the surgeon all injuries; most axternal diseases, and such internal ones as produce changes recognisable externally; operations, and all cases requiring their performance. Thus aurgery is a iarge division of the art and science which ate to disease; if that science, which may ieast equal the latter in extent and im-

My sonception, Gentlemen, of a course of lectures on surgery is, that it should embrace what I have stated; but I must in the outset of this course apprise you, it will not correspond to the sketch which I have given. I stand here, Gentlemen, in the place of Mr. Abernathy, and mean to follow my object to form a plan of my own. Mr. Abernethy has delivered in this theatre tha lectures on anatomy and aurgery, and ho has been accustomed to distribute in those courses, various ambjects in the way ho thought it would be convenient for you to noderstand them; thus he has placed in them, the diseases and accidents of joiota, surgical operations, and all the cases requiring them. It will fall to the lot of my coljects I have named; I shell deliver to you in the surgical course what I have to say on the pecific part allotted to it. (Great noise specific part alletted to it. (Great noise Conficion, in consequence of the crowled shall fix on some other time that may be seaveniest to the class, for delivering a of the medical atudent to make himself fided inches weekly, taking care that the sequeleted with the actions of the human which course shall be fielded at the period body, and with the actions of its different

ter into any further spology, but assure you, tomad to conclude it. (Great applause.) that as far as time and circumstances will When you hear, Gentlemen, physic and permit, a very endosvour on my part shall be surgery spoken of as branches of medicine,—when you find they are exercised in many instances by two distinct classes of persons, and that they form in this country the provinces of two distinct incorporated hodies, you will expect to find that there are some essential distinctions hotween them; this, bowever, is not the case, the distinction is completely arbitrary; it originated at a pe-riod of barbarism and ignorance, it has been upheld by deference to authority, but of late years it has been fading away before the eparate acience, nor a distinct light of reason, and appears likely altogether practice, but merely to designate to disappear under the repid progress of fresting disease. Custom has knowledge. The human body, Gentlemen, as you must all be sware, physiologically speaking, is composed of a great number of parts, all the movements and designs of which are subordinate to one common and. tho life of the individual; there is one source of untrition, the alimentary canal; one centre of circulation and nervous energy; morehe called in one word medicine, he divided over, the various organs are brought together, into surgery and physic, the former will at and connected, in many instances, by that which appears mysterious to us, and which is denominated sympathy. None of the parts composing our frame act separately, each is connected, immediately or remotely, with all the rest; you could form no idea of the ntility of one organ, if you insulated it from tho rest, any more than you sould estimate the use and action of a single wheal, or lever, detached from a watch, or a steam-engine, that course which be has adopted; it is not Each part exercises, it is true, its own particular office, but that office is subordinate, and for the good of the whele, all are necessary for the natural functions of the body, The causes which constitute disease, are soldom to be found in the affected part itself ; often it is situated in a part of the system very remete ; for instance, in a person labourthe anatomical course a great number of ing under gonty infammation of the toe, no subjects which would have been properly in- cause of disease could be ascribed to the troduced in the surgical course, namely, the partituelf, but on examination into the state diseases of bones, the eccidents incident to of the individual, it has bean found to originsts in a disturbance of the stomach, and the cure of the disease has been accomplished by directing the remodies to the alimenisague, Mr. Stanley, whe has the olorge of tary organs, probably without any applica-the anatomical course, to trest of those ebdual may have a toe, or finger, paralysed, hut you will not find in the part itself the reason why it is in such a state; you must oxsmino the state of the hrain, and you will state of the theatre.) If, Gentlemen, I flod, perhaps, changes there to account for should like that these subjects seanot be the disease. The cure, then, is to be accreted for two isotroms as week, according complished by means directed to that quarter the arrangement of Mr. Abernethy, I ter.

It must, Gentlemen, be the first business

arise; he examines the organic changes render it extremely difficult to say where produced after death, and learns to connect one terminates and the other begins, bewith them the appropriate external signs by which the disease is accompanied, deriving, from these comparisons, the means of estermining the axest seat of disease, and of extends; how far the province of the surgeon foretalting its source and termination. This is to go; what is the boundary of the inpart of your atudy, Gentlemen, is what is called Morbid Anstong and Pathology. I lined with nuccus membrans, for instance, Marbid Anstoney, is officed to Anstony, so do one? In what manner is it to be a Pathology is opposed to Physiology. Properly speaking, Anatomy regards the healthy attractors, Morbid Asstomy the diseased one. Physiology regards the healthy functions, Pathology those which are diseased. The observer is now prepared to apply the external agencies, such as diet, climats, energies, &cc. ; the outward or inward remedies, or the sargical operations, which may he mosessary to remove disease and restors health. These last circumstacces form the set of treatment, or, as it is frequently called, the science of therepeuties, and it is divided into three parts: that which resee to the management of the various external influence; that which has remos to internal remedies; and the other regards operations of surgery, To say, Gentlemen, that there is an essential distinction between physic and surgery, would be to assert that there were two kinds of pa-thology, and that the internal and external parts of the body are to be treated on distinet and different principles. When you reflect that the primary tissues that compees the various organs of the body, are the me throughout, and that the only differease mises in the number and proportions of these tissues, you will perceive that the position of the organs in the body will make no essential alteration in the trentment. It may, perhaps, very the mode in which it is to be carried into force, because various local applications may be made to the sater-nal, which senset to the internal, parts. The principles of pathology, therefore, are gesavel, thay are common to all parts of the healing set, and therefore they must be common to the physician and the surgeon. We may, therefore, antirely sgress in what Mr. Abernethy has said, that surgery and medicine are one and iadivisible. single branch of medicios one be well practised, secept by isdividuals who have carefully studied the whole. As to external and internal treatment, by those who have been anxious to ephold the distinction of physic

functions. These are the objects of the two of external diseases, and internal to the salesces which are denominated Anatomy physiciem. Unfortunately for this proposition and Physiology. He proceeds then to notice the circumstances under which diseases terior and interior of our frame, as to cause she has directed that they shall both obey the same physiclogical laws. Who shall say how deep the axterior of the frame extends; how far the province of the surgeon belongs to the physicise or the surgeon? Polypus of the nose is considered a disasse of a sorgical character, while a catarch of the same part falls to the care of the physician. Inflammation of the throat, arising from symbilis, is the surgeon's dis-sase; catarries lessmmation the physi-aian's. It is, therefore, mere matter of choice whether a particular disease belongs to the surgeon or physician. In fact, to ma it appears a kind of central-ground, on which each party selses on what he one get, (Laughter.) The affections of the bonus sad joints have been given to the surgeon, yet these parts ann hardly be called automal. The case of barnia, for instance, is under tha surgeon's care; here there is so external awelling, it is true, but it is produced by internal causes, and it cannot but be clearly seen, that external diseases ave produced by various internal causes, as erge gout, and so on. Again, many leternal discases are produced from external sauses, as rhoumatic and estarrhal affectioes, brought on hy exposure to cold. The eye has been regarded as an esternal part, and as such has been placed under the care of the surgeon, yet there is no organ of the body that is auhiect to so great a number of dissases, and no organ in which those diseases require a greater knowledge of all the principles to i rived from general pathology and therapeutics. It contains mecous, serous, and fibrous membranes; it is subject to be affected by almost every disease to which the human frame is liable; it suffers in small-por, measles, scarlet fever, and many others. It is liable to be attacked by scrofulous and syphilitic faffammation. If, therefore, as organ so various and complex in its structure, can be enfely committed to the the surgeon, I am at a loss to know in there should be say distinction whatever fully studied the whole. As to external and between the engage and the physician. It interests treatment, by those who have been there he no distinction, it should be raise to surious to ephold the distinction of physic and energy, various views have been taken logy and physiology. Welters and desired. of the ground on which it ought to rest, but turers cannot make a distinction, and to we that which has obtained the most general and the same diseases are considered and cumbacy, gives to the surgeon the treatment comprehended in the writings of both, at

treated by them on the same general prin- and the rate at which it still advances, ciolas. Some authors, it is true, have made a distinction between local and general discase, and have been inclined to assign the former to the surgeon, the latter to the phyaician. We shall find that there are few diseases strictly local, that is, where the cause has been epplied to the part itself, and the influence of the disease, as well as the treatment, do not go beyond it: a wart or a corn may be an instance of the kind, (Lond langhter.) Although we talk of general diseases, there are none which are strictly so. Several parts may be affected in en equal degree; but avan in those cases celled fevers, we fied that some porticular organ is the origin of the disease, and the various derangements that make up the affection, have reference to its source,-Some parsons regard surgery as the art of operating, and regard operations and manual proceedings as the prevince of the surgeon. According to this notion, the important distinotion between physic and surgery woold rast, not on any escential difference to the couses, nature, or seat of disease, our lo the principles of treatment, but on the accidental, and often varying, circumstance of the mode in which those principles are to be carried into affect. What shall we do with the cases, in which both internal remedies and manual proceedings are necessary, as in a large propostion of inflammations? It is often a more question of degree, whether the former alone wilk accompilab the purose, or whather both may be nocessary. If it be meant to confide surgery merely to a machanical department of the healing art. I, for one, must enter my strongest protest against such an errangement. I should really feel myself degraded, by exercising such ber-ber surgery. If this kind of errangement were carried into effect—if our profession were duced to such a state—there would be little inducement, judeed, for us to investigate its scientific principles, and we might put seids the study of anatomy and physiology altogether. I believe if such were the pase, our profession would soon dega-nerate again into the hands of its original

faunders, the harbers.
Considering the matter historically, I satisfied deep that surgery originally consisted of this limited, mechanical, and subordidepartment, which was axercised by

proof that its claim on the confidence of the public, is not inferior to that of any other department of the bealing art, Leepay, iog, Gentlemen, in this place, I would no trious Pett. Although he was equally salebrated as a practitioner and medical writer, his merita have been throwe into the shade by his contemporary and rival, John Hun-ter. When we contemplate this autraced nary mao, we are at a less which most to admire, his great so driginal genius, or his industry. For although the novelty of his views, his scarching glance into the structure and actions of all saimated beings, and the epleodour of his discoveries strike us with astonishmeot; we are lost in admira-tion on satering his museum, and one scarcely believe that this splendid monumant of science and indestry, could have owed its existence to the misd and labours of one man, May we not add to these cames that of a kindred spirit, who extered with ardour in the path traced out by his greet predecessors, and followed it up into oew regions of speculative and practical improvement-I mean the founder of this school-hir. Abernethy. (Loud applaces.). In France we may allude to the many eminent men who have reflected bonour on their country in the course of the last occurry, to the members of the Academy of Surgery; to Dessault, oud his pupil Biphat; to Hoper, and Dupuytren. In Germany, the assus of Richter will slaway he looked up to with raspect. We ought not, Gentlemen, to omit ooticing Beer, of Vienna, so great in the unnals of ophthalmic medicine. The name of Scarps, in Italy, is also calculated to produce great interest in every madical breast,

The attempt, however, Gentleman, to re-duce surgery to its accient limits, to bring it back to the art of plasters, bandages, bleeding, tooth-drawing, and the like, which composed nearly its whole encyclopedie in the venerable times of barber surgery, if it sould be carried lote effect, would be highly detrimental to the public, and injurious to our profession; the proposal comes a century or two too late. In those serious overs, Gentlemee, lo which local injury or disease is ettended with general symptoms, as io compound fracture attended with fever, in erysipelas or strangulated hernia, it is inter-department, which was accrused by in erysipelas or strangulated hernis, it is the properties of an under the direction of physicians. But ampeous have long sman-cipieted, their supposes have long sman-cipieted, their their their thin, degrading its bearings. It metters not whether he beared easily is submit again to such ignomial to be attended to the could be attended to the could be attended by a parson who understands the case is all the properties of the case in all the deserves a properties of the case in the deserves are relieved, with agency and suppose of completent knowledge of the case. The second of the case is the resent rapid propers of confidence which persons are inclined to repeat the properties of the case. The second of the case is the resent rapid propers of confidence which persons are inclined to repeat the confidence which persons are inclined to repeat the confidence which persons are inclined to repeat the confidence which persons are inclined. they call a combination of talent is falls-|done so, he makes himself master of his sician who knows nothing of the local, agement.

While I am on this part of the subject, Gentlemen, I may observe that the ners performance of operations is the le portant part of the surgeon's doty. To his by other means; to determine whether an operation is advisable, or not; to comes necessary; to prepare the patient for it, end to manage the case judiciously afterwards,-are points, if not of greater, at least I do net, Gentlemen, of equal importance. mean to speak lightly of this branch of our profession; on the contrary, you must cultivate with great care this important part of surgery. I would never advise you to eperate on the living subject till you have done so on the dead. It is, in-dead, a mistake to enpose that the performance of surgical operations constitutes the principal part of the duty of any surgeon. It is the great boast of modern surgery to have diminiabed, in a very remarkable degree, the number of operations; and I am within truth when I assert to yun, that the number operated upon at this hospital, is less, et least by half, than it was five-andtwenty years ago; the important difference to which I alinde, is owing to the improved knowledge and treatment of the discusses, acquired from the pathological and practical researches of surgeons. Whetever course we take, we arrive at the same conclusion, that there is ne natural distinction between physic and surgery, they ere closely connected together, they are parts of one and the same science and ert, the principles are the same in both, and the same method must be followed, because both here the same end to accomplish. Thue, the separation of physic and surgery is purely artificial; they are distinguishable upon un fixed prins, they are intended to apply to the study, not to the practice, of our profession. The several parts of the madical art eincidete each other; and he whe confines his attention to one branch, cannot thoroughly understand it without having a knowledge of the others. Proceeding in the netural order, the pupil will first turn his ettention to the study of the external effections of the human frame, then to the internal. To the former, the erigin, progress, termice-tion, and effects of the disease are obvious

cious, if the combination consist of a sur- art, and is enabled to prescribe a remedy for a ignorant of the general, and a phy-disease. If, theo, this be the case, is it not most surprising that the great body at the head of this department of our science, should make it one of its rules, that it will not admit a party to become one of its mem-bers, if he belong to any surgical body? I should advise the College of Surgeons to adupt a rule exactly the reverse of this, and to make it imperative on eli wha present themselves before them, to make themselves well acqueinted with medicine. The views I have stated to you have been recognised and introduced to France, Germany; and the United States of America. Io all these countries, the division between physicians and surgeons has been, in great meaoure, abolished; they have all to go through the same etudy and the seme examinations, and they receive the same kind of diplome; and with that diploma (which, by the way, gives one as well as the other the title of doctor) they may epply themselves to any part of the healing art they think proper. I heve but few werds to address to you, Gantlemen, respecting the mode of study. Need I tell you, that anatomy and physiclogy are the greet groundworks of me cal science? No one would think of repairing a clock or e watch who was not well versed with all its parts, its movemeets, and its connexions; the same with respect to the human body; no person is shie to ours its different diseases, without he is well sequentiated with the etruc-ture of the whole. Yet, Gentlemen, I am sorry to say, that we see persons constantly ettempting to palliate disorders incident to the human frame, who have but a slight knowledge, or, perhaps, are totally ignorant nf ite anatomy. Nut only are anatom end physiology the groundwork of medical science, but a correct knowledge of anatomy is absolutely necessary and essential to the surgeon, in the ordinery exercise of his duly duties, to enable him to discover the exact seat of disease, the exteet and neture of injury in fracture and dislocation, wounds of blood-vessels, and other internal parts, and size in the case of all surgical eperations. Your study of anatomy should compreheed the whole human frame ; ne part can be excepted, unless, indeed, there be some parts an which you never can be called to operate; some parts. which can never be liable to acc arts which never can be affected by You will never think, I trust, of co tion, and effects of the disease are obvious with how small a portion of measurate to the senses; the clear evidence derived knowledge you may be enabled to many on the from such a scoree must be supplied by one-logy to the more obscure effections of in-that a therough knowledge of anatomy is the ternal argans. The physician, therefore, groundwork of e good surgess. With respect must commence hie study of the profession to operations, they may, perhaps, to a sur-by attention to surgery; when he has tain extent, he reduced to mechanical refusiwilbsever plunge the knife into the body of a subject; they would become quite wearf-fellow-creature, without being sware of the object you have in viaw, without knewing the various descriptions of every mients where you may go with eafely, and where part of the human frame. I beg to axhort sanger begins. The knowledge of metomy, yoe to conduct your study of medicine, however, does not teach you that of disease; whether in neture, books, lectures, or in ings; no, you mest study them in the great book of Neture, that wide sod ample field. Lectures and books are, in many instances, useful, hot of secondary importance, in comyou imagine that a carpenter, or watch-maker, would thick of learning his trade from lectures? Ne; he prevides himself with materiele and tools, then he examines the production of which he is required to furnish a copy, and sets to work accordingly. Do you suppose, if several emicant watchmakers were to examine a young wetch-maker, who applied for a watch-making diplome, do you imagloe that they would require e certificate from him of having ettended so many lectures on watch-making? (Loud laoghter.) To know disease, then, you must see, watch, and closely examine patients. You most observe the altered functions unless you are acquainted with the healthy-fuections of the body? A large hospigation of homen infirmities, brought toge-

consider, however, if any unforeseen circum- of our public bodies, which requires the stance should occur, that will cause my rule skilbition of cartificates of having attended to be abortive—and such things will some-pertain courses of lectores, as a criterion of times happen—consider what must be the ability, has tended to keep up the delusion. confession, the feer, and diagrace attendent Lecturers and writers have too often oppled on an ignorant operator. In any operation such other, lostend of referring to the founyou have to perform, unless the kolfs is tain of knowledge; we cannot, therefore, guided hy anatomical knowledge, consider be surprised, that they often mislead and the risk of the patient, and that of yourself, deceive. A course of lectures contains a as the operator. I hope, at the same time, you general, hot not a minute exposition of the you may be perfectly aware of the whole soy other way, so as to embrace the whole heman atrusture, and yet ignorant of dis- of the science. To those of you, who are to ease. The question then is, how ere you be general practitioners, it is unnecessary to be taught this? Net by lectures or writ- for me to sey that this will be of the atmost consequence; for the greater number of cases you will have to deal with, will bear little or no resemblance to each other, and therefore will require a diversity of parison with the observation of disease. Do knowledge to treet them. Those, also, who mean to practise surgery only, such I suppose as would wish to be denominated pure surgeons, as a mark of superior dignity. would not, I think, be willing that, In their higher situation and mok in the profession, their portice of knowledge should be more limited theo thet of the general practitioner. An eminent surgeon will be continuelly consolted to cases of obscurity, difficulty, and emergency. What will be thought of him, if he should be obliged to say that he has not studied this part, that he is Ignerant of that; that, for a third, a physician or an apothecary englit to he consulted? Will he allow it to be said, that he is not compeduring life, and explore, after deeth, tha tent to the management of a surgical case in changes produced in the organisation by all its parts, and that he requires some one disease. Here your knowledge of soutomy else to help him through, aven in matters and physiology will be of the greetest beloogtog to blsown branch of the profession? service to you. How are you to judge! With respect to books, I should recommend of the distinctions of disease and health, those commencing the study of sargery, not those commencing the study of anygery, not to trouble themselves with many of them, your attention should be rather given to the tal, Gentlemen, is undoubtedly the best observance of things than to mech interplace for studying disease; the coogre- course with madical authors. Moch good is gation of homen infirmities, brought together is such as establishment, shored yets oboke; the elementary works of Mr. Sameel espectanties of observation which will encourage all, perbegs, that would he ambe you to make yourselves masters of discinned. Cliquical instruction, under a well-almost a madical library in Itself; it constitutes that sum he adopted of acquiring this insectionable art; facts are, by this means, a very scientific memoer. You may, if you brought home the semest; and what makes place, 'axeed, your study to the writings of Mr. Pott; to those of Mr. Abernethy; the strength income in the semest the student speculation of the particularly hie work on the Constitute Manyara. It prepares the student speculation of the particularly hie work on the Constitute Manyara. It prepares the student speculation of the particularly hie work on the Constitute Mr. Abernethy; and known him to plain matter of fact. I may say, tacked, this importance of leccertainly not derived from studylog various

inners; his great work was not prepared ginners; his great work was not prepared for the press by himself, it was posthumous, and, taken altogether, he was by no means a bappy writer. With reference to the works of foreign authors, I cannot omit to naties that of the venerable Boyer. His Traité des Muladies Chirargicules, unt only embedies the experience of a long life, but represents the present state of surgical knowledge and prestice in France; indeed, you will find a great number of very valuable productions issuing from the French press.

In conclusion, Gentlemen, cliew me to impress upon your minds, the serious nature of the studies you are now occupied upon, and to exhort you to employ most diligently the short, I may perheps, call it too short, period of time, that you have to devote to the purpose of readering you able to take upon yourselves the active duties of your refession. The study of medicina, Gentlemen. is a most arduous undertaking, and it would occupy persons of great mind and ahining talents many years to master it, and to being up their knowledge to the present state of science. It is, however, a salutary and pleasing exercise of the mind, while the practice of the profession calls forth all the better feelings of our neture. In some respects, we enjoy peculiar advantages; we are employed in the study and contemplation of nature, and the invastigation of truth. We are not called upon to defend dostrines or systems, nor to uphold any particular act nt opiniona. We have no luterests at veriance with those of the community. In pro-fessional intercourse with ner fellow-creatures, we are known only as instruments of rood : as the means of restoring or securing health, the greatest of blessings ... of allevicting or removing pale and sickness, the greatest of avils, and in southing the acote anguish which relations and frieoda feel for each other. Not only the happiness or misers of life, but the very question of life and death, often hangs no our judgment and eaurtions. Think of the responsibility belonging to those decisions, on which it will depend, whether a beloved husband or wife shall be saved; whether children aball be restored to their anxious parents, or parents be preserved for the benefit of their offspring. I trust that, beering in mind the serious nature of these duties, you will eagerly ambrace every opportunity of gain-ing that haswiedge which will qualify you for discharging them effectively. You will thus become respected members of an honourable profession, and yes will proper for yourselves, in the decline of life, the "bours devoted to the good of athers.

## FOREIGN DEPARTMENT,

ANASTOMOSING ANGURER, SUCCESSFULLY TREATED BY TYING THE CAROTIO.

By M. ARENDY, of St. Petersburgh.

IWAN KAVALONORS, a middle-aged man, of a very robust constitution, had a news over the right eye-lid, which gradually iscreased to the size of a large apple, and, from its weight, hung over the whole eye; in consequence of a blew nn this tumour, it auddenly awelled to auch a dagree as to covar the whole of the right side of the face, extending from the middle of the ferehead to below the angle of the lower jaw, over the right ear, and a great portion of the occiput; it pulseted strongly, was of a blaish-red colour, and so very tense as to threaten immediate burning. The patient threaten immediate bursting. The patient was instantly carried to the Artillery Hospital, and an hour after the accident M. Arendt, in conformity with the opinion of his colleagues, proceeded to the upuration of tying the acrotid, as the only chance of asving the patient from the dasger of falal hemorrhage. The artery having been laid bare, in the usual manner, the operator was going to pass the needle under it, when the tumour suddenly burst, to the extent of ea luch; and although the sametants used avery menas to arrest the homorrhage, the blood rushed forth with each a violance, that within a few seconds the patient bad loat about three pints, and was saized with syncope and hiccough. This draudful avent, and the imminent danger, made M. Arendt hasten the epplication of the ligature, which was no sooner parformed than the humor-rhage ceased. The wound was dressed by a uniting bandage, the tumour covered with cold fomentations, and acidulated putions, with opium, given internally.

On the day after the operation, the patient baving passed a very good night, a sion was made into the tumour, orneial inc and a great quantity of grumous blood re-moved; the hemograppe from the divided vessels was very considerable, and at least five pints of blood ware lost; twelve arteries were tied, and the wound was covered at powdered alum, guin arable, and kine. To patient was so exhausted as a reader a administration of wine, and other stimular emministration of wine, and other estimate indispensable. On the following day, right aids of the fine stein measures swelled; there was much fiver, head &c., but these apprising gradually subsid-the nights became and yourserves, in the decime of the trips wellief; there was highly brighted as weetest of fall reversite, the retropert of inbours devoted to the good of athers,

[Mr. Lawrence then retired from the theatre amidst the loudest absuts of applause.]

[only universalis event was a sight of

of angine and cough, which was, however, soon subdued by the use of leeches, and

Mercury.

Oo the seventeenth day after the operation the ligatures came away; the wound of the face began to heal, and all seemed to indicate a favourable termination, when, on the twenty-third day, at noon, without any previous cause, azcept, perhaps, a slight stack of cough, a violent erterial homorrhage enemed from the wound in the neck; the patient lost about a pint of blood, after which the hamorrhage stopped of itself. Oo examining the small sperture which had not yet hazled, the origin of the bleeding could not be discovered, but from this time it returned daily for four days, and, strenge to say, always at the same tima of day; the quantity of blood lost ower exceeded five or six ounces, and the hamorrhago always seased spootaneously. On the 27th and 28th, there was no homorrhage; on the 19th and 30th, it occurred agaio; but after this time It fortunately ceased entirely. The patient, noder the use of quinise, soon regained his strength, and, four months after the operation, was discharged perfectly well, Journ. Univers.

#### TRET OF ARESTIC.

The colution of suppluration and quantities of arcaic dissolved is animal quantities of arcaic dissolved is animal fluid. In other to detect the motal in the solphorat, Bernelius formarly proposed, either to volatilise it over red-inct inns, or to sublime it in a gless tube; he has lately found out the following method, which he considers superior to those hitherto omployed:—

The sulphuret of areasis, being mixed with an excess of earbonate of sods, and a few drops of water, is Introduced into an open glass take, which, at one end, is drawn to a very small dismeter; the mixture laving been placed about an inch from the smaller opening, is heated till it foses, after which a current of hydrogen gas, carefully dried, is passed through the tube for a few minutes. The gas is then blown off, and the tube being, by means of the blow-pipe, heating to a red heat, the areasis is deposited, in its meights form, on the sides of the jube; it is minuted in the median of the hydrogen gas and manner, his minutes and side of the loss particle of areasis will be assertanced, perfect of the property of the propert

ON CHRONIC SHPLAMMATION OF THE UVEA.
By Dr. Simeons, of Hopenheim.

Aithough it is very doubtful whether this affection, is its souts form, seer cover independent of irids, or inflammation of the other neighbouring organ, it appears that chronic aveitie not only may enlet, without any accommitant affection is of the iris, but that it is very eften the sense of syninesis, is which it inveriably terminates, if left to itself, as is generally the case, its signs being very observe, and, as far as we know, altegether overlooked, by the writers on the subject.

The hoginatne of the disease is characterized by the margin of the pupil belog drawn backwards, sod by its mobility being somewhat lessened, and the night becoming impaired; after some time a small ring of a greyish, or sometimes aven brown, colour, becomes visible, first behilod, then at the margin of the pupil, which still remains circular; the colour of the irie is unchanged, and it can he very distinctly seen that the ring is oot attached to, but adthat the ring is our situations, Sometimes, icatead of the continuous riog, some am fringse are formed, and gradually coaler into one uninterrupted chord; meanwhile, the receibility of the iris diminishes considerably; its contractions are irregular, and the ring round the pupil enlarges, so as to leavoonly a small retracted opening, Sight is now entirely destroyed, and the iris begins to be changed in colour; in brown ayes it becomes of a greanish yellow, with apots of a dark-brown colour; in blue eyes it changes into greyish yellow, with darker coloured spots. If the disease proceeds further, the pupil is completely closed, and the iris is, in consequence of the pressure from the thickened uves, partially ebsorbed. The uves is now seen protruding through the reptured fibres of the iris, in the form of small prominent tamonrs, which gradually advance towards the cornes. The disease is hardly accompanied by any pair, in the eye-hall, and the patient complains only of slight pressure in the frantal region, and, of first, of aparks and musem volitantes before the eye. If the capsula of the less participates in

If the cancula of the leas participates is the affection, its symptoms are somewhat modified; a cloud begins to be formed in the midst of the pupil, and is greatually changed into a scalesed centre, from which colours, are seen running towards the margin of the ints. This control-becoming larger, and the ring proceeding from the area linewise increasing, the pupil is at least obsess. The first symptoms of the disease, as well as the alterations in the taxture and colour of the iris, are the sums as described observe.

Rheumation and gont seem to be gene-parties peculiar to the hain, as living rally the cause of chrosic aveits; some-brain." times, but less frequently, it is of syphilitic

As to the operation of artificial pupil, in those cases where the disease, having at-tained its last stage, is of course beyond the reach of medical art, the author is decidedly against it; the fibrees timese of the iris being so thoroughly destroyed, that it cannot be exso increasing consumpre, the it common and posted the operation would be attended with any favourable result; and in all the cases in which he performed it, or new it performed, the artificial opening was very soon closed by new exaulations.—Journ. für Chir. closed by new exudations Augusticities.

#### PHRENOLOGY.

" MATERIALITY OF MIND."

To the Editor of THE LANCOT.

Sta, Knowing the liberal principles with which your Journal is conducted, and that your pages are always dedicated to " free discussion," I have been induced to send the following remarks upon a paper, or On the Organic Muteriality of the Blind," by G. D. Dermott, Eaq., which appeared in THE LANCET of the 11th of October last.

I um yours, &c., A PREENOLOGIST.

Dec. 20, 1828.

It will be seen by this extraordinary may, that the author comes boldly forth as a tury defender of materialism, yet, fearing the obloquy that swaits those who dony as immaterial agency in man, he subsequently admits—nay, maintains, that the existence of the soul is "underlably ac-knowledged," though domest in this life. I shall endeavour to examine the propositions in this gentlemen's paper serialim. He first meerts (and it will be seen

throughout, that exertion supplies the place of proof) " that the cortical part of the subsee of the brain is only subservient to the modullary part, instantch so the former is the seat of birth, to certain qualities ich afterwards become diffused or circulated through the medulary part of the

heats, and even nerrous system."

As this conclusion is so highly interesting, we would gladly be informed how Mr.,
Dermott made the discovery of the birth-

New Mr. Dermott " know that there are certain maners, or portions of the brain, individually possessing their peculiar properties," which is the passion doctrine, halieve, of phresology; consequently, as these "peculiar properties," according to the first seastion, originate in the control part of the brain, they must be propelled or circulated through the medullary part of the brain and nervous system, of which we should like to examine some few of the author's proofs,

Mr. Dermott then asserts that "one par-ticular portion of the brain is the region of perception, mother of thought, sandher of memory, and a fourth for judgment;" and we cannot but regret that none of these attributes of the fundamental faculties of the mind have been assigned a place expe judgment, which we are told resides in the ocrebellum! What, then, ere the offices of the cerebrum? These are fully established by Messra. Flourens and Rolando, says our author; for these gentlemen, he would make it appear, have taken away the core-brum, and with it perception, thought, and memory, but have left the judgment sitting undisturbed "amid the wreck of matter" in the corebellum! Now, that taking sway an individual's brains should deprive him of memory, &c., we can easily conceive, but to allow his cerebellum to remain, and with it his judgment, is very actions: reversing the order of things, however, we are led to suppose that the aforesaid gentlemen have removed the corebellum and its illustrious inhabitant, and have left perception, thought, and memory, to revel, uncontrolled by judg-ment, in the spartments of the cerebrum i Let experimentalists look to this; who knows but, in a short time, we may see some "march of intellect" men obtain a etest for purifying people's judgments, or, in other words, for an instrument to relieva them of all unnecessary incumbrance of thought, perception, memory, &c., by re-moving "the seat of birth" of these trouble-some faculties. But to be serious: Mr. Dermott says, "It is in vain to state that what I have now ventured to affirm is untrue, upon the strength of an secondition founded upon ignorance and projection and frequently made,—that the manual properties founded apon ignorance and frequently made, that the manifel property are totally different from this known properties, and all autablicing ideas of matical for our ideas are founded upon our known of dead or inerginal matter, to which and dead or inerginals matter, to which beg, we would gussay no more now a low a low seem we come upon ow any property of the high-place of one complete which hecouse diffused, dec., where he found the propel-man not in the profusion, should said an in the profusion, about a single medilitary part of the brain" is proved to possess "all the distinguishing living pro- on mind to dead or language medical it is

pretty obvious their speculations would soon | We are afterwards assured, that all suitesals e a dead letter.

To return more particularly to our point we have hitherto learnt from Mr. Dermott's paper, that all the varied operations of the mind are comprised in four functions, viz. perception, thought, memory, and judgment, yet not a single fact is proposed as a proof of this, unless the sesertion could be taken for one, that Mesers. Flourens and Rolando have separated the cerebrum and gerebellum, and with these their several

igned functions.

Let us cow go to where Mr. Dermott takes up the " argument on fresh grounds which are these, that nerves feel by their sculiar properties, and that sensations and impressions are conveyed from the different arts of the body to the brain, and this (the brain) " produces perception of seasation." An assertion follows, vis. that perception and sensation are material, being the actions of living matter; and further, that they must be material, because material and apiriual things are incompatible! Thought is stated to be the immediate sequence of perception, and therefore not immuterial!

"The same may be said of memory and information and all other mental presented. judgment, and all other mental operatione, the sequences of the last mentioned." From these assertions, it would appear that all actions of matter must be material, and that actions of matter, and matter itself, are incompatibles!

To support Mr. Dermott'e doctrine, we are directed to look to comparative anatomy for "incontrovertible facts." This, we are toid, teaches that the intellectuel or higher part of the brain corresponds in sise, so as to be communaurate in its development with the understanding, which we are giveo to suppose, from the former assertions, ie composed of memory, thought, and per-ception; the judgment, let ue bear in mind, residee in the cerebellum, and, consequently, far removed from the "higher part of the brain," so that the understanding is not nocessary to judgment. Now, were it correct that the intellectual or higher part of the brain corresponds in size to the understanding, a very meful table might easily he constructed, that would afford us, et one

have more or less a mind; but as this involves a definition of the term, we leave it for the present. Mr. Dermott further asseris, that Nature is imperfect, which is the most preposterous and noxious of all. that animals " pertook of the full of Adam." along with man; and then a joke about providing animals with hibles follows. come now to a etrange inconsistency : we were told in the early part of the paper, that material and spiritual things were different and incompatible, and yet it now appears, that "such a principle as a soul is unde-niably acknowledged;" and, as if to recon-cile these contradictory creeds, our author makes the soul to be dormant as long as organic life continues, and that on that coning, the soul enters into a state of development, or, we suppose, "it wantons in end-less being."

From the boldness with which Mr. Der-

mott makes these assertione, one would really suppose that he had shready an ineight into the " secrets of the prison-house, if, in the next place, he had not said, that we know nothing of the spiritual world, what-ever divince and philosophera may say. Mr. Dermott now grows serious, and after talking of providing the lower animals with bibles, considers it "impious as well as ignorant in the extreme, to treat such a thing with ridicula." We wonder, after ansigning different functions to different perts of the brain, Mr. Dermott did not point out the dormitory of the soul, as well as of the

jodgment.
We ere gied to come, at length, to two causes for all oor actions, and these are breeding and education, which give birth to conscience and judgment; and these terms a little further are made eynonymous, and then each is used but as a relative term : finally, this paper closes with a chapter of the author's belief. How much it is to be regretted, that we cannot take the advice of Horace in writing for the public :---

" Sumito materiam vestris qui ecribitis mquam veribus."

It occurs to us, that perhaps many of your ke constructed, that would afford us, at one genee, the exact proportion of intellectual actions possessed by any given individual.

We are further informed, that the reason of the intellectual, or meanth part of the facility in the lower class of arrangement, and the absence of its logical decimal than he man in the lower class of assistant than he man in the lower class of assistant than he man in the case are forcer against and fawer senses to case of the intellectual, or meant into section."

The first against and fawer senses to case of the meantainty man into section."

The first against and fawer senses to case of the meantainty man in the case of the senses of the senses to each the first of the fir readers may out trouble themselves to a

herrons system have cortain qualities dif-fused said circulated through them, which had birth in the cortical part.

3d. That there are certain portions of the brain which individually pesses peculiar func-

3d. That there is one particular portion of the brain for perception, another for thought, a third for memory, and a fourth for judgsent, which is attempted to be proved by a

4th assertion : that "re may take assay thu cerebrum, and with it perception, thought, and them that we may remove the acrebelthen ("without the cetebrum,") and we thereby take away the judgment.

5th. Have all men and animals judgment

in proportion to the cerebellum? rs. Flourens and Rolando have established this fact, which, in reality, they mover attempted to establish; their opinion, or rather the opinion of M. Flourens, being erely that the cerebellum presides over the forward motion of the suimal.

6th. That mental actions are nothing elas

than organic functions.

7th, That the opinions here advanced it is in vain to controvert.

8th. That our ideas are founded on dead

or inorganic matter.

9th. That sensation and perception are th muterial, because

10th. That spiritual things, and things material, are incompatible, and that naither of these could be the effect of the other.

11th. That thought is the immediate sequence of perception, and that memory, judgment, and all other mental operatio proceed from perception : inconsistent with No. 4.

12th. That these assertions are aupported

by comparative anatomy.

13th. That we have, in the most perfect mimals, the size of the intellectual, or higher part of the brain, corresponding to, and commensurate with, the development of the mederstanding.

14th. That this is the state of man.

that animals pertook of the full of Adam along with man.

16th. That animals should all have ministers, religious, bibles, and revelations, and

should enjoy a future state... 17th: That organic matter could not have its operations fully developed, confemporally with those of the immeterial principle—the

18th. That as long us organic life conti-sues, the soul must retain dormant; and that, us soon as the life of the body denses, the soul enters into a state of actual exist-

that the modulary part of the brain and cannot be existing in a state of intimate counexion: inconsistent with 18.

20th. We do every thing from bresding

and advention.

21st. That conscience or judgment reaults from education. Do the educated along possess conscience then I or is their consclence proportionam to their education? Do animals possess conscience in propor-tion to their breeding and education?

2rd. That conscience is only the production of an accumulation of knowledge.

23d. That conscience is entirely the affect of education.

Wa repeat our former opinion, and maintain, that this paper is presumptuous, issu-much as it professes an sequalotance with subjects not cognisable to man's senses.

That it is dogmatic, as assertions Nos. 11, 15, 16, &c., will show. That it is in-consistent, may be seen by Nos. 4 and 21, &c. That it is ignorant of nature, will be seen by assertion No. 4, 5, and 18.

Wa cannot but regret, that Mr. Dermott, while deeply engaged in a positive science, alouid put forth such theoretical notions; that he abould write papers absolutely useines, may, worse than uncless, injurious ;injutious not only to himself, but to the reader, who misapplies his time—the very material (1) of which his life is made.

#### ABBCRAS OF THE STOMACH.

## To the Editor of Tue LANCET.

Str.-The following is a case of abaceas of the atomack, and from its heing one of rather unusual occurrence, I have sent it fur insertion, if you exterm it of soficient

importance.
Thomas Stoddard (a prisoner,) west. 36, a tall robust man, very muscular, with large hones, and an unusual broad cheat, was similated into the Hospital, May 23d, 1820, with symptoms of catarrh; what was done 15th. That all nature is imperfect; and for him then, I am not acquainted with; ha did not come under my core until June 4th, 1826, when he complained of pain about the acrobiculia cordia, and when present with the hand, he described the pain as more at the body pert than the free; he had sipe a source of weight pert hearthese about the re-gion of the stomach. The pulse never as-ceeded 100, and would story as-ceeded 100, and would story as-plaining of great things, and howels con-ficed. These appropriate continued as the 16th of June, with Maley-surfactor. We have force to the stomach, capped twice, with a biliner to the acceptation comits; hept open for ten dept; the febridage maintance, and talks of the ext. ochors, et thi, bridgers. scrobiculia cordia, and when pressed with 19th. That mistorial and spiritual things and pills of the ext. octory, ot pil, lightner.

to bim; found he had gone to the closes, and in the act of rising from the seat, was seized with violent retohings, contlaning for six minutes, and then fell to the ground insecubly. On anamhing what had been vomised, there appeared an amazing quantity of black blood in congula, with a quantity of grumous fiquor and pas; miaed with these were some particles of curdied milk, amounting altogether to three or four plats. The sickness continued for twentyfour licers, lie at different times bringing up blood, and a dark and thick fluid, complaining much of a sharp pain in the ato-mach. The howels became all at once much confined, refusing to act with ol. richti, liyd. sible, and ext. colocy.; some strong do of croton oil took on effect. Some powerful stemas brought them late action, bringing away axceedingly dark coloured feees, quite saturated with blood. By the 20th he had rallied, and could take noprishment of a light natare. Hla pulse 70; very weak and feeble, countainance pale, and his body much emoniated. He had prescribed for him sucdynes, light asomation, and tonion; also buif a pint of port wina a-day.

From the 20th to 30th of Juna, he occaalonally vamited small pieces of congula and pus, mixed with a brown fluid, and his stools were mixed in some respents with it.

On the 3d of Jaly, he had pills of the as-perac, plumbi, of a quarter of a grain each, and inpressed to gr. jes., and on the t8th increased to three grains in a day. From this time to the 20th of October, he became worse gradually, though at times he would rally; emsciation going un, and adema of the legs fullowing. Within three days of his death, hia abdomen hecama awelled; nn saamination, it had all the appearances of sacitos; the urina flawed freely, and aven in larger quantities than he was secustomed to.

On the 23d of October, he drank for his breakfast a pint of but ten, he immediately complained of " Its burning his buwels;" he became Insensible soon afterwards, and died in the middle of the day.

## Post-mortem Examination.

On making an incision from the top of the botant downwards to the pubes, the scalpel suddenly antered the abdomen, when a vest quality of field received; some was congli-in h bucker; said, with what remained on the floor, we faithfund it to amount to three

The leage were vesterably healthy; the healthy is the storach, on healthy; the storach, on healthy; the storach, on sisteral and outward coats felt callous. From the particular appearance of this or-na, we supposed it to be the seat of the license; after tying a ligature above the

On the 17th, at 12 at night, I was called | inches of the daudenum, the stomach was cut away. In the centre of the lateral and posterior part appeared a kole, of auch dimensions that a pigeon's egg might be racily passed through it, the edges thickened and nueven. In the internal part was sean a dark red arcold, taking it a space of two inches dismater. All the vessels near it were gorged, and perfectly distinct. The pyloria orifice was thickened, and callouity extended to four inches of the duedessa. Liver enlarged, and hard; gell-bladder full; aplaen hashthy; killheys enlarged, particulady the right one. The intestines, at several parts, had a slight blush of inflammation on their external cost. Bladder collapsed but healthy. Your constant reader,

G. R. M. Portemouth, January 4th, 1825.

## HOPITAL DE LA CHARITE.

#### BFORTANEOUS PRACTICAL OF TRE THIRE anra.

L. D., st. 68, with a constitution broken by syphilis and mercury, was, on the beginaing of Docember, admitted into the Hospital, having, three months before this period, become subject to rheumatic affections, and to a deep-seated violent paie, which extended from the right leg to the knee, and had letely become so severe as to prevent him from following his occupation. In the Hospital the effection of the hip and thigh was treated, for a fortnight, as lachlas, hy blisters along the esternal surface of his thigh; hat, on the 15th, the limb was found considerably shorter than that of the other side, and though this shortening was, at first, considered as the effect of diseased hipjoint, it was soon discovered to be caused by a fracture of the thigh bone; the lower portion of the fractated bone was drawn upwerds and outwards, and appeared to be somewhat calatged; the knee and foot were turned outwards; the pale had so much increased, that it was impossible to examine the affected parts accurately, and to set the fracture. As to the origin and time of this secident, so information could be obtained, so that the patient probably broke the bone by muchoular contraction, when nhanging his position in bed. It is worthy of remark, that after the occurrence of the fracture, the left hip began also to be very painful. The patient's general health was very bed; he was week and emoriated, and suffered much from excesaire diarrhose, but no symptom of any orga-nic disease could be discovered. The treatment was, of course, entirely pailintive; no disease; after tying a ligatore there the local means were supplyed, and only opinin cardine ordine, and another, taking in six and muclinianes medicines given inter-

lungs, except some gangrenous excevations and deginition, and appeared to be increasin the latter, exhibited no morbid alters. ing, its extirpation was decided upon. In tion; the liver was rether enlarged, but of order to prevent profuse hasmorrhage, M. healthy atructure; the aplenic artery was much dilated, its surface uneven, and its internal membrane cove-ed with yellow cartilaginous spots. The abdominal sorts, being rebly lessened in its diameter, was surrounded by a great mass of indurated aterno-masteid muscle, and the artery tied, glands, of carcinomatous oppearance; its having been carefully asparated from the rous lining exhibited the same alteration as that of the splenic artery; the vens cava medle; a momentary pain and palences of was also comprised in this congeries of the face ensued, but there was no attack glands, which had, for the most part, gone of syncope, or any other nervous effection, into ulceration, and were firmly adherent and, after a few minutes' rest, the operation to the vertebral column. Another mass of was enabled to proceed. A similar lacicarcinomatous glands, attached to the perios- sion having been made at the external mercerous glands, and its tissue was almost en-tirely degenerated into tuberculous matter; the cervical vertebres, were divided, and the left kindary contained only a faw tuber-the tumour being foreibly pushed upwards, cles. The enaulgent veins were filled with was now assily detached from the parotid a apongy red anbetance, which, at first sight, gland, the masseter, and the skie, and thus eppeared to be grumous blood, but, on closer ultimately removed. No vessel, axcept the inspection, proved to be exceptualed matter, maxillary artery, was tied during the ope-The fat aurrounding the kidneys and the ration; the wound was united by three capadic supra renales, were also filled with autures; on the fifteenth dey the ligature of softened tubercles. The round ligament of the carotid came eway, and slaves weeks the right cotyloid cavity was somewhat in after the operation, the petient was per-jected, thickened, and of scirrhoun hard-feetly cured.—Arch. Génér. de Méd.

1. The fracture of the thigh bons was two inches below the great trochanter, and the two fragments were in a very oblique sition; their medullary canal contained a fatty, vascular substance, which was filled on the 28th of November, admitted on acwith camerous tabercles; the cancellous count of phthisis, which was attendy so attucture of the bons, being considerably far advanced; as to leave no chance of recothickened, was infiltrated with a similar matter, and the compact substance of the matter, and the compact substance of the ber. On examination of the body, the right hone reduced to a very thin lamins, the lung was found studded with tubercles and external surface of which was rough, without periosteum, and vary vascular. The divided by vary deep inclaions i from the same morbid alteration, but not in such an postarior surface of the superior labe there. bone -- Journ. Holdon

EXTERPATION OF A SCIERROUS TUMOUS OVER THE PAROTIN GLARB.

On the sitting of the Academic Royale thickness it we do Médecine, on the 23rd Novamber, M. nary ambetance, a Larrey, made a report of this operation, disease of the leng which was performed in the beginning of scenes and inherential last August, by M. Foeilloy, at Bunst. A long was required female, 52 years old, had been affected for Journ, Helifornia.

nally. On the 17th of December, the pa- a long time with a tumour over the left tient began to sink, became restless and perotid gland, extending from the temporal delirious, his countenance was vary much region and the ear over the cheek, lower altered, the tongue black and dry, the stools jaw, and lateral portion of the neek; it had extremely fortid, the palse very small, dee,, an uneven surface, was very hard, and example and he died on the 20th. d he died on the 20th.

On examination, the brain, heart, and able difficulty of respiration, mentiontion, Fouilloy considered it advisable to tie the carotid artery, previous to the removal of the tumour; a longitudinal incinion was accordingly made through a transverse fold of the skin, along the internal margin of the vein and nerve, by means of Dechamp's toum of the os secrum, surrounded the right gin of the tumour, M. Fouilloy succeeded like vessels. The intestinal canal and me—in arriving at its roots, which being situantary were healthy. The right kidney was ated in the cellular tissue, between the err enlarged; its notch was filled with can—and the rathus of the lower jaw, and drahly

PECULIAR FOR MATION OF THE RIGHT LUNG.

A young girl, ninateen years of age, was, very, and she died on the 14th of Decemsmall excavations; its three lobes were ndvanced stage, was found in the left thigh bone.—Journ. Holdman.

adhered, by its autories margin, to the lung, adhered, by its autories margin, to the lung, and through it received a bundle of this pull-monary vers and orthy, and of the broadels. monary vels and estary a it was on a level with the right lung; but and

# THE LANCET.

London, Saturday, Polimary 14, 1829.

In one or two recent numbers of The Po litical Register, Mr. Connery has taken occasion to speak of Twa LANCET in such terms of approbation as he is not much in the habit of applying to contemporary journalists, and such as it is gratifying to as to reflect that we are believed to deserve, by a writer whose powerful talents. if not universally acknowledged, are universally felt, and, perhaps most felt where they are least acknowledged. It has been said; that one of the heat tests of merit is the praise of those who are themselves the objects of general approbation. For our own parts, we had much rather receive the praise of a man who has been as much vituperated as Mr. Consurr has been by some of his contemporaries-who is as able as Mr. Cospery has aver shown himself to give his enemies tou blows for one, a species of taction wherein we may also take to ourselves the credit of possessing some small skill, and who, by reason of constant exercise in the task of inflicting chastisement on his opponents, has become slow and cautious in dispensing his approbation. In the last week's Register, Mr. Conners adverts, in the following manuer, to the very important point of law which was desided at the output of the late trial.

There was in this case a question of past interest decided; seemly, that a desiration time paramed, who though jumpled for the decided to the decided to the decided of the decided for the de

Now, wiring the personal naturalisment.

which Mr. Connery is here pleased to pay us, and assuming credit only for so much of approbation as, upon public grounds, we are fairly intitled to, we have no henitation in saying, that a more important point of law, as regards the intercets of public writers generally, and of public journalists in perticular, than that which we maintained on the late occasion, and maintained some late of the proposition to the opinion and service of our own counsel, Mr. Bauves au, has not for many years been decided in a court of justice.

We have been informed by several gentlemen at the bar that this decision, which gives to defendants who are in a situation to justify an alleged libel, the right of opening their case, and of having the general reply, is likely to produce a total change in the practice of special pleaders, and that whereas pleas of justification have hitherto been always discouraged in such actions, they will henceforth be recommended as decidedly beneficial to defendants, or, rather, as depriving plaintiffs of an advantage, which mabled their counsel to produce unfavourable impressions on the minds of a jury, by diat of unfounded observations to which a defendant had no opportunity of replying. The right of opening in actions for alleged libel, where the defendant puts a plea of justification on the record, first established in the case of Cooper v. Wakley-a case memorable, therefore, in a legal, as well in in a surgical point of view, and which will be as often referred to by lawyers as by lithetomists, coupled with saother proceeding, which, in many cease, may be found highly merful, namely, that of filing a bill of discovery in the Court of Chancery,-will afferd, for the most part, a complete protection to public writers against versitions appeals to the law for alleged abuses of the liberty of the press. The editors of newspapers are more especially interested in the e decision, because there is no class of

pablic writers so liable to become the ob- | will perhaps never understand, unless par igets of actions for libel, in ourse where seventure he should himself offer to The feets, tending to injure individual reputstion, have been published; and where information having such a tendency has been appolied by parties, of whose motivas the editors cannot be cognisant, and who may, by possibility, supply it from a malicious motive. In such a case, a plea of justification, according to the .ata decision, would completely exenerate the inoocent publigher, even though the motive of his agent, or reporter, or of the person supplying the information, were malicious; for Lord Tru-TERBER distinctly laid it down, that if, in such a case, the jury heliaved the facts reperted to be true, the saimu with which the facts were communicated, however melicious. eaght to have no influence on their verdict. It is impossible that the importance of this decision should have been overlooked by the public journals; yet it so happens that, axcept in the pensage above cited from Mr. Con-BETT's Register, not the slightest allusion has ever been made to it. The point has been guined, and it matters little by whom it has been gained, or whether the Editors of newspapers were or were not disposed to give us credit for having gained it ; but we mention this circumstance because it may farnish a comment on that part of Sir JAMES SCARLETT's speech at the late trial, wherein he expetiated on the connexion which he supposed to subsist between Tue Lancar and the daily journals, and even nentured to intimate that one of the leading erficies in The Times, calling public attention to the Report of Mr. BRANSAY COOPER's case of lithotomy, was contributed by ourselves to that journal... In this part of his speech for James had the morit, to use a Saure of his own, of killing two binds with enquince; for, in attempting to superse the character of Tax Lander, he was at the same time guilty of offering a gross launt the jury to have believed, that our regarded to the character of The Tigur. The procise entertained so much of milies toward nature of this issuit, the learned gentleman Baareny Copran, so to be gled of a

Times a leading srticle of his own composition; for if The Thues, or any other respectable journal, would disdain, as it most assuredly would, to address the public in the esquisite language of Sir James Scau-Laty, the learned geotleman will see tho absurdity of imputing to the editor of a paper, the admission of a contribution in the shape of a leading article, under any other circumstances. We have supposed a marimum of temptation in supposing the teeder of a leading article to a public journalist on the part of Sir James SCARLETT: and that learned gentleman's mathematical mind will readily perceive, that if an editor's virtes could be proof against the opportutunity of arraying itself in the exquisite plumage of the propounder of the Poor Bill, say inferior dagree of temptation would be easily resisted.

The following is Mr. Connerr's opicion of the merits of Mr. BRANSEY COOPER'S case, after a perusal of the full report of the trial :-

" I have now read a full and detailed report of this trial, the publication consisting of a hundred and sixty-sis pages; and, I cue only say, that if this report be correct, and I had been one of the jury, and no other swidence than that which I have read had been given, Mr. Coorea would not have got one single farthieg.

We haliave that the jury would have arrived at the same conclusion as Mr. Cuaper, had they implicitly followed that part of Lord Tanzzapan's charge, in which he directed them to dismiss from their minds all consideration of the sames with which the report might have been written, and else of the dramatic form which was given to it. Constituted as human nature in it is searcely possible, and, we will trackly admit, it is starcely desirable, that this direction should bave been implicitly followed, supposit

consequently, to injure his reputetion, We from utter rule, though wholly onsuited to between Mr. LAMBERT and Mr. BRANSEY Coopen, would ever have induced the former gentleman to pervert or migretrement the facts of a case transmitted for insertion io this Jouroal; and if Mr. BRANSHY Coorse had had the fairness and the manliness to publish his own report of the operation before the trial, the jury would then have been furnished with demonstrative evidence, that no facts had been perverted or misrepresented. Io many respects, as far as facts are concerned, Mr. BRANSEY Coorse's own report of his case is even more unisvourable to his surgicul reputation, then the report transmitted to os by Mr. LAMBERT. But though it would have been impossible for Mr. BEARST Coores to ohtain a verdict, had he vectured to puhlish his awn report before the trial-and let it be remembered, that Mr. BRANSBY Cooren kept back this report for the avowed purpose of increasing his chance of obtaining a verdict-though Mr. BRANSBY Coorse afforded the jury no means of ascertaining what he considered a true statement of the facts of the case, except by putting a single witness of the operation in the box, his assistant, Mr. CALLAWAY, which assistant swore, that he was oot better shie to form an opinion of the difficulties of the case, than any other man who saw the operation-and though not a single material Jan stated in our report was contradicted by Mr. BRANGEY COOPER's only witnessnotwithstanding all these circumstances, we are roudy to minit that, if the jury believed per reporter to here entertained melice toards the operator, they were morally ough, seconding to Lord Terranson's rection, not legally, justified in presumunitaly stated, and, consequently, in return-

portraity of publishing a case calculated to ing a verdict for the plaintiff, with da sapose that gentleman's deficiencies, and, sofficient to save his preferenced character believe that no querrel or misunderstanding the justice of the case, if they had believed him to have a substantial foundation for the iojory of which he completed. But to what circumstance is Mr. BRARRRY Coorna iodehted for having gained his " for per . cent." upon the alleged amount of injury, which Mr. Coszerr calls " a pitiful result for so grand a speculation ? "-solely to the suppression of his own report of the operation, until after he had obtained a verdiet; for that report, had it appeared before the trial, would have removed all doubt from the miods of the jury, and established, beyood the possibility of contradiction, the truth of the races stated in Mr. Lawser's report.

> The following observations of Mr. Conserr are well deserving of the public ettention :--

" It was curious to observe, that at this trial the BENCH was covered with Sergrons! What, are they got there too? In rich, that the powerful pre short, are to be perked up on the Bea-alongside of the Judge, are just to step dos from the Beach to the witness-box to give their svidence, and thee step back again resulos their seat upon the Beach; and all this while those whom they prosecute, an against when they bring actions, though perhaps a thousand times their worth, to be compelled to stand upon the floor, smonger the attorneys' clarks and court sadles? There was, upon this so old Coorse himself (without his fam struments, I beliave) seated on one side of he Judge; and there was Mr. Gnaze, and s whole tribe of Surgeons, all stopping witness box, to give evidence ag Waster; while their was Mr. Watter sitting or standing am aget the attorn clorks and tipetation I leave for the Ju to consider how for this was decousing in execution for his dis ity wee. be makeneed by having these companies the Beach; and, above all thing span, and togally, instance in present-ting some material flot, though anon-style by may avidence, might have been the minds of the jury might have which the minds of the jury in the effect which the study protocoding in the tree had made the minds of the defendant. It hap-made the minds of the defendant.

Surgeons had before them a man not to be intimidated by any thing; and z man to feel increased energy in consequence of the insult offered him in the perching of his enemies upon the Bench. This was a man enemies upon the Bench. not to be put duwn; but it is not always that there will be such a man to be a defendant; and, therefore, let us hope that even before we get a reform of the " collective," this practice of perching prosecutors, or the witnesses of prescutors, upon the Bench, will be discontinued. I wonder that Mr. Wasley did not complain of this upon the spot. However, he did the thing so well, obtained so complete a triumph for the press and for the public, as well as for himself, that we may leave to the Cooreas the privilege of boasting, that they have for once sat upon the Bench alongside of the Judge."

Who, in the name of common decency, are such persons as Jos Gazen, Chasins Key, BEN BRUDIS, BEN TRAVERS, and Ban Hasemon, el-derent vendor of botties, that they should presume to perch thomselves on the same bench with the Lord Chief Justice of England? Had ROWLAND STRPHENSON, the depredator, who fied, or rather who travelled by easy stages in one of the carriages which he called his own, loaded with the spoils of his confiding customers-had this man been subpurpaed to give an account of the way in which he managed the funds and dispensed the patroraige of St. Burtholomew's Hospital in the capacity of treasurer to that Institution, he bully some interest in the event of the texting as with the person of a or suit, was perched, on the score of his peer, place recent of his pleasuitfule as age, by the side of the learned judge, and even in the delightful climate of Little availing himself of his preximity, had the Mr. Walloos is followed by Mr. Creakton.

sened, indeed, that these tribe of Bencher-| presumption, in the progress of the trial, to address some observation to the Chief Jagtice, in a whisper. The reply of Loan Ecznyocoven to the poer, uttered in a voice which resounded to the extremition of the court, was brief and characteristic-"If you again thus presume to address me, I shall commit you to the custody of the tipstaff."

> We intended, this week, to take a review of the rise and fall of a number of Medical Journals, which have appeared and diseppeared since the first publication of Two LANCET, and also of the death of all the old rubbish which existed before the establishment of this Journal, but our space will not permit us to enter spon this subject in the present Number.

# Edinburgh Medical and Surgical Journal .-(Concluded.)

Tue article which succeeds Mr. Syme's paper, demands little comment; its object being a description of the well-known climate and diseases of Lisbon. According to the young traveller who gives it, Lisbon too would, no doubt, have been seen perched seems to be a pleasant place enough to reside upon the same bench with the Lord Chief in; there is as abundant supply of sunshine Justice of England. This practice is not throughout the greater part of the year; ealy indecent-mot only derogatory to the and at all times a fortunate dearth of disease. dignity of the Bench, and calculated, as People contrive, however, to die in Linben, Mr. Cobbett suggests; to have an evil influ- just as they do elsewhere, and of greity much ense on the minds of jurymen, but it some- the same description of maledies as in less times leads to practical violations of the favoured climes. This is the sum total of Mr. decorum which ought to be observed in a Wallace's statistical observations, who, we court of justice. In the time of Lord have no doubt, spiret his time very agreeably Mischerough, a peer, who was to be called between the stay and the one plant we get as a witness in a busing and who had pro- not quite so certain of the propriety of

he is not quite so interesting on the subject of the costs of that viscus. From the fact of hydrophobia, as he was when we had the pleasure of meeting him last, in an article on lithotomy. So fortunate an exemption from this frightful affection blessed the country around " Bonie Dundes," for several years, that Mr. Crichton began to think that there was no such disease as hydrophobia at all. The only parallel to this strange souceit with which we happen to be acquainted is, the attempt which was made by a Frenchman, some time ago, to prove that syphilis was merely a metaphysical abstraction, existing in the mind of some foolish speculative writers, such as John Hunter. A bull-dog terrier, however, brought Mr. Crichton to his senses on this subject, about twelve years ago. This ferocions little animal, he tells us, bit several persons, one of whom, a young lady, died of genuine canine madness, while the rest escaped at the expense of a severe fright, on learning her melancholy fate. We should feel happy to record any novelty in the pathology or treatment of this affection, discovered by Mr. Crickton, but, as yet, he has made as little progress on these points as any of his predecessors.

Mr. Crichton was not more embarraned examined after death, was incorated. The they about these seales and a half in ar year of the

of Dundoe; but we are sorry to say, that | length, and a great thickening, or contraction of the patient having worked after the infliction of the first injury, Mr. Duyar infers that the rapture could not then have taken place : the nature of the laceration disposes him to think, that it could not be the effect of the retention of urine; the openings, in such cases, being small, and formed by gangrane and ulcerations he therefore concludes that the rupture must have occurred at the time of the fall, when the bladder was probably in a state of distention. For one who knew nothing of the cese but what he learned from others, and through an autopay, Mr. Duvar's conjecture of the real cause of the accident is as rational as any that equid be formed, under such vague circumstances,

We are next fevoured with an account of another "rupture," by sesistant-surgeon Gun, of the Sportiste frigate, in the Tague; but this "rupture" happened to take place in the pulmonary artery. The petient, we are told, was an unlessithy looking "tar," and, as if in the habit of making too free with "grog," about which there can be very little doubt, he had been unwell for a few days, with some rather obscure symptoms, for which he was, of course, approprintely treated; but, on making some about hydrophobie, then Mr. Duvar, of exertions afterwards in his occupations Dumferline, seems to be, about the manner about the howsprit, "Jack" fell to rise no in which the hindder of a patient, whom he more, and would have been drawed, hy dropping into the water, but for the humans subject of his speculations on this problem | assistance of some of his companions. The received some severe blows on the abdomen, | chest was found filled with blood, in the in a drunken brawl; be was subsequently usual states of serum and crassames tum; seen, however, attending to his business; the lungs compressed, of course, by the and, at a still later period, fell on the ground, seffused fluid; which is not at all surprising, while he a state of inebriety; the symptoms of considering that a large rupture was found the injury of which he died, then first set in in the pulmonary creary, about one inch and with projectly. All this dir. Davet knows by a half from its origin, in the right contriols report only fact being blesself in attendence Around this specture the vessel was disis the case. At the post-meries sumi- essed, to the extent of a shilling; the is he discovered a second-cachie affection mosts of the recest being this, of a brown the statement and a rupture of the colour, and generally degenerated. This ciropmetance naturally introduces the subject

of the formation of ansuriant; but, to do repeated every hour, or hour and a half, so Mr. Gun justice, he has not abused an opportunity, so favourable for inflicting on us a criticism on Scarpa; and though his remarks are plain enough, we are really grateful him that they are so few, their brevity heleg by far the best part of them.

" If," with which word Dr. Thomas Masterman Winterbuttom begins the next article, is really so ominoth a particle to commence an essay with, particularly on so apeculative a question, as the nature and contagion of types fever, that, we had some nation of leaving the Doctor to accumulate his famelful westions around this memoryllabit nucleus of hypothesis without interruption, until we accidentally saw at the bottom of each page, the erudite sources of his materials, which comprehend quotations from, and references to, the writers of all ages, nations, and languages. We therefore gave him the benefit of a perusal, and found, at this estantations display of reading led us to expect, that were the various authors, whose ideas he has had the ingenuity to combine into this emity, merely to take back but one syllable each from the compound, they would leave blue in the melancholy predicament of the jackdaw in the fable, stripped of its borrowed plumage by the this ingenious medley, we perceive, is a recommondation of that now fushionable practies in inflummatory complaiets, the exhibition of calomel in large doses, say of some hundred grains, withit a few days. Among the diseases for which this treatment is proposed, there is one so seldom left to the mercy of mercury, or any other article of of the materia medica, except ateci, that we are induced to allow the Dootne with the awful name, to express himself on the sub-

"In autoritie and strangulated horain, two cognate diseases, I have found eglowel, in large doses, to possess a power equal to Peruvian bank in intermittent fever. In strangulated hernia, sen grains of calomel

that one hundred and twenty grains may be administered, in from fourteen to eighteen hours, will frequently cause the protruded gut to receda spontenaously, or, at least, with the slightest teach. When vomiting and paie are considerable, a grain, or buil a grain, of opium will be found useful. In upwards of twelve cases this method succeeded with me; in one lestance only it appeared to fail, from adhesion of the sec.

Strangulated hernis, strictures, adhesions." and all, to yield before calomal and tha slightest touch! Perhaps so, indeed, though to us it sounds rather strange, even with the adjuvant of a little opium; but we shall pertainly be on the look out, in the future cumbers of the " Indigo Journal," for forther novelties from the pen of Dr. Thomas Masterman Winterbottom!

We must stand exensed for a very bad oun, but Dr. Wilson, on the mechanism of the billary system, has really made us so bilious that we cannot attempt a better; aed Dr. Bostock, in a letter explanatory of. an error leto which he had fallen, in writing on the congulation of the blood, has net a little atirred ep that validele of indignant facing within us, that he should have written a trifle so ill, who has, on other occasions, said so much well. We must, therefore, pass them over in silence, lost we might become personal, and restore our equanirest of the feathered tribes. The upshet of mity by an examination of a peceliar epidamir, which has been lately visiting the West Indian Islands. Mr. Nicholson, to whom we are indebted for a monograph of this disease, has baptised it an " Arthritic Exanthem," is honour, we presume, of the memory of that greatest of all mesological onomatoligists, John Mason Good. natives, however, not dulte ac placeing in their notions respecting nonessisture, have salled it the " Dandy," for what reason Mr. Micholeon could not least, mer is it, perhaps worth inquiry, contidering the quier things which are said and done it a place where the same trade is carried on in living in Berke did to dead Suit, at Ediabergh. The Bories on the graph ne seil dit

of this singular effection, as described by Mr. Nicholson, of Actigue :--

"Intense headed; flushed countenance; pains in the back, lo the wrists, in the sa-clen; weariness of limbs; and great pros-tration of strength. Along with these there was a difficulty of flexion in the jointe of the ingers; heat of skin, with moisture; acete sensibility to impressions of cold; and vonitiog, which aggrevated the pain of the head. In the source of thirty-eight, or forty hours, these symptoms ell shated, and the patient, in general, left his hed on the third day, perfectly well. From the fourth to the eighth day, subsequent to convelescence, a pricking sensation was felt in the soise of the feet and the palms of the hands; an ereption, commencing in red pelots, dif-fused itself over the body in wheels, or pafused itself over the body in wheels, or pa-pulm, accompanied by pales of e rheomatic character. Io shout twenty-four hours, the eruption also disappeared, leaving the cuticie in a state of desquamation, and the ancies ordemators. In those cases in which there was oo eruption, the pains continued for several weeks; but in no instance was this disease, which very much resembled lofuseza and measies, followed by fatal results. Catharties, seline disphereties, warm clothing, and frictions with flannel, constituted the principal means of cure.

A sagacious little note, by the Editor, Dr. Craigie, appended to this paper, informs us, that this spidemic proceeded from East to West, through the West Indian Islands. and, unfortunately, deprives us of the hope that this harmless affection would, some summer or other, make an incersion among oer own " Dandies," to the great delight of the public, and the profit of the doctors. Here, however, and the " original" commooutlone of the "Blue" for the last three months, and with them we must take leave of our residers for the present. The reviews, which now bring op the year of this Journal, and no longer objects for praise or concurr, nor have they been since the retirement of Dr. Duncan, and the decease of Dr. Barenes, the Correlated of this once palebrated, but past liber fallen, publica-The said was a many to be still the said

LONDON MEDICAL SOCIETY. Minday, Farrary 9, 1889:

Dr. Suzaonau in the Cl REPORTIFO --- COMPLICATED CASES OF PERE-MITIS- AND DELIBIUM TORMENS.

The Minutes of the last Meeting were

The Pressurer did not somider that it appeared very distinctly from them what had transpired respecting reporting, and therefore he thought it right to stone, time the conversation upon reporting areas for Dr. Clutterbuck's objection to the pri tion of the mluetes of the proceeding the Society. The Doctor intended to a a motion, calculated to suppress such liention; he, however, found the maj of the meeting very much against a notion, and therefore he postponed the resolution till he had an opportunity of atten-ing at a more fell meeting. The questic had, therefore, not finally been dispused a but till it should, the reporting was so h permitted to so on under the emperimend-ence of the Council, the Reporter to be responsible to them; Dr. Clutterbeak being at liberty to bring forward the subject wheo he pleased. When it should be he forward again, lo eli probability the masse of the Society would be taken by ballet. and the further reporting decided upon by the result of that ballot.

Dr. Burez could not suderstand a part of what had been represented to have persent at the last meeting on reporting, but he was desirous of hringing forward e question now open the subject. As far as he sould collect from the Registrar's minutes, an irregular conversation upon the point had arisen,

The PRESIDENT observed, that the conversation had not been irregular, but a conversation then upon it by Dr. Blick woeld be out of order, and a waste of the Society'e time.

Dr. Barcz said, that if it was suffered to be brought forward last Monday, he hasw of no law preventing the conversation being renewed this wack.

The Parsinger. Dr. Blick, we must not

soter leto it at present.

Dr. Baigs. Then I sobmit to the Chair one other observation. (Cries of Chair, Chair.)

The Paustners. No; I cannot bear it. Dr. Bezen. Well, then, I nm to understand there is one law here for the Medes and another for the Parsians. (Laughter.) The Panetoner. No; certainly not.

The Renternat reed a paper, forwarded to the Society by a Member, on wint he

counidated cases of physicis, and delirium of his illess he did not present one single tremens. The subject of the first was a symptom of fever, and the pulse was selselicitor in the City, muat about thirty years, dom, if ever, above eighty or ninety. He who had lately married. His had been was blad to 16 oences; his head was shaved a temperate man, but for about a month, and blistered; naither the brain nor its at Christman last, had indulged much membranes presented any degree of vascu-more than ordinary in the pleasures of larity; about two ounces of serous faid were the table. Five days before his attack of found in the leteral ventricles; and the only illosse, his wife was seized with puerperal appearance of inflammatory action through-menia, and the grief occasioned by this, out the brain, was at the decreaation of the together with the late intemperance, was suspected to have sensed the attack. Very apposed to have sensed the attack. seen after this attack, he was ubliged to here the atrait walktoost put on, and, during the time it continued, bu had two visiont perceyans; between them an interval of nine hours elapsing of comparative quietude. Sixteen ounces of blood were ken from the arm; thirty-six leechas, in the whole, applied to the head, and he was upped. On dissection, there were much f messinged inflammation, and the plexus-beroides very turbid. The vessels of the its mater were much injected; a slight sea effusion upon the brain; but, otherise, nothing particular to be remarked.

Mr. SERARLY did aut think, from the lescription, that this case had any thing to do with phrenitis, but that it was a pere know, whether the gentleman had abstained from the use of stimuli for some days previews to the attack. If this were so, and parding the dejected state into which he had been thrown by the sudden illness of his wife, he should think un doubt could remain as to the character of the disease, ed that, in such a case, depletion was to

Mr. Krug pox inquired, what colour the min was, when out into, and whether any

be condemned.

be Agrana observed, that the patient had not left off the use of stimuli before the seconion of the complaint, though, for a short time previously, thu use of it had been lessened in quantity. The brain presented rather a more yellow appearance thee was with the money or the pearly and the pearly pearly or corn were not examined. The pulse was abarp and wiry, varying exceedingly in recovered. quickness, but never under 130.

The circumstances of another uses were related by the Registrar, communicated by the same Author. The patient was a medical the besin. student, who resided with a surgoon at the . Mr. Enwants recommended the most West end of town. He was taken suddenly prompt and free use of the lancet is negatively added to the control of the bring even is children bed for short seven days. During the whole of but a few mosths old.

optic zerves, where a small quantity of congulable lymph had been thrown out. He had complained of pain is the head for two weeks. The question with the Author here was, whether hydrocephalus was capable of axisting, without the cause to which it was generally referred, vis. inflammation? This case showed, to his mind at least, that effusion might go on to a considerable ex-tent, without any adequate inflammation preceding it; nor had be any doubt that the offusion into the ventricles produced death.

Dr. Burcs looked upon any quantity of congulable lymph thrown out, as a proof of adequate inflemmetion having existed. He did not put any great atress on the appearances presented by dissection; but he held bleeding, followed by a large dose of opium, to be the best treatment in delirium tre-

Dr. Ryan objected to general bleeding in dalirium tremens, as he had often done

before.

Mr. Linen was decidedly of opinion, that whenever acute manis, or any serious disease was going on in the brain, bleeding ought to be had recourse to. In hydroce-phalus, Dr. John Clarks, and subsequently his brother, Dr. Charles, had mad depletion, with the greatest possible auceess. He (Mr. Lloyd) had adopted the same plen; he was in the liabit of taking away blood, gene-

rally, and almost always, with success. Mr. Kingnus related a case that had the condition of the pulse with more pre-cision than had been taken notice of in the last, the particulars of which had been read, It was that of a medical student too, of a he was tract of a measure sources too, or very assistent and histourable mind, who had been so solicitous respecting his exami-nation at the College, that he was often-wards seised, though he passed his nami-nation with the unuset credit to himself, with the most violent brain affection. # WESTMINSTER MEDICAL SOCIETY.

Saturday, February 7, 1829.

Tue Minutes baving been read,

Dr. A. T. TROMSON made some observatious on the subject of a report of last week's proceedings, which appeared in "a hebdomadal, critical sort of a publication," in which he had been so falsified, that it ecame, he said, e great and eruel misfortune to the Society, that reporting should be allowed at all. He obarged the work with having violated every possible feeling, that it had made public, private business, and said, whoever was the reporter, he felt astonished that the Society did not expel him from its bosom; at the least, he thought, he ought to be severely reprimended. Dr. Thousen then publicly charged the enther of the mischief with falsehood.

Dr. Rouzzica MacLaon sat at Dr. Thou on'e elbow, but made no remark in reply !! For ourselves, we are unable to set Dr. Thomson right with the public, ne report having eppeared in Tua Lancer of the proocedings on the night in question. Although a very long explanation fellowed on the subject, we did not glean from it the parti-

culars of the case.

The Minutes were at length confirmed, when another member (Mr. Thomson,) rose with a like complaint against the same work, The Eccresoner, which he charged with " the oet unhandsome, ungentlemanly, unfair, and slovenly reporting.

On this charge, also, Dr. Roneeuca Mac-LEON made no remark! In enewer to a question from Mr. Thomson, whether a reporter could be kept out, or punished,

for erroneous reports,

The CHAIRMAN etated, that the subject had been brought before the Committee by different members, from time to time, but after mature deliberation, it had been deelded, that the Society had no lew by which it sould prevent reporting, either by memhere or visitors, nor did they know how to mount it. No measures had therefore been taken, and the only reply he could make to gentlemen who thought it right to complein. a, that there was no redress. (Loud spsee fullowed this announcement.)

Mr. Bungarr celled the attention of the embers to the destition of the blood heart; but, nome has disservations had is a survey represent by standard an un-dissed him to think; that the remain system was account with mome wither function; the brain, the system of reine-silved to, This was reason to suspect this; from the man to of us in relieving the sisues, propositerance of the volum over the arre-

ries. Indeed, so apparent was this, the unless some other function was connected with them, he might almost speak of the numerous and capacit Various systems of vains, particular of the liver in all creatures, and the kidneye in certain oviperous animals, afforded grounds, he thought, for believing that th business was not merely the mechanic conveyance of the blood. Mr. Beanett her exhibited M. Breschet's plates of the w hone system, showing the veins connected with the vertebral-poleum, running along which was to be found, a collection of veins separated into two series, one external, m another internal, the two communicati with each other by large venous bre some of which passed through the bodies of the vertebrm. The most extraordinary fact connected with these veins was, that the were no arteries corresponding in air number accompanying them, a circumst which rendered their use a matter of a speculation. At present, we might b lowed to explain the lastitude and painful sen-actions in the loine in fever, &co., by referring them to some darungement in the functions of these vessels, or of the circulation of the blood in them. There was a sys veins in the bony parietes of the skull ; by carefully removing the external table, less channels, branching off into numerous come were displayed, and small openings dis-cernible, through which the great sinusc-within, communicated with the veice sates ual to the skull. For these, of source, the was some function, a knowledge of wh would explain a variety of obscure pheno-mena obsected with disease, and particu-larly those various affections called headnche. He would submit it to the Society; as an interesting and important subject, to discuss the usture of that function. Mr. Bennett subsequently stated, that his chief inducement to bring the question forward, had been a hope, that it would lead to so discussion on the subject of apoplexy. To quantity of blood next by the heart to s brain was constantly varying, while the the same, in consequence of the new-distibility of the sinuses by which it flowed back. This circumstance would almost lead him to explain the occurrence of apoplexy upon mechanical principles, and, in illus-tration of his views, Mr. Bennett dwelt upon the constant connexion between hyperto veneral system: The relac trophy of the heart me apoptentic affections. It appears to be to be to the heart, when teriod, need to bring it back to the further to increased by etimulants, exin which Mr. Thomson, Mr. Bernett, R. excision very advantageous. He thought it other members, took part, there are the temperature between the veine and atteries might be, in great measure, equalized by the increased Mr. Arnott were present at one operation, velocity of the blood through the remous and that the want of power in the opicion of the instrument.

MA A waver expressed himself well nationally nat her members, took part, that the disparity tumoors near the rectum. isted, might also be compensated by a prothem. Mr. Beanett's opinions on the sub-ject of spaplexy were also opposed, and the mambers did not generally appear to colnmembers did not generally appear to coincide in the views which that gentlemus laid dere them.

Dr. Geanvilla explained a new method of extirpating tumours, invented by himseif, to avoid the danger which arose out of exising or extirpating some tumours, whether advantages. In answer to light may other way. The pra- Mr. North, Dr. Granville masses was that of a vascular tumour, nion, that the rapid was because with the right nyaphs of a young dual excision of tumours. by li patient at the General Dispensary. All treatment had failed in diminishing or arreating its progress, and it was feared, that considerable discuse of the vagina would cocur, if the tumour were not removed; but the danger of humotrhage from its excluion appeared to be great. Ligateres, however, would have been very painful, tedious, and difficult, as the tumour extended the whole length of the vegina. Dr. Granville, therefore, proceeded to apply pressure to cut off Mr. Prastan wished to make some ab-all communication with the surrounding servetions on the cubject of their confirmeparts, and then employed an instrument tion. which he termed a jugum, for excision of the tumour itself. The instrument (which was not exhibited) consisted of two hers of metal, with two sersws. Its action was such us, by turning the eccess, wholly to cut off the tumour. The tumour in the chair, who decided in favour of was removed on the fifth day. It proved to Mr. Frost. be scirrhous in the centre, but highly vancular eround. The nurface was now very healthy, the pain gone, and the pate fellow of the Society, tient doing well. The opinion, however, Mr. Mones Cavacas

M'Leed, Dr. L. Stewart, Mr. Bingham, and might be applied with great advantage to

fied with it. He had not, however, had sufportious selecity is the airculation through ficient opportunity to enable him to make op them. Mr. Bennett's opinions on the sub- his mind as to its advantages is all cases. He thought, that for tumours on the face, where much skie could act be afforded, and a great soor must be left, its use was not as advisable.

- Dr. GRANVILLE meent to limit the application of the jugues, but, in the cases he had mentioned, was confident it had great advantages. In answer to a question from Mr. North, Dr. Granville repeated his npinion, that the rapid was better than the gra-

# MEDICO-BOTANICAL SOCIETY. February 10, 1829.

The Lord Bishop of Bara and Wells in the Chair.

Arren the Minutes had been read,

A debate arose, in which Mr. Moras Churchill and Mr. Frost took parts; the latter gentlembe opposing the right of discussion on the minutes. The question was nitimately referred to the Rev. Prelate

On a proposition being made that Dr. Steggall, of imithfield Pars, should become

Mr. Mones Cauacusta observed; that he tient idding well. In opinion, nowever, which he (Dr. Granville) had formed on the subject, after greater experience, was, that the juguan would give the practitioner the properties of ancising the tumour at once, and without gradually regulating the pressure by the screws, as he had done in the pressure that there sent once. He was convinced that there may amongst whom were two or three of the control of th sent once. He was convinced that there men, amongst whom were two or three or would be no denger from homorrhage, and thouse fellows who had opposed the ejectures. The pain at the moment he would drown by opium. The appoints olds in their type, the popular olds in their type, the proper ment to treat it in the name way. Dr. Grant will stated, that he removed one tumour forms of like. Price, who had formed to only the previous moralag, which came in the first figures of like. Price, who had formed to drop of blook.

A Manuscus accasioned the readditive the rither half into the like their large. A Manuer considered the rapidity of the that he had not been hinckbulled for

personal objections, and that he might be proposed again; this he had now been by some of the very men who had before re-jected him, and he (Mr. Churchill) thought the nirevestances very diagrasoful.

Mr. Facer called Mr. Churchill to order,

and thought that he ought to be termed out of the room, for making the atstements in the pressures of the Roy. Prelate in the

. The debate, which had become extremely warm, was ultimately checked by the Chairen, when

Mr. Poorr stated, he had been commanded by the Council to inform the Society, that er would not, for the future, allow any discussion whatever, occupacted with its objects, to be carried on during the meetiog. The Council considered it was con-

sulting the interests of the Society by comioz to this determination, The Rev. Prelate hoped, that the Fellows would sequiesce in this decision, and

all that had now passed would be huried in oblivion.

A Paper was read, entitled " Observatious on the Chempedium Olidum," hy Joseph Houlton, Esq., F.L.S., Associate of the Society; which plant the author, after making some observations on the coglect into which many of our indigenous plants, once highly valued by medical practitioners, have fallen, says he has found, in two particular cases, to postess the most decided enmecoagogue powers, which seem to have been known to many former writers on ma-teris medica, but which have been lately much neglected. The author exhibited to the meeting a specimen of outrast which he had prepared, and in which form he had always administered this remedy.

Another paper was read, entitled "Remerks on the Pressy Countries," by Professor Michael Tenore, of Reples." The whole of the Continent was at one time re-duced to the necessity of suppleying tadiga-nous substitutes for fureign drugs; this plant was then used as a substitute for Peruvina bark, and successfully administered in numerous sames of intermittents. A hutsnical description of the tree, and a chemical study at all aftimate constituents, were appealed. Thenks were voted in the usual

# ROYAL COLLEGE OF PHYSICIANS.

On Monday avoning last, the first maching or convenience of the Royal College of Physicians, of the present Scotler, was held at the College, Pell-mall, East, and was

very nomerously attended.

Dr. Matou presided, and Dr. Matoutchael' read a paner, drawn up by the lete Dr. Baillie, "On Persplegie," also a paper, by Dr. Gregory, "On Shallpox," showing the prevalence of the disorder during the last yeer, sod the humber of cases in the Smallpox Hospital. The cases were principally sup-plied from the neighbouring counties, where smallpox has been very prevalent. Saffalk. afforded by far the greatest number of cases ; and as no circumstances occurred to invalidate the prophylactic powers of vaccination; it would seem that the medical men of that county here shown some degree of remissness in the performance of their duty.

# ST, BARTHOLOMEW'S HOSPITAL

PRACTURE OF THE SEVENTE AND SIGHTS DORBAL VEGTERRE.

With Paralysis of the lower half of the Body, .
Dislocation of the House of the Former, and first Bone of the Stormum.

WILLIAM FRAY, mint. 38, a brickleyer, was edulited into Rabers's Ward, Jan. 5th, at 2 o'clock, ander the care of Mr. Lawrence, lo a state of incombility, having fallet from the roof of a house three stories high, in-Fetter Lane. He was taken to a surgeon io the neighbourhood, and brought from theore to the Hospital. Mr. Burnett, the discovered on irregularity about the This day, and vertabra. There was also a lactrated wound of the integuments covering the metatareal bone and first phalunges of the great ned next toe. The wound was dressed, and a dose of house physic erdered. The pulse feeble.

7. Completes of poin and difficulty in breathing. There is total loss of sensation and motion of all parts below the umbiliout. The body is odd, particularly the lower extremities. Pulse still feeble, but same to have railled a little since vesterdelphes, of Januthus (Br. Jales C. Blyrby), day. The trine has been drawn of night

9. Was very restless hat night. There is more power in the pulse, and the lower forwards. There was the sonal offence automatics feel warmer. The circulation is blood into the magenlar and ligament egether more vigorous; breathing very ofal and difficult.

13. Remains in a grimine state. The urine drawn off, and the faces pass involuntarily. The urine latterly has acquired the assessment small. Pales weaker; countenance sinking; complains of much pain in the right sid

15. The pain and tightness of the cheet are ser very distressing; breething quick and sult, with frequent conguing; bowels

17. Can searsely breethe without cough-ng; pulse very quick and feeble : coun-

19. Died last night at half-past ten o'eleck.

Post-morton Exemination at Two o' Cleck.

Blood extravasated into the substance of the muscles of the back, around the seat of injury. The rim, articular processes, and body of the 7th, with the superior articular process of the 8th dorsal vertebra, fractured. Slight offusion of blood upon the these vertebralis. A considerable quantity of bloody serum escaped, on separating the noid membrane from the shord, which was found in this situation, completely broken down and disorganised, having been on by the fractured rim of the 7th vertebra, being quite pultaceous at the sent of injury, and softened both above and below, especially for some little distance helow, and presenting here and there, who cut into, patches of congulated blood, which agulated blood, which on effect into its structure. On noving the steraum, with the cartiper of the ribe, for the purpose of exam g the chest, the upper portion of their was found dislocated from the second, ad a large quentity of blood discovered in a cavity of the chest. Blood we also offened into the cellular texture of the A curious appearance presented itself in the loft hing, a sort of ap undis, shout two juches and a half is ragth, and one in breedth, pt its base, radually narrowing towards a goint, was stinched to its lower portion, an atte apparently, to form a third lobe. pliem al appearance in the position of the right lower autremity having excited the n of one or two present, the limb influ hoing absetoned and everted, a disco-

8. Slopt a little in the night. Felt much of the upper part of the thigh was com-ein about the middle of the back this more | menced, and the head of the fraper was then ing, particularly when the nurse moved him found to be resting on the hely of the on his side. The bewels noted last night pubes. On further ensumentation, the light after the calculate and julys, and again this meatum teres was seen to be ruptured, as marning, involuntarily. The lower extrain milities are still cold, and the pulse feeble. pubes. On further examination, the liga mentum teres was seen to be ruptured, and the upper and interest position of the rim of the nostabulum broken away, the head of the bone having been thrust upwards a forwards. There was the sinus official structures around. The external surface the brain presented the strongest marks of nervous surgencence, with much of lymph beneath the arachnoid. The internal parts of it were not examined. By some neglect, also, the bladder was not examined. Neither the dislocation of the sternum nor fumur was discovered before death.

> REMOVAL OF A CARCINOMATOUS VICERA-RATION OF THE LOWIS PALPERSA.

> George Smith, mt. 54, was admitted into Henry the Eighth's Ward, Jan. 9, with a irregular indurated ulceration of the lower palpebra, evidently carcinomatous, extending on each side to the angles of the eyelids. About seven years ago, it began in the shape of a small pimple, and had gradu-ally attained its present state. Occasionally attained its present state. Occasion-ally it had been painful, but generally easy. Various remedies had been used. Ordered cates. penis, and house-physic.

> 14. At half-pest one o'clock, Mr. Law-rence removed the lower palpebra, extendiog the incision around the angles, and apwards, over the external and internal fourth of the upper eyelid, leaving the two middle fourths. The operation was a delicate and tedious one. A piece of list, spread with cerate, was directed to be placed between the middle pendulous portion of the upper eyelid, and the out surface of the lower one, and a wet cloth to be laid over the whole.

> 15. Passed a tolerably good night; there is some little tumefaction and redeem of the integuments sround, but compleins of little pain. Bowels not open. Home physic. 24. The same dramings here been con-

> timed up to the present time, Inflamma-tion of the conjunctive came on within these last for days, and the pain has presented along at nights. Accidents admitted during the week, under the care of Mr. Morgan.

Accident Ward-Injury to the knee. Contused wound of the leg. Fractured humerus.

Injury to the ancle. Injury to the apine. Chapel Ward-Fractured patella.

Burn. Luke's Ward-Jajury to the testes.

#### AMPOTATION.

Toesday, February 10th, Mr. Braneby. Cooper performed the flap operation below the knee on a middle aged man of healthy appearence. The limb was removed in a short time, but some difficulty was experienced in securing the arteries, which occupied a considerable time, and about twoive ounces of blood were lost,

# GLASGOW ROYAL INFIRMARY.

ATRE-NEGLECT OF THE LAWS OF THE BOSPITAL, --- AMPUTATION.

Abdominal muscles strongly contracted, and raily understood that to-day there would be the pain so severe, as to esuse him in an amputation of a man's thigh, by Dr. writhe in great agony. Pain somewhat re Conper: secondisary a great annabas of ease. Couper; secordiagly a great animber of sta-Heved by pressure; lim had no stool since dents assembled some time before the ope-Tuesday, and then but one. Pulse 80, full, rating hour, to witness it. As for myself, I was carried to the operating theatre, more by the wishes of a friend than my own; for frequent dissippointments in my endeavour-ing to see the operations performed, had almost sickwood me at the idea of another Oil of turpentine, 1 drachm, avery four attempt. Although there were many before hours, until the bowels are opened. me. I was still early enough to get a seat sik diet, enficiently near to easile me to see what was going on, soless some unisety wight, aboutd, in the mean time, step in between me and the patient, and afford a grada-tons and unwished-for opportunity of right-leg the benation of a well-made cost, and a lithrane Feele rather better.

7. A blister to the abdomen, and to take.

Dilated sulphurie soid, 25 minims, with ladd an equality well-tening person, by a caching a drachm of tiecture of houses, every six bours.

9. Bowels open, free from pale, and, is suspensed to surprise well easily be him avery respect, much bester; complains only of weakness.

10. Considerably better; nearly connected the description of descriptions only and visitors, of every degree and destination account; complains only of weakness.

so that every non any what was going on. peatedly a nation in the Hospital before. Perhaps it will scarcely be conceivable how and now came to have the limb removed. twenty individuals could be accommodated. Compression was made on the femoral io a circle, the radies of which cannot, certainly, be more than cight feet; but such an occarrence did undoubtedly take place. Dr. Couper and Mr. Cowan deserve the thanks of every atudent attending the linspital for the change, for, to their good sense and good feeling, we are no doubt indebted for the smendment. This was the first operation which had taken place since the ap-pearance of a letter in The Lancar on the subject, which, though short coough, was, it seems, sufficiently long to effect its purpose. There needs not one word of commeet to be added on the sabject. The stadants have for years sourmared respecting this abuse; they bissed and hooted loud enough, to be sure, but as one generation went away, and another succeeded that which was gone, they still found the abase continue, and if it had not been publicly noticed, it would, in all probability, have continued to axist. I hope the efforts of THE LANCET to this instance, will always be attended with a result as happy, unexpected, and beneficial.

Before saying any thing of the patient or the operation, it should be mentioned, that the day pravious to the removal of his limb. being at his bed-side, I happened to cast my eyes to the ticket attoched to his bed, and-will it be believed? although he had been admitted on the Wednesday before, I found the following description, " Robert Leggats, admitted December 27th, 1828: ulcers, secondary apphilis. This ticket had belonged to the man who had occupied the same bed before the admion of the present patient; but although this is a glaring, it is ant the only, instance of carelesmess and neglect on the part of the gentlemen whose duty it into attend to such things. Some few days before, I counted, on one side slown, of Ward Nn. 6, no less than six beds wenting tickets. It is one of the regulations of the ital, that the name, date of admission, and disease of each patient, should be marked on a ticket, and attached to his bed. On the fulfilment of the first two of those iojenotions, the pupils have a right to insist, to enable them, without troubling the paor union man, without troubling the pa-ingr, in-refer to his case in the journal; het in which his of the three, of course, it is better at he content with the least of tre-aris, and tabler want his name of a disease, that he presented with its insorrect one. The Directors, before they made such a re-pellation, should have quantered the meas-ning of stowys appointing clarks sapable of aboying their orders.

ertory by Dr. Auchinless, with his thumb. The operation was performed at the superior third of the thigh, by the double flap, with Lisfranc's knife, the mand instrument in almost avery case of the kind which occurs in the Hospital. The outer flap was formed first, and the inner immediately afterwards. A gush of hood teek pice from the divided femoral artery, which, however, was in-stantly taken hold of by Mr. Cowns, and compressed till Dr. Couper applied a liga-ture on its extremity. A scalpel was new carried round the bone, so as to divide the muscles that still remained attached to its surface, and the retractor put on to semere the integuments out of the way of the saw. The bone at this part was thickened, and appeared, from the case with which it was divided, to be much softer than is natural. hight vessels were secured, and the Sape brought together. In the description of an operation, there is seldom any notice taken of the dressing, the nestness of which, in the present instance, I could not but ad-

The man having been put to bed, an incision was made through the mus the anterior part of the thigh, and the joint laid open. There was an abscess axtending for a considerable distance between the muscles aituated internally, which Dr. Couper, however, supposed did not commu-nicate with the joint, the cartilages of which were regged and ulcerated. The bone, on its posterior aspect, was denuded of its periesteem. It was, throughout, soft and thickened. Dr. Coaper intimated his intention of making a section of the bones, and showing them to the students at a future opportunity.

#### SOTAL WESTERN HOSPITAL.

## To the Editor of THE LANCEY.

Sis,-You have thought proper in your last Number to observe, that " you believe the certificates of attendance on the surgical the certificates of attendance on the surgical practice, of the Western Hospitel, ore set received by the College of Surgeons." To this statement, I beg to cheave, that tweire mouths not having clapsed since the Hospital was opened, for the neception of a hundred patients, with a hundred and five bods, pu-pils cannot, since, have presented certificates from it; so for woor seatonent that they are from it; so far your matement that they " are Edition, should here considered the mean of received, is perfectly cornect; but here considered the mean not received, is perfectly cornect; but his of fiverys appealance, are not, for will not, and as the subject has come was admitted by Ds. Conner, been introduced. I shall treappes on your with statement hape joint. Its that here perfectly professed independence, with a brief account

of the resons assigned by the Cossell of the College for not having juddely recog-nized this Hospital. As a body; they have not thought proper to give any reserc; but many of them have stated to myself, and by far the majority of them to others, that when it recognized. The excuses (individually) reognized. The excuses individually they here given are, 1st. Thus they were publicly reorgnized pay keptind; 2dly, That they doubted the stability of this hospital; Sdly, That although it contained upwards of a hundred hede, (according to their by-law.) yet that they were not all accepted; 4th, That the heds were too close. The first the heds were too close. The first than the seasons of the crease is not work a comment. When they advanced the account, "That they deubted its stability, dec." his Majesty was not its patron, the Dake of Wellington was not its President, the Right Hon. Robert not in Freudest, the Sight Hon, Robert Peel, and thirty, at least, of the principal nability, were not its Vice-Presidents; at that time it was a private establishment, now it is a public a one as any in this metropolis: will they now dove doubt its stability? The third excess, "That the beds were not all occupied," I am inclined to think, will be considered by every men of m technology. of m independent spirit, as futile a plea se was ever made; when it is recollected, lst, That we have had seventy-five patients at a time in the hospital; 2dly, That all the hads are ready for patients; 3dly, That mone have ever been refused admission; 4hly, That one of their own recognized itals" contains only forty surgical leds! As to the " beds being too close," they shall very soon have no reason even for this somplaint, as the building is immediately nt, as the building is immediately to be enlarged, so as to contain from 150 to 200 heds. Finally, before next January, I shall, in all probability, send to the College fifty pupils; and I can tell you, they will not dars to refuse my certificates; for, el-though it is probable "they pritter case ans, nor be seed in the name of their secu-tary." I shall maintain my rights, and teach them individually not to break those laws (vide by laws of the Royal College of Burgeons in London, Sect. 18.) which they themselves have made. I eminet conclude without stating, that for some of the mem-bers of the Council, I entertain the highest respect, and am, Air,

Your very shedi W. W. SLEIGH.

25, Upper Seymour Street, Porter Square, Feb. 9, 1829.

ARDRES IN THE WRES-STREET SCHOOL.

# To the Editor of Twn Laucay.

Sen,—You are, purhape, sweet that of loss a museum has been would to the Webb-street School of Austony, which, it was stated at the commencement of the season, would be open to the students denotedly, and I believe many entered under this idea, and on that account. I can, however, an case, it is always closed, except when the high and mighty enter it themselves, and students are, and I have been, actually refused admission by Mr. Appleton; when, upon questioning his authority, he declared that it was the express order of Massra. Grainger and Pilcher. This looks like a " hole and corner" proceeding. Let these gentlemen recollect upon what principle their school was established by the late and regretted Edward Grainger: was it not to herst the barriers of a system of monopoly and humbug practised upon the poor borough student? And will they profine this individual's memory by perverting his good and landable object? Is this the Webbstreet School?

A Punt.

# TO CORRESPONDENTS.

Wz really wish that some of per correspondents had a little more patience. It often happens that we receive more commu-nications in one week, than we can find time to peruse in three. Let we are frequently required to decide on the movite of au article, occupying several sheets of paper, and to "send an answer, or the communi-cation, by return of post." We have unot yet read the Essay signed "B. E. X."

We were wrong, we find, in styling Mr. Vines primonernaton, in our last Ny My. Sewell is the nominal Department but la trath, the pupils have to dismonst My. Sewes: My the pupils have so denoted at all. It is much its be regretted it Vines is not applied to the office. "X." The operation was pedage formed in a bangling manifer. But

# LECTURES

OF THE

DISEASES OF WOMEN AND CRILDREN.

PRLIVERSO AT GUY'S HOSPITAL BY

DR. BLUNDELL.

LECTURE XVI.

Of the Bindder, and some Dissesse to which it is Roble; Of the Catheler, and its introduction; on Busture of the Mander.

Or the bladder, in women, it may be proper to rentark, that it is a musculo-membranous receptable, which, when contracted, lies concessed behind the symphysic pubic; and when dilated, advances forward and becomes large, containing, occasionally, nearly two gullons of water; of course this is the effect of over-distantion. It is of three tunics that the bladder is composed, at least according to the British accoucheur: and the distinction is sufficiently minute for all practical purposes intermelly, it is innally, it is partially sowered with pertu-tions, and intermediately you have asses-rous muncular fares maning in all disc-tions; and, of course, when they contract, the discontinue of the blodder are, in every direction, described decreased. The petitogeom furnished a very partial coat for is binder; covering merely the book part this birdy and funder, while the mock all suand, see the whole of the front, lie bare, fairs the birdher in covered by porito-rum, it by smitch) whose by the cellular At the lower part of the part of the at day time, when dd fool the deb it by patting

areters, there are generally two, opening into the back part of the bladder, at the sides inferiorly, so that there are three spertures; the two esides of the ursters, and the orifice of the ursters internally, forming the points of a small triangle. When the bladder is dilated, it fills up the abdomen much in the same way that the womb would do, perhaps occupying one-third, or one-half, of the front and middle part of the awity; but when contracted, it lies behind the symphysis puble, sed, at all times, the back part of the neck of the bladder is lying on the front and superior part of the vagine. And hence, if an examination of the bladder is to be made, year may pees the finger up to the anterior and upper portion of the vagine, and thus seentian its condition amount as well as if the finger were within it; this is a fact of which all are not awage, and a fact of considerable importance in obstatric practice.

I send you round a painting of the symphysic publs, and the internal parts posthe polvis. (Dr. Blundell explained the differ-

ent parts of the painting.)

Here in a preparation of the bladder overdiatended, and burst on its peritoneal surface, which is remarkable, for that is the strongest side. The back, which is covered with peritoneum, is amouth, and the front, averad with cellular web, is rough. The next two preparations which the same nexts.

two preparations exhibit the same parts.

Resenting of Urine.—As men are liable to restentions of urine, so also are women; but are from caused much less grave. In women; from caused much less grave. In women; the retention of urine is of two kinds, partial and complete, and very important the distinctions see. Patients we sometimes all meet with labouring under a templete retention of the urine, so that not a drop content to of the urine, so that not a drop content away, the abdomen, in the course of two or three days, leoking like a case of action, away, the abdomen, in the course of two or three days, leoking like a case of action, and particularly if a women laws before the patient, partipe, ow account of ker decition, giving but un choose listory of her lay once; and forcing open; and sheak pain of the blodder. An action of the blodder. An action of the blodder with a case of superiency meeting with a case.

eventhe inexperienced, finding that no water has passed for two or three days together, can secreely mistake the case for dropsy of the peritoneum.

But more frequently we are meeting with cases of partial retention, and of a very deceptive kind; the patient may tell you that she cannot retain the water, because it is frequently gushing from her, or dripping away continually, so that your first impression is, that she labours under incontinence, for weher mover passes in a p. sary stream, and in large measure, at once. If at this time you lay the hand on the obdomen, you find it is large, as if it were secitie; and it fluotness very distinctly; and there may be tenderness and pain, and foreings, and rigours, and sever, which are characteristic of the disese, and help to distinguish it from ordi-try peritoneal dropsy. Now and then nary perioneal dropsy. Now and then there is a swelling of the legs, particularly if the woman he pregnant, so that if you are at all in the dark, as to the nature of the discess, you still retain a wrong notion of it. You began with the suspission that the wa-man was incapable of retaining the urine, and you now fall into the opinion that she labours under an escitar. There is n case related by Sir Richard Creft, in which, under partial retration, the urine had been gradually accumulating for four or five weeks together, the abdomen at length becoming exceedingly distanded; for in these cases, exceedingly distanded; for in these eases, the water issuing more slowly by the wrethra than it enters by the ureters, there is a continuel, but gradual and allow increase of the quantity. Thus is the case referred to, the urine occumulated to the measure of nearly two gallons. Nor is it alone with inconti-nence, or peritoneal accites, that this disease may be confounded, for the abdomen being tender and painful is high degree, with rigour and fever, and the patient continually writhing and complaining, we may get a notion that also laboure under abdomical mation, joined with supportation or as, Well, then, here, perhaps, you will wa, you will e how it is that we are to know at the bed side the nature of an effection so fellacions, simulating at owns the symptoms of inflammation, drappy, and minury insonti-nence. Why, by the following diagnostics: that there is a retaction of the subt always to suc cover a large intemestiones of the abloques, factuant and accomplated with speck pair, tenderates, and foreings, and No. annivelways reasonably suspect, that sheet is a condenable quantity of wantschaled aris provided the water do not instant at all, provided it is issuing in a very small sine or by drops involutionly, or in sounds gushes, and all this in conjunction wid large, tendor, painful, and destunding the ich b

of this sort, will soon learn its nature; and men. If, in these cases, you are told that the patient can pass the water, let it be submitted to inspection, and take ours that it is the secretion of the petient that is produced to you, as the sturses are not always to be relied upon in this point. Now, if you find that the urine issues in copinus stream, there is an danger, but if there is an dis-charge at all, or only a very small discharge, then there may be a retention, which may repture the bladder, usless file patient is relieved. Agaio, wheo you suspect that there is a retention of the urine, introduce the oatheter, and this instrument, properly managed, will prove an excellent diagnostic. In passing the instrument, however, do not slide it into the womb, and draw off the liquar munii in mistake for the urine; be nereful, too, cet to urge it upward too foreibly, so as to force it through the back part of the prethra inte the vagice. in place of the bladder; in passing it gratly, be careful, however, that it is passed sufficiently high, in dubious cases especially, for sometimes you may just reach to the entrance of the bledder, sod there stop short; remember that the watheter should be clean, ite spertures, eight or teo in number, ell upen, its calibre clear, and the stylett withdrawn; recollect also, that from over-distection, the bladder is sometimes paralytic, and, therefore, even though the catheter be fairly introduced into its cavity, the urine may not readily flow eway; all this bear in mind, and then if the eatheter be introduced with all these cautions, you will and it an excellent diagnostic. One other caution I ought to mention, which is, that sometimes there is a deep musous follicle by the side of the arethra, perhaps an inch or more in its profundity, and into this the eatheter may pass, you mistaking it for the urethra; and, as an urine flows, you may then perausde yourself that there is no ascumula-tion of it; inflammation of the bladder, if not repture, being the consequence of the error. Here, then, is the namer wilch I would give to the question before pro--How is it that we are to know at the bedside the nature of the affection?-The remee the nature of the affection 1.—The re-tention in known, by the intermediance and floatestion of the sedemen; by a total re-tention of urine, or an involuntery discharge, by dribbling or by gushes; by there being in the chamber no large measure of origin, passed at one time, by the patient is. tion the more important in woman. Roton-then directing the patient to take pitters on tions cover sometimes in consequence of a her kness and allows; or this failing, by general constriction of the methra; two again emptying the bladder and making with es of this kind I have seen, in which the wrother was constricted from end to end; in one of these cases the bladder lay open by an eperture into the vegina, so that the action of the uzethra was superseded; and m the other, the bladder was healthy enough, yet the wrethen was so contracted, that I found it requisite to sound it with a sobe, and every morning the patient used to be twenty or thirty minutes in passing the water, if the ordinary quantity were accumulated. Dilutation is the remedy for this defect; nor will it be difficult if there

Ø.

be no extensive organic disease. Women are sometimes affected, or fancy themselves affected, with appropriate stricwomen reputed to labour under this dise mixture of caprice and hysterics; yet there is no doubt that spannodic stricture does sometimes take place, and it is more likely to occur in very irritable girls, then any other persons. A well marked case of this kind I examined is the hospital; for Dr. Williams, In those cases of spectrodic stricture, for days together no urine pe without the catheter, and then it may flow readily amough; being afterwards again retained and again emitted, ar arbitrie. In the general, and perhaps always in real sparadic stricture, the catheter may be passed, the constriction giving way before the instrument, so that pullistich is easy; but with a view to the radical cure of the disease, you may try what can be done with the thestern forri muristis, the warm hip-bath, the cold hip-bath, large blisters at the lower part of the spine, and above the symphysis pubis, and perhaps I may say the extract bella-

After hard labour it sometime happens that the urion is retained, and the retention is the name produced by inflammations in the book part of the meak of the handler, and swelling, mean or less, and speece. Time, a period of more er loss, and space. Time, a period of two as, three days, for example, generally sugges this affection. The dure may be sorated by the application of leaches shove to the to twenty-

but of the uterns, by emptoing the blad-i, and between appointing upon the womb ph the pure ph simplified the pure

the hand more active ettempts than before to replace by the hand, in a manner already explained at large.

Retention of the urine in women, more or less complete, arises opensionally from prolapaus of the uterus, where it comes down heyoud the external parts, producing president (considered fully in a farmer lecture,) the bladder desclading together with the womh; but where the uteras comes down but a little way, so as to constitute the relexation considered at a former meet some retention of the urine may still be produced. In cases of this kind, the most Sectual mame of relieving the patient, is by replacing the storus. A wem taught to replace the wemb for herself, by making pressure upwards and backwards, so that the muther may thus be replaced and rendered pervious, and the water may be found to flow. Of course, in cases of this kind, it is occasionally necessary to introduce the catheter, and this, too, if the patient have a tolerably intelligent mind, the may de for herself. Prolepeus of the bindder not times occurs; and in consequence of this descent of the bladder, an obstruction may be produced as before. The most effectual mode of relief in this variety of the dis is by replacing of the parts, and supporting them by media of a peacery. If the water cannot be liberated in this manner, then the catheter must be introduced.

In women you may, occasionally, most with retentions of urice, arising from inert-ness of the bladder; in some costs, perhaps, the result of an injury done to the spine, A case, which were this aspect, I cane ex-amined in the Hospital, where a severe blow had been received in the lumber region, in consequence of s fall on the stairs. Three or four prints of urins had been ac-cumulated in the bladder, and when the outhette was introduced, so as to remove all resistance, a flow, indeed; securred, but I remember once seeing Sir it was feeble. Actley Cooper introduce the authoter, in a male, is whom there was great abdominal distortion, and when the catheter was introduced, the urine secreely flowed at all, type inflator—by functionisms, purgate the temperature of the hystenders, till, at length, the hand was laid on the abdomen, we intend observation you, that re- and when a gentle presence was made those, as the minus and sometimes to be the utrue, discontinued the interference of the utrue, discontinued the interference of the utrue, discontinued the interference outputs of the bladder, the runsents of the interference outputs of the temperature of the interference of the utrue, discontinued the interference outputs of the temperature of the interference of the utrue, discontinued to be made so the interference of the utrue, discontinued to be insert solved on principally see, ty, giving the to both the recivities. I believe, in the drag place, the introduc-discuss below described. Of occurse lies of the catheter; secondly, the employ-lating sees bounded in the replace-table control, by emptying the blad-id discussed, by emptying the blad-id discussed present the week to the lower way of the abdustra in fount he womb to the lower part of the abdence in front, der, and or to the buck of the spine.

You will now and then be called to cases straight, for them you are more likely to where urine is said to be retained, and pass it through the back part of the urethra; really a suppressed secretion. My friend, Dr. Chapman, late of Demerar, tells as, that in the very last stage of the yellow fever, when it is all over with the patient, there is sometimes no secretion of the urine for hours. In this very Hospital I was once called to see a poor creature, dying under a aloughing chancre, and who had not passed any water for some time. I was requested to introduce the catheter, and did so, too inconsiderately, before I had duly examined the abdomen; but I was nawilling to disturb the poor girl. When I made my supt, I found I could not introduce the coetheter to half the depth I had expected, and, frustrated in my endeavours, I made my comminstion above the symphysis pubis, when the abdominal purietes being exceed-ingly attenuated, I could readily distinguish he point of the catheter lodging in the bladder, just behind the symphysis pubis. Violence has no place in scientific mid-wifery; operating as I was, upon a poor young girl, only not moribund, you may well uppose I proceeded with the utmost gen-sees; indeed, in this case, had force been med, much injury of the bladder might

These, then, together with the modes of treatment, are some of the paincipal causes by which the retention of the urine may be produced :- A permanent constriction, or nodic stricture, an injury done to the bindder by severe inbour, retroversion of the uterus, prolapsus of the nterus, prolapsus of the bladder and vagins, a want of muscu-lar power in the vesical tunios, and a total failure of the secretion of the urine.

## ·Of the Catheter, and its introduction.

· Under retentions of urine in women, it is necessary to have recourse to the catheter, and, for this purpose, different instruments have been contrived, of various form, size, and meterial : of milver, powter, flexible metal, and escetchouc, but most frequently nf silver. There is a flat catheter, the contrivence and recommendation of a very ex-cellent practical accompleur, Dr. Ramsbottrivence and recommendation of a very excollent prestical accombent, Dr. Ramshottom; and there is a double outstar, which
Dr. Clark has contrived, not without eleing a small estheter within a larger, to that

where there is, in truth, no retention, but a certain degree of curvature, somewhat bold, should be given to it, so that, during the introduction, the point may be easily passed upwards and forwards. At the under and of the catheter a stop ought to be placed; it enables you to hold it more steadily, and prevents the risk of its slipping into the bladder. All catheters are properly made with the upper extremity closed, being opened at the side by apertures. Some of the older eatheters have only two or three penetures in their extremity; but these are not sufficiently numerous; there ought, at least, to be four or five on each side, for some of them may become obstructed, and thereby the flow of the urine may be prethereby the new it the arms may be provided with a large vessel, to collect the water; but you ought to have a small one of the collect the water; but you ought to have a small one of the collect the water; but you ought to have a small one of the collect the water; but you ought to have a small one of the collect the water; but you want to have a small one of the collect the water. slee, to receive it immediately from the instrument, and a docunter, or any bottle, of proper size, is, I think, one of the most convenient resects for the purpose. In introducing the catheter, the first and

most difficult point turns, on finding the prifice of the prethra. Sometimes it may be necessary to expose the person a little for this purpose, if the operator be unskilful; hat when tact is not wanting, the orifice of the arethra may be reached with-out. There are different modes in which this part may be discovered; first, by putting the patient in the recumbent posture, and planting the tip of the left index on the gians, you may afterwards carry the finger downward about an inch, at an equal di tance between the nymphe, when you will and its extremity iving immediately before the ornice which you seek, and the instru-ment may then be easily introduced; and this is a very good method of introduction, but wanting in decorum, and I prefer, therefore, another mode. Now operating in this manner, you place the woman on her left side, in the usual obstatric position, afterwards planting the finger upon the urethra, to be felt like a piece of layourd close upon the symphysis pubis; and you then serry the singer down to the arch of the pubis

close to which lies the orifice of the urethra, [are shat up; in other cases, you may have and there feeling for the opening; and there introduced the entheirs into the vagina or is no reason why you should not find on the uterus, mintaking it for the artifact; or these parts the orifice of the urethra, just as if the introduction have been fertiles, you readily as you would find any other orifice, to the fouch. Now, in some of these cases, into the vagina; in other cases, the entheter the orifice is so fleecid, that you may have may lie within the cevity of the bladder, but a difficulty in distinguishing it; and, in these cases, you may venture to apply the catheter at a risk upon the part, when you will generally find that it enters without difsculty, on moving it about a little, as here demonstrated; in most cases, however, as the orifice is generally a little dilated, and sometimes also elevated at its margin, you may feel the sperture readily enough. Well, having found the critics in one or other of these modes, you imbricate the catheter, taking care that you do not close up the punctures of the instrument, and then passig it into the opening, you slide it onwards, carrying the point upwards and forwards shove the symphysis, but not with vio-lence; for if the instrument will not peas without violence, lay it saids altogether. The back of the urethra has been bored through, over and over again, to the dishonour of the profession, so that there is no need to perform that operation again. I know of one case in which a male eatheter being employed, the point was pushed through the back of the week of the bladder, the patient dying in consequence. Do think of your own urethra, when you are passing the catheter into the urethra of any other person; and really this reflection may have good effect in mollifying your operation, In passing the catheter, not only proceed with gentleness, but beware of holding the instrument stardily in a certain position, as if you were determined to carry it up, according to atrict anatomical rules, bearing down all resistance in a scientific menner, for somstimes the urethra lies very much out of its ordinary course. My own method is to pass up the catheter with the umout gentleoess, holding the instrument lightly, that it may take its own turns in ascending, when you may sometimes observe it to make nearly a complete ofscumgyration before it enters the bladder. The catheter heing in the bladder, you may generally ob-atract the water seally, but semetimes, on surrout the water reaching to the drop will be found to pain; and holog surprised and rebuild, you collect yourself a little, and holigh it assentiate which it file inture of the impediment. How there are different cosine hopin to assent the white is the salture of the impediment. How there are different easies to which this failure of the flow may be asserted, the following being the principal; asserted by aone foreign maintance, and attentions the sufference of the instrument by account to the period of the procidentia, where the asserted by aone foreign maintance, and streeted by account the partners of the instrument physic public, but in a direction somewhat

may have made a false passage, and instrument entering the wrethra below, a qual size, formed in a piece of mois- instrument entering the wrether below, may d-leather, for example, and submitted have been forced through the back of it a failure of the flow may result from a para lytic weakness of the viscus; in other cases the failure may strice, not from the non-entrance of the Madder, but from a west of the secretion of urine ; now and th rarely, it happens that the fallure results for your not having passed your natheter suffi-ently far, particularly in cases of retrove sion; and now and then the difficulty sels from your having got the instrument into a of those deep mucous folicies to which I h fore adverted: (for I will relate to you a ve useful case, with a view of illustrati point:) a indy in the country laboured a retention of the urine; the practiti a man of candour and talent, latter the catheter, and withdrew the water again he tried to introduce the instru but failed; gave some pain to the patiend declined proceeding further. I was a talkativa nurse there, generous in the gift of her opinion; and in oc of her weighty decision, mother practiti s rival, was called; who took, as it pears, some edvantages, not very a nimous, of this paltry incident, and the catheter a first time successfully a but, on a second trial, failing, yet h unwilling to loss his learnin, i the instrument onward with so violence, occasioning pain and h but no discharge of the urine. In this nosture of circumstances, Dr. Haighton was sent for, and he introduced the cath ter, without difficulty, the first time; but, on making another attempt, he also failed; recollecting, however, this deep muce folliole, and suspecting that it was igh sear the crifice of the urethre, he execu more carefully, and found that the whole difficulty arose in consequence of the instrument sometimes entering the one canal, a sometimes the other, and then took his measures accordingly.

It may be sa well I should add here, that the wrethen may lie in three principal directions: first, on the back part of the symphysic pohic, being drawn upward more than ordinary, as in retroversion of the distorted, for the mostles recommonally takes [dilatable, this might sessiy be dues; this a tertuous course, and this you will find accomplished, the lacoration might be especially in cases of relaxation, where the aloned with ligature, the parts of the hind-wather common down a little way, and that day, lying forth beyond the ligature, but out the distortion a ziets, you know by the carefully cut away, and the hinder being such distortion a ziets, you know by the such distortion exists, you know by the carefully cut away, and the bladder being more ment of the catheter, for it is in those then drawn up by means of the ligature to cases that, during introduction, it turns va- the abdominal opening internally, and of the

riensly, as before stated.

Wall, when you have entered the bladder and the other might be brought to lie out at with the instrument, and find the urine is the wound, to separate, and be withdrawa flowing, I should recommend you not to withdraw the whole quantity at once; suppose there are several pints, or two the balf of this, and let the bladder contract upon what remains, introducing the catheter again, and abstracting the remainder some few hours afterwards; under this practice, there is, I think, less risk of inflammation. After the prime has been drawn off, you nught to be on your guard against inflammation of the bladder, or any other chronic disease. But should inflammation superrepe, I would treat it on the same plan as inflammation of any other important viacus.

# Remarks on Rupture of the Bladder.

The recture of the bladder in women is happaly rare, yet it occasionally occurs, and eyst may give way posteriorly into the peritoneal suo, the urius becoming inter-fused among the viscera; ur, the laceration may be scated in front, the water making its escape into the collular well which lies about these parts, and covers the contigenus emfaces. If the urine is extravasated in front, I fear that there is little to be dons ; inflammation, sloughing, death—these are successively the fate of your unhappy pa-tient. If, however, lusteed of the anterior rupture, there is a laceration of the bladder behind, so that all the urine sacapes into the peritoneal suc, I conceive there is yet something which might, perhaps, be st-tempted; and, were a relative of mine in this condition, I abould recommend the making of an opening above the symphysis publs, to withdraw the trine, and the thorough ablution of the abdominal cavity and its contents, by means of the free is jection of distilled water, 980, or more, of Farenheit's thermometer; the operation being contimeed productly, on symptoms forbidding, till the water flow away without manifesting the urinary characteristics; for if the wrine were left in the peritoneal acc, avairs and fatel inflammation must ensure and its quite evident, in the present state of our knowledge, that the secape of the attention in without hope. The peritoneal account of the peritone are described, by surgical observation in without hope. The peritoneous continued, in which there is no the abstract of the secape of the attention of the peritoneous continued to the secape of the attention of the peritoneous continued by the peritoneous continued to the peritoneous continued by the peritoneous continued to the peritoneous continued by the peritoneous continued to the peritoneous continued by the peritoneous continued by the perito till the water flow eway without manifesting the urisary characteristics; for if the arine were left in the peritoneal eac, ex-

ends of the ligature, one might be out away, afterwords, as io tying op an artery. Dis-ruption of the bladder ought, I think, by no means to be given on as wholly desperate; feets ought to be collected-experiments ought to be made-proper cases ought to be chosen-and skilful operators ought to give their help; and, by proceeding in this mea-ner, I am not without hope that, in some faw cases, life might be preserved,

To assist is clearing the ground a little. I have already made some experiments upon the rabbit, and it may be proper to give you the results. Into the abdominal cavity of four rabbits, I threw about two ounces of buman urine, and left it there for an hour; after which I withdrew the pripe, and washed the viscors thoroughly with tepid water from the cistern ; of these four rabbits three died with general inflammation of the perito-neum, but the faurth lived. It follows, therefore, that this unimal, though prone to disease within the peritoneum, and containing many and large viscers, may, never-theless, escape with life, though these vis-cers have been bathed in urins for fifty or sixty minutes, provided the cavity be then washed not. Such escapes, however, are, I suspect, both parrow and rate.

Again: in another set of experiments, I tied up the fandes of the bladder in the rabbit, afterwards cutting the fundus sway, and I bave found that, in a few days, the ligature separates, leaving the bladder closed, though some of the rabbits have perished some months afterwards in consequence of chronic disease, not apparently the necessary, but the accidental, affect of the experiment.

Since these experiments were published. Mr. Travers, so well knowe by bis excellent writings, bas tied up, with success, a small aperture in the stomach; so that, although I would not have you rashly engage in an undertaking so hazardous, yet at may, I think, be asserted, that what I am have been doing. I de think that, on ax-periment, they would find this came exer-ting of the mind more agreeable to them-cities than the fretful ebullitions of small which followed this operation was however. passions, and cartainly it might provo more beneficial to the public. Such men often have talents for better things if they would but so use them, and, when coming in estisat with them, I cannot forbear thinking of the reproach addressed to Philip of Macedon, by Damades, the Athenian:
"Why do you, O King, descend to the
part of Theraites—you, who might ac nobly
personate the character of Agamemnon?"

I here show you several hieddars, from which I took away a part with the seissors, in some of them you will see where the ligatures were applied, and you may observe

that the closure is complete.

# FOREIGN DEPARTMENT.

TRANSVERSE PRACTURE OF THE STRENUM. CAPARD BY MUSCULAR OFFORT DURING MIRTH.

MARIE P., selet. 25, of a robust constitution, haing for the first time pregnant, felt, ou the 14th of April, the first symptoms of opproaching parturition; the pains were rer strong and continued; bot the head, which presented, being rather large, a considerabla time clapsed before it pessed into, and through the cavity of the palvis. In order to accelerate the expulsion of the child, the patient used the most violent muscolar esertion, and, at last, a healthy male child, of eight pounds and a half weight, was born. During the last stage of labour, she auddenly felt a cracking in the chest, and subsequently, excessive pain over the middle part of the sternam, and difficulty of respi-ration. On the following day the pain and dyspaces continued, and frequent sough, with copious axpectoration of purulent matter, succeded; except these symptoms, her general health appeared so little affected, that on the fourth and fifth day she was able to leave her bed, but, on the nixth day, she was seized with shivering, respiration became very laborious and painful, and the es-phatoration began to be mixed with blood. Un accurate examination of the aternum, M. Changaier found so unastural mobility hetween the two upper portions, which, glid-ling over use needler, in every deep impir-ration, pastuped distinct creptestion. The pailout was hope, very quiet, and lorches were repeatedly applied, but an alteristical in the symptoms took plane; the pain in-creased, ringination, because etertorous, and

which followed this operation was however but transitory, and the putient died on th fifth of May, apperently with all the symptoms of suffocation. On examining t body, a transverse fracture of the storaum was found, one line and a balfabove the cartilage, between its two upper portions; ou the enterior surface of the sternum, the periceteum was thickened, and infiltrated with pus; on the posterior surface it was exten-sively lacerated, tl' bone was broken into a great many fragmente, and the whole of the anterior mediantioum, as well as the adjacent parts of the lungs, were infiltrated with purulent matter. - Revue Medicale.

PROLAPSUS AND RUPTURE OF THE WIERUS DUSING DELIVERY.

Bu Dr. Housener, of Breise.

A female, mint. 50, of a very weak equalitution, who had, since her last confinement, hern affected with incomplete prolapsus uteribecame again prognant; during t period of gestation, the uterus gradually re-ascended into the pelvis, and at last regulard its natural position. The incipient stage of labour seemed perfectly natural; the contractions of the uterus were very powerful; the or uteri had dilated to about half ex inch, and the head had entered into the small pelvis, when, on a sudden, during a pain, the lower portion of the uteres proapaed. On examination, Dr. Henfound a large fiealty mass protrading from the vagina; it was of cylindric form, six inches in length, sod two and a half in diameter, very tensa, and of a blueish red colour; the upper portion eppeared somewhat thinner than the lower, in which the os ateri, the edges of which were much tumefied, was easily distinguished. The petient was very much exhausted, and complained of secreciation pain in the prelapsed mass. The head of the child having descended through the lawer aperture of the pelvis, lay between the labia pedendi, and was forcibly pressed, by the contractions of the nterus, towards the cylinder; the opper portion of which being violently distended on each utering contraction, threatened imme-The or uteri having meandista rupture. while dilated to more than an inch. Dr. Henseliel resolved open terminating labour by the immediate application of the forceps; which having been readily introduced, the towards the aperture, when the upper por-tion of the cylinder all at once began to ed. teaptration become etertorous, and burnt; the forespa were accordingly with-tour fermed at the anterior part of the drawn, and the bend made to descend as

head descended through the on ateri, the external surface of the cylinder, a little below the symphysis, presented a transverse rupture of about two inches in length, and of considerable depth, without, bowever, as it appeared, penetrating through the paries of the uterus. The child was born alive, but died within a few hours. After the removal of the placents, the prolapsed portion of the aterus powerfully contracted; it became considerably shortened, but increased in thickness, so that then Dr. Henschel in thickness, so that when he pelvis, its attempted to return it into the pelvis, its attan measurement erest difficulty. This was, however, at last accomplished. On axaminiog the internal surface of the vagina and lower portion of the uterus in situ, an trace of any wound could be discovered. During and after the laceration, the hemorrhage was slight, but the sufferings and exhaustion of the patient were very greet. Emollient injections wern thrown into the uterus, d small doses of apium givan internally. The ensuing night was very restless; the patient lost much blood, and complained of violent pain nver the whole abdomen, which was tenne and very tender on pressure; the upper portion of the uterus had completely contracted, but the lower was still very tu-mid and painful. The oplum and emollient injections were continued, and a position laid over the abdomen. On the second night, the tension and pain of the belly considerably increased; the patient was very feverish, and in a desponding state. After the application of an emollient giveter, and some leaches to the hypographic re-gion, the inflammatory symptoms gradually subsided; the breasts filled with milk, and the lower portion of the uterus began to contract; so that un the seventh day it had mearly regained its natural size. The lono trace of any previous incuration could be discurred; the nterns wee of the netural size, and in the lower portion only, there was a slight degree of touternoss. - Sichild. Journ. Für Geburteh.

## WARRAL LENGTH OF, THE UMBILICAL CROED

In the obstetrical phaervations of Dr., Schneider, of Fulds, a case is related, for which, during a very tedious labour, the on an individual, in whom neaths she us contractions of the uterus hering boun almost instanteneously excited by a large. The imple of the schole budy was the ordone of secale cornium, a male shift was six inches; the distance between the order of the unbitted clord, which was the great trackmental and half-inches; because of the unbitted clord, which was

alowly as possible, to prevent further lace- twisted six times round its nack; but inv-ration, but without success; for when the ing been immediately extricated, the shild was restored to life; the umbilical chord was five feet five inches in length.

In another case releted by the m thar, the umbilical shord went twice round the neck, and once round the trunk, from whence it meased between the things to the placents. Besides this unusual length, it exhibited a real knot, which, as appeared from the glatinous substance of the short, had existed a long time before hirth.—likid.

ANNUAL REPORT BY THE BOYAL LYING-IN INSTITUTION, AT DESDEN.

## By PROFESSOR CARUS.

The number of hirths which occurred during 1827, was 290, of which thirty-three required obstetrical aid, viz., one perforation, nne crearies section, one induction of premature labour, and seven extractions; in four cases the child was turned, in nineteen the forceps were applied, and in six the placenta was detached. There was one case of three children et a hirth, and four of twins; the number of males was 115, that of females 110; twenty-one girls and eight boys were born prematurely; the largest child was twenty, the smallest sixteen inches and a half in length; the weight varied from four pounds and a balf to ten and a quarter. Of 223 women who were delivared, not more than seven died; the others left the hospital a shorter or longer period after delivery, perfectly well.

In one of the cases where the shild was extracted, the operation was rendered necessary by the umbilical chord having pro-lapsed; the abdominal surface of the child being directed towards the symphysis, it was turned round its longitudies axis, but was born dead: immediately after its birth, chief flux was very profuse, and contained a violent hamorrhage ensued, to arrest much puralent matter. Four weeks after which the placents was extracted; the nteres delivery, the patient was perfectly cured, ahmwed, however, no tendency to contract, On examination of the vagine and aterus, the humorrhage frequently recurred, and the humorrhage frequently recurred, and the patient died on the seventh day after delivery, from loss of blood.

Perforation was performed in a case where, from previous rechitis, almost all the diameters of the pelvis were found soe smell. The uterine contractions were not proanticient to expel the shild, after the reme-val of the brain, and it was measurery to extract it. After ten days the mether was

The spinal column was extensively distorted; the waters escaped, the head remaining the distance of the promontery of the sacrum immoveable; the pains saiddenly cassed, to the symphysis was two and a half lookes, and the patient complained of a violent and the cavity of the peivis was so small, burning pain to the belly; and a sensetion that it was lardly possible to reach the of faintness; the countenance was pale, to the symplectic was two and a half lookes, and the cavity of the pelvis was so small, that it was liardly possible to reach the head of the child. The incision through the abdominal skin and lines albe was seven inches long; the child was extracted slive, and did well, but the mother died on the third day. The wound of the uterus was found very widely gaping.

Labour was brought on prematurely in a person, in whom, on account of deformed , the head of the child had been perpervis, the need of the carm are with the forsted in a previous labour. The child being night months old, sixteen inches in length, and five pounds in weight, appeared per-fectly espable of having lived, hot it unfortunately presented with the feet, and owing most likely to this circumstance, was born dead. The mother jeft the hospital on

the ninth day.

In the case where three children were sorn at a birth, labour was very quick, asting out more than too minutes. All the children exhibited signs of retarded and incomplete development, and died within a short time after hirth. The quantity of liquor amuli amounted to thirty-four piots; the common placeets, two pounds to weight, was sleven inches to diameter. The secretion of milk and the lochial flux were regular, and the mother was able to leave the hospital on the 20th day,-Gameins, Feltschr. f. Geburtsk.

REPUST UP THE LYING-IN MOSPITAL AT MRIBELBERG, UNDER PROF. MARRELE.

During the years 1825 and 1876, 415 children were born, of which 199 were boys, and 2t6 girls. Is 394 the head, in 4 the face, in 15 the breech or fast, in one the arm, and in another the shoulder presented; not more than two women died; 16 children were boro dead, and 19 prematurely; out of which there were three abortions. le six cases twins were born. The forceps were applied is fifteen cases; io ten of which the contractions of the uterus were insufficient to expet the child; io three cases the operation was readered necessary by the smallness of the pelvis; and, in two, the limit prelapses of the funis, the head pre-

The operation of turning was performed lives times; in one case where the shoulder, is another where the wins, and, in a d where the feels prosented; the last

the pulse very small, and the extremities oold; perforation was immediately per-formed, and the child extracted; but the uterus did not contract, the belly swalled, and was very tender; the patient became very restless, vomited, &c., and died on the same evening. On examination, the lewer portion of the uterus was found ruptured to the extent of four inches; the abdominal cavity was filled with extravasated blood, and exhibited distinct signs of inflammation. The distance from the promontory of the sacram, to the symphysis, was three inches.

In noise of very small pelvia, labour was artificially brought on to the eighth month of gestation, with complete success.

in a young female, with very large pelvis, isbour was nousually quick; when the bead descended through the external genitals, violent hamorrhage sessed; the funis was twisted round the occk, and the body was born before it could be loosened. The umbilical vessels were found extensively facerated; one of the arteries being completely torn sauder, and the vain partially rap-tured. The child was very pals, and as-phyzisted, but soon after the ligature of the funis, restored to life, Klinische Annal.

ON SPINAL OSFORMITIES.

By Da. HASBISON.

To the Editor of THE LANCET.

Srn,-Ever sines my attention has been particularly drawn to the consideration of spinal deformity, and the complaints de-pendent upon it, I have been more and more convinced of the frequency of both, and of their injurious sflects upon the health.

So great is their pravalence, in this country at least, that I really believe out one female in twenty, above the condition of inberious servitude, remains whelly free from them. In proof of their tendsecy to undermine the constitution, it will be sufficient to add-tst. That where much deformity exists, the sufferer is disqualified from properly following any active employment; he is seen tired with labour, and mind, where the desis presented; the last meet; he as soon tired will abour, and called any sees seven.

Performation was performed in a rachitic female, whe, when bright into the fault to the spine, are untable freely to carry on tudien, had been asvered days in ishoer.

The beam cover totality present into the tubes; hence the vital fault, pretamaturally hadre; after a very powerful contraction, soonmulated, encourages the formation of anvorians in the arteries, and various in the lam, whatever may be their authority or veins. Sdly. The internal organs always merit in other respects, who declare that suffer more or less in their functions, when recumbency, as new conducted in spinel the spine is distorted. According to the order laid down for publishing my. "Observations on Spinal Com-plaints," several cases, which I am anxious to make known early, would probably be de-ferred for several years. With view to ob-viate this delay, I am desirous to print a se-lect portion of them without further loss of time, that they may come under the immadiete notice of my professional brethren, The accompanying case will be succeeded, at short intervals, by others, if it be deemed proper for insertico in your valuable periodical.

I am, Sir, yours, &cc., EDWARD HARRISON. Holles Street, Cavendish Square, Jan. 20, 1829.

CASE OF PARAPLEGIA, COMPLICATED WITH SPILOPSY, CURED BY APPLICA-Trong TO THE SPIRAT. COLUMN,

in good badily health, had the minfortune to

antly felt as if something had given way in small of her back, and fainted a few inutes afterwards. From that time her rangth, the activity of her legs and feet, sgan sensibly to fail. In six weeks she ad a second fainting fit, which left her in er present helpless condition, both as to te sensibility and power of moving her in-stice extremities. She was admitted into large provincial hospital three months ter her accident, and remaised there elto-ether two years. While in the hospital,

he was frequently bled with leeches and ourificators. She had also several blisters pplied, and large canatic issues issured in interest parts of the back. The tartarised astimonial continent was rubbed upon her pine, and electricity used to the paraplegic

mbs.

Finding no relief from the means pursued, she returned home, in a more daplorable state then she left it. The assistance of medical men is her own neighbourhood seing equally unevailing, she was at length mought to London, and placed under my pare. She was seized with epileptic fits, for he first time in her life, during har residence in the hospital, and they centiaued to afflict har some time after her return home. These fits generally left her insenshe remained in this deplorable condition upwards of a whole week. On recovering har faculties, she found herself la e copiosa salivation. In answer to her inquiries on this point, the medical gentleman replied, that she was wholly indebted to the salivation for her recovery. As the fits always produced a temporary loss of understanding and memory, she cannot venture to say how meny of them she has had in all, but she is

certain they exceed tee.
On examining the course of the spinal colemn carafully, I found it every where ex-tremely tender, end painful to the touch. It was more particularly sensitive in the small of the back, where she first received the strain. On looking at the back, I could perceive so deformity. The only imperfection that I saw in it was that the lumber hollow that I now in it was, that the lumber hollow had shuded disappeared. On drawing my single properties and the same of the manner of the same of the sam

"ye hooket filled with water; she in- in her loins, which obliged her to cry out, and desire me to desist. She was this afterneon placed flat upon a firm crib, and after being well rebbed with an emollient oin tment, the useal shield was fixed to her back, so constructed as to make firm pressure apon the dorsal and lumbar vartebras. It was kent in Its proper situation by means of a tight bandage epulied all over her back and oheat,

Nov. 5, 1823. The means recommended have been carefully pursued. The bank is considerably easier, and less sensible to the touch. She can already move the toes of

buth feet.

15. The only pain of which the patient now complains, is cuntisad to the small of her back. Moderate pressure on the soles of her feet is no longer perseived in the She is able, with considerable difficulty, to drew, in a slight degree, her legs upwards, and elso to bend her kness. The lumbar bellow is antirely regained, and the vertebra have recovered their preper places.

30. She has suffered ne inconvenience or enessiness in her back since the last report. She can raise herself from the crib, and move every part of the spine with great ease. She can also cross her lege backwards and forwards, several times in quick succession, without much effort. She thinks her back and limbs have acquired strength enough to bear her waight upon them. The natural feeling of her back and limbs, is wholly restored. The menses return at their usual periods, they are of a hrightar colour, and no longer emit a disagreeable smell. Centiaus.

Dec. 15. She meves her legs and back with the greatest freadom. The recumbent posture has been strictly observed from the first. She thinks herself strong seconds to walk slene, if she might be permitted to

make the experiment.

31. The patient was suffered this afternoon to get up, at her own urgent request, and try how far ahe had the use of her limbs. The moment she left the couch, she was shie te stand erect, and sinue. Soon afterwards she walked about in the room supported between two persons, for shout five minutes. Finding herself fatigued by the exertion, ahe desired to be replaced npon the crib. The moment she was put spon it, she declared that she had not felt the smallest pain or inconvenience, either in her back or limbs. The menses continue regular, and primitive their natural appearance. She is perfectly well in health.

Feb. 29, 1824. She has been suffered to walk shout in her room, a quarter of an hour every other day, since the last report.

<sup>·</sup> See goes 4th, in Dr. Harrison's Essay

March 17. The improvement to her limbs has been regular and progressive; she has lately been suffered to walk two miles every second day. Finding neither pain nor weskness from the exertion, she solicits permission to increase the distance.

I have been induced to comply with her application to leave London for Sidmouth,

under particular restrictions.

May 10. In a latter received from Sarah Tribet, dated Sidmooth, Dec. 30, 1824, she says, "I continue your advice, as far as in my power, and I still feel myself mendiog. Sir, when I returned to Sidmouth, the ladies and gentlemen, and even the clergyman d at seeing me walk, and wall they might, after witnessing the helpless state in which I left them."

In a second letter, dated Sidmouth, Oct. 9th, 1825, she observes," I sm sorry to say I have been very III. I kept my bed three of their remote situ weeks, and I was very much straid I should sition of a bony case. Be crippled; hot, with the blessing of God, I am able to walk again without any sup- we saw observe, the

port."

I received a third letter from Sarah, io October, 1826. She enjoyed good health, and had undertaken the management of a

school for young children.

In her last letter, dated April 23, 1827, she observes, "You canont imagine how without feeling the least effect in my back. I never felt better in my life."

#### REMARKS.

The paraplagis, with this patient, followed so closely upon her accident, that I think, whatever difficulties we may fied in ex-plaining the loss of secability and metion, in the lower limbs, we shall have no heaitation ic referring it immediately to an afperienced any disorder of the head, through the whole course of her indispositios, except when under the ioffuence of har epileptic fits. Moreover, the curative means, which proved efficacious, were wholly directed to the epine. Although this organ, when first examined, manifested very little irregularity oxinored manufacture very more arrepresent, to the sight, the long-bar covity was many obliterated. The vertebes, too, were found, on close axamination, to have just their resistive distance, as well as their proper atations in the column. I see of upinion, tive distances, as went of the column, been of opinion, and cannot, theirsfire, emerge in a proper that this defective arrangement in the ine-dissertion. 6

The suffering apot, whenever the back becomes afflicted with pain, has not, second-ing to my own observations, in a single instance, been traceable to the theca. Great s-ternal tenderness is felt on pressure near the spice, and especially emeng the con-tiguous muscles; the uncesioess is, there-fore, superficial, and confined to the soft parts; the symptome and sofferings may, in such cases, be easily discovered, and their true nature accertained, as far as they become objects of the touch. When the malady is stationed within the bony tube, things are widely different; it must then be very difficult to detect the deep-seated mischief. The symptoms denoting it are nacessarily obscure, and indistinct, on account of their remote situation, and the interpo-

In confirmation of the preceding remarks, we may observe, that the spinal nerves, io their way out of the back bons, to their ultimate determination, have to traverse the vertebral holes. These are formed of notchas, io the upper and lower edges of the lateral bridges; they are constructed to make a round hole, between the adjacent vertebre, The nerves proceeding from the spinal marwell I am able to walk, and even to run, row, and the blood-vessels, pass through these belee; when the arrangement is perfact, the two portions of the notch fit ex-actly. In this happy state of things, the earyons beedles connented with them, in glidiog along the heles, eccounter no impediment; the muscles and organs, to which they run, receiving their full supply of ner-vnus infinence, perform their offices satily and well; but whenever the spinal column becomes distorted and misshapen, the correspeeding notches, losing their proper adfection of the back. We are more favourable justment, cesse to fit correctly. This change to this conclusion, because she never ex- in the conformation of the vertebral pillar, leads to nomberless evils in the animal economy. The cerves, la their progress through these irregular epertures, become impeded, loterrupted, and squessed against the bony sides of the canal; honor the nixyour power has to surmount many diffic ties in its journey. From the contricted figure of the column, the spinal cost is forced into an appropriate posture in the thece. The acturior and posterior necessity factors from the posturior necessarily forced from the posture of the posture

lucnes is either wholly or partially ar- ing in the same organ. These, as well as its course, by the impediments it optiepsy, being accompanied with spasses to surmount. The organs, dependent die contractions of the voluntary muscles, on its regular supply, being imperfectly swided, exhibit the different phenomena ich have been described in this and my ser cases. In accordance with these ohrvations we may remark, that when a erva is wounded, or hruised, the musels which it terminates is thrown into spasodie contractions; after its entire section, a muscle becomes insensible to the strong-it atimuli. It is, moreover, experimentally ue, that whether we irritate the muscle zelf, or the nerve leading to it, the muscle ill equally contract; it follows, therere, that the excitation of either end of a erve will influence the muscle which it nimates.

lly applying this doctrine to the nervous andles, in their passage along the displaced ertebral netches, we shall be able to unerstand how slight pressure upon thom in-uces pains and cramps, while a greater egree of it produces insensibility and entire oss of metico.

I am the more inclined to favour those pinions, because we searcely ever meet with a patient sufferiog from a distorted spine, who has not some paraplegic symp-ioms. It follows from these premises, that beth feeling and motioe, in the inferior extromities, are functions dependent upon the

apical nervas.

The patient endured several severe paroxyams of epilopsy, while she was afflicted with paraplegia. The sources of this diswith paraplegia. tressing and obstinate complaint are often as much concasted, that it is impossible to discover them. We know enough to say, that the excitiog couse is sometimes placed within the skull, sed, at other times, remete from the hrain; for example, the pre-sence of intestinal worms, and of sorden in the bowels, are common causes of opilepsy. These set primarily open the nerveus fila-ments of the intestines, and the irritation being conveyed, by some unknown communication, to the spinal cord, the volcutary muscles are forced into violent and irregular contractions. For the same reason I contents to seems, that irritations applied, in the first instance, to the apinal cord, or necessions transis near it, will occasionally lead to the minute train of symptoms as if they had been directed to the minute nervoise fibrit. I have already recorded as transple of hyderic regiments in the splind, and many and I shall hereafter introduce as incomes of chases seem with this presentation of chases seem with the presentation of chases seems. are to assert, that irritations applied,

Dr. Moaro's Observations on the Nor-

me System.

See the case of Mary Rafter, in my ey on Spinal Discerce.

make it highly probablo, that, in all similar cases, an impression upon the spinal cord

may be the originating cause.

The patient had complained of pain, and tenderness in the spinsl column, from the commencement of her maledy, but its great-est severity was about the loins. Many practitioners do not heaitste to refer symptoma of this kind, in every instance, to inflammation of the spice cord, or its invest-ing membranes. That they sometimes ladicate an ioflammatory disthesis, or, as It has been called, a sub-soute inflammation, I am ready to admit, though I am enabled to say, from multiplied experience, that it is a rare occurrence. We ought, however, to recollect, that whooever the disorder is iofiammatory, or accompanied with increased vascular action, the complaint will either be speedily subdued, or it will terminate in affusion, soppuration, or gangrene. Inflammatory complaints are never stationary; they are always progressive, and run their course in a few days or weeks. The aches and pains, which, as in this case, continue unabated for months and years, without leading to structural changes, are neither of an iodemmatory character, nor are they seated in the vascular system; they proceed from some malady in the narveus composition, belonging to the auffering part, and are chiefly to be relioved by applications directed to it. In order to set with effect, wo most ondeavour to fied out the nature and exact seat of the complaint before we proceed to the treetment. This discrimination is especially necessary, because the remedies heat adapted to moderate inflammatory action, exert little power ever a distracted atate of the nervan. So many examplea of chrooic paios, arising from neuralgia, have lately come under my own cognizance, and been cured by the treatment so often explained, as to lead to a conviction, that they are much more common than

is generally admitted.

In cases originating from nervous irrita-tion, undevioting rest, and porfect quiet, so long as they are submitted to, will mitigate the symptoms; but the miserable sufferers no sconer reture to their usual occupations. then the old pains reappear, with their former severity. In this way invalide drag on a miserable existence for the rest of life, because, satil the offending come is dis-covered and sabdeed, the disorder will remain unabeted.

As I employed no remedies with this patient, to overcome increased vaccular acnot suffer from that cause. She became free from pain, after assuming dorsal recumbency, which is a convincing proof that her uffictions were not in the circulating system that they were of a different complexion, and required other measures for their removal.

She bad been ineffectuelly subjected to long and repeated courses of the usual treatment, both in bospital and private practice; that they afforded her ue relicf is evident from her own statement, end the helpless condition in which she applied to me. The condition in which she applied to me. seems on which I relied ware entirely confined to the epinal region. As the verta-bre approached the Snative beds, the spinal cord, and nerves issuing ent of them, graduelly recovered their heelthy tone and ebi-The nervous influence being at length freed from ell irritations, and being mereover regularly distributed to the muscles, they entirely recovered their lost strength and former activity. The petient, thus in-

for the cure of Sarah Tribet, that her disorder was wholly confined to the epical cord, and its nervous trunks, at their origin. It was in accordance with this pathology, that I determined to remore the netural figure of the back, in order to relieve the pinel nervee from injuriene presserc. In this I completely succeeded, end, as a consequence of it, I had the gratification to witness a fell confirmation of my doctrines, ie the recovery of my patient, to the bless-ing of vigorous beelth.

The conclusions deducible from the pre-

ceding and former cases ere,

ist. That pareplegia is a disorder of the spinal cord. Meny examplee of this distressing complaint have come auder my care, et different times. Several of them heve been permanently oured, by removing verte-bral deformity. This encous scables me to ert, that pereplegie was, in every instance which has occurred to me, en affection of the back-hone.

2udly. The epilepsy, likewise, originated from the beck. We ere warranted in this opinion, because it appeared, for the first time, after the injury, and went away on

her adopting quietness and rest.

3dly. The satrons tenderness, in this cone, was not no in Santamentor, chapterer; it turns cone, was not no in Santamentor, chapterer; Had it either originated in a phosphate with so it he parts, or here accompanied with inflammatory action. In the a citie disorder would not have remained auditorary for me would not have remained stationary for so long a time. By referring it to neuralists, or irritation of the spinsi sord and its ner-vous trunks, we use both widershad its long continuance, without producing stree-tural change, and its final disappearance on rectifying the vertebrus.

RICHWOND SOMOOL OF ANAROMY.

# To the Editor of TER LANCET.

Sie. I em most enzious to complete my netices of the Richmond School of Austomy, and I will not occupy many more of your pages with my critiques on its pro-

My former letters have been noticed in somn late numbers, and, (since my reply to e writer styling himself " Richmond,") by e correspondent who affixes the signature of "Philalethea" to bie production, and by a nameless author, who concludes his performacce, by professing histaelf your obe-dient servant, Mr. Editor.

With respect to the first of these letters. vigorated, was happily rectored to the full to so solemn as eppeal to our Irish hearts, sound constitution.

It follows, as a consequence of the indications, proceeding from the peas of resulting and practice, successfully employed in sum," "J. K. I..," or "Erinemais;" and, in hie condemnation of the remarks of a minor scribn, who has sought the same protection es these distinguished writers hevn found shelter under, seems to have forgotten that the principal, perhaps the only, use in anenymous correspondence, is to enable the workman who lebours in the lowest etery, to reach the artificer employed at the eummit, with hie veice, since he canuel tnuch him with his hand ;-in plainer language, to permit the approach of truth to the mantle of eethority."
"Junius," "J. K. L.," and "Erinensis,"

have sung soble streins, eed "Philalethes" ie musical enough to admire them; my lay, balled like, has hed nothing ber truth end simplicity to recommend it; and hence it disgusts the ear acoustomed to a higher melody. "Anasymous well-ing has afforded a shelter to important sistemments; it has exabled the matric to distant his shaft sepance a manifest believe." If this significant is displayed in the matric; so that the desired displayed in the native; so that the desired display in mindful the matric; so that the desired display in mindful, it memoralities whether the adplact in gained, it memoralities whether the adplact in mindful, it memoralities whether the adplact in mindful of "Justice," or the humbles pins of "Lambou" he amployed. Whatever Mr. Carabehasirs on Dr. M'Dowel's theister they have been, they are undefended by stell writers as for the solemnity of the details of my som"Philastnes," who cannot contradict the present number; the oxerdence of the de-plain statement, that the former did neglect, monatonion of his colleague alone, would and that the latter did nowunderstand, his hardly assemble sufficient to pay the porters, duty; the signature book proven the one, If any fault can be laid to the charge of Mr. and the cases to which your correspondent sludes, catablish the other. With roapect to your latest correspondent, that nameless scribe, who has ventured to oppose vulgarity to plain atatement, falsa-hood to truth, and a tissue of rodomantado, too fulsoms even for the palate of his omployer, and insufficient in wit or aprightliness even for amusement, to an assem-hlage of unvarnished facts, I will only observe, that his manner betrays what his modesty would conceal; the sycophentic nother to whom I have before referred, stands confessed; the ex-clinical of Dr. M'Dewel and the numclais acribe, are one. I must apologise for thus occupying your pages on auch so unworthy subject, but

my last reply is given.

To resume the subject of my lotter. Mr. Adams, the principal anatomical lec-turer of the Richmond School, is a gentleman of rare acquirements; bo has been letrodeced to the medical world in your Jour-usl, by your admirable critic "Erinensis," and, in truth, in somewhat an unkind mannor. His fetroductory lecture forming the aubject of his remarks, was composed in n hurried, and delivered in a blovenly, manner, and was, Indeed, little calculated to advance the reputation of the author; but if " Erinemaia" would visit the school, and liaten to an ordinary locture delivered by this professor, be would coefess, that to a bighly cultivated mind, to an admirable keuwledge of his subject, was added an originality of thought and expression, calculated not unly to improve, but also to dolight his hearars. Delivered in the most familiar manner, his lectures comprise not only the information gloaned from others, hut the experience gained in a life of prac-tice and observation, whilst the good humour of the man, added to the seal of the tracker, warms the hearts of his pupils towards him, and ever dispuses them to receive him with respect and attention. Without this professor, I do not believe the Michmond class would equal a tithe of their

Adams, it is a certain weet of arrangement, a species of inconsistency in choice of matter; but this is the error of genius, and wo heartily forgive it.

Mr. Read, a surgical lecturer, is no atranger to your pages, in which he has been exhibited as the admirable clinical lec-turar of Mercer's Hospital. This gentleman, with avery advatage afforded by sound knowledge, grant experience, and gentlemanly mannara, does himself a great injustica, by the atyle in which he reeds his lecturea. To hear bim relate a case out of hook, is really a treat; the case of his ma ner, and his general expression is most forcibly contrasted to the style be adopts, when he recurs to his black portfolio, and which always reminds me, in its unvaried and monotonous tone, of the secretary of the Catholic Association, whilst reading a communication from some rent-paying contributor. His communications, however, are highly interesting, and display great talent and observation; and his general character for skill in this city, reeder him a fit assistant in the Richmond School, as the instructer of youth.

Dr. M'Donnell, tho ex-demonstrator, and a present anatomical professor, is a perfect original. Possessed of abilities of uo common order, he appears to the by-stander as a dull and heartless being, to which the actual warmth of his feelings give the lie direct; but this gentleman is misplaced; he is calculated for the retirement of atudy, or for the edinosion of a sur-not alarm him into bashfulnosa. Ho is a young anatomist, and we would hope that young anatomist, and we would hope that or for the edification of a few, who could and tedious, he stands before his class the very personification of doubt; and what would be related by a man on better terms with himself in five minotes, he occupies the hour in delivering. I mean him most kindly when I assure him, that he cannot even float in the atream through which he undertakes to guide others. As a scientific man, or as a physician, he would gain more admirers in a day, than he will obtain in the education of anatomical atudouts during

The poor box who had his tible man-The poor a shabitant of the House of his wnose use. "I are advised him to hasten his standard," he improve the appeals and his standard property and the standard property ane degree, even when engaged in the most common-place demonstration, our wonder is excited at the production of each sentence. I may good humoneredly remark, that the observation applied to a clergyman (as nervoys as himself) in the last century, "that his mother, in bearing him, was brought to bed of a palsy," would suit our demonstrator, but who, in spits of nervousness and timidity, performs his duty edmirably. If this gentleman were afforded more frequent opportunities of public demonstration, these infrantics might be shasedied; and, as he has the great advantage of giving much information in a short period, the very reverse of Br. M'Donnel's qualification, a permission to take that professor's place, now and then, would meet with the general approbation of the class.

. I have now concluded my communications respecting the professors of the Richmond School, and surgeons of the Richmond Hospital, communications in which "nothing has been extenuated, nor aught ast down in malice," but afforded in the desire of messuring out an act of instice to teacher and student. The establishment, taken as a whole, is unrivalled in point of usefulness to the student in the whole empire; and it is griovous to reflect how mismanagement and ignorance may convert so fortile a source of good into a channel that can nourish any nonious weeds on its surface; yet, Sir, such is the general excellence of the fountainhead, and so admirable are the qualifications of some of the individuals employed in the direction of the atream of knowledge proceeding from it, that it is capable, under its present direction, of affording ample nourishment to the mind of the popil, malgre the impediments be meets with in the shape of conceit and self-consequence. As to my identity, Mr. Editor, that la a subject of little consequence, although it has bithorto been as much speculated upon, as mistaken: that I have doos good, may be inferred from some alterations that have succooded to my remarks, and that a guilty conscience was swakened, is apparent, from the augry notice they occasioned, and by the spirit that prompted the use of the pen in reply from some wretched sycophants, whose praise is the worst spology that could be offered to the object of their anlogy, and whose conferention if my highest pride.

Let the professors of the issuitution he amounted and pot beware. At friend is behind their curisis, askions his proclaim alika their steady walk in ability and rectitude, or to detect their washings. Iroland, alsa! must seek the press of England as a means either of praise by bossure; and the medical journal that has becomplished so much for one country, will not refuse its sectome to its sinker and unfortunate land,

I will watch over the Richmond, and your pages shell enable me to call the hour. I am, Sir,

Your obedient servant,

LENNOX.

Dablin, Feb. 4, 1819.

#### YELLOW FEVER AT GIBBALTAB.

To the Editor of THE LANCET.

Sin.—I send you the following account of a successful method of treating the yallow fever, which has lately committed such dreadful ravages at Gibraltar: it ignatracted from a letter received from a gentleman of great respectability, and a particular friend of mice, residect at the rock; the authenticity of the communication I can, therefore, perfectly rely on; I abell give the statement in bis own words; if you think it worthy of insertion in your spirited Publication, I abell be obliged by its appearance in an early number.

I sm, Sir,
Your admirer and reader,
Hawny Rupon.

Leominster, Jan. 29, 1829.

My friend, Mr. Oxberry, first observes "that persons having once recovered from this fever are not liable to a second attack, vbich marks the distinction between the Yellow Faver of Gibraltar, and that of the West Indies. Hostates, the only remedy which has proved successful in this dreadful disease, is the administration of a large cupfel of olive oil every helf hour till copious vomiting onsues, which is to be promoted by drinking freely of warm water; the treatment is to be continned till the stomach discharges nothing bot water; at the same time, frequent injections of olive oil and salt-and-water should be administered ; afterwards, an ouoco and a half of castor oil, with the injection of continued till the fever subsides. The patient may drink freely of lemonada and actis to excite perspiration; and for thet, good soop, without a particle of greats, in given: soch, without a particle of greater, in given, Out of 85 patients treated in this manner has a Spanish-doctor, (whose same is not stated,) only once died. The legible practitioner, sommand gith column and beading, and under this treatment has every patient; seeing the effency of the all, they slapidle it, and proved its edies by their manufact. success; were this treatment o the West Indies, it might save th many."

# THE LANCET.

London, Saturday, February 21, 1829.

WE insert, this week, Mr. BRANCEY Coorne's own Report of his colebrated lated to do far greater injery to the reputagical readers, and, above all, sech of them as to his reputation, without publishing a have themselves performed the operation, to Report which must satisfy every profes-

tion, which proves that he was not, in point of fact, entitled to a verdiet : a Report which, as far as the facts of the case are concerned, differs, in co material respectfrom the Report transmitted to this Joureal; and which is, in some respects, calcuoperation of lithotomy; ebataieing, for the tion of the operator. Why, it is saked, was present, from comment on the details of Mr. BRANSET Coores not content with a this document, but, at the same time, ear- verdiet in his favour, and " fine per cout." on nestly leviting our readers, especially our sur- the damages at which he rated the injury comparesche facts detailed in Mr. Coorsa's sienal man who reads it, that he obtained a Report, with the facts detailed in the report verdict, not in consequence of any facts published in this Journal. The result of which he disclosed to the jury, but besuch a comparison must be to convince cause he dexterously concealed the facts of every man, capable of forming se spicion on the case, until he had reaped the beaufit of the subject, however previously inclined to a doubt which the supposed mulies of our think favourably or enfavourably of Mr. Reporter raised in the minds of the jury? Beansay Coorga's professional chilities, This is a problem which we will take issue that out e single material fact in our report to solve. The publication of Mr. BRANCET was misrepresented, and that had the ope- Coorea's own account of his operation rator ventered to publish his own report of was not, we believe, a matter of shoice, but the case before the trial, it would have been of necessity. He had obtained a verdict, it impossible for him to obtain a verdict. The is true, hat how had he redeemed his jury presumed misstatement in the eb- pledge to put the profession and the public sence of testimony; and we have already in possession of the "FULL PARTICULARS OF frankly admitted, that if they believed is the case !" Why, by producing a streeze the alleged malice of our Reporter, they witness at the trial, which witness awore were morally justified in presuming mis- that he was not better able to give the jury statement; but the subsequest publication any leformation than a common spectator. of Mr. Baanear Cooren's Report has Mr. Baansav Coorsa instructed his counsel demonstrated, beyond the possibility of to tell the jury, first, that no one can form doubt or contradiction, that our Report was an opicion of the difficulties of an operation, substantially true, and that the presumption, but the operator himself; and, secondly, on which alone the verdict of the jury could with a pleasing consistency, that next to the have been founded, was not werranted by operator, his assistant possessed the best the facts of the case. To many professional means of explaining the difficulties that and especially to those at a distance occurred. New Mr. Callawar, the mucle rails, who are not acquainted witness of the operation called on the part h all the workings of the machinery by of Mr. Banuar Cooren, had not been in the Bets endeavens to uphold a cor. the witness-ber, Ive minutes before he disthere specime, it has afforded tingely admitted that he personned no better rice that Mr. BRANSEY means of explaining the difficulties than a mid here apparently committed common speciator. What follows? why, blishing a report of his opera- that hir, BRANERY Cooper's pledge to put

the jury in possession of the "FULL PAR- had been obtained, it was pretty broadly hinted TIOURANA of his case," ended in mounthine. to Mr. Beauthy Cooren by some of his He calls but one witness who saw the opera- friends, that, in the absence of all testimony, tion; and that witness beneatly confesses the profession and the public would not be that he sen no more explain the difficulties, satisfied with the defence which had been or account for the extraordinary delay, then made for him by Sir James Scattery, howa committee spectator. My way of saabling the onelectual point of view, the most contemptible, mles of a Free Medical Press, to estimate base, and grovelling, is the Scotch Dus the probable leave of their impotent attempts who passes under the name of Jawas John- to diminish the circulation sed the influence son. We semit that in noticing any of the of this Journal, we shall here present them productions of this despisable writer, we with the obituary of our contemporaries are chargeable with a waste of force, some- since the first establishment of Tax Lawwhat analogous to the process of extermi- car. On the 5th of October, 1885, the nating a caterpillar with a stedge-hummer; date of the commencement of this pubhut we shall not suffer the incliable baseness, lication, the following Medical Journals and worthlessness of this scribbler to be were published in London:-The Medical pleaded in bar of the chastisement which even letelligeneer, The Quarterly Journal of the correct hide should, from time to time, Foreign Medicine, The Medico-Chirargical be made to fast. The venom which rankles Philosophical Review, The Medical Rapoin the breast of this miserable Aberdsen sitory, The London Medical and Phy-Due squinst THE LANCEY, and all whom sical Journal, The Medico-Chirargical Rehe supposes to be connected with THE view, and The Gazatte of Health. Of these LANCET, takes its origin to a species of in- Journals, The Medical Intelligencer died jury to that part of the autward man, wherein within three months after the appearance of a hungry Scotchman is most sensitive; to THE LANGET; The Madico-Chirurgical wit his pecket. This is the true west of Philosophical Workly Review died within honour to a genuine Scotch Dou; and if this six months; the Quarterly Journal of Pereign be respected, there is, perhaps, un other part Medicine died within two years from the of his person, which he will not permit you same period: The Medical Repository in three in pround at discretion. The pocket of Dr. years, and The Mudico-Chirusgical Review James Jourson, like the best of Aubilies, in four years from the same period. Tho winths only next wherein the Due sould feel London Medical and Physical Journal the sweets of an enemy, but have the renom- exists, and, since Ropenius MacLion has non occords for wherein the valuerable been dismissed from the management of it, the exemy, the weak point of the Social Cazette of Health has, for many years, been Dyname Mes the most mediable, and the a popular publication : it possesses a very least countries of resisting opposition. In extensive circulation, and is the only medical journal that has supported the principles advecated in THE LANCEY. Since the establishment of THE LANCET, the following medical journals have been started. many of them being despicable imitations of this Work, which we disdained to notice during their ophemeral existence : The Scalpel, The Medical Examiner, The Medical Advisor, The Probe, The Dissector, Dr. James Johantone an Fortnightly Fasciculus, The Oracle of Health, The Edinburgh Journal of Medical Science, -all of which are dead; The London Medical and Sargical Journal, Dr. James Johnstone's Monthly Pamphlet, and Roderick Macleod's Weekly Excrescence. The London Medical and Surgical Journal is a new enterprise, of the marits of which we can speak in favourable terme; Dr. James Johnstone's Monthly Pamphlet is a concern whereof the sale is attested by the voluntary affidevits of the manufacturer; and MacLuon's Excrescence is a concern supported by the voluntary subscriptions of a few hospital eurgeons. So much, then; for the rubbish which has appeared and disappeared during the last five years, and for thet which is fast disappearing. The rapid annihilation of so large a portion of the medical press is a phenomenon which the Bats and Correptionists explain, by ascribing it to the depraved and vitleted tasts of the great body of the profession; another, and, at least, as probable a solution, is to be found in the activity with which professional information has been communicated in the pages of this Journal, and in the independence and impartiality which have uniformly characterised the conduct of THE LANCET:

Mn. Warsuaron has given notice of his intention "to bring in a Bill, hewing for its object the better supplying of our anatomical schools with subjects for dissection." We feer the time is not well chosen; and the REPAL of the closus, which comeigns the nurdarer to dissection, should certainly be the first step.

## "GUY'S HOSPITAL.

"Case of Lithotomy, which was the subject of the "Libel in THE LANCET.

'[Communicated by Branshy B. Coopus, Esq.]"

STEPHEN POLLERD, mt. 53, of a plethoric habit, but pourtraying want of constitutional power, admitted into Job's Ward, Gay's Hospital, March 7, 1898. He states that he has been enbject to a gravelly deposit in his urine fer saven years, and a twelvemonth after its first appearance he was attacked with excrucieting pain in the region of the right kidney, which was constant and severe, and confined him to his bed for three months; at the and of which time he vaided a stone with hie urine, ebout the size of a berley-corn. Subsequent to this his health become re-established, suffering hat a slight inconvenience from the sediment in his arise, which remained unaltered. In three years e second attack, similar to the first, took place on the opposite, or left side; the same symptoms expervened, and, at the and of a fortnight, he voided another calculus, of nearly an equal size with the first. He soon recovered hie health, and the gravelly sediment, though continuing, has latterly been much diminished in quentity. About a twelvementh ago, unusual irritation in his bladder attracted his notice, which rapidly increased, causing a difficulty in micturition, the urine suddenly stopping, and the complete evacuation of the hiedder inducing intense enfering. At length he was obliged to apply to e enrgeou, t whe advised his coming to Gny's Hospital. Upon his admission, he stated that his journey to town from Sussex, in a cert ant bung on eprings, gave him greet unessions, pro-ducing repeated inclinations to void his urine. Walking also increases the symp-toms. The pain is most considerable when the bladder is empty. The extremity of the prepuce is not much ewollen, neither has he ever passed bloody nrine. The sound heing introduced, indicated the presence of e hard calculus. His general health not much impaired, but suffering from a slight catarrh, from exposure during his coming to London.

The operation was perfectued on Teasday, the 18th of Marsh. The second being

This report is mines earlistic from the thing belonging to the Yellow Goth. The variations in the type, are, however, our own—En. L.

i Mr. Hodgeon, of Lowes, has amborised us to say, that he are nor recombend the man to go to Gey's Hospital.—En. L.

introduced, the calculus was fait with diffi- | mediminished; pulse 120, small, with a dag culty; and then only while withdrawing the instrument. The narrowness of the perineum (!) excited attention. The straight east being introduced, the external incision was purposely extended beyond the usual terngth, to compensate for the natural deformity (!) The groove of the staff was entited, and the knife readily passed into the bladder, as indicated by the flow of e small quantity of urine, On pessing my finger into the wound, the extent of the section of the prostate could not be ascertained, in consequence of the depth of the perineum; and upon introducing the forceps, the same could not be feit: I was, THERROOM, induced to ENLANCE the opening hy means of Sir Astley Cooper's beaked knife. I then withdrew the straight staff, passed a curved one into the hisdder, and detected the atone in the concavity of the curve, and to some the penser into the bladder, pensed the currino COSORT, (which was necessarily furnished with a beak,) and used this as a guide to the introduction of the forceps; but atill, though the forceps passed readily is to the bladder, as was experienced by Mr. Callaway as well as myself, the stone sluded detection. A femels staff was then passed into the wound, but could not be brought in contact with the stone. A male sound was next introduced through the incision into the hindder, and with some difficulty indicated the stone above the prostate, and consequently behind the pubes; and at length the hindes of the forceps (the handles being directed downwards and backstards) were brought in contact with the calculus, which immediately on being felt, was extracted without any force; elthough, from the circumstances above datailed, the operation had mayoid-ably been tedious. When he was replaced in bed, he felt depressed and axhausted; forty drops of inudenum were given, which

produced slight composure, but no aleep.

5 o'clock.—Compleins of very sente pain in the lower part of the abdomen, especially in the LOFT ILIAC RECION; this increases on pressure. No tension of the abdomsn is discernible. Apply thirty leeches and

hot fomesterions.

30 o'clock.—The pulse has increased in minuter to \$16, and is tremulous. The pein of the absence worshood by the leeches. The hearities is hearied, and the skin bedward within a cleany perspiration. The hearitroung is natural. Asswers questions h great bemposters.

Ordered Hyd. Sub. gr. iij. ; Est. Opil gr. ij. M. To be taken directly. A large emaltient positice to cover the whole of the aldomen.

Murch 19, 1 o'clock, a.w. -- Fies not had any sleep. The testlerness of the abdomen

of hardness. For the last half hour less had nauses, and inefficient efforts to vomit, which greatly distress him, hy increasing the pain.

Repeat the Cal. and Op.
5 o'clock.—The pain in the obdesses is foressed; the pulse 120, small and hard; respiration difficult; names unabated.

V. S. ad 3x.

This relieved the urgency of his symp-toms, but was followed with depression.

Ordered Hyd. Sb. gr.iij.; Opii Est. gr.j. atat. Continue the cataplasma.

10 o'clock .- The pain in the aldones co timus; pulse as quick as in last report; tongue covered with a white fur, but moist; names still present, even rather more urthe pit of the etomach, and thirty leaches to the abdomen. These gave immediate relief, to such an extent as to enable him to sleep. 1 o'clock, r.m.-Pulse 156, and irregular as to power, but constant in number. The anxiety of countenance indicates a fittal depression, and has a penuliar yellow has, the lips heing pale. The nances has returned, and the pain of the abdomen is only complained of during the spann. The respiration is short, hurried, and attended with

pain.

B. Ammon. Carb. gr. iv. Tr. Opii. gtt. xxiv. Infin. Serpent. Jim. F. Haunt. to be taken directly.

After having taken this draught he slept two hours, when the respiration was 26 in a minute. He ewoke in an alarming state of depression, the countenance suzious and pallid; he reluctantly answered questions, but said he was entirely free from pain. He took a small quantity of hrandy and water with the julep of ammonia, but continued gradually sinking until half-past seven, when he died.

It may be worthy remark, that this pa-tient felt consisted in his own mind that the operation would prove fatel; and so strong was this impression, that he persuaded two patients in the same ward to show him the burial ground of the incepital. + He visited this, and expressed his conviction that it would be his resting-place.

Economics of Body 60 hours after Donth. (From the Motes of Dr. Hedghin.)—The peritonsum, at the lower part of the abdomen, as well as that portion which lines the parietes, and that covering the intestines,

The poor fellow was avidantly a man of discernment, and merited a better fate .-En. L.

<sup>†</sup> A very rational step, all things con-nidered.—En. L.

was minutely injected. In the polois there peritonnal inflammation and in the axten-was some arre-axecutanous effusion, very sively lacerable state of the cellular memslightly puriform, and unmixed with lymph, or floornic. Behind the perimeum, in the POSTRBIOR part of the ERFT ELIAC RESIDN, there was some manuacum. The cellular membrane behind the peritoneum in the pelois, was extremely lessrable, readily breaking down under the finger, and scarcely requiring the use of the knife for the removal, except ander the pubes. There was a free division of the prostate, and a CLEAN CUT into the bladder, the mucous membrane of which was generally healthy. Immediately behind the meatur drinarius there was a exact toneur-snappe body, which, on the epetiting of the bladder, and when obstured hy congula, was considered to be the third labe of the prostate; but a more cureful PRESENTATION proved it to be a SMALL PLAY, composed of a portion of bladder and prossate, and which had been formed by ANO-THER PROPERTY SOMMUNICATING With the first, about at inch in leagth, and a third of an inch bailed the opening of the mentus. There were a few spots of the ecolymonia, and abrasion comprehended in a space of about the size of a shilling sround the orifica of the mentus. The edges of the incision, from the external opening to the bladder, were RASGRD, and intermised with udberent congula of blood, a state which was unamidy produced by the repeated introduction of the forceps and other instruments which were had recourse to in the attempt to remore the stone.

In the preparation a PASSAGE RESETS & the arms of the alaepan : this was not noticed by Dr. Hodgkin till after" it had been is the hands of the reporter of Tue LAN-CET; and from the extremely lacerable state of the part, it might easily here been formed after its removal from the body. That it was either formed then, or in the act of removing thom, is an idea which the absence of cougula teeds strongly to con-

Besides the injection of the peritoneal poer of the small intestines, the foternal membrane was of a diffused red. The rectum was perfectly sound and healthy, with the a zoeption of a very slight appearance of piles. The kidneys were of moderate size, soft and fiably, and in an advanced stage of the light mottling deposit described by Dr. Bright. This case resembles all those of manus-

cessful lithotomy which I have neveral had

an opportunity of examining, both in the

brees behind the peritoneum: similar resulte have, I believe, iereriably been found by Mr. C. A. Key in this country, and by

my friand, Herray de Chegon, in Paris. The peculier derangement of the kidney chaerved in this case, was likewise met with in a patient of Mr. C. A. Key's, who died efter an operation for the stone, and has likewise bees found in others who have sunk after the operation OR -- secident.

## THE MEDLEY ORATION

February 14th, 1829.

" Dip you hear the Hunterian Oration a. the College yesterday?" "No, it escaped my recollectioe." "I em very glad of it." "Why glad? what sort of an eration was it?" "Oh, a prucious jumble." "Veil, but what was it about?" "I can hardly tell you, it was a philosophical madley; there was a little of all the sciences ; a mixture of mathematice, materal philosophy, astrooumy, and all that sort of thing; ie truth, a little of evary thing hut the right. I was very sorry for the Onaron. I like Vincent very well, but he shows to great disadvan-tage in an oratioe." "Ha! bu! and how did he deliver it." "Worse still; it was shockingly done. He looked like a man going to be executed. He never lifted his eyes from the paper: they brought him e glass of water, but he couldn't see it. I deciare his fright estonished me; I don't think they'll get him there again in a hurry. I went axpecting that the craticu would be no great shakes, but even with this preparation I was disappointed."

If we were to insert every syllable of the Oration, our renders would not be better informed of its contents than they will be after reading the above conversation, which passed amongst a knot of medical gentleneu the day after its dalivery. We spara them, therefore, the infliction of perusing e paper which contained nat a new thought either on the subject of John Hon-ter, his stupendous museum, or his invaluable discoveries. Mr. Vintent considered John abby, and in an advanced stage of the light discoveries. Mr. Viscent considered John Hunter to stand very high in the scale of This case resembles all those of anomalies are opportunity of examining, both is the scale of the stage of the s

exist arroha you showed the parts to Me. Lambert?

# WESTMINSTER MEDICAL SOCIETY. Saturday, February 14, 1829.

Mr. CROAD HAWKING in the Chair. DECEPTIVE DISEASE OF THE MEAD.-TREA SURED'S ACCOUNTS.

THE Minutes beving been read, the Chairman steted, that the promised communication of Dr. Gregory on buffy blood, was still delayed in consequence of Dr. Gregory's absence in the country. After a coosiderable sileoce,

Mr. ARNOTT called on Mr. North to fevour the Society with the perticulars of a case which had letely been attended by Mr.

North and himself, which

Mr. Nonru etated was a peculiar example of the insidioos manner in which disease sometimes made its ettacks. He was, some time since, called to see a lady who laboured under symptoms of saturb; frequent encesing, discharge from the nose, cough, and beadach. There were no dangerous symptoms in the case, and being, therefore, uoder ne apprehensioo, he treated it as tho disease which it appeared to he, giving purgatives, and other usual medicines. The pain in the heed, however, gradually inoressed, and on the third or fourth day frem his first visit, the petient referred bar chief euffering to the situation of the root of the nose. The ferebend and right eye were tumefied, and, on placing his finger over the seat of pain, he suspected there was matter forming. This afterwards turned out matter forming. This afterwards turned out to he the fact. Mr. Guthrie was called lu, and an incision made in the ferebead; four ounces of metter were discharged, and the patient was relieved. No danger of any kied was now, or hed been hefore, apprehended; there had not appeared the slighteat cause for it; he was in doubt, however, what was the nature of the disease, and so he continued. In two or three days after, the eymptoms considerably increased; the pulse became rapid, the countenance enxious, the general disturbance considerable, and, in eight or nine days more, the oppearminos became altogether extremnly obscure. De. Manlacd now eaw the patient, but he could not discuss. Dr. Leviscos was their called his first pain in the land discuss. Dr. Leviscos was their called his the pain in the land discussion of their called his could not depending the disease. Dr. Le-tico was their salled his the pain in the had been presented on the brain. It ashined head homesed abundantly, but was not con-line. In the days the right side bearing without presence on the hear might exist single. In the gays the right side bearing without producing come. If the present paralyzed, and the patient lost the power, patient had been found comatone, it would of mentioning perficular works; this was not sure which arose from the affusion; it is not less than the present parallel was not to be investigated to the pres-ter of the parallel of the present parallel of the joondies, and there were no ayappens of proved that we had yet to learn what was comes. In Sourcess days the ledy died—that peculiar condition of the brain which hero makes the whole of neveral conteness gave rise to the existence of comes. which fell from the appealer, in consequence

of the noise occasioned by the entrance of chairs for late members ; this greated at least twice the disturbance it need have done.

By the time It had coused,

Mr. Annorr had taken up the case, from whose statements, and the discussion, w believe all the additional particulars will be elicited. The patient, Mr. Arnott said, was aged nineteon. The body was very little emeciated by the disease, but the yellow tings, which he considered a peculiar feature of the case, was distinctly marked throughout the winde frame. On examining the head, no disease was discoverable, nn inflammetion of the integuments; there was nothing but a lancet wound, the effect of the incision. However, on taking down the scalp over the root of the nose, after deeth, the perioranium exhibited more deoided marks; and, oo sawing through the skuli, a quantity of matter issued from the dura mater, and, on the opposite side, was a large portion of the dara mater in an ulcerated at te. (A proparation and a drawing of the parts were here exhibited.) On proscenting the examination, the arashmoid was found much thickened, and there was e copieue deposition of matter pressing apon the brain. On examining the longitudical siaue, that part opposite to the ulcer had its coats also much thickened, and the internel enriace was lined with an effusion of lymph. The hraio throughout was healthy. The case had impressed him (Mr. Arnott) strongly, as one of those in which the real disease was totally undiscoverable by externel appearances; the most chacure point was, he thought, the cause of the yellow coleur, which perveded the whole body; it stose, perhaps, from a diseased state of the blood, or the biliary system, but he had ex-emined the liver, and there was no apparent derangement, nor ony annoual quantity of hile present. On a question as to the exact aituation of the matter.

Mr. Nonzu stated, that the dara mater was separated from the bono, and the matter was offused over the whole anterior surface between them, lie had thought, at first, that this case was one of rare cocurrence; but ou referring to the elaborate work of Dr. Aberorombia, he had discovered one or two others very similar to it. The absence of come was singular, where so much met-

Dr. Luy seld, that much matter might

upon the beain, without injuring the | there was not pressure, but a more change intellectual faculties, and mentioned some of contents in the cranium, which change cases, one of puerperal fever, in support of was not of a nature to produce pressure. his statement. In Mr. North's case, the Cema and paralysis were not necessarily pressure had been on the anterior of the brain; hut if the same pressure had existed on the base of the brain, very different effects upon the jutelleets would have occurred. He was one of the late members, and had not heard the whole of the case, but he wished to know more particularly the part apon which the matter had pressed. Mr. Nearm said, it was distributed over

the whole surface; (here was another great noise from the chairs;) there was hardly a single part of the auterier pertion of the brain not covered with a layer of pus.

A Manaan inquired, in what way the series of symptoms was produced, and where was the origin of the inflammation. He understood, that it had appeared first in the integuments of the forehead, theu went te the perioranium, thence to the dura mater, and that ulceration was an ulterior effect, Great atreas had been laid on the layer of matter which had been found on the longitudinal sinuses. Was that the primary or the last link in the chain of events. Ha (the Member) thought it was the last, and that there was no reason to believe that the inflammation began within, but that it proceeded from the external to the internal parts. There need have been ne wonder, then, at the shaence of stronger symptoma; none were to be expected. The disease, too, was not of e nature to produce com . Whenever the effusion of matter ou the brein was gradual, very promisent or marked

symptoms were never produced.

Mr. Hunr thought the effect of a suddan effusion on the brain would produce local

Dr. Law considered, that a secretion of find upon the brain acted on all parts of it yearly account, which was received as very alike, as pressure would act upon a bulb of astisfactory. He stated, that there was a water; not on one part, but throughout the whole mass.

Rongater Macagoe thought, that some of the observations of the member, who apoke before Mr. Hunt, were very unfortunate, and that Mr. Arnett and Mr. North had everlooked some of the points necessary to a full elucidation of the case. He considered the disease originated in the fruntal sineses, and for that reason the sacaning had not been coured. Those which we't taken to be called the salar had preceded the salar had considered the prince to the yellow colour of the shin, said, cured. Those which we't taken to be called the salar had preceded the salar had considered to get instead of the veton, a yellow that had necessarily all constitutional disturbance. The father faths:

The Sanarany referred to neveral cases affected with angering a long time province. affected with ancezing a long time previous, which had occurred in St. George's Respi-unaccompanied with any other catarinal in, in proof, that whenever a yellow or ayesptoms. The effector was not sufficient larid state of the skin had occurred, the to produce come; it was merely distributed veins and arteries themselves were in ways over the left hemisphere. He eccaidered healthy.

connected.

Dr. Corland thought the disease had arisen from an absorption of purulant mat-ter from the ulcerated surface. He had often noticed the yellow tlege after ulcerations. Had not the patient been carried off by irritative fever?

Mr. Nenra said the patient often lahoured nder irritation, but there was no continued

Dr. Lur. Was the discharge from the costrils effensive? If so, he could easily understand hew the disease had extended iuwardly. Discharge from the our often preceded comatesa symptoms. The succesing did not prove that the disease was in the frontal sinuses.

Mr. Neath said, the discharge from the

nose was not effensive.

A MENBER, whose name we could not learn, thought that throughout the whole detail, the treatment hed been too much lost sight of; the psthological condition of the hrain alone, seemed to have occupied tho attention of the aveakers.

Mr. Nours replied, that as the nature of the disease had not been discovered nutil after death, he had not thought it of consequence to say much on the subject of the treatment, which was not of a very active kind; he stated this very candidly, and thought it was ne disgrace to the gentlemen attending the case. If they could have looked ieto the lady's head before death, more active treatment might have been rasorted to.

About half past nine, the treasurer varied the debate, hy handing in e statement of his balance in hand of 125% of funded property, in the 4 per cents. The discussion then went on again. The chief points of the case were ably summed up by Dr. Granville, who expressed his opleion that the discase originated juternally. Net the alighteat blame could be attached to the medical attendants.

## LONDON MEDICAL SOCIETY.

Monday, February 16, 1829.

Dr. SHEARMAN in the Chair.

BYFICACY DY THE ERDOT OF BYE .-- AL-LEGED PARTIALITY OF THE BEGISTRAS. -CARE OF MOMSTROSITY .- MOBBID SPE-CIMENS.

Tax minutes of the last Meeting having been

Mr. Beown related the particulars of a case showing, to his mind, the afficient quality of the argot of rye. The lady had been delivered a few days previously of her tenth child. In the course of the nine former births, she had been subject to the most alarming hamorrhage, and after her ninth delivery, was under the naccasity of having the operation of transfusion performed by Mr. Waller, and, in consequence of which alone, it was apposed, her life had been preserved. As she proceeded in her last pregnancy, she had an impression that she should not survive the birth of the child. Recollecting the danger that had attended all her former labours, Mr. Brown had consulted Dr. Blundell, and it was agreed, that a preparation of the orgot of rye should be in readiness to axhibit, should the circumatances requite it. Mr. Brown was called to her at nins in the morning; he then found that lahour had begun, that the soft eris were dilatable, and that labour was there he a sufficiency of nterine action, but which turned out to be wholly ineffective, without the assistance of the argut of rye. The patient having remained pretty much in the same condition till shout three o'clock in the afternoon, with the exception of her pains having rather flagged in energy, a table sponnful of the decoction, and twenty drops of the tincture were administered. Twelve minutes afterwards a pain came on, distation and dagree when the second of the

neatly contracted state. The force with which the child was expelled in this instance, after the ergot hed been ambibited, impressed his mind, that no mechanical obatraction ought to exist in cases where the argot was exhibited, and that the greatest eaution ought to be exercised, to ascertain that the soft parts were in a proper condi-

tion for the delivery.

A Managa wished to know, why Mr. Brown had continued to exhibit the ergot after the first dose had been so effectual, and whether there was any anbacquent inflammation of the abdomen or uterns?

Mr. Baows observed, that an inflammatory consequences had resulted, and that he had continued the use of the ergot for the purpose, if possible, of parfectly securing

purpose, it possions, or paramy several the patient against flooding.

Mr. Waller remembered the patient, from his having performed apon her the ope-ration of transfusion; and, had he here pre-sent on this letter occasion, he should have agreed in the propriety of exhibiting all the ergot that Mr. Brnwu had stated he had given, because he should have been appre-hensive of relaxation, the patient being of a flabby habit, and a constitution to warrant

the apprehension.
Dr. Walshman remembered having had one or two cases, of a very similar description. In those cases, the hemorrhage was of an alarming nature, and the pulse had at times entirely disappeared. In both the cases, the palse was raised by the exhibition of opium, and recovery followed.

Mr. Parasz, as a member of the Society, likely to be terminated very speedily, should considered that he had a right to complein of the Ragistrar, sa to the mode in which he had been in the habit of taking minutes of the proceedings of the Society. On the night on which the Society had last met, the Registrar read two papers communi-cated by a member. Mr. Shearly had made some abservations on those papers, and upon what Mr. Sheorly had said, he (Mr. Felvse) had delivered his opinion; but, notwithstanding the Registrar had seemed gradual at first, increasing in force, and of a to make a very full report of whet had direction and dagree which surplused any transpired in the course of the evening, not string he had ever seen, and by which a very a syllable of notice had been taken of what

ing, that he did charge the Registrar with partiality, and that he could relate a series of cases which would bear him out in his declarations.

The RECEPTAGE deuled my partiality.

The Pressparr again intimated, that the complaint coeld only be made, and the subisct discussed, before the Council.

Mr. Suggary axhibited an instance of enstrosity which he obtained from St. Seviour's Workhouse. The case was that of twice; both children were born slive; the one he axhibited had lived from half past ten in the morning to seven in the evening, and, in the course of thet time, had performed the act of deglutition several times. It axhibited e double harelip, oo nostrile, herais serebri, a deficiency of the frontal bene, and the stumps of somn of the fingers of the right hand, as if amputation of parts of them had been performed, and the wound neatly healed ap. The other child was not well, and was likely to die soon.

Dr. RAMADGE produced to the Society spesens of a morbid lazynx and an esophagus. Ha took also the opportunity of expressing his surprise at having heard it stated, that in one of the cases related un the former evening, and which had already been alluded to, there was no fever present. Since then be had been assured, and the assurance came from a relation of the patient's, that the patient had had a violent affection of the brain, accompanied with fever, for at least four days after his attack of illness. This fever probably bad anbaided before tha author of the case was called ie, otherwise such a misstatumeet would probably not bave been made.

The Parsiders auggested, that this statement ought to have been made in the pre-

sense of the euthor.

Dr. Ranados merely wished to remove the impression, that no fever had existed.

In some remarks on Mr. Brown's oase, Dr. Rysa said, that the practitioner should always procure the ergot of rys in its natural state, as no dependence could be placed on the different forms, kept in the shops, as they were invariably adultanted. The egot of rya should be kept in in metural granular class, in closely stopped fieldles, and would retain its extraordinary sewers for many years. If exposed to the air, it would, after some time, become a brown powder, and be perfectly useless.

## GLASGOW ROYAL INFIRMARY.

Catheeles Apais, aged 32, a woman of a week and delicate constitution, was admitted by Dr. Brown, on the 25th of October, with rupis. The disease, in somn places, was simple; but, in others, assumed prominent character, and was apread over the arms, fore-arms, face, thighs, and lega. Some of the scale were plevated shove the surrounding skin two or three lines; still rather flet, and of a greenish colour. When these fall off, they leave behind a deep excavated sore, which the putiset described as exceedingly painful. She described the disease as beginning in the farm of small vesicles, followed by the formation of scabs. There was, likewise, un eruption of scabies scattered over the hands and fore-orm; her health and eppetits were tolerably good, her toogne was also clean, bowsle upon, and pulse 100, but small.

The eruption appeared about five months previous to her admission, and was preceded by a smart attack of faver of three deys' derstion. She hed taken bark, and also a solution of the muriate of mercury, in whiskey, which had out, huwever, affected ber mouth. She complained of sometimes feeling feverish during the olght. She was ordered balf an ounce of castor nil.

26. Has had neveral stools, but still complained of occasional chills and flushes; and se har pulse was 106, and throbbing, eight ounces of blood were ordered to be taken from the arm. She was directed to take alx onoces of the compound decoction of sarsaparills three timesdaily, adding to each dose tweety minims of the solution of the mari-

ate al mercury.

30. Complained of alceping ill during the oight, end her bownia were regular. She was ordered to continue ber medicina, inereasing the dose of the solution of mercury

to tweety-five minime, and to take en anodyne draught at bed time. Nov. 3. The patient new same under the charge of Dr. Miller, who was appointed the senior physician in the place of Dr. Brown, who had resigned. The treatment adopted by his predecessor was continued.

adopted by his predoceane was continued.

18. There was no change in this nations for the better, but still there had been no further exaption. Senged of the utler's locked clear, and healthy. The decocition of paragraphs ordered to be omitted. To have the following t was pounds of the second of class, and a sheaken of this meenical solution, mixed; and of this are was to take two owners there imma, daily; and to the alease on the lange alon with a purity. to the sloars on the last sin was to apply, morning and evening, the ciniment of the cuide of sinc. · total

Dec, 8. The elects on the legs ware oking worse. She was ordered an embroation of water and vinegar.

11. The appearance of the ulcers was till more unhealthy then at the last report, ad more painful. A common poultice was

irected to be applied to them.

13. Little change for the better in the deers situated on the leg. Solid pitch, one ounce; wheat flour, sufficient to make uto grain pills ; take three pills three times a day; ostaplusm to be coctioued, and the solution of arseois to be omitted.

24. The scree on the leg were looking batter, but there was a new scab on the neck. To take twelve pills daily.

neck. To take twelve pills daily.
27. There was a new aruption to-day, spread almost over the whole body. Her appetite was diminished, and she was every way much worse. The pills were omitted, and fifteen drops of moristic acid to be taken threa times daily, in water.

31. She had avidently, for some time past, diminished in strength. Her appetite was also bad, and alse complained of alceping ill during the night. In have an ounce of wice, to be repeated four times

Jau. 8, 1329, There was still no im-

provement.

Soft opium, 12 graios ; Galomel, 8 grains ;

Frantie tertar, 4 grains;

a-day.

She was ordered the decoction of sersaparilla, to be taken with each pill, and to omit the muriatio acid.

This patient still remains in the hospital, little or un improvement having taken place, notwithstanding the great variety of treatment employed.

## ROYAL INSTITUTION.

Thus was every provided attendance at the Royal Institution on Friday last, when Mr. Faraday delivered a Lecture on the Active Molecules existing in field Hodies, Or-

loudly applanted.

There, were asveral curious presents on the Library table, among which was a tempor supply single by the situative diskin is past ages, found in Maridon-Subire; some rere Chinese phintings, by makive artists, &c.

## CONESSION OF BURKE IN THE GAOL.

Edinburgh, 3d Jan., 1899.

An old pensioner, named Donald, lived in the hoose ebout Christmes, 1827; he was in bad health, and died a short time before his quarter's peosion was due; that ha nwest Hare 41, and a day or two after the pensioner's death, There proposed that his body should be sold to the doctors, and that the desigrant should get a share of the price. Declarent said it was impossible to do it, because the man would be coming in with the coffin immediately; but after the body was put into the come, and the lid was nailed down, Hare started the lid with a chisel, and he and declarant took out the corpse and concealed it lo the bed, and put tamer's bark, from behind the house, into the coffin, and covered it with a sheet, and nailed down the lid of the coffin, and the coffin was then carried away for interment. That Hare did not appear to have been concerned in any thing of the kind before, and seemed to be at a loss how to gat the body disposed of, and he and Hare went in the avening to the yard of the college, and saw a person like a student there, and the declarent asked him if there were any of Dr. Syrip of ginger, nufficient to divide into Mouro's men about, because he did not 26 pills; to take one three times know there was any way of disposing of a doed body, nor did Hata. The young man saked what they wanted with Dr. Moaro. and the declarant told him that be had a subject to dispose of, and the young man referred him to Dr. Knoz, No. 10, Surgeon's Square, and they went there, and saw young gentlamen, whom he knows to be Jones, Millor, and Ferguson, and told them that they had a subject to dispose of, hat they they had a subject to unspect to did not ask how they obtained it; and they did not ask how they obtained it; and they told the declarest and Here to come be when it was dark, and that they themselves would find a porter to carry it. and Harn went home, and put the body into a mok, and carried it to Surgeon's Squar and not knowing how to dispose of it, laid it down at the door of the cellar, and went up act. Brown. Mr. Faraday, by drawings ap to the ream, where the three young she specimens, showed that fiving and dead men new theat, and told them to bring up additionable made, roots, fro., pro-like long to the room, which they did, and dead in minute periods dispelle of motion, they took the body out of the mack, and laid state of which were of the 1-15,000th of an it on the dissecting take; that the shire, and demonstrate as low in 1-30,000th was on the body, but the yoong mon aked burst of an inch. The Lieuture was very me questions as to that, and the declaration of the sand the declarations. and got 74.10s. Dr. Knox came in after the shirt was taken off, and looked at the body, and proposed that they should get 71. 10s., and authorised Jones to settle with them; and he neked no questions as to how

the body had been obtained. 41. hs., and the declarant got 31. hs. Jonee, &c., said, they would be glad to ees them again when they had any other hody to dis-

pose of.

Early last spring, 1828, a woman from Gilmerton came to Here's house as a alghtly lodger, Hare keeping seven heds for lodgers: that she was a stranger, and she and Hare became merry, and drank together, and next morning she was vary ill in consequence of what she had est, and she sent for more drink, and she and have drank together; and she became very sick and vomited, and that time che had not risen from bed, and Hare then said thet thay would try and emother her, in order to diepose of her hody to the doctors. That she was lying on her back in the hed, and quite insensible from drink, and Hare nlepped his hand on her month and nose, and the declarant laid himself across her body, in order to prevent her making eny disturbance, and she never stirred, and they took her out of bed and undressed her, and put her into a chest.

The next was a man named Joseph, a miller, and lying badly in the house. he got some drink from declarant and Hare, but was not tipsy; he was very ill, lying in bed, and could not speak sometimes, end there was e report on that account that there was fever in the house, which made Hare and his wife uneasy in case it should keep away lodgers, and they (declarant and Hare) agreed that they should antiocate him for the ne purpose, and the declarant got a small pillow and laid it across Joseph's mouth, and Hare ley across the body to keep down the arms and legs, and he was disposed of in the same manner.

In May, 1828, as he thinke, an old woman came to the house as a ludger, and she was the worse for drink, and she got more drink of her own accord, and she became very drank, and decisrant suffocated her; and Here was not in the house at the time ; and she was disposed of in the same manner.

Soon after an Englishman lodged there for some nights, and he was ill of the jauu-dice; that he was in bed very nawell, and Here and declarant got above and held him down, and, by holding him down, sufficested him, and disposed of him in the same manner.

Shortly afterwards, an old woman named Haldane (but he knows nothing farther of her) lodged in the house, and she had got her) lodged in the house, and the had get some drink at the time, and got more to in-toxicate her, and has end Hars sufficiented

her, and disposed of her in the same manner. Soon afterwards, a cinder-woman coule to the house as a lodger, as he believee, and she got drink from Hare and the declarant,

Hare got | and he and Hare suffocated her, and disposed of her in the same manner,

About Midsummer, 1828, a woman, with har son or grandson, about twelve years of age, and who seemed to be week in his mind, came to the house as lodgers; the women got a dram, and when in bed saleep, he and Hare suffocated her; and the boy paratiting at the fire in the kitchen, and he and Hare took hold of him, and carried him into the room, and suffocated him.

That soon efterwards the declarant brought s woman to the house as a lodger, and after some days she got drunk, and was disposed of in the same manner. That declarant and Hare generally tried if lodgers would drink, and if they would drink they were disposed

of in that manner.

The declarant than went for a few days to the house of Helen M'Dougal's father, and when he returned, he learned from Hare thet he had disposed of a woman in the decisrent's absence, in the same manner, in his own house; hat the declarant does not know the woman's name, or any further particulars of the case, or whether any

other person was present, or knew of it.
That about this time he went to live in Brogan'e house, and a woman named Margaret Haldane, daughter of the woman Haldane before mentioned, and whose sister is married to Clark, e tinsmith in the High Street, came into the house, but the declarant does not remember for what purpose; and she got drink, and was disposed of in the same manner. That Hare was not present, and neither Broggen nor his son knew the least thing ebout that, or any other case of the same kind.

That in April, 1828, he fell in with the girl Peterson, and her companion, in Con-stantine Burke's house, and they had breakfest together, and he asnt for Hare, and he and Hare disposed of her ln the same manpar; and Mr. Ferguson, and a tall lad, who seemed to have known the woman by sight, saked where they lad got the body; and the declarant said he had purchased it from an old women at the back of the Canongate. The body was disposed of five or six hours after the girl was killed.

One day in September or October, 1828, s washer-woman had been washing in the house for some time, and he said Hare sufficeted her, and disposed of her in the same MAURACA.

Soon afterwards a women, aspect M'Desgal, who was a distant relation of Holes M'Dougal's first husband, come to Broggan's house to see M Dougai; and after she had been coming and gaing to the house for a few days, she got drunk, and was served in

the same way by the declarant and Hare.

That " Daft Jamis" was these disposed and became tipsy, and she was half salesp, of in the manner mentioned in the in dist-

ment, except that Here was concerned in it. That Hare was lying alongside of Jamie in the bed, and Hare suddenly turned on him, and put his hand on his mouth and nose; and Jamie, who had got drink, but was not drank, made a terrible resistance, and he and Here fell from the bed together, Here still keeping hold of Jamie's mouth and nose; and as they lay on the floor together declarant lay surces Jamie, to prevent him from registing, and they held him in that state till he was dead, and he was disposed of in the same manner; and Hare took a bress snuff-hox and e epoon from Jamie's pocket, and kept the box to himself, and nover gave it to the declarant, but he gave him the

That she was not put to death in the man-ner deponed to by Hare on the trial. That during the scuffle between him end Hare, in the course of which ho was nearly atrangled by Hare, Docherty had neept among the straw, and efter the scottle wa over, they had some drink, and after that they both went forward to where the woman was lying sleeping, and Hare went forward first, end saized her hy the month and nose, as on former occasions; and at the same time the declarant lay seroes her, and she had no opportunity of making any noise; and before she was deed, nno or niher of them, he does not recollect which, took huld of her by the throat. Thet while he end Hare were struggling, which was a real scuffe, M'Dougal opened the door of the apartment, and went into the inner passege and knocked at the door, and called out pulice and murder, but soon came back; and et the same time Hare's wife called out, never to mind, because the daclarent and Hare would not hurt one another. That whenever he and Hare rose and went towards the straw where Dosherty was lying, M' Dougal and Hare's wife, who he thinks, were lying in bed at the tims, or, perhaps, were at the fire, immediately rose and left the house, but did not make any moise, so far as he heard, and he was serprised at their going out at that time, beprised at their going out at that time, be-cause he did not see how they could here way suspicious of what they (the declarant and Hare) intended doing. That he cannot may whether he and Hare would have killed Declarity of act, if the women had remained, becomes they were no decreasined to kill the memon, the doith being in their head.

## WESTMINSTER HOSPITAL.

#### ENTROPEAN.

MARY ANN HUNTLY, estat. 23, admitted Nov. 20, 1828, under Professor Guthrie, with entropeon.

About ten years ago, while recovering from the messles, she became affected with ophthalmia of both eyes, which has occasionally recurred since, and sometimes to such an extent as togender her totally blind. Blisters, issues, and the verious sutiphlo-gistic items, had all been employed without much benefit.

And the last was the old woman Docherty, The superior palpebric are unw com-for whose morder he has been convicted, pletely inverted, and the eye-lashes in contact with the hall; cuusiderable contraction of the engles of the lids, and increased secretion of the meibomian glande; conjunctive deeply inflamed; corner opaque. For the last two or three years her health has not been very good. She now presents e de-cidedly chlurotic appearance; tongue fabby and pale; bowels singgish. Dec. 2. The "author" ensoted the opera-

tion in the presence of all his colleagues, and a great number of pupils and visitors. The struggles of the patient protracted the operation. The blade of a hunt-pointed pair of science was carefully introduced close to the external angle of the right eye, and a perpendicular incision made the third of an inch in length, dividing the terral car-tilage. Another incision was made in like manuer, at the inner angle, external to the punctum lachrymale, it being a point not to divide the lachrymal canal. The lid was now perfectly free, and a fold of akin was excised transversely from the superior palpebra; three ligatores were introduced, and the divided parts brought in contact; each ligagature was twisted, and fastened to the fore-hood by a slip of edhesive plaster. A bandege was putner the whole. The ope-

ration was next performed on the left eye.

8. The furmation of granulations was prevented by occasionally muching the would with caustic; the ligatures have come away, and the eye-lashes ere compictoly everted.

13. Made an out patient.
Jan. 1, 1829. The lid remains in its namural position ; the vitiated curvature of the ternal certilage is removed; the corner of the corner charing, and wearels of the conjunctive lave everly retained to their natural califire. General beakti much improved.

This is a case which Mr. Guthrie had for some time treated at his "Eye-sore Infirmary," in Warwick-effect; but not having accommodation for her in that splendid institution, he vouchesfed to admit her within the walls of this hospital. This is remarkable, being contrary to the usual minated by either of our reporters, we can practice of the liberal "author," who, in vench for its accuracy. We shall key open his search after patients, smuggles every this most stupid of all Oversus next week.] ophthalmic case that appears here, and by sending the patient to Warwick-street, contributes to swell the list of cure elaborated in that wonderful crucible of surgery.

#### **SUMPOUND PRACTURE.**

Thomas Collenham, set. 30, a large sinewy mans, of temperate habits, admitted 43d of Jessery, 1869, with @mpound fracture of the leg. The tibia was much commissated, and a spiculum of bone projected about an inch, through a wound three lunkes above the ancle; this was removed by the bone-nippers. The mas was placed on his side, and a piece of dressing placed over the

26. He has been restless doring the night; the broken bones displaced. Mr. White saw him, and swathed the limb in an eighteen-tailed bandege, and fixed a splint mious in rotation, beginning with the junior. on the outer side,

Eveniog. Leg painful; abdomen some-what distended with fiscus. A dose of house physic to be drunk in the morning.

25. Leg extremely painful; abdomen tympenitic; pulse 100, small. The splint and bandage removed from the leg, which emitted a gangrenous odour; the patient is hid upon his bank, with the limb in the mifexed position, and supported with been bolsters.

verieted mercury, grs. lv.; Cathertic extract, grs. vj. form two pills, to be swallowed immediately.

In the evening he begame restless, and oberent io manner; eltempted to get out of bed, and displaced his leg from the proper posture. Tongue dry, brown; pulse 110, thin. A grain and a half of opium were given Immediately, and a dose of uperiont sedicine ordered to be taken every three hours, until the beweis should be seted

agon.

- 26. The upper part of the log, and the rehigh, emphysrantors; wound gangranous; discharge discoloured, and fatility.

Mine and continue.

A beer-grounds poultice. Wine and cor-als, and an opensional dose of spirit of dials, and an occu mendererus and water.

27. Symptoms announced; gangirms actending. Tympositis intentionis: swelling out the abdomen to a great size; respiration, herried; pulse 1100, assessingly weak and small. A cordial minture to be taken frequently.
28. Expired. The next of his would

not permit the body to be executined.

(Although the following was not commu-Saturday, Feb. 14th, 1869, Sir Anymour Overza collected the pupils in the theatre, having notified that he had some interesting communications to make to them. Enuminer Lyam, Professor Guthric, and Councillor White, being present, John Murphy, whose case is noticed in No. 222 of this Joursal, page 546, was brought forward. The man knying unfolded his un-mentionables, Sir Anthony introduced him to the notice of the company, and cheerved, that the physicians and surgeone had deter-mined, to future, to hold a public consultstion in the theatrn every Saturday, on such cases as were considered audiciently loteresting; and had agreed to observe the rule promulged in Dr. Persival's Medical Ethics, to wit, that after the medical sttendant had stated the history of the case, his colleagues should pronounce their opi-The Knight then laid hold of the acrotum. and said, that having treated (" tickled up?") the men for ten days, with a fivegrain blue pill night and morning, he opined the maindy was not venereal, but acrofu-lous. Mr. Guthrie considered it was also inflummation, and might be cared by the ordinary means. Mr. White thought, with Sir Anthony, that the disease was scrofulous, and was not to be oured in the stmosphere of an hospital; change of air, oxer-cise, and regular living, would, in his opi-nion, do more than all the physin io the kingdom. Mr. Lynn seld he had not paid particular attention to the case, but from tho patient's appearance, he should conceive the complaint to seise from disorder of the digretive America, "The man (John Mur-phy) having pulled up his breeches, and walked away, Sir A. Cartisle observed to the students, that he had a very painful duty to perform in referring to some scandelous reports of cases treated in this Hospital, that had lately appeared in a neterious publication, which he considered a diagrace to lication, which he considered a diagrace to the medical republic. He west extremely acry to find, that may pupil of this Heagh-tal could be found have example to supply respect to so levelling a publication. Which respect to the particular separate, he should not healtate to may that they wrong to make pleatance, joint, and they wrong in make with a size to injust the anighest a principal facility, and to putder to the accellation-rests of a currier absorbs necessar. Of the feetings, and to pender to the steelid interests of a certain absorbers person. Of the reporter he should pay, that he was navorthy to nasociate with gentlemen; was a traiter, a spy is the own; and would doubt-less, go on from one vile dead to another, till he had sunk to the lowest abyes of in-

hem; that they would consult their own Mr. Calleway at the same time holding the hiding place, in order that his Gorgon insumants might be recognised in the face of day, and that he might be for ever axcluded from the society of honourable men!! in conclusion, he declared, if the pepils continued to screen such a wretch, and if similer. reports shoold continue to appear io that vile periodical, he would never open his

mouth (query, a re !) again. Mr. Guthrie said, he had no objection to the publication of his cases, provided they were fairly represented. His feelings had been much hort by the manner in which he had been handled in the reports elluded to-In one instance, especially, (a case of hernie) he had been made to say, that he had used too much force, and had ruptured the gangresous intestine; now he had merely said, that he was afreid the texture of the gut could not withstand the force necessary to restore it into the abdom

Mr. White considered that Twa Lancor had done some good in the profession, and, if conducted in a spirit of moderation, would have done much more; but of late it bed adopted such as obnormous and injurious line of conduct, as to disgust the heads of the profession, and, consequently, to paralyse its ntility.

Mr. Lynn gave no opinion; but doring Sir Anthony's oration he said aloud, " let the

## GUY'S HOSPITAL.

OPERATION OF LITHOTOMY BY MR. KOY.

On Tuesday iast, shout a querter past one o'clock, Nobie Freeman (the patient), was placed on the operation table. The straight santh having been introduced, the second lactrice lard here a small pertion of the methrs, and the polet of the knife was in-serted into the groove of the staff, and ex-mied converte into the bladder. It was evident, however, that the kulfs in its in-tablection into the hadder had to contend indoction into the badder had to monum-indext recess considerable resistance, to as fairs it approximat out of its course. This mic recedibited by the Modder contracting, and decing the marks which was of large life, done in the mark. The badder made made, and facing the marks the badder made made and fill, were think withdrawn; and the droops man, down in the marks The daile and open were their withdistant, and the damops missional whose the fagure. The above transposently neathly hald held of and the open ratter attempted to extract it, but were failed; and although it two populatily generally in forces, yet, an assessed of the large star, it was from impossible to article to write the distingtion. The knowledge the referent dilating the awards. The knowledge therefore,

enry. He trusted the pupils would not her | was a second time introduced, and the sec-our such a degraded character amongst tion of the neck of the bladder enlerged; sonour, by bringing him forward from hie forceps in the bladder, with the atone in their grasp. To the effort of extraction, the alone broke, sed a large fragment was removed. The operator egain introduced the forceps, and endeavoured to extract the remaining portion, but the stone again broke, and enother fragment only was removed. The forceps were afterwards necessarily iotroduced a great number of times, but the irritability of the bladder was so great, and the contraction so violent, that it was with considerable difficulty that the remaining portion could be grasped et all. Each effort, however, succeeded in removing larger or smaller fragmeous, till it was so crumbled that the operator called for a scoop, which was introduced, but it was found impossible to use it with edvactage and facility. From the excessive sufferiog produced by the operation, and the necessary and repeated introduction of the forceps, the patient begao to feel exhausted, and the operator thought it best to desist for a few minutes, during which time some wine, and a few drops of isudanum, were edminiscered. Ha then determined to inject the bladder with warm water, convinced, as he was, that many fragments still remained. The operation of injection was repeated several times, washed ewry many pieces of stone, and some congulated blood, and facilitated the grasping of the stone very considerably; five large pieces were removed after t are mige pieceion, and, after the sixth, not the smellest periole of the stone was left behind. He was immediately unbound, mech exhausted, and pot to hed, sud a dose of the syrup of poppies administrated.

18. We visited him with the surgeon this morning. He had passed a good oight, was tolerably free from pelo, and there was but little tenderness of the abdomes. The urine had flowed freely through the wound.

The operation was one of considerable diffionity, owing to the large size of the stone, and the extreme irritability of the bladder. It was such he one to be operator, to use his own words, " had never before ex-perienced." Mr. Key did not, for one mosent, less his presence of mind, but con-seted himself "in a manner that the publie have a zight to expect from a surgeon of Guy's Hospital." The operation lasted about (westy minutes.

nte admitted during the Week, under the nary of Afr. Hednaby Conser.

Chapel Word - Born on neck and arm. Direct Ward-Lojury to the eye. Corneling Ward-Retention of Urine. Accident Ward-Lajury to arm. Lacerated scaip.

## ST. THOMAS'S HOSPITAL.

#### OPERATIONS.

On Friday, Reb. 13, Mr. Green per-formed two amputations below the knee; the first on an elderly man, of emeciated appearance; in this case the circular incision was adopted. The limb was removed in three minutes; the arteries were easily secured, and the stump dressed in the usual manner. The second case was that ofthe manner. The second case was that ofthe young healthy-looking man, on whom the double flap operation was performed; considerable difficulty was experienced in securing the vessels, and secondary humor-rhage occurred during the night, but it was readily suppressed by Mr. South.

#### SLEEDING FROM LEECH-BITTE.

Mr. H. Storer in a note to the Editors of the London Medical and Surgical Journal states, that he has found lunar caustic scraped to a point, and applied to the month of the vessel after the blood has been dried for the moment, an effectual method of stopping the bleeding from leech-bites, when all other remedies have failed. He recommends that care should be taken to apply immediate pressure, to prevent the skin from being discoloured by its spreading. For ourselves, we have found small pieces of dry sponge, rolled hard between the fingers, and inserted lu the orifices, by far the most effectual and desirable remedy in these sometimes obstinate cases of humorrhage.

## LECTURES

ON THE

DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT OUY'S HOSPITAL BY

DR. BLUNDELL.

LECTURE XVII.

Incorpability of Retaining the Urine.

Woman are somatimen affected with what is called an incontinence of urine, an iocapability of retaining the water, which, like the urioary retentions, may srise from vary different causes, requiring a little attention from us, sod to the consideration of these

we will now proceed.

The uterus is too frequently the subject of a sort of scirrhous change, followed by malignant ulceration; and this malignant nlcaratioe, beginning shout the neck and month, gradually apreads itself into the vagios, the rectam, end the bladder; and whee the bladder is laid open lote the vagios, of course as inexpability of retention is produced, this being the last stage of the malignant ulceration and admitting of no effectual ours. Dilution of the orine, by drinking freely of squeeus fluids, and the thorough ablation of the vagios, by the lajection of tepid water, are principal palliatives, in cases of this kind, and the more attention is paid to desaliness the better.

It further happens, occasionally, and this course of a few more necessary. It further happens, occasionally, and this course of a few more weeks also becomes that retentions of arise seminonly suites that retentions of arise seminonly suites the course of a few more weeks also becomes able to hold the water vary wall, heavy still liable to the gusbes, when such these bases where the observability of the disease of which Jornariy took triaty of the disease of which Jornariy took consists to the principal remedial means; in some cases, when the bladdar because looked, there may be continual stillicialium, the maket their and tracked, at length, with much abdominal pain pain and trackers, and continual ariging, with mach abdominal pain, for the more you improve the general health respected gushes of the urine is much in the more you will increase those healing

tities, and a greet deal of constitutional irritation, the urgiog, perbapa, being scarcely less valuement and paioful than that of parturition itself. Now, the impression made on the mind, particolarly before this urging manifests itself, is, that there is no retection of the urice, but simply an incontinence, a mistaks obviously of grave consequence, as rupture of the bladder may arise from the misapprehansion. The affectual means of relieving as incontinence of this kind is, the introduction of the satheter, to empty the bladdar thoroughly, after which the cause of the retention abould, if possible, be ascartained and removed, on principles already explained.

explained.

There is yet a third variety of incontinence, and that is, the iconoticence of orice, which resolts from a mere weakness of the neck of the bladder; common in those who have had very large families, ten or twelve children, for axampla. In these cases, more aspecially if the child is large, or the pelvis small, when the la-bour has been laborious, the bladder is apt to get so infirm about the neek, that it loses much of its retentive power, and, per-baps, from the mument of dalivery, the woman is iocapable of retaining the water : or if, at any time, she chance to sough, laugh, rise suddeoly, or io any other mannar con-tract amerily the ebdomical muscles, the water comes gusting away. For years this disease may continue, in greater or less severity, but it frequently cores itself, in good measure; and the first few wasks after delivery, say at the end of the fortnight, the patient is batter; at the sed of the mouth the retentive powers are still more increased; and in the course of a few more weeks she becomes able to hold the water vary wall, though still liable to the gusbsa, whee sudden efforts are made. Hence, where iccoutinense is the result of an enfechied carvix vestors, time must be looked upon as one of the principal remedial means; in some cases, perhaps, advantage may be obtained from plunging the hips into cold water two or three times daily. The improvement of the general health is by no means to be neglected. for the more you improve the general health

powers of the parts on which all norse are | the prethrs, in the ordinary manner; or, on trial, e large plaster being applied alternately to the abduman and the loins; the vesications being repeated for five or six times, as the parts may be found to hear them. Whether any advantage would be derived in these cases from blistering the back part of the neck of the bladdar, (a proposition which may surprise gou.) I am not pre-pared to say, but I presume this would not be found impracticable, for the upper part of the vagine lying in contact with the nack of the bladder behind, something stimulatiog might be applied there for four ar five hours together, according to the affect produced; and in cases where there was a ere weakness, without grave arganic lesion, if stimulus is likely to be of use at oll, I should axpant more advantage from this local excitement, than from axtensive but remote veniontion of the abdomen or the loios. Understand, bowaver, sharly, that I do not recommend you rashly to resort to this prec-tice, which may be attended with its avile; but I think it proper to mention it, and the proposel may not be undeserving of further consideratine.

Of locontinence of prine, one of the most abatinate varieties is that which reseits from an aperture formed by slough, and leading through the nack of the bladder into the vagina; this aperture may be very small in its size, so much so, that you cannot clearly distinguish it by careful examination, or, on the other hand, it may be of very considerable dimensions, insecuel as two or three of the fingers may be passed through it is to the urinary cavity. This disease mey, I thick, generally be traced to parturition as its origin. The labour has been laborious, erhaps instruments have been need; for the first few days after delivery the urlashas been passed with difficulty, or the catheter has been required, and then, perliaps, for a few days more the water has Sowed without help, and then sa inconti-nence of urine has followed, and this has been strocecied by the atcaps of a membraneus

racre immediately dependent. Commeo the ather band, if the angiture be small, it define is bestowed by some upon the use of may be very often full by a delicate touch, blisters, and they may, at least, deserve a in the same manner sawe may, by examination, detect the os uteri. If the sporture la so small that you cannot discover it by manual examination, there receause one other mode by which the point may he ascertained, and that is by inspecting the oritios of the vagina, and sacertaining whether chaler forcing the urine passes from the visitial orifice, or that of the urethra, or from both. In some cases, perhaps, a piece of anonge passed into the vagina might enable ne to determine whether the urioe really found its way into this canal or not. In cases where much oicety of discrimination is required, the practitioner may employ the vaginal dilator harvafter de-scribed; and this, with or without a specuium, will coable him to secertain, with precision, whence it is that the urine is flewing, and what is the size of the aperture, and what is the situation in which it is placed.

Incontinence of uring from an apenlog in the neck, may be treated in two ways; by paliatives, I mean, or with a viaw to a fundamental cure. In the general, women will submit to the trial of the palliative means only, of which the fallowing are the principal: in the first place the patient should drink somewhat copiously in the course of the day; not at her meals, bowever, for fear als aboutd disturb the digestive organs. Pure water, toust and water, or any similar baverage, she may drink freely se as to dilute the orine, and diminish its acrimony; and by drinking one or two pints more than ordinary, in the course of the four-and-twenty hours-from the axcoriation, inflammation and awalling, prodoced by the distillation of the price over the anriace of the vagine, much reliaf may be obtained. A second point of treatment, of an small importance, is that of great personal cleaniness, and, if I may be allowed the expression, neginal eleminess; in the same way that the hands and feet are daily, and repeatedly purified by ablution, so, too, this part of the body may be kept clean. I sticoceaded by the stoape of a membraness substance from the vagins, which, on insurance from the vagins, which, on insurance in consequence of specific of binder that vagins, altered in consequence of specific of binder that vagins, altered in consequence of specific of binder that vagins, altered in consequence of specific of the state of would recommend the patient to week

its superior part; and then, by expelling to be attributed to the action of the vagins; the water briskly, she washes this part of for the neok of the bladder lying in contact her person from one axtremity to the with the vagies behind, the vegius, swelling other. This should be repeated three or out a little, may press into the sperture, four times in succession, and the whole and thus act much in the same manner as operation uight to be performed four or the apong itself is designed to do. five times in the course of the day. There But you will sometimes be asked, whether is, however, yet a simplar mode in which there are no mesos of radioally curing the the bath, which will often be found to up be of very recent occurrence, if, for exposture is preferable; and by repeated injection with the syringe, she may purify the vagios as before. In maosgiog the practice, it coght to he a main object to perform the operation sufficiently often, and thoroughly well, and when executed in this manner will be found to remove all that is offessive and acrimonious from the vagina, and will, most probably, heal the surface, if brokes by superficial ulcerations. There is yat another palliative practice which may be thought of io this very distressing disease, which may close up, in the way of a plug, the opening into the bladder. The practice is more especially renommended by Mr. Barnes, who has written a paper on this subject, which has been published in one of the earlier volomes of the Medico-Chirurgical Transac-tions. Wa are advised, by Mr. Barnes, to take a ball pessery, and corar one hemisphere of it with a piece of fine, soft sponge, afterwards of the vagina. If the aperture is very small, this instrument is not likely to be of much service; but if it is large enough to admit a finger, for instance, then the aponga will make its way into the opening, and may be expected to close it. When the urine is to may render the removal of the pessary un-necessary. Here, then, are the three pulliative measures well worth your opseiderssich, for the disease is one of the most dis-

iginal ablutius may be accomplished, and disease; and different propositions have at is, by the use of the syringe without been made to this purpose. If the disease swar the purpose very well. The patient sample, you have stiended the labour, and may alt if aha please, but the recumbent lisve had the womenunder your care, when the alongh comes away, why, then, by im-proving the general health as much as may be, by keeping a catheter introduced in the hielder, lying there, so as continually to draw off the water by the nateral passags, (the ursthra.) a buttle, or bladder, being connected with the other extremity of the catheter, you may, perhaps, sometimes find in these cases of slough, that the part will heal and close up of itself; but certainly auch closures are of very rare occurrence. Where, however, a alough once seperates, so and this consists in the use of some iostrument as not merely to break the contiouity, as innisioo orrupture might do, hot to remove a part of its aubstance, I presuma it rarely happens that the disease cures itself in this way. Of a ours of this kind, I never, myself, saw s well-marked case; yet this core should be uttempted, for if the opening be small, and a good deal of adhesive matter be secreted now and then, perhaps, the aperture may become closed. Of course, the less the bladsliding the instrument into the seperior part der is disturbed while this operation is prooceding, the better, for motion disarrang more or less, the process of hesling. But to proceed. In those cases in which there is so incontinence of urine produced by an specture, fistulous perhaps, and of small size, searcely large enough to admit a small he passed, the patient may withdraw the catheter, for example, it has been proposed plug, and suffer the urius to flow, afterwards that we should attempt a cure by mesos of replacing the instrument; or, perhaps, she tha actual cautary; and this method of treatmay be tsught to introduce a catheter; and if also can perform the operation well, it with success. Mr. Travers, from whom I may render the removal of the pessary unscessed. Mr. Travers, from whom I first received my information, assured managements. Here, these are the these ballies late he had a my information, assured managements. that he had seen it performed. With a good speculum, and a vaginal diletor, in wo-men who have had a large family, it is perthereing kind; the thorough dilution of the feetly easy to obtain access to the apperior mater, the thorough shintion of the vegics, but of the vegics in front, where the open-and in these cases where the aperture is inglies. Nor would it, I conceive, be by major, the thorough shintion of the vegion, part of the vegina in front, where the openand in these cases where the aperture is inglies. Nor would it, I conceive, he hydroge, and which mould seem to shmit of say means difficult to apply the cauteriang lies least remedy, the introduction of a theorem difficult to apply the cauteriang shows a least may be analyzed; but I should show the aperture in the which may a least may be analyzed; but I should show the aperture in the which may be supposed; but I should show the irreduced the parts. The whole prachabled, the arise may be retained in the library countries separably, to the amount of a dust of the parts. The whole prachat positions separably, to the amount of a dust of relief by means of those mild pelfaw amount in these seems, a part of the listices before recommended, the cases in retensive power may depend on the situation of the speciars, but mans, I assigned, is adoption, must be rere. For myself, I have hitherto had no exparience of it, and, there- upon into the vagina; the opening arising fore, I forhest cotering into details. It is not from slough, but laseration. The way proper I should add, that in one case in which it was tried by an emiceot surgeou io this country, it failed of success, but the patient aeffered no further injury to consequence; and I need not tell you that It would he nowise to condemn the practice on account of the opaucoessful termination

of one solitary over.

Where there is no aperture of this kind, it has been proposed that we should close it by ligature ; and the extension of a principle before laid down, was first auggested by ao esteemed pupil, Mr. Pressoo. Of this operation it is, I thick, proper, that we should not lose aight sltogether, though it would he foodd, I fear, of no sasy peris so circomecribed, that the application of a ligature in any way must be difficult; and I cano ot forhear indulging a sanguina expecend to the other, care being taken that this bladder or a bottle about be moosed to fastolous opening shall soter into the interior about the cather, to collect the sion, and form a part of it; amert inflamma-water as It flows.

And here I think it right to observe, as kied, I think, that already auggested, the actual cautery, I mean, might be preferable. So, theo, to bring our observations here

to a summary, when the patient la anxious simple disruption of the teature. In slough, to be cured radically of the disease, we have too, there it always a great deal of injury in-

Before I quit the aubject of inconfineoce, there is yet one other sariety which doubtedly secur sometimes, and I have I ought to meetion, and that is, the incom- seem one very comprisoned instance of it, tinence arising from ruptors of the hack A woman, in the neighbourhood of this part of the neck of the bladder, laying it metropolis, for it is well to relate an illus-

io which this rupture is produced, I explained to you in e former Lecture. Buring delivery, the hladder becomes over-charged with urine, and the head of the child coming down ioto the pelvis, presses the hladder, thus loaded, against the symphysis poble, so as te divide it loto two obsmbers, one of which lies below the head of the arch of the puhis, and the other above and in front. If the hisdder be emptied exrefully by the introduction of the catheter, no ill effects enses; hat if the accomplish the delivery without emptying the bladder, the hand still pressing down upon the lower chamber, it hursts the hladder, and tha urine comes away lo a large guah, giving formance; for the whole space of surface oo | the first lodication of the occurrence of the which we should have occasion to operate, accident, (observe the demonstration,) and on making your examination as soon as this a ligature in any way must be difficult; and guah issues, yoo find there is a large aperit woold be still more, to apply it without ture, ieto which you may pass two or three distressing the urethra. These distinuities fingers. Now, at the first sight, this woold ought not to be concealed; but, after all, appear to be an accident, which acarcely admitted of a remedy; sod certaioly it is tation, that if the ligature could come be much to be deprecated, and the rather, as it properly applied, o apeedy closure of the may teo often he attributed to the bad ma-aperture would ensue. Remember the ax-sagement of the accoucheur. Nevertheerlmeots already laid hefore you, io which less I am astisfied, that the closere of the ligatures were applied to lerge spertores hisdder by hasling is hy no means impracin the bladder of the rabbit, with the effect theohle lo all there cases. Improve the of closing it completely. There is one other general health as much as may be, intro-practice which has been suggested, a rough duce a catheter into the bladder, and let it ons, it is true, but which, however, de- be contioued there, so as to withdrow the serves a pessing outlies from ns. In this water continually, and perhaps you have the practice it is proposed, that in those sases satisfaction, in the course of a furthight or no which there is a fistulous opening through three weeks, or a mouth afterwards, of findthe neck of the hiadder, we should take so log the parts internally healed. Dilution

haps, more active than that produced by an probably you know already, that there is a aperation of lithotomy; and from this in- wide difference between this case sod that fammation a closure of the aperture might in which an apeniog is produced by slough; be expected; hot to an operation of this in slough there is not merely the aperture, but the removal of a part both of the womb and the vagina; in rupture, no substance is wanting, the injury being effected by a to be cared radically of the disease, we have the turn is always a great cest of largery means before us—the day; dicted on the parts contiguous, but in those also of the urchra—the closing of the aperture by ligatures—the use of the actual exceed that which might be produced by cautery all of them uncertain—the actual clean incision with a knife. The not, here cautery in small fishlous opening being, ever, kinging estable in the incision, that in perhaps, the most promising remedy of the turn, the distribution of the large much three. donbt; such closures, however, most un-

trative case of this kind, under smart labour, | making an incision into any part of the was delivared by the lever, with no small lungs was abserved, on the least pressure, violenes, according to her awa raport; and to onse out from their times. The stomach when the child's head was liberated from the polvis, the perlacum was torn, and a enplous gush of the water issued, and from this she laboured under incontinence; the water issuing continually, and the parts be-coming excoriated, inflemed, and awelled. A friend of mins, a vary axcellent acconnhaur, being called at length to see this case, he found her with the arine still flowing, and labouring under a great deal of exco-riation and irritation in the vagina and parts adjacent, and, led by these eiroumstances, he instituted an anamination, when he per-ceived an aperture in the bladder, which he requested ma also to investigate, when I plainly found a rupture of length saffiat once. This woman I cubecquantly examined with more care, for I was subported to give avidence respecting the case, as it became the subject of legal investigation; and some time after I had made the first axamlastion I saw her again, and, no making further examination, I found the neck of the bladder was completely closed, and the woman could then retain her prins sufficiently well, though not with the same ower as before the accident occurred. Now here is a case which, after considerable experience, I examined with more than ordinary attention, and where, though at first two or three fingers were introduced through the upening in the neck of the bladder, a somplete closure was at last accomplished. The eure was abtained in the manner recommendad, hy introducing a catheter and keep-ing it there, a bottle being affixed to its inferior satromity, and the urina being lu this manner withdrawn continually by the natural canal. Of course the general health was made the subject of attention.

## FOREIGN DEPARTMENT.

ON ASPETALA PROM. SUBMESSION.

By M. Oavila.

The latest experiments of M. Orfile o this subject, seem to prove that stor duch the liquid penetrated into the intellect remi-fections of the brunchia. In a body, which thirty six hours after ducts had for air hours and a half been placed in a bathing tut

did not contain the least particle of the finid. In two hodies, which two days after death were placed in the minture for about forty minutes, it had entered the traches as far as its division, and no trace of it could be funnd in the atomsch. Two important conclusions appear to result from these experi-

1. The presence of water in the bronchia and tiesne of the luggs, is no anticlent proof nf the body's having, during life, been im-marsed in water, as is asserted by several

writers on forensic medicine.

2. The fluid does not penetrate after death into the atomach, and its presence in this organ affords ennsiderable ground of cient to have admitted two or three fingers suspicion of the body's having been daring life immersed under water, provided there be un reason to believe that it was awallowed before, or injusted after the immersion,---Journ, da Chim, Médic.

> ON THE DISSAGES TO WHICH THE WORK-MEN IN TORACCO MANUFACTORIES ARE BUBIRCY.

## By M. POINTS OF LYONS.

This little treatise may be considered as a valuable supplement to Rammanini's celebrated work on the casual relation which anieta between different trades and occupatinna and several diseases. Wa presume that a brief account of it will be of interest to nur readers.

The number of workmen who were the subject of M. Pointe's observations, amounted. to five handred; they were amployed at one mannfactory, and, although occupied in different ways, were all of them in continual contact with tobacco. The affections to which they seemed subject, were principally palmonary consumption, inflam tion of the eyes, anthrax, and faruncies, tha two latter of which generally appeared on the trunk, were extremely tedinus, and unless the occupation of the patient was changed, hardly ever admitted of a permanent ours; but the affection which seemed to prevail meet was purpura humarrhagion, and a disposition to sentry. On the other hand, it is worthy of remark, that tobacco manufacturars, in some degree, appear to be azempt from certain affections, viz. intermittents and scrofule, which are very com-mon among the inhabitants of Lyons, the latter being remerkably pravalent in other manufactories, especially in those of silk. and a Ball defit proces in a seminary core; manufactories, especially in interest it made.

filled with water, with which sight pounds I tech, against which tobacco has often heen
of powdered saimal chargost had been smerted to possess prophylaotic powers, was mixed, the coloured finid was found in the very frequent; but trembling and nervous extreme brenchial ramifications, and on affections, to which persons who are much

in contact with parcotics are said to be very liable, was in no instance observed as the effect of coerinued amploymant in the menufactory in question.

METHOD OF OSTAINING PURE CRYSTALS OF GARBON.

Is the sitting of the Académie des Sciences, on the 3d of Nevember, M. Geenal gave un account of his researches on a method of obtaining crystals of carbon, by means of the action of phosphores on the carburet of sulpher. The latter substance haing placed in a retort, aed cevered with a small quantity of water, a few pieces of phosphorus were introduced, and brought into contact with the carburet; the phospherus immediately melted, and was precipitated in a liquid state, so that the centuete of tho retott were separated into three strata; the fluid being now abakno became of a milk colour, but when left quiet, soon separated into two atrata, the uppermost of which was water, the lower phosphuret of aulphur; and these on a closer examination wern found to be divided by a thin layer of white powdery sebstance, which, whas exposed to the rays of the sun, produced the colours of the prism. Eccouraged by the anccess of this experiment, M. Gancal repeated it on a larger scale; the quantity of water, bosphorus, and carburet of sulphur, used in the second experiment, was eight ounces of each : the three aubstancas having separated were left at rest, and after twentyfour hours a very thie pellicis, consisting of a white powder, formed between the water and the carboret of sulphur, and presented several centres of crystalization. After enlarged, at the same time the separation of the two lower strata became less marked, and at the expiration of three months they appeared to form one meas. The crystalized sence was removed from the phosphuret of sulpher with some difficulty on account of the great inflammability of the two aubstances. The crystals were found to produce the colours of the prism, and the largest of them, which were the aise of a millet seed, when shown to M. Champigny, a jeweller of great experience, appeared to him to be real dismonds.

LIGHTURE OF THE UPTER THYROLD AN-THRY, AND THE CORNOR CAROTID IN BEONCHOCKLE.

Fred, Gerocht, setat. 29, of a strong consti-tation, had been from his fourteenth year affected with hronehocole; and this having latterly attained auch a size; as to render any exertion impossible, he applied to M. Laugeebeck, of Göttingen, with the liope of being freed from his deformity by a aergical operation. The whole gland was considerably calarged, and had a strong pulsation, particularly over the right upper thyroid artery, which was vary superficial, and was as large as the common sarotid; the left thyroid artery was less calarged, and more deep areted; from both ressels numerous branches ran over, and antered the enlarged gland. The tumoer was very tenus, and its temperature considerably sugmented; the voice of the patient wea hourse, and respiration was rendered extremely difficult by the least exertion. order to prevent the further growth of the tumour, M. Langenbeek determined upos tying, first, the apper thyroid artery of the right side; and is case this should not have the expected effect, npon subsequently performing the same operation on the left side. A few days after the operation, which, from the superficial situation of the vessel, pre-sented no difficelty, the patient was able to leave his bed; the pulsation and tension of the tumour had somewhat sebaided, but Ita considerable hesisorrhoge took place from the wound, which, though soon arrested hy means of sold water and compression, returned within two days with such vielence, as to throw the patient into a state of the greatest exhaustion; so that oe its recer-rence a third time, M. Langenbeck resolved upon immediately tying the common carotid shove the omohyoid muscle; the hemerrhage was icetautly atopped, and the patleet, who had bernn the operation with great firmness, was, (spparently in a favour-able state, removed to tile bed,) where he, however, within a short time, full into a state of stupor; his countenance was pale, the eyes were closed, and the pupils immoveable; he seemed deaf, and it was only by frequently to be real dismonds.

In the sitting of the Académie Royale on could be elicited; all meaning haves, expending of November, Mr. Themped give copy there we the height any measures, expending the results of his chemical examinations of these supposed diamonds, which he found to be pulse very small; the stoom and writes consist entirely of silicit, and when brought; were passed juvolentially. The communication of a voltain pile, to silicit any other pulses of the pulses gradually inquested, and the action of a voltain pile, to silicit any other passed, and the scion of a voltain pile, to silicit any other passed, and the scion of a voltain pile, to silicit any other than the passed extinct; which is not any other passed, and the scion of a voltain pile, to silicit any other than the passed extinct; all measures, all measures, all the strength of the passed extinct; all measures, and are the operation, the right correlation than the plant of the passed extinct; all measures, and are the passed extincts; all measures, and a repeating the question, that may enswer

were of natural size; those of the left side,

where no trace of exadation could be found, were distanced with blood; the right lete-ral ventricle contained a small quantity of serum; the right caretid was firmly ettached to the serrounding pullslar tissue, and to the pneumo-gustric nerve, the substance of which was somewhat more dense than usual; the internal cont of the extery, which was circularly divided by the ligators, was of a bright red colour, and Its cavity, from the ligators to the stigin of the upper thyroid ertery, was filled with congulous; below the ligature the congulum extended into the innominate; the thyroid artery had also only its internel cost divided between the ligature and the thyroid gland; a congular was found, which edhered housely to the periotes of the vessel; the process of adhesiva inflammetion had apparently been very incomplete, which, probably, armse from the following anomalous distribution of the vessels; the common carotid, instead of dividing into the enternal and internal, divided isto the latter and the upper thyroid artery, which furnished all the branches generally arising from the external carotid; the ligature had been applied near the ori-giu of one of these branches, in consequence of which the continual afflex of blood pre-vented the occlusion of the artery. The bronchocele was partly of a spongy texture, similar to the corpus eavernous penis, and partly celleler and compact, cartilaginous, in some places even precous; the branches of the thyroid arteries were considerably enlarged; most of those proceeding from the opper right thyroid were ob-literated.—Neus Biblisth, für Chirurg.

LONDON MEDICAL AND SURGICAL JOURNAL.

#### Celeulus in the Urster.

Me. GARRET DILLOW gives on account of a post-mortem examination, from which it appeared that a stone of about the size of n chestent, "with a small segment of it looking, as it were, into the savity of the bladder," was found in the extremity of the bladder," was found in the extremity of the wreter. The patient was known to have calculus while living, as the stone was stily felt with the sound; and the operastill more awkirerd.

ON THE CONTRMPLATED PROJECTS FOR SUP-PLYING SUBJECTS FOR DISSECTION.

## To the Editor of THE LAWGET.

Dean Ein .- The importance of such questice, as the proposed scheme for pro-viding the achoole with enstonded materials, which has set so many pece in motion, would have made mo pause before delivering an opinion, if my discent from the views of the mejority of those writers who have treated this topic, did not at case determine my alleose, through the fewr of appearing singular. The receipt, however, of the avi-dence chicited on this subject by the Com-mittee of the House of Commons, and the Report drawn op by that body, accompanied by a request to state how the project recommended in that Report would effect the interests of the sactomical schools of Dublin, leaves me as other alternative than obedience to your wishes, and the misfer-tone, of course, of being considered as " eccentric." You will not, I presume, imagine that I disrespect your flettering commission, or that I merely shun the tolla of such a task, when I decline a formal digest, or examination, of the contents of this interesting volume. Besides your own masterly condensation of these documents, I have not seen an English or Scotch newspaper, or periodical, weekly, monthly, or quartetly, io which a summary of there was not givent To add, therefore, to the number of these analyses, would, I conceive, justly subject me to the proverbial sareasm of "importing cools to Newbastle." The Irish press alone has been dumb on the question, and I do not regret this additional instance of its tocitaralty on matters of atility to the country; for, as I shall confine myself priscipally to an examination of the contemplated projects in relation to the school of Deblin, I shall have the consolution of not being confronted by the contradictory teatimony of persons, who might be supposed as well informed on Irish affairs as myself, and more competent to express their in-formation with rhotorical effect. As usual, therefore, I shall make "Home, sweet home!" the foom of my special time; if my of them should, by chance, apply to other places, but those places profit by them; bet such of them we may not, I trust will tion has been frequently proposed by many pinors, let shose places profit by them; conducted sufficient security to satisfact to it. From the constone position of the contoning AR. Dillion is led to remark, that "had this patient they do not it of counstances for which they included to the operation, the images which its way on the foot of a dwerf, may infinition to the operation, the hopera which like easy on the foot of a dwarf, may would have been placed in a most switzend piech the tops of a giant; so the observationism." To this, we assent; but pro-tions which may be true of one country, bubby in the hands of some surgeous, the become false by translation to mother, nituation of the putient would have been without an error in logic, or a breach of vetacity in the writer. I am thus partioniar

is pointing out the abjects of this paper, to blished feeling, and not for creating a new avaid, if possible, the imputation of schimm one. That this was the inhestion of the from the fashionable doctrines of the day; Legislature is pretty excellent, even allowing and because I understand yno have, in London, a certain set of men called " Journalists," who would be happy to mesh me in their nets, not for sake of the fish, as I have learned from an experience of their friendly intentions towards me, but perely from the pleasure of pointing out its bed qualities.

The multifarious opinious set effoat on this question by Parliament and the press, all converge, I perceive, in the single project of procuring subjects, by a repeal of that statuta which subjects, as an edditional mark of infumy, the bodies of executed murderers to dissection; and by the ceactment of another statute, for the appropriation of all hodies ecclaimed after a certato time, for the uses of the anatomist. The first of these propositions assumes, that if this statute were repeated, the prejudices against anatomical pursuits would be so far diminished, that persons would leave, and that their surviving friends would permit, their bodies to be dissected efter death. the repeal of this statute did not produce these effects, I confess I neither understand the grounds on which su much importance has been ettached to the ubliteration of this ordinance, nor see bnw it would multiply the resources of the anetomist. The advo cates of the measure ere all positive on this mint, and essert that it will: here my dissent from the crowd commences, sud from none of them with so much diffidence as from you, who expect such salutary consequences to flow from the extinction of this statute. The utility of the proposed repeal of the statute depends, I think, entirely on the fact, whether the same prejudices which exist et present against dissection, were felt before the ensetment of the inculpated lew?-for, if they existed previously to the passing of this estatute, how thee can its repeal remove what it did not create? The reasons for believing that these feelings were entertained enterior to the operation of this lew, are so strong and numerous, that one or two of them will suffice. The further, for instance, we trace back the history of the human mind, the more pewerful will its disgust against dissection be found; so that, if we compere eny given period in the history of men with the etate of his feelings on dissection since the enactment of this law, it will be found, that, contrary to the assumption of the advocates of its repeal, these feelings have

for the occasional everyights of that itiustrious body; for, otherwise, we most suppose them guilty of the extreme absurdily nf imagining, that the wretch who could deliberate on the destruction of his fellow nan, would be deterred from his purpose. by the fear of a diagrace, to which he or others were insensible, while in a state of innocence. This would be rather too much, even from the " Collective Window" of the empire; but to do them justice, they certainly were oot guilty of this blunder; they made this lew on the false hypothesis, that as honest men have a horror of dissection, the murderer might be actuated by e similar motive, end be prevented from the commission of crime, by the certainty of this posthomous puolshment being inflicted. In their general opinion of the feeliege of mankind, they were right; in ite application to particular individuals they were wrong; for it does not follow as a necessary consequence, because one, who, hy way of illustration, mey be called Virtue, fears dissection, that enuther, called Vice, will be accessed by eny such eppreheasions et all. To suppose that e man who coolly cotertains the design of morder, will fling from his hands the dagger or the bowl, on reflecting on the prospect of being dissected, is as obsurd, as to imagine, that the same in-dividual would awellow a camel, and be choked by a gnat. Io all prohability, no morderer's hand was ever steyed by each a consideration; but as we have no autheo-tic confessions from speculative assassins, the analysis of their feelings most be mere. matter of conjecture. We only know the naked fact, that a much more powerful motive in such deliberations, the fear of death itself, is so far centralized by the hope of escaping it, that the number of murders now, are pretty much the same they ever were to similar conditions of society. It is true, perhaps, that this foolish statote may have made the prejudice against dissection darker, by e shade or two of sectimental colouring; but admitting this icorrase of hostility to anatomical pareoits to have taken place in consequence of this law, it is surely too much to expect that its repeal: will reduce public projection below, that level from which it caused it to assend. The truth is, that this metastry is making. This deeper than the favors of the substate back: its notice is to be found in the disadvonter of its repeal, these feelings have posterious of human maintain itself. It is recally diminished instead of being increased. The principle, too, so which the law distinctions; than usually falls to the lat of itself was concled, its proof of the correctments of this opinion; the Legislature passed its future, to confine the operation of feeling for the purpose of operating on an esta-

A Section 1

feelings are not oxclusively possessed by men; they are common ever to the inferior enimals. A horse will evoid, against the severe remonstrance of the whip and spur, the presence of the corse of one of his own rest of mankind; for any other use that can bresent moral system.

be made of it, against the arguments which have been here advenaed, it may, I think, it is intended to supply the schools by the fairly indiged in Mr. Macarinay assueum; appropriation of undimmed bodies, is also among the "morbid preparations of the enounbered by some doubtful costingencies, which is would seem to have which seem to have except the observaemanated. The cample of France has been to have a scaped the observaemanated. The cample of France has been tition of those whe have so dogmatically deadduced as a powerful reason for the repeal of this law. It is true, that this law is the professional men a seminad on this
does not wait in France, and that subjects point, and the returns of unclaimed bodies
are plentiful there; but these circumstances, laid before the Committee, ore fastful odds
I conceive front conceeded by the relation
of cause and offset. There are various confeel the force of the opposition, and yield so
ourring cutters to which such an abundant
far as this question has been settled, with

exerted with effect; and thus to restrain samply of subjects, may more justly be the inducates of this sumagest of all human jettributed, than to the absence of may such posacions, add-publicynthus, which, tran-lessed the subject of the property of the subject of the subject of the scending the besideries of life, instinctively etands sentinel over that system, of which it English, or any other people, if I am in-was the protector even in its raiss. Such formed rightly: but they submit to it, as feelings are not oxclusively possessed by they do to other inconveniencies imposed by the law, not from chuice, but through operoion. And with respect to the boasted supply of subjects in Paris, I have this season received several letters from stuepecies; and there can be little dnubt, if dents residing there, stating that subjects he possessed the powor of generalising his ware much more readily procured at home, ideas, the deficiency of which, according to where the comoxicus statute is in full ope-Locke, places him et such an immeasurable ration, and no unclaimed bodies are approdistance beneath his rider, that he would printed for the schools. Pray observe that never stand tamely by, at the dissection of a in analysing this proposition, I am not connever stand tamely by, at the dissection of a in analyzing this proposition, I am not con-dead brother of the stud. I have repeat-edly asked man, by way of experiment, opposing the exaggarated effects appeared whom I considered the loast susceptible of from its sholition. As a preventive egainst such impressions from their temperament urime, totally imperative, and a possible and svocations, whether they would suffer the body of a deceased friend, or dissection, it ought to be expunged from the relative, to be lacerated by a parcel of attute book. By views axism no further boys in a public dissecting room? and than a balief, that its repeal will not icorease they inveriably conwered me that they the present cupply, by a single subject in the would not. I am ewere that in the city year; and that neither by the ebolition of in which I em writing, there is a do-this, sor by the sunctment of any other, current containing the names of several law, will the inhabitants of these countries self-devoted subjects to dissention, which be so far familierized with dissection, as to might be opposed to the suistence of those leave their own hodies, or their surviving facings for which I contend—I allude, of friends to suffer them, to be dissected after coarse, to Mr. Macertney, of our suiversity, death. The little which I heve read, hes and his stoical disciples. The doctor, how-elevising and the strong in the doctor, and bls candidates for the bonour of au lity of mankind, and their susceptibility to euctomicel sapultore, are not the world of the initionic by the property of the initionic by the second of the missionic fraction of it, which scarcely Decalogoe by Lyeurgus, and a five hoadred used be taken to to the account. Had the lasmed Professor, instead of spenleg a which all the cardinal virtues of our system, registry for the europient of the names were the vices forbidden by his, are almost of persons volunteering their bodies for the safficient to prove that mee, instead of think-advancement of acisance, proposed a trip to ing it inoffensive to dissect each other after the moon, there can be very little doubt but, death, might, by education, be taught to like nil enthosissts, he would beve his failsustomical sapultors, are not the world of he influenced by the most apposite circumlike nile other can be very steam actually one, located at its very laudable act to devour lowers, end that every seat in the first each other slive. Yet, admitting this woo-balloon that he launched for that planet, derful planticity of the buman intellect, would be taken by companions as accentric; the religion, education, and habits, of the as himself. The only thing which this dopone of these islands, will prevent them, as himself. The only thing which this do-people of these islands, will prevent them, coment proves is, that there ere anne I imagine, from being ever reconciled to sixty or seventy persons who differ from the dissection, without a total revolution in the rest of mankind; for any other use that can present moral system.

respect to the demand and supply in Lindon claim the deed beggar-man as one of "his and Edinburgh, reserving to myself the thirteen poor relations," where, you know, right of expecting some defects, in the the roots of the inflicit genealogical tree working of the proposed system. With ultimately terminate. The number of unrespect to the zohool of Dublin, the esticitated bodies to be derived from these mats is, by general coasest, deemed personal courses in our city would, I factly erroneous. One fact, it is said, is worth a thousand assertions. There is in this city a very large pasper saylum, containing, generally, between two and three thousand inmates, called the House of Industry. In this vest repeatory of There are, for example, at present, in Dub-missay, every grade of human wretchedness lin, apwards of five handred dissecting flads its lest home. In a city second to pupils; allowing such of them the lowest Loudon in point of population, and in a quantity stated by those examined on the security the worst politically aircumstanced question, that is three subjects each, they in Europe, the majority of whose inhabimats have been denominated, in a parlis-mentary return, as " vagraots," or beggars; It may well be supposed that, in a refuge of this kind, there must many die who come law. There is, partly in connexion with this establishment, a private enstomical school, and not the largest aither of its kind in Dublin, which receives all the unclaimed bodies of this obsrity; and what is the fact?—an umple mapply, of course, will the proposed isws, been grossly axag-be the maswer of the advocates for appro-gerated. If you compare this vast supply be the maswer of the advocates for appear in the of sobjects, with the rarity of the appearance is the of sobjects, with the rarity of the appearance is the of sobjects, with the rarity of the fact; this large pauper saylum does not half in which sublic feeling is outraged by extent, this large pauper saylum does not half in which sublic feeling is outraged by extending the control of the cont prietors being obliged to have recourse to you will agree with me, that the good the ordinary means, of procuring dead bodies greatly prependers over the evil of the by exchumation, in fact, if parformed for obtaining unclaimed bodies, there are but two or three others which would furnish subjects to any amount worth notice. These are the Old Man's Hospital, and the Hospital for Foundlings; but as the govermore of these institutions possess the right of disposing of those who die in them, and exercise this right at the expense of the funds of these institutions, I doubt much whether any law could compel them to give they preside. I suspect the governors the sobject. Admitting, for the purpose of would not, at least, do so voluntarily, illustration, that the law of appropriation With respect to the supply that might be was pussed, and produced the expected appected from the medical and surgical "golden age" of anatomy, how is this hospitals, an attendance for years in saob irich harvest of corner to be distributed to the manufacture of them enables me to say—first, the num- by what aethorities 1—and to whom 1—by her is very inconsiderably supplied by the our civic police 1—or by our chartered pro-largest of them; and, ascordly, that such fessions!—to our corporate schools and bodies, is despite of all law, would be, as they gively !—or to the private once is discrimination or monopolited and dissected by the nately ?—for payment in each, or in compli-sportentiaes of the aurgeome to these as well means? Here oping a field for abuse institutions. Take a public indeed, not of opption, and litigation, through which the an hospital io Dublis, to add to a common genius of a Tribonian could scarcely see its stock! No, no, we manage affairs in 17th way. The police are accessible, to briber, land in another way. The moment such the medical corporations to the influence of a God-send would appear is an hospital monopoly; so that between the power of a Cod-send would appear in his nonstant spinony of the best vertex as a power where, under the new law, the most shahion- money on one side, and the impulse of self-able coxcomb among Mr. Counch's approx- aggrendiscement on the other, a perpetual

grant, be something considerable; but when compared with the demand, or with the actual consumption, to any one acquainted with the myological statistics of Dablin, it would appear but as a drop to the occurs. would, of course, require fitteen hundred, a amaber of anelaimed bodies which would, I think, not be supplied by all Dablin, not in one year, bot even in ten. The number of dead bodies consumed alone la Dublin sach seasoo, not to include those experted, cannot be less then from fifteen hundred to two thousand; not one-tenth of this quantity could be procured by soy other means than those at present in use, the writs of which have, like the other circumstances of boat of all ways to avoid offending the fai-ings of the public. It has been said that this system has a tendency to make its agents villains; I do not think it makes villains, it merely gives them employment; and if they are not at this work, they will find amployment, perhaps, of a worse kind. There is sucther point, of much importance, involved in this proposition; bot one which such bodies, in the establishments over which I have not seen noticed by any writer on tices would instantly put on crape, and scene of corruption, in all probability, would

take place. I confess myself totally vanile | man, son of Major K- u of this place, to compose, out of our present political or was affected with humoptysic, followed by professional authorities, a tribunal from which justice to all parties might he expected in the division of the spoil. I have not new, however, time to ran ever the contingencies by which such a law might be entirely defeated; but, from the interrogatories which I have started, you may readily conjecture the coerse my lequiry would take. Do not, howover, in this, noy more thus to the consideration of the former proposition, conseive that I am apposed to the seactment of a statute for the appropriation of the unclaimed hodies to the uses of the anatomist. It may assist, but will never do all; and if sompled with a clause for the effectual prevention of rehumation, tha cere, I conceive, would, at least for Dublin, be far worse than the disease.

> Sincorely yours, Entwewers.

Dublin, Feb. 7, 1829.

P. S.—My compliments to my friends Doctors Johnstone and Macleed: I have got through the second volume of the weekly editioe of the Medical sed Physical Joureal, and shall transmit them my view of its contents by the earliest opportanity.

## QUACERRY.

#### To the Editor of THE LANCET.

Sin,-As you profess to appose quackery in all its forms, I do not hesitate to address you on a subject which has lately been much talked of, sed which has not sltogether escaped your notice; I sliude to the pretended cures of consumption by a person named Long. I am at a loss to conceivo the motives which enald have actuated the Editor of the Literary Gazette to yield such implicit faith to the deplarations of such a preteoder; the liberal codowments and general informating which a poblic writer ought to possess, should have indeced him to lace a little more reliance on self-judgment, place a little more rename we want by declara-tions which beer the stamp of infetuation or ignorance. Of all the mass which have or ignorques. Of all the cases which have been mentioned at successful in that work, not one of them beers the character of true consumption; and it is rather singuing that while the pretended cures are hissoried forth, we should been nothing of the unsuccessful cases, for I suppose the man does not profess to ours all that are sent to him. However, I can give you the result of one of his pretended cures.... A young gentle-

cough, emasistion, sed all the symptoms of threatened phthlus; he was declared consamptive by the medical efficers at Chatham; being sent on leave to his friends, he was seen by Dr. Diokson, of the Naval Hospital here, and many other medical men, who egreed in that opinion. In this state his frieeds were strongly recommended to seed him to the consumption-curer; he was new able to ride ont on horseback, and was only debilitated from the effects of the disease, and the nonessary abstemiousness which it was thought boat to adopt, so that there could not be a more favourable case for the ettempt; he went to town hy ses, and bors the voyage vory well; on haing seen hy the obsrictan, he declared him to be in a confirmed consumption, but that he would send him back well to his regiment, in throa months; he was to visit the doctor sace s-day for an hour, during which time he was locked up in a room, with the doctor and others, who were pledged to recreey regarding the proceedings there adopted; during the rest of the day, he was ardered to est and drink what he chose | not to abstain from company, walk about town, and consider himself curable. At length, in shout three mouths, the patient was pro-neunced oured, and invited to remain at the doctor's house as a guest, where, no doubt, overy use was made of him, as a specimen; but at length the cough, which had not sub-sided, was accompanied by symptoms which convinced him that he was fast verging to eternity; the usual alternations of awasting and districts came on, and he insisted on coming home to die among his friends; which after a tedions journey, was jest effected is time to breath his last in the midst of his sorrowing relatives. Although this statement may nover reach those before whom this young man has been axhibited as a proof of the doctor's success, yet it may onable many practitioners to deay the validity of the cares which have been promulgated, backed by the authority of Lord this, and fir George that. In this neigh-bonshood the above result has damned the doctor's credit, and I hope, through your means, it will have the same effect in many other places; but unfortunately on those octhe sofferers are convinced of their error. bes setisted himself with his ill-serned spolls.

Fremaie,
Yoor constant reader,
M. D.

Plymouth, Feb. 4, 1829.

THE OLD MAGE OF RECEASE HALL.

## To the Editor of Tax LANCET.

Str. -- It is now more than twelve years since the Apothecaries' Company announced their success in obtaining a legislative enactmeet, empowering them to meddle with those departments of the medical profession of which they were then, as they are now, (individually and unliectively) notoriously If it be asked, what stops the great mass of ignorant. The tameness of the College of gusting; the ratail chemists and druggists, the actual epsthecavies, throughout all England, presented a striking contrast; they met, anbecribed, and formed a committee among themselves, to watch thin programs of the Bill. What were the consequences? Why, that their interests were specially protected in all thu cionses; and thus a measure, introduced into Parliament with the specious and avowed intention of correcting the shuses in the statu and condition of that body, by whom medicines are chindy compounded, prescribed vive socs, and dispensed instanter, in every village, town, and city throughout England, was pervarted, most scandalously, from its nbjnct, and, to serva the espidity of its originators, metamorphosed into an engine of interference with, and oppression of, the medical and surgical profession at large. This, Sir, is the brief history of the power of "the Hage of Bhabarb Hell." Shartly after, in 1816, the reduction of our military and naval ferces was immease, and hundreds of medical officers were thrown upon half-pay, and, among the reat, the writer of this erticle. What did the Haga? Why, they promulgated a notice, intimating, that no persona, and of course neither army nor navy sur-geous, could practise as apothacaries, until exemined by them !!! Hed it been ordainad by lew that such axaminations were to is espable of instituting an efficient unbe conducted by Fellows of the College of deal analysis. Who is he, possess—Physicians, all would have anhunited with ed of this principal? Name him! I be obserfulees, and many with pride; but I say, there is not the continuous will not attempt to describe my seasones who had been intrusted, many years, with the medical charge of 600 or 800 men, 600, the bear, of asstrony and possible of principal observations in the world; had been painfully conversement with gun-shot wounds; and had performed in the capital and minor operations influenced in the particular of superly, and size, and insultant of the continuous and indignation were minimum by the drug-pounders of black-of-balence? If an individual, so gifted, friers!!! My diaguat and indignation were minimum; the sensation was universal in both services; and manuscrials were instantly be detected in week company! ad hy law that such axaminations were to both services; and mountrials were instantly forwarded in the heads of the respective de-partments; of which these shopkespers were no sooner aware than they met, com-

cocted, and advertised a by-law, exempting from the operations of their set, all medical ndicors who had served his Majesty!!! The concession was scorned, es it deserved to be. A legislative measure was arranged hetween Lord Palmerston, the Secretary et War, and the Admiralty Secretary, which rendared their by-law superfluous, and placed them and their act beneath the contempt of the medical corps of both services. aurgeone and general practitioners took on Surgeons, and of the great body of general this occasion, I grieve to say, the answer practitioners, on that occasion, was dismust be, "none." The consequences of their tressonable and spicidal apathy may be found in The LANCET, Nn. 270; but it is not too lain; the nld proverb, "Givn a rogun rape enough and he will hang himself," is peculiarly applicable in the Blackfriers' shopmen. The impedent and pranumptuous pretensions of these people must npen the ayes of the respectable and educated part of the community, and ultimately lead to the destruction of them and their act together.

In 1816, when the notice from Rhubarh Hell first appeared, the quastion which arose in my mind, and which was cagarly asked, was,-" Whn are to bu the Esaminers? Who is there among the Apothecasies' Company competent to conduct an axamination in avery branch of the medical pro-fession, and in all its auxiliary aciences, which their regulations require? Where is that man to be found? Name him!" The reply from all quarters, cauched in the lan-guage of well-deserved ometempt and derialon, amounted to this,-They will divide the and, amounted to tria,—Leg will droke the version departments consignt source, and they will sopy their questions, and the appropriate ensurers, from books / A pretty set of Easminger, truly! Let mn, Mr. Editor, now repeat the question, let ma ask, "Wiso in the men, belonging to the impodent junto composing the Rhubarb Hell Gang, that is combile of constraint as afficient. is capable of instituting an efficient mnbe detected in such company!
Your very children servant,
E Hela-bay Naval Officer.

Devemport, Dec. St. 48

IRISH APOTRECARIES DIPLOMAS.

To the Editor of THE LANCET.

Srn,-I avail myself of the readiness with which you give insertion, in your very useful Journal, to every communication relating, aither to the advancement of medical knowladge, or to the health and comfort of the community, to solioit, through its colomus, attention to the manner in which diplomas are granted from the Lying in Hospital of this city. With the manner of conducting the internal arrangements of the institution, or the description or kind of instruction given within its walls, I have nothing to do. If defects axist la these particulars, (and it has been whispered that some do exist,) the pupils, who are the persons most Interested, if they possess no other means of remedying tham, have, at least, the medium of your Jouroal, (which has produced so much reformation in other places,) to meka them known; and no one, who has witoessed the offeets of your exertions, will deny, that defects may be removed and abuses corrected, by making the public sequainted with their existence. What I complain of is, that diplomas are granted to persons, who are by no means qualified to practise even midwifery. The persons to whom I slidde are Irish apotheoaries. Amongst this body I will admit there are many individuals who are wall informed, but they are axceptions; and I will essert that the most prominant characteristics of the majority are great ignorance and consummate effroatery. In England, the apo-thacary is a well-instructed man, compared to a person of the same danomination in this country; because, by the laws of the Apo-thecaries Hall there, he is chliged to be informed upon many branches of medicine, beaidas pharmacy : while, harc, his education consists in using the pestic and morter, and compounding physicians and surgeons pre-scriptions—"secundan artem," together with the reading of the London or Edinburgh Pharmacopous, without any attention whatever to the primary and material branches of medical knowledge, vis., anatomy, physiclogy, surgery, and the practice of physic; without an equalitance with which, he is as unfit to be macoucheur, as he is to be white he prefence, and attempts to be, hamaly, a general practitioner. In it not shimmen a general practitioner. In it not shimmen he have the care of human life intrusted to mea, who, after seven years houses feet, cannot be uninteresting to any recassed smidet the tures, syraps, belasms, olass of the community, I anciose the paper belasms, without hear, a black eye, or a full-grown foot, having led to many arrors in these matters a state hear, a black eye, or a full-grown foot, having led to many arrors in these matters. crop of the lich; and after thirty minutes ters, I propose, first, to endeavour to class examination at the Hall upon the making away the mist which has enveloped it, and,

of calonel, the doses of rhubarb and magnesis, the making of cintments, with a few set questions upon eclds, aikalies, and opinm, receive a diplome to practise the art and mystery of an apothecary? With such qualification as this, or without any whatever, a person can pay 201, at the Lying-in Hospital, and, after aix months, raceiva a license to practise midwifery! That such an individual, from practice in that way, may attain a machanical expert-ness, like an artificer, in devising and employing the most ingenious methods in forsing children, delled or elive, through the natural apertures, I will not deny; but I attongly asspect that he will not be possessed of that degree of medical information, that skill and judgment, which difference of constitution, concomitant and incidental circumstances, and diseases in the partorient person, demand in a practitioner of midwifery. If such a person abould, by chance, be a handy finger-smith, and he competent to the doties of the vocation, yet a great injury to the community results from the practice of conferring a diploma, where no real qualification accompanies it; for, with this document, man palm themselves upon the people in conciry towns and villages, and commence the pions employment of killing and curing his majesty's liege subjects with as much professional pomposity and assetimonious gravity, as the most lsarned, or seemingly learoud, big-wig im-London, Duhlin, Edinburgh, or clsewhere. I remain, Sir,

Your obedient servent, HIRERKUS.

Doblin, Dec. 25, 1828.

MON-EXPANSION OF HORSES' PART.

To the Editor of Tun LANCET.

Sin,—The following experiments, &c., were originally intended as an answer to some letters which have recently appeared in The Sporting Magazine; but as it epicors the party who have the menagement of that publication, are desirnos of hearing only one aide of the question, they have refused them admittance. Aware that most of your reeders are interested in the safe going of their horses, and that any thing which can tend to alumidate the much-agitude question of fast lameness, or he productive of practical results in the shoeing or treatment of their houses' feet, cannot be uninteresting to any

at a future apportunity, to pursue the sale-| back, or nothing! And that all this tirade jest matter in its practical bearings, and to shout expansion, is entirely functiful and point out what I have found to be the cause, theoretical. Three doys afterwards, I repeat-

and best preventives, of foot lameness.
On reading the November anmher of The Sporting Afagazine, I was much surprised that a correspondent, who styles himself " Nubia," should have asserted, the foot of the hurse expands the eighth of an inch, or more, avary time it comes in contact with the ground. If your readers will excuse the pun, I really thought he must have been in multius, when he hererded such an assertion. I draw my infeconce from rather an satensive saperience, and having been in the habit of continuelly dissecting feat for some years past, and most devotedly is search of facts and information on thesa matters, it is singularly unfortunate I naver sould discover this much-talked-of expansion, ar opening and collapsing, ar shatting, of the foot of the horse.

It has been too much the fashion to take this expansive quality, wrongly assigned to the foot, upon trust, without submitting it to the test of autual experiment, and " Nubi has certainly not smonthed the way much for trying it, when he informs us, that it cso be tried fairly only nu the feet of hurses that have seper undergone the much dreaded operation and baneful affects of shooing! and, as I understand him, they must be wellbred ones. That the lamine elongate, nr . descend, I am propored to admit, thereby squaing the vein, as the amiths sail it, to descend also; and that if the frog and heels meet the ground, as they coght to do, the side cartileges have motion to a certain deree. Having occasion to he at Mr. Thaobald's, of Stockwell, and aware that every facility would be offered ma to try the ca. periment, I determined to measure the font of some of the celts with the calipers, as " Nubia" describes he measured his mare's feet. There being plenty of scope for trying it, fully and fairly, on some of the best bred stock in England, that never had hasn under the influence of the " iroo prison and wedges," as " Nuhia" terms the shoe and nulls; that it might be tried fairly, I got a friend to stand by and see me perform, who is not only a good mathematician, but who is frequeetly and practically in the light of using calipers and sompasses. We saught four of the young horses out of the paddocks, and applied the instruments to such of the fore feet repeatedly. The result was slearly to my friand, myself, and the head groom, (who merits our thacks for the sivility and askinty he evineed, that the axperiment might he fully and fairly indes,) that there is unt an atom of difference in the width of fore feet, or whether with 20 stone on his chil-

ed the same experiments on the same feet, with precisaly the same results. A horse came to he shod with a remarkably good foot, I placed a man, between aleven and twelve stone, on his back, held up nue foot, and then tried the apperiment -- same result as the others. I have often occasion to rasp the quarters to the bleed, previously to turning out; and when the frog has been the chief support to the lateral parts of the foot, have tried the appariment on many of these, whilst made to stand upon one foot, and, in several icatances, with a scuple of man on their backs, yat an expansion whetever took I am, Sir, place.

Your obedient servent, C. Munoan, Vat. Surg. Feb, 10, 1869. Blackfrium Road.

RECOVERY OF AN INFANT, APTER ASPLYXIA OF TWENTY-FREE MCUSS.

## To the Editor of Tue LANGET.

Sia.—On perusing Dr. Bluodell's Lec-ture, in Number 263 of your interesting Journal, (for Sopt. 13,) he therein atates.— "New-born infante may, now and then, he resuscitated, after they have lain in a stote of asphyxia for a good part of as hour." I have sent the following account of a sase, which accurred in the practice of my father; if you think it worthy of your notice, you will please to insert it when convenient.

I am, Sir, Your abedient servent. Hanay Paintes. Eton, Jan. 9, 1889.

Mn. PRINTER was sent for to a Mrs. Groves, of Staines, Middlesex, arrived at the full period of atero-gestation, whom he delivered of twins, a boy and a girl. The boy, which was the second child, spps-rently deal. Having used the means to raaters the child, without success, Mr. Pointer wrapped it up in a finnel, sed laid it on the hearth before the fife. This occurred about elevan n'olock, a.m. The fullowing morning, about the same time, Mr. Pointer called to sea the patient; the shild was still lying to the situation he left it in, but retain-ed a little warmth. Conceiving, in the shift retained some warmth, these must be life, Mr. Pointer desired the aures to give it some gis; two teaspeonaful were given, in as kinty he evensed, that the experiment its pure state. In a short time after, the might ha fully and fairly made,) that there child began to show some symptomic flife, is not an atom of difference in the width of the here's foot, whathar on or off the ground! Whether standing on one or both boy became afterwards by far the finest

CASE OF COORDA SANCTE VITE, FROM AN

By Enward Harrison, M.D., F.R.A.S.Ed., &c.

Miss Isacalla Poaca, of Lime Street, aged ten yagra, has a fair complexion, with light eyas, and broweigh hair; she was naturally well formed, is of a lively disposition, and rather tall of ther age. To countersot her innerating deformity, the horizontal position has been strictly enforced by her mother, for the last seventeen must he. She has remained is excellent health during the whole period, nor has the weelling increased since recumbency was adapted. Upou examination, I found the three last dersal, and five lumbar vertebras raised into a large, highly-clovated, posterior arch; It was free from paie, had no discoloration, and hore pressure without inconvenience. Palse natural, howels ragular, appetite good, and she alsope wall.

The following nerrative, drawn up by her anxious mother, details the history of the complaint from its commencement to the present time:—

" My daughter last Loedon in the month of June, 1819, an e visit to some relations in the neighbourhood of Frome, Somersetabire; she was nearly four years of age, and, at the time, in an excellent state of health. She was first seized, in February, 1820, with fits, which the faculty nailed, St. Vitus's dance. After she had been afflicted with them three weeks she osme home, and nn eminent accoucheur was immediately consulted. Under the influence of the fits, cuch of which was of about half an hone's duration, her right arm and leg were in con-stant motion; they kept turning round per-petually backwards and forwards, the former at the shoulder-joint, the latter at the hip; she had no power over the affected limbs, their motions being quite involun-tary; her face, on the same side, was contracted, and the sorner of her month drawn outwards; sha could not speak so long as the fits continued, har tongue appearing too the fits continued, har tongue appearing too large for her mouth; they returned three or fair times in the day, but never attached her in the abguit; when they were over, she appeared three and fatigued, but was peer-deepy; also was quite against in the fits, nor were her faculties in the feast impaired by them; they continued to return for two contents and armount hat him. monties, and gradually left her. From the excessive weakness brought on by the disorder, it was deemed proper, in the follow-ing May, to send her to Brighton for the advantage of see air and bathing.

hathing appearing to disagree and relax the system, she returned to London in July, All her joints, and in particular those of her wrists and fingers, had become exceedingly debilitated while she was at the sea, and admitted of heing much heet in all directions. She had the misfortune to be thrown out of a gig soon after her arrival at home, but did not appear to be much hurt by the sections.

On her second return, she was constantly complaining of great waskness, and pain in the small of her back. This showed itself by her frequently priting her hand to the part, by her often atumbling, and being easily thrown down, on every slight occasion. Her limbs were so feeble and numb, that she could not welk even short distances without support. Alemed at these circumstances, her back was frequently examined by myself and others. Nothing remarkable could be peresived till some time in October, when one of the lumbar vertehrs was observed allghily to project. Her eye now becams inflamed, end as experienced coulist was consulted for it. This complaint was noon removed, and she continued in delieste health for some time longer.

In the latter part of the ensuing Decemher, she was sgain seized with St. Vitus's dance. I took her immediately to the same seconcheur, who prescribed eparient medicines, and directed function ounces of blood to be taken from the back of the head, by means of onpping. At this visit I showed him the protuberance in her back; it consisted of a single joiet, which was considershly risen; he treated the swelling with great levity, "declaring it would never be of any moment to the child." During the cold weather, sha had frequent stacks of spams in both arms and both legs, sttended with excrecisting pain. These continued about ten micutes at a time, and returned every two or three days, for several suceessive weeks. She had about twalve in all. They left har imperceptibly; and efter they were gone, she niways fell saleep. These fits were attributed to debility, induced by the capping, and loss of black from it. The pain and weakness in the back continued for some length of time. In July, 1821, the eya again became sfleeted, which occa-moned another somultation with the oculist. He examined her back, and was told what had been said. His answer was, " Let me and seas said. It is nawer was, "Let me all yon, it will be of very great moment in your daughter," and ordered her to the sea-side immediately. She was taken a second time in the following August to Brighton, where she remained filsen months under the care of a physician, who ordered her the rathe warm bath, and to lay constantly on a plain The set board. This was done, together with

to. She was constantly taking calomel with aperients. In chort, he said, she could not lire without medicines of this the improvement of her general health, description. This gentlemen recommended a caustic issue to be inserted on canh side hitter in July. "On her arrivel et a caustic issue to be inserted on canh side hunc," asye the mother, "I was larmed to the loins; his application was never here. For complaining of great washess, tried. While there her eye was frequently infiamed, and she became mere and more frequently stumbled on level ground, and chilitated. She was, at leagth, brought was easily thrown down. Her limbs were home in a very weak, feable etet. Her so feable and minh, that also could not walk back much worse; I, and her father, became so thoroughly disbectened by her These infirmities offord unansewable teageneral appearance, that we laid saids all to. September 5, 1825.

I entered upon the treatment of this interesting case ie September, 1825. The lumber ewelling was dispersed, by the process so eften detailed, in March, 1826. During this interval the patient emjoyed good health and excellent spirits. Size experienced nn feeling in above, nor has it subsequently returned. We have, I think, a convincing proof in the instance hefore us, if e close union indicating hetween choren end the vertebral column. The striking feeture, indeed the only sign of bodily infirmity, eppeared in the lumber projection. In order to connect it with

active amusements for only a few days."

sea-bathing, which was afterwards resorted | chores, we may pramise that the first attack

general appearance, that we laid saids all timony that comething was seriously emiss

The inter continued several months unsolved, netwithstanding the application of a lord month of the column, absted, netwithstanding the application of a lord month of the column, absted, netwithstanding the application of a lord month of a lord that division of the column, absted, netwithstanding the application of a lord representation of a single joint.

Evan experienced practitioners have been various internal remedies. She remained frequently deceived in these respects; I in the country till April, 1824. She relare divided to the country till April, 1824. She relare divided to the first threat the country till April, 1824. She relare divided to the country till April, 1824. She relare divided to the first threat threat the country till April, 1824. turned home in very weakly health; though, where the disorder has been overlooked for during the time of her being in Semerset- several years, and shell enumerate othere in chire, she greatly recovered, but was sub- the course of the work. We may, I think, jact to the same fits of chorce, which always infer under the circumstances, that the came un ofter exercise. Since her return, swelling had subsisted some time before it forced, and the fits have entirely left her, first appearance of cheres. We are led to This practice was carefully persisted is this conclusion, because, efter the gibbonity from April, 1824, till the meeth of September, 1825, when she was released and the second second control of the second sec ber, 1825, when she was placed under Dr. Harrison's care. She had remained in exwas elways well in the herizontal pesture. On its interruption fer a few days, the fits concellest health during the whole period of stantly returned, an long as the ewelling reclining. I am quite sere, hewever, from remained. No sooner was it removed, than various circumstances, that the fits could, the fite entirely left her, from which we infer that the deformity and the fits bore a at any time, have been reproduced, hy leaving her conel, and resuming her former relation to one another. This I think must be admitted, whatever difficulties we may find in explaining the connexion.

18th July, 1826.

Miss I .Porch has enjoyed uninterrupted good health, since the last report. She is grown considerably tailer and stocking there has been no appearance or chorvely though she taken a good deal of exercise, and foot and in a comme.

October, 1228.

.

## THE LANCET.

London, Saturday, February 28, 1829.

Ir was emphatically remarked, the will day, by one of those profound persons, who are justly classed among the ornaments of the medical profession, we aliade to Mr. JOE BURNS, that appeals to the understanding of men are seldom so personsive as arguments which address themselves to their pecuaiary interests. The observation was made in the course of a conversation at Callow's, on the surprising conversions which here recently taken place in the political world; and our friend Joz had no sooner delivered himself of it, that he looked round upon the company with ec air of mixed satisfaction and flareeness-of antisfaction arising from the consciousoess of having just given utterance to a brilliant and original sentiment : and of ferceness. inspired by the conviction that he was entitled to the general applease. Is the expectation implied by the confident expression of his vivid and shining countenance, Joz was not disappointed; indeed he was secore, upon this occasion, of main- insteadly to the general etream of protaining his intellectual ascendancy, for feesional and public opinion. Is it to the none but heads of the profession were pre- Influence of reeson, to the love of truth, and sect; and though there be not wanting per- | to a desire of promoting the public good, that sons mulicious enough to insinuete that Jox | we are to escribe the conversion of some of that he is a wit among fools. Be that as it | volgar scarrility could supply, for having expressed by Mr. Busine, without stopping ties? Clearly not; for the reasons which in highlin whather it was reserved for our now render it expedient to give publicity to species of specialing which finds the way to binely the same force, five years ogo. It every men's understanding, and effects more was the personary interests of these gentleexhortetions of saints - more solid transmu- expediency of endeavouring to follow in the

of alchemists. But we have no design to intrude upon territory which is too sucred for the footstaps of medical journalists—it is above our province referre armenes Decrees to advert to the speeches of Reverend Fathers in God, or investigate the proximate causes of the sudden flood of light and liberality which has been shed upon the bench of bishops. We shall content ourselves with a more humble illustration of the principle with which our facetions friend. has supplied us, by reminding our readers of a few circumstances connected with the publication of hospital reports.

Five years ego, when reports of cases occurring, and operations performed in publio hospitals, were first published in this Journal, there was no term of obloguy and reproach with which we were not manifed, for communicating this species of information to the profession and the public. At the present day; the very persons who once denounced the publication of hospital reports have become humble imitators of our plan, and no attempt is made to question. the right or expediency of publishing such reports, except by a few ladividuals who have an interest in concealing their own inofficiency, and who, therefore, yield reis a fool among wits, even the exemies of our contemporaries, who formerly manifed un that gifted individual will scarcely deny with all the tropes which malignity and may, we concer entirely in the sentiment opened a new path to professional informa-Secutions friend to make the discovery. The the cases occurring in our public hospitals, mentum of organism is, no doubt, a existed to the same extent, and with prereturn than ever followed the men which enabled them to discover the ever blessed the waiting dreams path which we had traced for them, and

raich they originally described as the high | them, to the execution of the profession as reed to all that was been and dishonourable. They found that the supply of solid information had produced a corresponding demand on the part of the profession, and when interest pointed out the necessity of a change of opinion, they become engar, if not cheerful converts to the principles and practice which they had condemned. Now it may not be politic, upon all occasions, to scrutinize too rigorously the arounds and reasons of sudden changes of opinion, because, if we discourage repentance, we perpetuate siu; if we do not allow a graceful locus positentic, we cannot hope to reclaim a heretic; whether in religion, politics, morality, or medicine. But a convert may have so far committed himself by his seal or intemperance in behalf of one creed, as to out himself off from all chance of making e decent justification of his adoption of another. No man can hone to gain credit for aincerity in embracing e new set of opinions, if he has been intally regardless of all deceney or moderation in defending the upinions which he doesns it expedient to abandon. " So deal with your friends," says an ancient precept, " as if they were one day to become your they were one day to become your friends." The first part of this rule of conduct, however salutary on the score of prudence, would, if strictly followed, encrosed, perhaps, e little too much on the amenities of social life; the second part of the precapt is it is hardly necessary to offer any apology worthy of all approbation, and he who has I to our readers, for adopting the only course wholly disregarded it, is in no condition to by which a regular supply of valuable probecome e convert to e new set of opinions, fessional information can be obtained. The without incurring the contempt or derision profession has bad abundant experience of of his contemporaries. Let us try by this what can he effected in a journal supported part of the rule, the conduct of that respect- by soluntary contributions, at is a jou able individual who, by dist of fifteen pounds | may alectured by the hand of a single ] sterling paid for an Aberdeen diplome, passes rious blackheed, too penarious to expend a under the name of Ductus James Joneson. bawhee for literary assistance, but prodigat At the period when hospital reports were of the meanist by which he disgusted, and arst published in THE LANCET, that indivi- jut length exhausted the patience of his

" spice and sampires," and strongly recommended the hospital functionaries to expel ony atudent who should be detected in sommunicating cases for publication to this Journal. Subsequently, when the Quarterly Journal was in a declining condition, the Aberdeen Due seems to have become sensible of the expediency of offering to his readers something more substantial than "the chaff and bran" upon which he had hitherto regaled them; but, as he had always relied, like a spider, upon manufacturing his Journal out of filmsy materials, which cost him nothing, he was unwilling to incur expense, and, therefore, hit upon the expedient of inviting atudeuts to furnish him with hospital reports, promising, by way of remuneration, sets of his own journal, which were worth their weight in paper, and for which he had long been unable to find purchasers! He who had denounced atudents as " spice and vampires," for having transmitted reports to this Journal, had the unperalleled efficultery to invite these gentlemen to supply him with reports in his hour of need, and the unparalleled meanness and impudence to offer as a reward for exemies; so deal with your exemies, so if such contributions, the very journal in which he had vilified and traduced them !

With regard to the remunaration received by gentlemen who have contributed hospital reports to this Jeurnal, of which so much was said at the late trial, we suppose deal held up the guntlemen who furnished readers. It has been said, that "every

tion is an ass;" oow, although this propo- sical entity-not e substantial remuneration furnished medical reports to this Journal, however, by which lawyers have onebsurd to deserve serious notice. It la nothing, litigants know to their cost, that e rather e rare occurrence to hoar sentiments barrister's honour is sopported by means in of this kind from woli-educated and intel- oo respect differing from those which uphold ligent gantlemen; for the depreciation of a tradesman's honesty, and that the term literary labour is cow, for the most part, kireling is fully as applicable to Sir James confined to perse-proud estimos, or under- Scantery, es to the humblest mechanic, bred upstarts, who sesk to iodemnify them- who exchanges the produce of his manual selves for the slights to which their vulgarity labour for the necessaries of life. If there society, by rejoicing in the penary which degrading in the act of isbooring for hiremost needs, in their estimation, oppress which we deny, for in our view of the men of education, who derive pecuniary matter a hireling is honourably distinprofit from their intellectual ettaioments. guiahod from e drone-if labouring for The term hireling is applicable to any man hire really involved a sacrifice of dignity who receives money in exchange for his or independence, instead of affording, labour, and can only be consistently used as as we are prepared to contend, the best and a term of reproach by one who lives abso- surest means of maintaining dignity and in-Intely on the labour of others, sod who con- dependence, the profession to which Sir siders the abstinence from all labour, bodily James Scanner belongs is of all others. or mental, that deserves compensation, es perhaps, that which would give him the honourable distinction. Sir James Scan. least title to stend on a laftier emisence harr, indeed, took an ingrnious distinction then his neighbours; for let it be rememat the late trial, between the delicate sense bered that, by a timely epplication, we of honour which distinguishes the inter- might have bired all the elequence and course between professional men and their logunuity which Sir James Scaslery was employees, and the teliger, commonplace notions of honorie, which regulate some mercial transactions; and we are, moreover, ewere that there exists a legal fiction, by virtue of which a barrieter's or physician's fee is held to be honorerium quiddens-not un

unpaid contributor to a periodical publica- honost guines, but an honorary metaphysition requires coosiderable qualification, for which an action may be maintained, but aspecially as applied to journals devoted a mere creeture of the imagination, which, to professional topics, in the handling of as it goes for nothing at law, so it makewhich the fame acquired by a contributor tains its visionary character in all the phases may often be more than equivalent to e of its moonshine existence; for as nothing direct compensation in money, yet it cannot in giveo, it follows that nothing can be rebe denied, that any reliance upon casual or turned, and if nothing be done by the counvoluntary contributions for the regular sup- sel or the physician, withing is at least as ply of a periodical work, would soon prove much as the client or the patient has a fatal to its reputation. The contempt right to expect, and often much more than which Sir James Scanlerr was indiscreet be has the wisdom to be thankful for. shough to sapress for gentlemen who had Notwithstending the fine-spun embileties, on the score of their being hirelings, was too deavoured to prove that they labour for and ignorance capone them in cultivated were ony thing really dishonourable or able to bring into play against us. We demonstrated, in a former Number, the

<sup>\*</sup> No action lies egainst e harrister for emakiifulness orns gligence, though it amount to summ negligentia.—Vide Penke's Nini Prins Cases, p. 95.

Sit JAKES SCARLETT made, in the course of his address to the jury. We did this in justice to ourselves; and we shall now add, in justice to the learned gentleman, what gree improbable. No error has been specimay be deemed, in some nort, an apology for his conduct, in the words of Archdescon Paley. "There are falsehoods which are judicious attempt, on the part of Mr. not lies; that is, which are not criminal: as where no one is cheeived, as in a servant's denying his master, an advocate tomy. It has been said, that if in a late asserting the justice, or his belief of the justice of his client's cause. In such instances sarily occupied, in consequence of Mr. KEY no confidence is destroyed, because none was reposed; no promise to speak the troth | meal, if it had been Mr. Bs awasy Coopen's i is violated, because none was given or understood to be given." Such is the doctrine laid down by the anthor of "The Principles of Moral Philosophy," in his chapter on lies; and this doctrins may serve to account for the absurd, or, as Mr. Concert would call it, the beastly attempt of Sir JAMES SCARLETT to make the fact of recaiving reward for literary labour, a ground for contumely and reproach. Of the surgeons who have, from time to time, supplied this Journal with hospital reports for a pecaniary consideration, we are bound in justice to say, that we believe most of them to be men of as high honour, and as unblemisted a reputation as Sir James SCARLETT, and that some of them are now rapidly advancing to the highest eminence in their profession.

We had intended to make a faw remarks on the " publication of hospital reports by hospital surgeons themselves," and on the tweddle of Sir Anthony Carliels, but the lawyer has engaged so much of our attention, that the Oyster has escaped from us, and we must postpone the opening of the crustaceous Knight to another opporinnity. We may observe, however, in passing, that as Sir Anruovy visits the Westminater Hospital only twice a wash, he can be but very imperfectly informed as to what takes place there, and that the arrangements

Telephood of some of the assertions which | which we have made for our reporting department at the Westminster and at the other metropolitan hospitals, are such as to render any material inaccuracy in the highest defied, and we challenge Sir Anthony to point out one. We may also here notice another BRANSSY COOPER'S friends, to keep alive the memory of his calchrated case of lithocase, where considerable time was necesbeing compelled to extract the stone pieceturn to operate, the difficulty would of course have been imputed to his want of skill. What must be the real opinion as to the merits of Mr. BRANSRY COOPER'S CASE, entertained by those who resort to such miserable subterfuges in order to bolster it up? The ground upon which Mr. BRANSBY Coops n's skill was impugged was, that there was no assignable difficulty in Stephen Pollard's case, to account for the extraordinary circumstances attending the operation : and now that Mr. BRANSBY COOPER has poblished his own report, he is avidently as incapable of assigning a cause of difficulty. as he was at the time of the operation. The explanation which Sir Astery Conras volunteered at the trial, with as much confidence as if he had seen the case, was a mere tub to the whale, and having served the purpose of mystifying the jury, has not been repeated by the Nephew in his report. Well might poor Mr. BRANSEY Coors a exclaim in the words of the Spinish proverh, " God defend me from my friends!" Šv.

BFIGRAM,

By a Pupil of the Westminster Homital,

LONDON MEDICAL AND PHYSICAL JOURNAL. February, 1829.

POOR CHARITY RODERION, when he brought his colebrated action against us, in which he obtained "FIVE POURDS AND A OBNERAL LAUDH," stated, in his " declaration," that hy our criticisms we had held him up to ridicale, and rendered ble "dis-charga" from the editorship of the above Journal, more than probable. The following is a portion of bis whina; and seeing that be was a finngry Scotchman, having an eye to the siller, and a Dun withel, who can wondar that the miserable wight dreaded the frown of his master, Mr. Souran, of St. Paol's Charchyard :-

" Declaration,-Roberton MacLaon, the plaintiff in this suit, complains of Thomas WAKLET, that he wrongfally sed maliciously intended to lajure and aggrievs him, by causing him to be assessed and ou-Madieal and Physical Journal, \* \* and thereby has austained damages to the amount

OF TWO THOUSAND POPERS.

The jury, however, heing man of sound judgment and much liberality, awarded the Dun fee pounds; just five shillings per cent. on the sum so modestly laid in the declaration. So here is a PHTEICIAN, complaining that he is likely to be discharged from the servitude of a bookseller; and afterwards has the impudence to pretend, that he is not

Roossick, it seems, had sound reasons for dreading that he should be discharged, as Mr. Sporar has had the discretion to axpange his name from the cover of the Yst-LOW JOURNAL. This glandered, foundered. spavined old back, is now, we hear, in the stables of Mr. Onne, who deeply ismeots his purchase, as it has been attended with a very leavy loss, and it is not likely that be will obtain even a sixpence for the animal's princtured hide. It is expected that the retched creature will not survive long, as he is in an exceedingly weak nod tottering he is in an exceedingly restained received considering; and from castignations received in someoqueness of his former bad habits, there remain several old seves, from which issues a horridy futil periodical distinguishing, of a dirty green colour. Although severy, this discharge is no offensive, that the house of LOHOHAN and Co. has become noterious for its ill odour, and the only automals which now cheer the old back by their presence, are a few of the most ghastly and filthy of the most rat. Bars. "Where the carrion is, there will the crows be also

The Number for the present month does not contain many original communications, and the majority of those are by no means remarkable for their axoellence. The first is entitled," On Diseases of the Nalls and the surrounding soft perts." Mr. Burnett, Mr. Burnett, the author, thus speaks of the first of the

"The right side of the toe was chiefly affacted, and from the sulcus between the nail and fillat, which bounds the onythalamus, there was a semi-purulent discharge : unbsulthy granulations had aprung up in the ulcerated cleft; and these, with the ichorous discharge, &co., gave the disease, at first sight, the sepect of onyohis maligna."

Liut having for soms time been introduced in the cloft between the nail and the flesh, and the side of the nail having been afterwards pared away without affording any reliaf, Mr. Burnett " placed the point of a callin in the eleft, and removed at once the side of the nail bed, into which the nail entured. The sore soon healed, no cause of irritation being left; and the like operation was subsequently performed on the other side of the toe with the like result." Mr. Burnett, however, wishes it to be under-stood, that he is far from thinking this trestment would be beneficial in cases of tree onyebia maligna,

The second paper is a communication by M. MONTANCKIX, on the "Treatment of. Colies Pictonum by Alum, under the direction of M. Capelar, of the Höpital St. Autoine." Alum has for a long time been used successfully in this disease, and there is nothing remarkable in any of the cases related by M. Montanosix. The remedy was given in doses of from one to four drachms. It is alleged, that neither inflammation of the stomach nor bowels, bas followed its use; and that, in most cases, three or four drachms of the alum were sufficient to rendar the patient convalancent, and that in no instance did a relapse occur. The medicine was administered in some mucileginous miature, at intervals of from four to six hours, according to the urgency of the symptoms, and, in several instances, the operation of the medicins appeared to be beneficially promoted by the use, at the same time, of oily injections.

The above uninteresting paper is suc-ceeded by an article on diseases in Hindostan, by Mr. Watan, who gives an appelling account of the terrible revages of sholers, and of the inefficacy and uncertainty of every mode of treatment that is usually adopted. The following extracts are worthy of notice :-

" The pufortunate soldier would make bis Mr. Southe's journal is now added by will, as he called it; and them lay himself Mr. North and Dr. Whatley.

at other times, with the fixed eye and con- arisen from disease of the arteries, as there ex once times, were the mass eye and con- largen from thesess of the arteries, as there whisive shidder of despair. Of cholera, as were no less than alx ligatures applied, and it appeared in Burmah, little sless might be; by three different persons, myself among said beyond the sad record of its attack and the rest: notwithstanding which, however, fatal result; if the ayantoms of this pariod the bleeding recurred et intervals, and the occurring when the regiment lay at Madrae part at which the ligature was applied, but for ten or treive days previous to its from the extremity of the funis." embarketion for Rangoon. In those days of health and plethoric fuloses, cholers perwaded the corps with upidemic violence and great mortality. The men in his bar-rack-room was as often seized with cholers, as his comrade exposed to fatigue and in-solation. • • Throughout the middle and latter periods of attack, or growing state of able our readers to form an upinion of the excessive collapse, atrong and warm punch, nature and contents of this document. with warm aromatic dranghts, to as great an satent as the atomach would admit, were given alternately with calomet and opium. These two powerful articles of the Materia Medica were, in this disease, seldom, I might also may never, as far as my observetion went, attended with their usual specias results. Naither stimulus, excitement, nor ptyalism followed, although given to a startling extent, not in grains or drops, but by scruples, drachms, and apoenfuls!"

Mr. WALLER has communicated the halfyearly report of cases from the London and Bouthwark Midwifery Iostitution, of which ha is Consulting Accoucheur. It appears, that out of 160 womeo delivered, there were five breech presentations, one footling, and one face, the remainder boing natural. There were three or four cases of sovere humorrhage, and it would appear that the patients were seved by the prompt removal of the placents. One patient died from inflammation, following severe labour. On the postmortem examination of this patient, it appeared that "the periloneal surfaces were highly inflamed, and extensively, nay, almost generally, adherent to each other. A con-siderable clot of blood was resting on the omestom, which was tightly adherent to the intestines, among which was a large quantity of bloody serum." "In several cases, (says Mr. Waller,) I have administered the sale cornutum, and its effects continue to justify the favourable opinion I have before given of its powers. I find that the powder, in doses of half a drachm, repeated (if occessary) in a quarter of an hour, is smally aufficient to answer the purpose. The au-thor concludes his paper with the following paragraph, but we are at a loss to underatand how the blood sould have excaped from the extremity of the funis, if the ligatures had been properly applied :--

metion, indeed, but without a ray of hope ; few days. This, I appreheaded, must have

The rear of the original communications is brought up by one from PARFAIT LAN-DRAY, entitled, "Remarkable case of Corpuscles, freely moving, both in the vitreous humans and in the posterior obserber of the eye," which title is quite sufficient to en-

Among the " selections" which make up the remainder of the present Number, we per-ceive a report of a difficult case of lithotomy, from the pen of a Country Bar, that wrigglea in the neighbourhood of the Winchester Hospital, where, in the vermeuler, he is atyled Mr. J. W. Wicknam. He is oot only a Bar, it seems, but a critic also; and when we can find space to insert the whole of his report (as the thiog is so good, that no part of it should be smitted,) we shall probably teach this jacks! to Ozma'a" old back," that he has entered open a most dangerous occupation, and one, the duties of which he is probably, of all Bars, whether matropolitae or provincial, the least capable of executing.

### MIBLAND MEDICAL AND SUBOICAL REPORTER.

THE third number of this Journal eppeared on the first of the present mouth; but the next number is not to appear until the 1st uf May, as our country contemporary ap-pears to think that a quarterly publication will be better suited to the extent of his resources than a monthly one. The journal before us contains several interesting pa-pers; the first of which is written by Dr. Welker of Huddersfield, and is entitled 4 Observetions on English Hospitals." We shall extract only that part of the paper which relates to Country Institutions, as we have already, on many cocations, presented our readers with, probably, more accurate ac-counts of the metropolitic hospitals, then that of Dr. Walker.

"Among the earlier Provincial Hospitals established in this country, the Bristol, "In one instance there was repeated Winchester, York, Exster, and Cambridge, lamorthage from the imbilioul short, which island conspicuous: and the other large so weakened the fafant that it died in a towns soon after fellowed the example. In

most of the earlier structures, various alter- | 900. Two fever wards have been sracted ations have been made at different times, in the garden of the Hospital, by e separate in the number or size of the warde; in the fund raised for the purpose. There are also warming and ventilation, or other improvements, which it is not possible to sunme-rate within the limits of the present paper. In stating, too, the number of patients and expenditure, it should be remembered that no two years are alike in this respect, and that the facts here detailed apply only to one year, and that, not always the last. With respect to the number and size of the wards, it has been the practice of most of the more modern Infirmatics to prefer small wards to large ones, which were less adapted ed to the elemification of the cases. Examples of each will occur in the course of the following details.

" The Bristol Infirmary," oun of the cerliest Provincial Institutions, was astablished in 1735, and ie a noble monument of tha munificance of the inhabitante, by the voluntary subscriptions of whom It is chiefly supported. There are fifteen wards, seven for medical and eight far sorgical cases, and each of the former receives 13 petients, so that, although occupied by more then 90 individuals, no inconvenience can arise from any orowding, or improper accumulation of any kind. The total number of beds, in both medical and surgical wards, exceede 200. The number of in-petients, in one yeer, is nearly 1800; and out-patients, nearly 4000; and the ennual expense, per bed, about 261.

" A County Hospital was established in Hampahire, at Winchester, as early as 1736. The building consists of e centre, and twn wings; and, in 1824, contained nearly 80 beds. The number of in and out-patients, in one year, exceeded 1500. The ennual

nxpeose, per bed, shout 284.
"The Hospital for the relief of the diseased poor in the rounty of York, was in-etituted in the year 1740; and the present public edifice was erected for that purpose, se soon as the charitable fund would nllow of that expense. It was, for many years, the only Institution of that nature north of the Trent. The great utility of this Hos-bital procored it such liberal benefactions, that though at first the lower wards only could be opened, in a few yeers the upper wards else were fitted up for use ; so that, in wards she were fitted up for use; so that, in the whole; the number of beds for men was linguaged to by said the same number for weiners. Every person who is a benefactor of SOL, or h subscriber of two guineas an nully, is a Governor, and is estimated to recommend one out-patient, or one in-patient, it is time. The total number of it and out-

more than 2000 petients annually relieved at the York Dispensery.

" The Exnter Infirmary was erected in 1741, et en expense of ebout 6000f., and is supported by annual subscriptions. The sunual number of in and ont-patients, amounts to nearly 1700. The annual expense, per hed, ebout #36.

" The Salop Infirmary was formed in 1745. It is situated on the verge of an eminence, and commands avery advantage of salubricos air and delightful prospect. There ere nearly 90 beds, end the annuel number of in and out-patients exceeds

" The Hospitel, at Cambridge, was founded by John Addenbrooks, (from whom it derives its name,) in the year 1740, and who left about 4000L to neert and maintain e amall Physical Hospitel; but the monny heing insufficient for the support of it, an act of Parliament was abteined to make it e General Hospital. It was opened at Michaelmas, 1766, and the number of pathents entually oured end relieved, is, upon an average, 1000. The expenses, of late years, heve been shout 17001, per amum, of which sum about 6001, arises from the permanent fonde, end the remainder from the voluntary contributions of the public. Two wings have lately been erected and furnished, at an expense of nearly 4000L, which are now open for the reception of patients. Benefactors of twenty guiness, or upworde, ere Governors for life; sanual subscribers of twn guiness, or upwards, are Governors during payment."

THE COMMON BUCK-SELY, OR MARSH TRE-FUIL, AS A GUESTITUTE FOR HEPS.

Mr. Your communicated to the Medica-Botznical Society, that the above-assued pleot is used in Germany as a substitute for hops, and contains the bitter principle in greater abundance than the common lop. The leeves should be gathered in the spring, and dried in the shede. It is elso amployed in browing porter in Swedne, end it is said to have been introduced there by an English sailor, in 1789. For this communication, the Society presented to Mr. Youy their silvest model.—Transactions of the Masion-Baterrieul Society, No. 1.

## MICHMOND SCHOOL OF ANATOMY.

In our last Number, we stated that it would be impossible to insert a tenth part of the letters which we have received on the adventages and dissilventages of this Institution, and on the professional conduct of its medical officers. We are at all times anxious that all parties should be heard fully, both in accusation and defence; but the controversy under the above title, has grown to such a length, that we scarcely know, what to select from the mass of comications now lying before us. We are of opinion, however, that the following extracts from two of the communications will be deemed by the friends of Dr. M'Dowell and Mr. Caranchael, a satisfactory reply to the alleged misrepresentations of our correspondent Lennox, relative to those gentlemes. Should any further communications be transmitted to us on the affairs of this Institution, we entrest that they may be made as brief as possible.

### DS. N'DOWELL.

As your readers have been treated with a caricature of this gentlemen, and sa his character has gone before the English public in an unfavourable point of view, it may not be unacceptable, before I conclude, to give something in the shape of a likeness, Dr. M'Dowell is somewhat above the middle size, with a pale, thoughtful cast of coun-tenance, plais in his dress, mild and un-affected in his manners. As an hospital surgeon, he possesses in a high degree the faculty of combining despatch of business with an accurate ettention to the examinecion of every case of interest. He does not hurry from bed to bed, with a look of solemn sawerable, mainportance, lesving his pupils atting in easily be assort blank ignorance, nor does he cocupy their signesture book. time in minute and trifling disquisition. He makes it a general rule to have the symptoms and treatment of every case deserving attention, accurately noted by the clicical clerk on the ticket appended to each bed. By this means he gives to the pupil the epportunity of studying at a glasco, at any exporturing or studying at a glance, at any studying and the publication of time, and in the most fevourable situation. Lemma's first letter, just as before it. Mr. also origin, history, and treatment of disc. Carmichael has, unhappily, been greatested ease. There is one point in which this attending the hospital at alghe of dock for gentleman has obtained a distinguished pre- some weeks past, by Harses; and it is reagainful and the property of the sum disquosis. In this important heart has any low. Mr. on the only similar coession I mean disquosis. In this important heart has within my members; when Mr. Carmichael medical attory Dr. Mr. Develt manks with went to England for the recovery of his the first surgeous in this metropolis. As as breakt, two years ago, Mr. Huttes, net Mr. operator, he has many advantages; sheadth Eletton, was appointed to do the same day; ness, ocolocus, and an extensive knewledge though Mr. Belton was then, as now, in of relative smatoury. The second of the size then the size of the angle of the axism parferent operations performed by him at the

Richmond Hospital, is the best proof of his capability. In his deportment towards the students he is frank, accumunicative, and gentlementike. During my attendance at the Richmond I have studied him closely, and my conviction is, that no man is so suzious, and very few se capable, of furnishing the student with sound and practical information. Mr. M'Dowell is still a young man; let him boldly and steadily persue his present course : avery day will make new additions to his valuable acquirements, and with the abilities and industry he pessesses, he has before him the prospect of a long and splendid career of utility. Dublin. A Stunder.

## MR. CARMICHARL.

My answer to Lennox's charge of irregulux ettendance, un the part of Mr. Cormichael, will be found in the following certificate.

### Richmond Surgical Hospital, Jan. 2, 1829.

Having carafully examined the surgeon's signature book of this hospital, from the lat day of November, 1827, to the 1st day of November, 1828, I certify that I have secertained from it, that Mr. Carmiobael personally visited the hospital, on Mondays and Fridays, seventy-six times at eight e'clock, and fifteen times at twelve e'clock, the hours appointed to meet the pupils. have further to state, that during a part of the summer, the hour of ettendance was changed from eight to twolve o'clock, at the request of a majority of the class, to give them an epportunity of attending e course of lectures on botany, given at the former honr, by Dr. Liston. The accuracy of this statement, for which I hald myself snawerable, may be relied en, and mey easily be ascertained by reference to the

# PARENHAM BRATTY, Apothecary to the House of Industry, and Hospitals attached,

I have frequently seen Mr. Belton employed in prescribing for the externs, in the Richmond Hospital, since the publication of "What," exclaims Lennor, in sease- with inflammatory distheris, such as was ment, "does Richmond mean, by the ad- usually met with in old people, colobicum ventages afforded the pupils by the House of Industry, and which induce several of them to flock to the Richmond anare l' My reply is, the House of Industry is not simply an immense poor house. This great establishment, supported by government, includes, besides the Lunatic Asylum and Poor House, which, in a great measure, supplies the hospitals with patients, four large hospitals: the Richmond Surgical, the Hardwicks Fever, the Whitworth Chronic Medical, and the Wellesley, (the most distant not a five minutes' walk from the school) and, leatly, the Talbot Dispensary, where a very great number of out-patients are daily prescribed for.

I now take a final leave of this discussion ; and appeal, with confidence, to the judgment of our follow-students, to whom I have addressed myself through you, respecting the matters in dispute between

Leanox and myself.

I have the bonour to be, Sir, Your most obedient servent, Richmonn.

Dublin, Jan. 1829,

WESTMINSTER MEDICAL SOCIETY.

Saturday, February 21, 1829.

Mr. Anyorr in the Chair.

THE SACEVILLE-STERET CIVIL STAFF. OF COLCHICUM IN ADUTE ENSUMATION.

Tur Minntes of the lest Meeting were read, in the course of which the items of the Tressurer's accounts were detailed; one of these creeted considerable merriment throughout the Society, namely,-" Police

officers, 11, 10s." !!!

Dr. WESSTER, in the absence of Dr. Oregory, brought forward the treatment of all; lergo doses of colohicum he condemned. Anute Mheumatism, by colehicus, with a la two cases, where drachm doses had been slew of necertaining, whether the Society given every three or four hours, dysentery and found this medicine as officient recently succeeded, and carried off the patients as it was estimated to have been three or is it was estimated to have been three or within three days. Colonicum be considerated by parallel to have been the patient fall (solieved by parallel to act on the system as a contrasticular to the patient fall (solieved by parallel to the symptome were aggravated by perspiration, and relieved by wernth without perspiration, in combination of the must be latter were direct terminate.

Dr. Macken differed from Dr. Webster. The utility of the colchicum dopended upon the part effected. In the most acute form his opision it ought not to be administered; in the limbs, generally effecting the substance case. In cases of rheumatism, not attended

was hurtful. In cases, such as he had de-scribed, and which he considered fevourebla for its exhibition, he had given it with the best effects: he objected to large closes. His mode of edministering it was from 25 to 50 drope of the wine, combined with sulphate of magnesis and peppermint-water, preceded by aperient medicioe. Bleeding was en excellent remedy in some species of rheumetian; coloium acted on the sys-tam very similarly to bleeding, and re-quently superseded its necessity.

Dr. MILLIOAN had used this medicine in oute rheumstism, and from his experience of it, he would not trust a case, well marked, to colobioum solely; bleeding was called for. Dr. Fordyce had stated, that since ho had left off bleedings, be bad met with fewer cases of metastasis then he had done before; his (Dr. Milligan's) experience was just the contrary. He was not an advocate for large or repeated bloeding, hot colohicum ought to be preceded by depletion. It ought also to be given in combination with Disphoretics, probably with the infusion of senne and the liquor ammon. seet. Would Dr. Wabater prohibit bleeding altogother, or would be recommend it in some cases; and were the colour and condition of the blood to be any guide as to the continuance or non-repetition of deploting? A betcher, a patient of his, who had been afficted with rheumstic gout, had objected to bleeding; he bad been treated with colchicum, and other remedies, when labouring under a second ettack, and under this treetment got worse and sunk. On examination, it turned out that be laboured under pericarditis, rheumstism of the heart, and sacites. This was a case showing that it was not safe to rely on the use of colchicum.

Dr. Wresten did not object to bleeding in some cases of acute rheumatism, but administering the colchicem, agreeably to his formule, would very frequently cure the disease without the abstraction of blood at succeeded, and parried off the petients within three days. Colohicum he consider-

the smell and large joints, and bore the nearest resemblance to gout; the closer the resemblacce the rhoumatism bore to goet the more efficacious would solchisom he found. The result of his experience ied blm to say, that whenever the synovial membrane, and sheaths of tendone, were affected, colchicum was very beneficial ; is other cases, unless it was combined with other powerful remedies, it would do no good; and if accompenied with other remedies, and good reaulted, the becefit could hardly be ettribated to the colculeum. He regarded its best effects to arise from its action on the bowale; as a direct diuretie it was not certain,

Dr. JOHNSTONE had found people to die without the use of colchicum at all, (laughter,) and, therefore, he did not think that Dr. Webster's opinion was well founded, in attributing the death of the two patients to whom he alluded, solely to the use of the colchieum. It was true that drachm doses were large; even twenty-five drops, when repeated three or four times in the course of tweetyfour hours, were to be looked upon as large deser. He seldom gave more than from fifteen to twenty drops. Dr. Webster lud sh:wa nothing to prevent its baling fairly moved by matastasis to the mucous membrane of the bownle, and that this had

Dr. Corelann thought that rheumetic Dr. Corenan thought that themsetten seffected the fibro-serous structure, and that it was not to be found to the middle of the limb, and in the muscular substance; therefore, he did not put much stress of Dr. Meelcod's distinction. Great attention by the process as atom of good feelwar necessary to be paid to all the service tag to the public, or to have any thing like and the ness of disphoretics, he might give colchicum with the best effects. He had not edministered more then half a tracks at it is disclose the importance of the invision, time. He believed complier, the liquor united the invision of the invision of the invision of the invision of the invision.

joints. There were cases, of equally scute of this description, to form the most useful Justice. In one were cases, or equally actus our team assorption, we were the most destruct the unations, where the joints only were combination with the colohisms. In the affected, or the sheaths of the tendone in more chronic form of the disease, decided the neighbourhood of the joints, and which purgutions ought to be resorted to, followed gave rise to a swelling limited to the joints by disphoreton; and then the colohisms and tendone. This was met with both is combined with aumonia or camples; or it might be tonin inferious. In all cases where the vacculer or servous systems were inordinately excited, and in all diseases of the chest, of the bronchial lieings, and so on, colchicum was to be regarded no n sedative or counter irritant. He wished to know whether the exhibition of colchioun actually increased or diminished the liability to metastasie. Campbor was not to be regarded as a direct etimulant; and as Dr. Webster bad not used colchicum in combicatian with it, bis opiniou npos it was to be bet little relied upon.

Mr. Banners looked upon rheimetism more se e disease of the blood than of the solids. The ground of this opinion was, that where no inflammatory symptoms ex-iated rheumatism was found, and the blood decidadly altered, presenting o buffy cost. The frequency of metastasia was likewise to be regarded as a sircumstance cothorising that opinion, as well as the great number of cases of hypertrophy of the heart, which were daily to be met with from rheumatism.

Dr. Geanville was heppy to find thet doctors differed in opinion. Though the colchicum had not been productive of beesficial effects in his own person, yet he concluded, that the rheumatism had been had prescribed it with great success. It might, therefore, he neeful is some in-stances, and ho of no benefit in others. He carried the patient off. He deprecated the had found small doses of calomel combined warm or tepid bath in ceees of acets rhaome- with antimony extremely useful. A gen-tism. Fementations or evoporating lotions theman who had been regularly educated to might be used.

Mr. Thouson wieled to know whether this profession io krace, endwin bad brought with him to this country every proof of good Dr. Madeod had found, in the case he had alladed to, the effusion absorbed mader the true of the colonioum; or whather, if eb-which he pledged himself to remove all themselves the partition less than the colonioum. sorption had takes place, he secribed it to metio effections that came noder his notice, the use of other medicioes? Dr. MacLEOD had never employed the give time remedy a triel; he asked for so colchicem elone. He was a great advocate reward-he merely wished to have its benecolchicem sions. At was a grant strong level of the application of leeches. The absorp-for the application of leeches. The absorp-tion of the affusion had taken place, but and he (Dr. Grantille) hoped the gratianess where it had, it was very likely to return. would not heateste to give this newly dewented medicine a fair trial. The gentlemen

it as downright quackery.

magnasia, in arthritic rheumatism, productive of the most beneficial affects.

## ST. BARTHOLOMEW'S HOSPITAL.

CARR OF SRYRRO LACRMATION OF THE UP-PER AND LOWER LEFT EVE-LIDE, POL-COWED BY TOTAL LESS OF MONT.

Estune Luson, selet. 14, was admitted at half-past six e'clock on Teasday evening, Dec. 16, under the care of Mr. Lawrence. On running hastily out of a butcher's shop, a book ou which must had hung, caught the lower syelid, passed over the globe, cotered us derneath the upper syslid, and came out "It about three-quarters of ee inch sheve the , palpebra, making a complete section of the parts, and tearing the upper systid from its attachmaets at such angle of the orbit. The globe was not in the least affected, oer any part of the substance of the eye pene-trated. There was considerable ewelling of the parts around the eye. He removed two very small specels from the frostel hone, near to the external angla, and thought be felt an additional fracture. The poor girl suf-fered much from the affect of the light upon the sye, and a great portion of the palpebra, end integuments covering, and eround, the eye, were hasging down upon her check; she was in great agony. Mr. Burnatt pre-scribed no medicine, simply requesting the nurse to keep a wat cloth over the parts. lo this condition the girl remained till nearly two o'clock on the fellowing day, when Mr. Lawrence reached her bed in his rounds through the ward. Mr. Burnett did act thick it necessary, from the condition of the edges of the wound, to bring them to-gother, on admission. The iodinmunatory process that was subsequently to be expected, he somewived, would have bean aggravated by such an ettempt. Mr. Lawrence considered that injuries of this outure ought so, here the most prough attention paid the most prough attention poid the most prough attention and attention properly demains the parts, eaght to have been issuantly beinght together by servine, somewhat it is stored to the parts, and disposition of the parts, and disposition is storighten the adjust, after over it for the parts, it is because the socket, in the storighten the adjust, after over it for the parts, and the parts, and the parts, and the parts, and the parts of the parts.

5. The wound is rapidly healing. No part of the parts 

5. The wound is rapidly healing. No part of the parts of the parts of the parts of the parts of the parts. to heve the most proupt attention paid

qualities, and trying its officacy. He regarded so important that union, if practicable, should be effected, that he deemed it right Mr. Trousen had witnessed the use of to give the parts a chance. Accordingly colchicum combined with the emborate of he brought them together with sight or nice autures, after much difficulty, and ordered three greios of calomal and twelve of jalap to be taken immediately, the house medicine is two boors efterwards, and a wet cloth to be kapt constantly applied.

18. The inft side of the face in much awollen. The eyelids are very black, and the inflammation rapidly extending. Great paio io tha parts and head, and exquisite iotolerance of light. Tongue white; pulse frequent. The bowels have been freely Mr. Lawrence felt under the neopened. ceasity of dividiog the sutures, eod consequently ellowing the parts to fall back into nearly the situation in which they were when he first saw them. Ordered an ouece and a half of the saline mixture, three times a-day.

19. Soppuration has taken place, and the sloughs of the upper eyelid are separatiog. The whole face is much swellen and iofiamed, particularly the left side. Slept during the night. Twelve seeches to be applied round the sys, and continue tha

mintere.

21. Supporetion going on to a considerable extent. A small abscess is formed in the left temple, and the patient is vary feverish, Apply twelve more lesohes, and continue. the medicioe.

22. Mr. Lawrence opened the abscess, and bloody pus escaped. The corner has become opeque and abrivalled, the ayelida mech the same. Ordered a bread and water poultice.

23. Granolations appear on the edges of the wound. The corner has sloughed, and a portion of the contrate of the globe escaped. Passed a good night, and feele better, 30. Still considerable discharge; the gra-

oulations are increasing, and the wound looks healthy. The conjunctive heeseppurated. The surface of the cornes is removed hy ulceration, presenting a yellow foul excevation, from which there is a slight dis-

S1. Mr. Lawrence enlarged the opening luto the abscess. A very considerable portion of healthy pus, mixed with blood, escaped. Considerable inflammation about

appears a little pupillary opening, and a vomiting occased; calemel and opium every

From this period the healing process went on, occasionally, however, interrupted by one or two slight accumulations of pue, natil about the and of the mosth, when the patient left the hospital. There was, then, a large granulating surface over the situation of the eye, upon the lacerated integnments, the edges of which have been brought together, so as nearly to conceal the remaining parts of the orbit.

### ST. THOMAS'S HOSPITAL.

### STRANDULATED TEMORAL MERNIA.

M. B., stat. 65, was brought into Anne's Ward, about four n'clock in the afternoon of Wednesday, February 11th, under the care of Mr. Tyrrell, with a atrangulated fenorel hernis in the right groin, which had descended, during a fit of vomiting, the pre-ceding night. The tumour was of canaderable size. The patient, who had incessent romiting, and complained of great tenderness of the abdomen, stated, that she had been subject to hernis for a long time, but elways before had been enabled to return it herself. On the arrival of Mr. Tyrrell, with whom was Mr. Green, the taxis and freezing mixture having been unsuccessfully applied, an operation was proposed, to which the patient readily assented. The sac was found to contain a considerable quantity of omentum, and a portion of small intentine. The omentum, one or two ounces of which were removed, was adherest, but not discoloured; the intestine dark and thickened A great many pupils were present, who had sseembled for the purpose of ettending Mr. Green's Surgical Lenture. The aperatino, which was well performed, accupied 23 minutes. The patient was put to bed, and ordered warm fomentations to the chdomen.

15 minims of landamom immediately; afterwards,

Calomet, 2 grains;

en, one-third of e grain every four hours : House enema, with 4 drachma of costor

12. Has been restless during the night,

but slept a little towards the morning ; vomited occasionally, which was slightly ater-coraceons. Pulse small and feeble. Contions the aslomel and apium ; no evacuation from the bowels; enems repeated; a little brandy in the avening.

13. Passed a tolerable night; pulse feeble;

part of the membrane of the aqueous ha- six hours; enems of compound mixture of senne, which again returned; red wine, four ounces; a pint of porter daily. 14. Brandy, 3 nunces daily; pulse 100, soft and feuble; bowels opened three times

since yesterday morning; sage and syrup; na vomiting. The townd presents an an-healthy appearance; complains of great de-bility, which continued to increase till halfpast eleven a clock this morning, (Sunday,) when she expired.

The body was removed by the friends before any post-mortem examination had taken place.

## ACUTE TETANUS.

David Goodhall, setat. 15, was admitted ato this Hospital about 12 n'elock on Tuesday, the 17th of February, 1829, labouring under soute tetacus; the symptoms then present were trianus and apisthotonos, with greet rigidity of the abdominal muscles. It appeared, from his own account, that the ymptoms had made their appearance four days previous to admission, and the only se that could be assigned was, a chilblain which had alcorated immediately over the right tends schillis, in size rather larger than a shilling. He was ordered by Dr. Ellintson to take helf an nunce of the subcarbonate of iron every two hours; enema, with three nunces of ail of turpentine, and s pint of decection of barlsy, which produced three or four evacuations. Pulse strong, and rather full, varying from 100 to 140,

18. Common ensms; continue the subcarbonate of iron. Experiences no relisf from any thing that has been done; evidently much worse. Expired about halfpast eight, p.m.

An examination of the body took place 18 hours efter death, when the brain, spinal chard, thurseic, and abdominal viscers, were carefully inspected by Mr. M'Murda, in the presence of Dr. Williams; nothing, however, was discovered in any of these parts, different to what is usually observed in health.

## BRERATIONS, SOTH FEBRUARY.

John Kute, stat. 66, came into the Hospital, under the care of Mr. Green, about live weeks since, with symptoms of stone, which he stated had existed for those years. aptoms of stone. When placed on the table and some could be distinutly heard at a could distance from the patient. After the skin

Mr. Tyrrell, however, examined the body after it had been taken from the buspital, and was unable to discover any thing to secount for the women's death.

20

and cellular substance had been divided, was bled, and began to take saline suixture, the gorget was applied, but apparently an Two fluid stools chaued, but without any the gorget was applied, but apparently an appening had not been made into the urethra; the knife was therefore again used, and on a second application of the gorget, it was passed with facility into the groove of the staff, and carried onwards into the bladder; the forceps were then introduced, and a stone of large size extracted; but it was ascertained that a second remnined in the bladder, this broke into cumerous fragments which were removed with difficulty, the scoop having been employed for extracting the smaller portions, and the bladder several es injected with warm water. Mr. Green wal perfectly cool and collected throughout the operation, which was necessarily a very tedinus one, occupying 39 minetes ie its performance. The patient bore it with fortitude, but et the oceannion, was removed from the table evidently much exhauated.

Mr. Tyrrell afterwards operated upon a boy fourtees years of age, from whom a atoms of onesiderable size was extracted. The operation lasted about aix minutes.

### HOPITAL DE LA CHARITE.

PROFORATION OF THE ILEUM.

In two post-mertem examinatines which were lately made under the superiotend. secs of M. Chomel, the intestinal casal was found perforated under very different previous circumstances.

The first case was that of on elderly man, who had been admitted on account of pulmnnary disease, with profuse chronic diarrhea, to which, all so a sudden, violent inflammetory symptoms secoded, and, within a very short time, proved fatal. Oe axamination, the upper portion of the lungs was found filled with tuberculous matter; the mesecteric glacds were diseased in a similar mannar; the mucous membrana of tha emall intestines was extensively ulcerated, and, in some places, covered with gasgrehous eschers, two of which being detached, the fecal matter had escaped into the peri-

toneal covity through the apertures.

The second case was of a young man, sets: 30, of a very robust constitution, who was admitted on the litts of Movember. He consisted of wandering pains in the limbs, violent headmar, ions of appetts, limbs, whitent insident, loss of appetite, exposing within, a white, epaque, and irrethirst, and great debility; the fever was gelarly rungh surface.

\*\*vary bigit, the skin day, and hot; tongue fost; meath very feith; the abdomen free paster, and pasted left behind an irritable and spars diet, were ordered. On the following day, the patient having meased is storough the ball of the eye, which restless hight, with accessions delirium, gradually decayed. Vision had left the eye

alleviation; the tongue become dry, the prostration of streegth iccremed, although the pulse was full and the abdomen free from pain, evan on pressure ; venesection was repeated, and the internal remedies continued, without my change. On the ninth day of the disease, the patient, who, for some days previously, had profuse mucous diarrhosa, became very agitated; the pulse was very weak and frequent; the countenance ex-pressive of violect paie; the abdoman was touse, tympanitic, bry tender, especially in the right iliae region. Emelient fomenta-tions were epplied to the abdomen, and mocilagineus potions givau internally, but the patient died on the eleventh day.

On opening the peritoneum, a great quantity of fetid gas escaped, the fetestical convolutions were adherest to one seother, and e considerable quantity of serum mixed with puruleet matter, was effused over the lower part of the intestinal causl. The ileum, about tee inches from the ilio-secral valve, presented se alceration of an inch in diameter, in the centre of which its costs were perfarated. The mucous membrane of the amall intestines was covered with minute elecrations, which were most numeroes towards the secrum, and, in many places, avidently passing into gangrene. The iliosacral valve was injected, and coated with purulent matter; the sacrum exhibited a few isolated ulcerations; the colon and restum were violently injected,-La Clinique.

### GLASGOW ROYAL INFIRMARY.

SCIERRUR-EXTERPATION OF THE EYE.

JAMES BENNIK, oged 50, antered the Heapital, February 9th, under the care of Dr. Couper. At the outer cauthus of the right ays a small tumour was mituated, which, on pressure, felt as hard as carti-lage. The patient said it was the seat of severe lancination paie, which sometimes also extended over the forehead. In its centre there was ou closrated opening, from which ourdy pus was discharged. The enrrounding integuments were now dull red co-leur, and the pelpebra could be separated with difficulty, only to a very annil catent, exposing within, a white, epaque, and irre-gelarly raugh surface.

twelve menths before, and, at the commence—purple colour. The conjunctive were darker mast of this period, he first observed the them entural, considerably distended, and tumour, which had become unch larger and poured out a large quantity of sensions yelmore pushful since an attack of fever three low matter. The corners appeared to months before his admission into the hospital. His health was pretty good, and none of the glands of the face or neck med affected. For some slight acidity is his atomach, he was ordered a scruple of plained of severe hurning pain in the bells rhubarb and magnesic, with three grains of of both eyes, occasionally extending round rhuberb and magnesic, with three grains of

10. Dr. Couper examined the patient today, and having done so, he torned to the students and said, " that the removal of a disease of such long standing, and obvious tracted a generalize, for which he used vacharacter, by internal treatment, was altogether hopeless. Nothing bet the entire removal of the discused mass could afford any chance of recovery." A consultation

was therefore called.

13. The patient was informed, that the

which, however, did not require a ligature. The commining portion of the upper eyelid the eyeball, as well as the lower. The eye leeches and scarifications were to be rewas then taken hold of by the forceps, and posted. the muscles cet through by the curved scissors usually employed on such occasions. The eye was in this way extirpated without much difficulty. Immediately afterwards, whatever diseased substance could be felt, sitrate of silver continued. was removed. The portion of the frontal bone situated at the outer cantius, seemed a little softened. The outer portion of the see caused by the removal of the eya, left temple, and every night an anodyne The tumour, when examined, was avideoutly draught. of a scirrhous structure. The eye was also

asamiostion gave the patient, and the parts being obscured with the discharge, could not be ascertained with any certainty. He comthe orbit. Its severity was much increased during the night, or when exposed to the light. His pulse was 108.

A month before his admission, he conrious ramedies, with relief. In a fortnight the discharge from the oretira was leasened, but twelve days since he felt a slight itching in his ayes, which gradually hecame more severe, accompanied with heat, and an acrid discharge. Two days after this occurrence, medical officers were of opioion, his only his syclids became swollen, end the dishaps of recovery rested on his allowing the charga more of a pursuest character. He diseased substance to be removed with the had used washes without any heocht. There haifs, and that it would not only be neces was still some slight discharge from the any to take a way the tumour, but also the crethra, which, however, was unettended remains of the eye. To this, after some sitcher with heat or pain. The eyes were slight objections, he consented. 15. Dr. Couper began the operation by water, the conjunctive scarified, and eight removing the tumour, along with the por-tion of the palpebre, by which it was co-sired to take two ounces of the sulphate of vered, and to which it was firmly adhereot. Images in mediately, and the next morn-A small vessel spring at the outer can hus, log to drop into the eyes a solution of the nitrate of silver.

11. The state of the ayes was nearly the was now detached from its connexions with same, nod similar treatment continued. The

12. The paio was somewhat dimloished. but the purulent discharge still remained profuse. His pulse was 110. A blister was ordered to the neck, and the solution of the

13. The blister caused him considerable uneasioess, to which he attributed his want a little noftened. The outer portion of the of eleep. He complained most severely of wound was secured by a suture, and a the left eye; outlier corners were visible, pladget of lint inserted into the new vacant Palse 90; ten leeches were ordered to the

of a scirrhous structure. The eye was also affected with the same disease. As the painter of the complesized of severe pain after the operation, he was ordered 60 drops, of less. There was none acclusing of the companies. On the same day Br. Couper removed a large warty tumour from a man's kack. Mr. do not be sensed by distinct of latver, paint to we child.

On the same day Br. Couper removed a from the argifare, thengh, highly, stiff sendings warty tumour from a man's kack. Mr. do not be detected. The distinction of the man is child.

"Sir," and derkassa. The bliner that had been said she falteriagly, "I am adual to call on cod darkness. The blister that had been applied to the neck was kept open, and the muriate of mercury was increased from one to two grains, dissolved in the same quantity of water. A blister had also been opphod to the right temple, which wer kept disthering by means of the savine clotment. To day, the schalibility being considerably diminished, the eyes were aximised; the left cornee appeared shrunk, and altogether must for the purposes of vision. The right, excepting one small apace in its centre, was covered with pale granulations. Ho was ordered to omit the lotion, as well as the visum opil, and to drop a little of the following, three times daily, into his eyes:-

B. Lap, inform, gr. EXX.; Aqua, 3vi.; Vin. spii, 3ss. Solve.

He was also desired to smear his eyalids at bed-time with the unguontum hydrargyri aitratis.

17. The discharge had ceased. With the right eye he could distinguish large objects, placed between him and the light, and with the left, light from darkness. He complained of weakness. The vinum opii was again ordered to the eyes, and a pill, containing one grain of sulphate of quinina, with three of the extract of cinchons, twice daily. He was also allowed half a bottle of

Feb. 14. Vision remained nearly the same, and as he was making little or no progress towards recovery, he latimated his intention to-day of leaving the hospital. Dr. Couper desired him to be particularly cereful of his health, and to continuo the use of the vinum opii. Ho gave him some hopes, that when the inflammation had entirely subsided, the right eye might efterwards, by stimulating applications, be somewhat improved.

PARTERN FRELING FROM THE LATE DIS-CLOSURES AT SHEETSUSON,

A succer time since, a woman called on Dr. Annania of Hy Piece, to count him on some complaint, for which the doctor ordered her to be cupped, and desired her codered her to be empose, and desprea are smit for Lumstice, with a view of Panpar-tos apply to Mr. Knez, in the Adelphi. Two is and for Lumstice, with a view of Panpar-days after the woman colled again on Dr. Ramadge, but had not been emposed; also Mr. R.C.S.E. pp. 605. Edinburgh, Officer and Boyd.

A New Stytem of Treating the Human as he was told, would operate grateinously.

A New Stytem of Treating the Human as he was told, would operate grateinously.

A New Stytem of Treating the Human as he was support to the Infirmacy of which Teeth; explaining the Causes which lead to br. Rumming is physician. The woman therefore, and their Decay, and the most approved Methods abortly lifter made a field appearance, at a great property of the support o

without having been cupped. She was now closely questioned as to her reason for not following the physician's advice. "Sir," said she falterisgly, "I am afraid to call on Mr. Knox."—"But why, my good woman; Mr. Knox will cap you outremely well."—"Yes, Sir, I have no doubt of that; but I am afraid he is some relation of Doctor facts the fact that the contract of th Knoz, the Scotch gentleman, and that he will make a subject of me; and, if you please, I'd rather not go.

POPOLAR PERLING FROM THE LATE TRIAL.

A MAN went to Bartholomew's a few days ago, complaining of hydrocele, and was placed under the care of Mr. Eactr. He was told he would soon be cured; and on Saturday last, was desired to go into the operating theatre, where it was intended to tap him. When he arrived, the theatre was crowded to oxcess, and the first object that ettracted his attention was Mr. Earle atarding by the table, with a trocar in his hand ready to operate. " Oh !" anid the patient, "is this it ? No, my lade; I have heard of that Bernsby Cooper's operation for the stone, in the Borough, and you don't take any stone from me, depend on't; heides, my friends don't know where I om.' And buving thus expressed his dotermlostion, he bolted, smidst the load laughter of the pupils. A chimney-aweeper was waiting just by, to have a cancer of the acrotom removad; but on seeing the other men meko so heaty an exit, he took to his heels in the same manner, and was no more seen or heard of. The retreet of the sweep excited renewed laughter, and Mr. Earl axolaimed, "That trial has played the devil with our operations !"

DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT QUE'S ROSPITAL BY

DR. BLUNDELL

LECTURE XVIII.

Of the indelent Scierpins of the Uterus.

In the same manner as there is much variety in the features of the face, so also there is much variety in the make of the os oteri in different individuals. In some women the os uteri is very small, firm, and flet; in others, again, very large in its size, and soft and projecting: sometimes, in those who have borne children especially, the aperture which leads into the uterus is so especious, that one or two fingers may pass it; and sometimes it is so small, that you can accredy ascertain its existence, arong the carrying approximation and which may generally be slitped into the uteriae savity; in the generally the surface of the or start is tolerably amosti, but not always, for a sort of inequality may be felt, sometimes arising; films reposity of the large membrane invisiting these parts, and semetimes, perhaps, from layerstones of the uterine substance, which have occurred during parts. it; and sometimes it is so small, that you

Of the parated, there are three forms which we must frequently observed in prac-tice, the are the flat or uteri, the other the tion, the see the six or uters, the other the jas the womb, at the and of a nim months' on a uters formed into a presented indeed, pregnancy, or even larger than this, as you and preservated by a describe executed; the may see in the preparation before you. In third the est step prejecting like a table—other cases, again, in place of this different the varies, and divided by a time—facel calrebusty, the parts are assolied with varies facely, (for the faceure never streether is solir-busty, the parts are assolied with varies facely, (for the faceure never streether is solir-busty, in the first formation of the interested of the subvenier him); and from the faceure the subvenier in the first formation of the

uteri, in form opposed to that flatinged on neer to which I before referred. In the preparation which follows, the flat on uteri is well demonstrated, the month, in both cases, heing perforated by circular apertures.

Here is a third preparation, exhibiting the transverse fasure with the labella, the one anteriorly, the other behind.

Next follows a specimen of the on uteri in a state of ragosity, free, however, from the changes of serious disease.

In the preparations which follow, may be seen apcomens of the large or uter; and the small, with the capacious and with the con-tracted sporture, the last being more especially deserving of attention, because, the aperture being overlooked altogether, the overnight may give rice to strange mi respecting the nature of disease.

### Scirrius

Among the various diseases to which the womb is obnoxious, not the least important is the indolent scirchus; and of those cause of sairrhoaity there are three varieties, the knowledge of which is of practical import-size to the econolieur. In scirrhosity of the womb, we cometimes find that the whole substance of the uterus, together with the parts of the vagins which lie contiguous, are involved in a scirrious disorganisation are invotred in a scirricous disorgenisation of the diffused kind, aprending itself squally in all directions through the aterine substance, and under this diffused scirricous disorganisation the unions may selecte gradually and greatly in the size. At first, pechapa, it hereaftes as large as the pullet's egg; then life still's leaf; and, ultimately, as large as the woods, at the not of a nine months' as at the woods, at the not of a nine months' as the womb, at the sad of a nips months To illustrate these points, I may now air-aniam the preparations before me; and you ambedded in its asbatance are the tuber-here here a specimen of the tubercular on class, cometimes fewer, cometimes more now.

200

margum, ten or éwenty in number, or per-hape not more thus one of two. At first in which the scirrhous change is of the these substrong gairrid are not larger thin pens, but within limits they may calaries the pens, but within limits they may calaries and country, is rounded, and very considerably, so that when the laber of the discover, has produce of large as in other in cases, and the change of large as in cases of diffused scirrhosity, as indeed the frepientious before you demonstrate. There is mothes appearance of diffused activities as indeed the property of the affection, and little and mention are recommended. preparations before you demonstrate. There is yet a third variety of this affection, and which, in practice, it is necessary to distinguish from the two former, and it is that is think you have a single televale only, or only nic or two twhere(Is of large size, the root, if any, being of diminutive bulk, so as to have but little inflaence over the symptomic of the disease. When the large tuberoless are few, or single, they may be varietishy seated in different cases, on the fundum the mouth, the from the back, the ndus, the mouth, the front, the back, the des, the womb sometimes enlarging ex-semight under this form of the disorder, indeed so less so than in the two preceding

In these cases of single tubercle, very much depends upon the seat of the disease. If the inducated mass be growing from the fendus of the sheres, or isterally, it may sockation but Hitle inconvenience, but it mey district the patient much when sested in frest or posteriorly, as in these situs-tions, more especially if it le low in the publish. It meant urge and distress either the bledder or intestion, so that the patient and the practitioner are led to suspect a variety of diseases, as, for example, homor-rheids, cancer of the rectum, ascarides, cal-culus, strictures of the urethra, irritable bladder, and many other affections, of which

the entimeration would be tedious.

More, then, are three variaties of the disease, all, parhops, essentially the same, bat, lo a view to precities, all properly distin-guished from each other—the diffued solrrhos, the soirrhus with many tubercles, and the soirrhus is which the tobercles are few. And to this let me add, that in all the three varieties of the disease, but in the diffused varieties of the disease, but in the diffused scirring more especially, it is not to the wome only, at to the womb and the vagini, that the disease is confused, for it not un-frequently happens, that, together with these parts, the overies, the tubes, the bladder, the rectum, may, in more coses, the liver and longs themselves, use involved in the discremination; understand further, that the disease is more likely to prove topical when it takes the form of tabercie, and more frequently spreads over the parts con-tigens, when it appears in the diffused variety. Let us ow observe the illustra-tive prejectual on

tive preparations.

Here is a specimen of the es uteri begin-

in which the scirchous change is of the diffused kind; the surfuse of the sterm, you may observe, is rounded, and vary emoch and equable, very different from what we observe it of the stranger from the stranger from the stranger stranger from the stranger stranger and subseque, but it is the stranger stranger from the stranger which is the rather deserving of your notice, because it is very cirilingly characteristic of the disease. your notice, because it is very strikingly characteristic of the disease. The specimes which I maxt exhibit, is of

single tubercle growing from the posterior corface of the oters, and which would have altimately troubled the patient mach; by bearing on the rectam and the parts adja-

The preparation which follows, is a specimen of many tubercles; the disease is here in the luciplest stage, but the womb must, at length, have colarged to a great bulk, if the patient had fived aufficiently

long. Here is a specimes of a solitary tuberole of great bolk, formed on the womb anteriorly, and close by it stands a beautiful specimes of the diffused solrrhous disorganiaction of a rounded and equable form, the wholn mass being about as large as the womb et the end of e pregoency of four

Here is a specimen of the diffused scirrhous action, presented by my friend Mr. Workman, of Reading; it has acquired the aise of a nice month ovum. Io this case there was a sort of fungous growth pushthere was a part or rungous growth posi-ing forth into the ragins, and giving rias to very fraquent and copious bleedings, under which the patient eventually unit. The apet specimen is an interesting az-ample of polypus occurring with the schrrhous disorganisation; and this leads me to make another remark respection the morbid anatomy of the parts, which is, that in scirrhesity the disease mey consist of softrhus marriy, or of scirrhus in conjuncsadrius marely, or of actrius in cohunc-tion, with polypus fungus, or other affect-tions, is themselves more or less formidable, though these combinations are by no musics very frequent. In the preparation circuit-lated, you may also observe that the stage of the ot above varies much in this disease; it has be large or satell, or with contracted, or with diseases disting, or with industri-tion, or with audientar; so that, although a cirrhoutly of the or stort, and of the va-plus, is a strong corroboration of the real axistance of reposted actribute in the parts above; the contrary is not certain; and we variety. Let us one observe the illustra-tive preparations.

Bere is a specimen of the se uteri begin alog to enlarge, under the diffused soir-thus. of the womb which he shore.

Of the Character of Indolest Schröses of the ping or leneing pains along the limbs, seven—The character of scirchess uterus though these are not common; and there is conveniently enough divided into those may be a want of muscular power in the legis, with numbers, and other mights of pressure. Uterus. The characters of scirrhous uterus are conveniently enough divided into those which manifest themselves when the dise has been of long standing, and the mb has acquired a large size, and those characters which are observed in the earlier etages of the solrabous disorganization. Now you will sometimes and patients comyou wan summumer and patients office to you with abdomes as large as if they were in the end of preguncy; but, on a little investigation, they bell you that they have been hebouring under the discasse for years—a clear proof that the sulargement is not from gestation, for with extra-uterine pregnancy it is sourcely worth while to emberress ourselves hers. On further inquiry, you discover that it is not in the upper but the lower part of the abdomen that the disease was originally sested; and, efore, that the intumescacce does not arise from an enlargement of the splaen, liver, or omentom, but of some part below; probably, therefore, the womb or ovaries, for an overgrowth of the kidney is exceeding rare. You will find, too, if you examine with great care, that the tumour is lying in the place of the gravid uterus in the general, not obviously inclining more to the one side than the other side. If the disease be of the tubercular kind, and of many masses, the uterus will have the tuberose form and feel; and if It be a diffused scirrbons disorganisation, as in Mr. Workman's preparation, then the feel of the uterus will be precisely the same as It is at the end of pregnancy, except that it in harder. Well, then, if you find in the sbdomes a tumour hard, circumscribed, of years' standing, sed which, therefore, counct be referred to pregnancy, you may be pretty well satisfied that it is from gestation; ood this opinion will acquire additional strongth, provided you learn that the tumour formed originally in the region of the pelvis, and that it still lies centrally in the region of the gravid womb, Tuherousty of the swelling is a secful corroborative diagnostic, but a useful corroborative diagnostic, but s smooth and equable surface is no diagroof of the disease. An indurated on uter in a valuable sign of scirrhosity, but the womb

Patients belowing under scirring of the nieras, will assactines, call upon you neach miles: whall the thursde is not bique thin the featel head, for entemple, in which this, the feath bend, for example, he which istitutes in the practitioner. A blusted condition I may present many distraining present may interest may, in these cases, he peased into the sangle, New, in these saving obvious to the laugh. New, in these saving, presents the salest talls use that there is a great due if severing, in it is severe in what the heat has no sand in provided you peases the requisit destroity, are saving, that the heat no, on and invitation; your disgnasts may, I think, generally be in the bleeder, and pages of the beases and blacked, and with certainty enough.

In all varieties of the disease, whether of 7.2

upon the nerves. As the inquiry proceeds, perhaps you are told that there is at ewelling seated above and behind the sym-physic publis, perceived as the patient lies in bed, compared, perhaps, to the festal head, or to a melon. Now when you meet with one of these rounded tumours in the region of the bladder, combined with irritation of of the bladder, combined with irritation of the rectum, and bearing, and the other symptoms enumerated, you may always entertain a strang cuspicion, that the patient labours under the disease we are now, considering; but it is believe in the partient by examination only, that the affection may be under united actions. be made out with certainty; and where t importance of the inquiry is deemed andicisot to counterbalance the inconvenience. you ought to proceed exactly in the same manner as in investigating a reputed pregnancy of four months, but directions on this oint I shall presently communicate. If you feel the uterus bard and round, and large as the fortal head, there cao be little doubt respecting the nature of the affection; if this mass be tuberose, the proof is still more decisive; and if the os uteri is hardened, or if the vegins be thickened and indurated, as you may observe in the preparations sent round, there can be little denot as to the real outure of the disease. Remember, however, that you must not decide too hastily, and you must not infer that you have a scirrhouty of the uterus, merely because the nterus is enlarged, for this anlargement may. erise from a pregnancy of four months, not always disclosed to the practitioner; it may arise, again, from a pregnancy of seven or eight months; and then the abdominal muscles, and the utarus, being very thin, you may feel the head with considerable distinctness, and may mistake this for a sourhous weekb.

Let me add, too, that io some of these can the womb prolapses a little, and no as uteri-ean be felt as such, the apertura being more contracted than ordinary; and is such drivenstance, if the uterine sulargament be-incassiderable, the case may be missioned for a shrould phersion, an error of which I. have seen two instances. Errors like these, however, imply a west of due skill, or due advistion in the practitioner. A blunted

single tuherels, of numerous tweereles, or leaches, itementations, and the attiphical-of scirrbus of the diffused kind, there may the plan of the milder kind, may be proper be mucous discharges or flooding, or occa- when inflaminatory againstonic enter; but be mucous discharges or flooding, or occasionally a regular flow of the catemonia. Frequently there are inflammations of the scirriose mass; sometimes there are closrations, but I add with satisfaction, that those ulcerations, always formidable, are by so means frequent. Occasionally, the wine is retained, and this, in cases of the tubercular anirchosity, especially where the growth is in front; occasionally violent spasmodio makes and fifth the translation of the tubercular anirchosity. pains are feit in the uterine region.

Treatment.—The treatment of this discuss.

so far as it admits of that which is useful, may be dismissed in very few words, for, in truth, there is little to be done; yet some remarks may be made with advantage. And, first, I should dissuade you from having recourse to any very active remedies, in order to occasion an absorption of the scirrhous deposit. Iodine may be thought of, but much purgisg, copious doese of mercury, coninna, sed other remedies of the scirre kind, should not be employed in this view; for there is no reasonable hope whatever of removing the tumoor in this menner, and if you injure the constitution by this rough practics, you leave the patient worse than you found her. Although, however, you may is y it down as a rule, that you have it not in your power redically to produce an absorption of the sourhous matter; yet there seems to be little doubt, that such shaorptions may occur spontaneously. By a very excellent writer and practitioner, Dr. Clarks I meas, a case of double tubercles is recorded, in which the masses wasted away, and the patient died under another disease, when, apon examining the nteres, there were the traces of the tuberclee stili to be seen, so as to prove clearly their previous existence in larger bulk. This shows, that new sed then the natural power is capable of socomplishing an absorption of the deposited matter; an encouraging fact, though certainly of very rare occurrence. Let me add further, that with sociations to the me and present the Will sociation ty of the uterus in its less extensive forms, impregnation is not impossible; and as the whole absorbent system is developed in the nierus by gestation, and afterwards ex-cited powerfully on delivery, perbaps, now and then, a removal of the solribous materiel may be effected in this manner; and I ones met with a case which, to me, appeared to be of this kind, but as it cooursed is my cerlier practice, and was not investigated with sefficient nicety, I would have you receive it as apportyphal; for I should be sorry to add to the huge and oumbersome

when inflammatory agraptoms occur; where there is this actionally discuss i abdomen, I would not advise you to bleed largely from the arm. If there is, as come-times will be, much spanmodic pain in the uterus, leeches and fementations, and abdominal poultices, may be looked upon as useful pullistives; and after these have been premised, you may have recourse to enodynes, either taken into the stomach, or used in the form of a suppository. Above all, when there is much irritation of the bladder and rectum, I would recommend you to ascertain whether the enlarged electus is retroverted or prolapsed, for this is sometimes the osse. The oterm prolapsing, may descend a great way towards the orifice of the vagins, and may in that manner obstruct the bladder. Where this occurs, perhaps a possary should be introduced, et all events the uterus should be passed above the brim of the pelvis, an after this operation has been performed, the urinary pessages mey become pervious, so as to render the use of the catheter easy, or perhaps unnecessary. When the womb is retroverted, you may empty the bladder and replace the uterus in the same manner as in the retroversion of pregnancy, an operation which has already been explained at large. In the general, remember that the of the uterus, the better it is for the patient, and, above ali, beware of sallvations

Prognesis.—The prognosis of this disease ou may look upon as favourable upon the whole; for though it rarely happens that women are cured of this disease, yet it is cot, I think, often, that it speedily destroye life; so far, therefore, the prognosis may be deemed very favourable, compared with that of many other diseases of diserganisa-tion. But although this disease does not commonly deatroy life, at least in a short space of time, it greatly isconvenience pa-tisous by its bulk, its weight, and the displacement of the womb by prolapsus, retroversion, and pressure of the enlarged aterus varion, and preserve of the enlarged starts and the serves and other parts. In some cases, too, the petient becomes obsertions to foodings, particularly if there is a line-gous growth, and these fandings may short an her life. Obtained they say by no makes the period of the life, being the life, and they say by no makes in the period of the life, prelignist biocrations mailtan themselves, and by their the disease may aprend into this binder, rectum, or parts adjacent; and I have known it they open the return into the particular large there extering there and audiousy destroying the mans of pseude-phenomena with which the rectives into the peritoneal suc, the faces whole healing art is overwhelmed. What reterior there, and suddonly destroying the you are to so, therefore, in cases of this patient with colleges, as from internal heart, will turn principally on palliation, and morriagy. The body was imported after

death. Remember, too, that the disease may spleen, or omentum (unless adipose) are be accompanied with other affections, as supplied with blood, net in mention the connurrance of hepatic tubercles; so that, on the whole, though the prognosie is favour-able, and though the patient is not generally destroyed, or, at least, not speedily by this disease, which mey be long protracted; yet it is not without great evils, and now and then the patient perishes unexpectedly by floodings, by alcerations, hy openings into the rectum, and occasionally, perhaps, by the autenuation of infammation

Is sairthus of the nterus, so long as the symptoms are not argent, so long it is scarcely fitting to expose the patient to the inconvenience of examination; but should it be deemed necessary in doubtfel cases to investigate thoroughly the state of the disa manual inquiry must then be made. It is true, indeed, that such surgical uperations may be by an means agreeable to the feelings, but eiroumstances may be urgent, and it may be necessary to asbmit. And we will, therefore, in closing the Lecture, give a little further attention to this sub-ject, commencing with the consideration of those cases in which the disease has made

considerabie progress.

When a patient is labouring under a reputed uterine scirrbosity of long standing and larga hulk, one of the first points to be determined is, whether the abdominal bulk arise from air, water, adeps, or a diseased grewth of the viscers, or from two or more of these causes combined. Gaseous enlargements are clastin, and yield exceedingly under well-directed pressure, and may be randily negad from one part of the abdomi-nal cavity to another. The enlargements of dropsy may, in general, he recognised by Suctuation, more chvicus when the Suid is in the peritoneum, more obscure when it la encysted, whether in the bladder, overy, or the womh, distinguishable, however, inmost cases, unless the sac be unusually thick. Adipose enlargements are not confined to the abdomen generally, but affect equally all parts of the body, and may, therefore, be easily recognised ; so that if on examinawe find a large abdomen, firm, hard, And we find a large stoomer, first, here, and hereleding, and not to be attributed to estimate them to be attributed to estimate the stoomer of the stoomer

Again. When existing from emission in that the abdition between between en from solid growth, we ought next to shiercals whether this growth be sented in however, requires tact, the upper part of the shiercares or infectively. But what is to be done in those cases in In women, solid enlarging case of the liver, which we are called upon to decide respect-

not common; yet, when they exist, lying polypus, or spongy or fungous growths, well in the superior and middle regions of the peritoneal cavity, they are very readily distinguished by their firm, hard, and unyielding character, and by our being unable to make a dasp depression when the hand, applied in the region if the bypochoadris, below the margin of the ribs, is pressed perseveringly towards the spies. Bhould the swalling be uterine and scirrhous, of course it will occupy the lower and middle parts of the abdominal cavity, not reaching the pit of the stomach till the disease is advanced to its last stages; and hence, on pressing the parts which lie in the scrobiculus cordis, we shall find that they yield readily under the action of the hand, dezterously applied, while the central parts, and those below, possess an unvielding solidity, even firmer than that which is produced by gestation. It being ascartained, then, that there is a solid enlargement in the lower and central regions of the abdomen, it still remains to be known whether this growth be nterine or overien, or a com-bination of the two affections, a point which, in some cases, it is not very easy to decide. In general, however, when the enlargement is nterine, the mass will be found to lie equidistant between the wings of the case innominate; but should the intumescence chance to be ovarian in its nature, then, on careful and disterous investi-gation, it will, I believe, in most instances, he found lodging more upon the right side than the left. Thus, then, by examining manually, we may, in most instances scirrhous nterus, ascertain that there is a large solid growth in the nterine region, of many years' standing, as wn learn from the patient; and where this is the case, there can be but little doubt that this enlargement is of the natore of an indolent scirrbus. It must be admitted, however, that the proof is not decinive, as, not to mention pregnamy, the womb may, per-haps, enlarge from nther causes; but these ere of rara occurrence, and I think I may add, that, in the present state of know-ledge, these would not prove of much chical importance. If large tubereles can be felt through the ebdominal covering, this will greatly help the diagnosis; if the mouth of the womb and the vagina feel aclrhous; there can be little further doubt. Scientistic of the womb and of the overy any he combined. By emptying the blad-day and lubricating the abdomen, and plachig the patient recumbent, and relaxing the be much facilitated. The whole inquiry,

ore suscessed of Warma scirrbing, in first segme of its supposed furnation, , for assaults, the mean is no larger the bend of the festes? Why, in cases a kind, the bladder previously suffered segmes, first maded, may immediately, is the experimentor, be emptied of its state, in order that the abdominal musis may become more completely relaxed; I then the petient may be placed on a left side, in the ardinary obstatric po-los here demonstrated, and one or two alight, here demonstrates, may one or are figure of the left hand, may be list upon the mouth of the wombs while those of the right are applied immediately above the symphysis publis, in the region of the bladlers, where the upper hemisphere of e enjarged uterus may be felt; so that he wome being interposed between the we hands, its bulk and firmness may be secretained with vicety. In more and malons osses, the index of the left hand y be pleased in the rectum against the back of the sourchous uterus, while the thumb is resting on the uterine mouth; and the right hand being applied, as before. bove the symphysis, the state of the womb may be investigated even with greater exectness then before. By these means, a etest and dexterous examiner may t always accertain whether the womb is enlarged or not, and the more easily if the patient have berne children; and if, as other happens, in cases of scirrhosity, there had occur store or less wanting of the flosh. In making these examinations, if tuberclos are felt through the abdominal coverings of if the on uteri be large and hard-or if the vagina be scirrhous, of sourse in this, as in the former case, these diagnostics are of no small, importance in marking the character of the disease. In doubtful inies, the bulk of the uterus may be red after a arst exemination; and a second inquiry may be instituted some two or three menths after the first, so as to ancertain what is of no small importance in the diagradais-I mean, whether the exlargement be tardy or rapid in its grouth. In seaso of this kind, it is not to be forgetten that the interior may relieige, not from adjress merely, but from a prepared of four meeting. In the season of the meeting of the season which is the season when from polypus—and further, that an incom-parent investigator may fad the head of a fotus, mistaking this, perhaps, for a large and seirnbose uteres, for of this error, on observed before, I have seen two came-ples. Ramamber, however, that if the infargrancht in from a presentage of frier mention or from hydathie, it will improve rapidly—if from the lived of a six or seven iffy if from the light of a ma or writer the problem of the paper will be upperlift the open by delivery; or if, their, it dispell by delivery; or if, their, it dispell by delivery;

MUNCULAR ACTION, AND ON THE CURR OF DEFORMITIES.

By Ma. SHELDRAKE.

## On Artificial Muscular Action, and its Uses:

Havino andesvoured to show what muscular setion, involuntary and voluntary, is, I shall now proceed to treat of extificial mescalar estion; by that term I undarstand muscular action that is effected by some external agent, without any participation, or effort, being made to sasist it by the person whose muscles are acted apon, but, to reshest it really useful, it is indispensably necessary, that the person whose muscles are acted upon about make no. Nonational, for effort of my kind, nor in its way constarrat those exertions which me made by the operator whe materials.

way counterent those exercious mote, by the operator who apparents in aiment has associated a secondar.

The flecturery, if it hearest that there is not the prestice, and the bearderst with the I here been, for many years, able to produce by it, I make by melanting on one of the operations of John Huster, and, asting upon that absorvation. (II) I sealing the proper of curing flatorious of the feet, of these, second remarkable cases have been

<sup>&</sup>quot; See The Lasteit, Whitee."

inserted in the first volume of Tax Lispour-As I have princised this treatment with very great mesons, and very extensively; for more than ferty years, and many of my early patients say still living, in good health and in the full poissoners of their metron forms, no doubt our now he entertained of the officery and the value of that disputery. In this practics I have made important im-provements diffifig the lost twelve years, and shall commendate their through this them-nel, at mose father disputently.

I have applied the same principles of mouler action, both voluntary and artidisk, to the cure of spinish curvature, and the numerous peculiarities in the branen form that are connected with it, and with success quite equal to that with which I tions of the feet; indeed, the cure of both

these classes of defects depends upon similar siplications of the same principles; but, as aphall curvature is somested with adme peculiarities which require separate investi-gation, I shall postpous the consideration of that subject, and those that are connected with it, till I can bring the whole together under one point of view. I shall, at present, confuse inyself to showing, that the artificial muscular action, which I have employed in ouring distortions, may be employed with much advantage to assist the effects of medicine and surgery in the ours of some dis-cases, for which additional powers are wanted to effect all the benefits that such cases require.

Every professional men has, et some time occasion to tell his petient, who is either invalid or convainment, to take some gentle exercise, but to be careful that he does not over fatigue idenself, as that will produce debility, and, therefore, will be injurious. No one can doubt the propriety of this addies, yet it is often unsuccessful, because à patient is, sometimes, in such à bendition that he compot take even the smallest exercise, without feeling effects that, instead of being beneficial, displain the small por-tion of etragch be had, and which exercise th, therefore, highly injudices.

if an invalid has a very must pertien of sith, a great quantity of product with great pulsary sites, has been series and the series and the series and the series are series and the series are series and the series are series are series and the series are series thore shelts; except they the briled to be. If the first time that this spaline tion, thirties I have been extended to the origin of my discovery had been publicly top, the biferred of, it will be be been this tion of my discovery had been publicly top, the biferred of, it will be be been the offered account, for retaining its progress from the minister that the best about the times of sample of the best of the critical accounts of the retaining the present time, before a sample of the best of the critical accounts of the critical accounts of the critical accounts of the present time, before a sample of the critical accounts of the present time, before the sample of the critical accounts of the present time.

The great besent which is produced by exercise is, that it increases the vigot which the blood abrulated through which frame; that harmonic through hidden all this material benefiting, pu-the absorption and deposition of the tained from food, w rial that is bittained from feed, thus converted into unimal mant process increases the size and at al matter ; process increases the size and attempts of the person by whom such emission are practiced.

One of the plant that I have adopted, in to increase the quantity of baneficial supercies, which say porous may take, a any accriton of their coni, and of course out fatigue, and is effected in this measur I have invented a chair, in which sky pa is seated; if it is intended to act up arms of the patient, two cranks are to d with the chair, in such a m when the patient places one hand upon each crank, so as to keep the handle in her hand, but without any exercise, the una-chinery that is compensed with these prestice is so arranged, that, when put in mod as emistant, the erms, together or soys-rately, as it may be desired; are made to describe circles of say dismeter, or to move

the same may require. One advantage of this invention is, that e necistant, who turns the handle, done all the work, and the patient, who site still in the seat, receives all the beautit, because, by keeping her hand, or hands, upo handles, the whole of the erms, shoulders, soupulm, and pectoral muscles, may be kept in action for any time, or to any extent, th

in any direction that the circum

can be required, without any exertion of the patient, or any latigue whatever. Another advantage of this invention is, that the morement may be either extres slow, so as to adapt it to persons who very delicate health will allow only of t most gentle exercise, or it may be i gradually, as circomstances require; or it may be given at once to any or may be destired, and, in all cases is which it is applied, the fall effect of my quantity of exercise may be given without products any fatigue winstreer. It must, necessarily by deduced from this faut, that is any one in which it is supported as the bear in the fall physical affect of sith and the may be produced upon any person; particle may be produced upon any person; particle may be produced, with any mountralesses the making of the making o

More than forty years here elepsed since can my departments upon this subject, i explainments that were founded upon of that had been discovered, by Mr. Ner. This greatest of sergeomensor and toroid of these experiments, and likememory. That precise of argeomanic and like-mine recommended many of his own pa-tients, to whom my-treatment was useful. Mr. Hunter watched the progress of his sweep policies, and was mainfed with what he see. Many other arrivous, of equal mark: in nectety, honoured me with their nectice and approbation and my practice was alepted to a great extent, privately, water their chaervation, and my practice wait on with success. After the interwant on with success. After the inter-course that I had with Lord Byron, the particulars of which are detailed in Tun Laxore, I made very great improvements

in my treatment.

At last, I determined to make the general ples of my discovery public for the risciples of my uncovery puncts for the sized use of society at large, as well as of some members of the medical profession e might shoom to adopt the practice; in mequance of that determination, I wrote to the editor of Tun Lancer, with whom I had no acquaintance whatever, that letter which was first published in his Journal, and those which followed it in the last volume. Much interest was assisted in the minds of professional mee, as well as others, on the person of the cases; but some doubted their correctness, and even decied the possibility of performing those cures, and many expressed a wish to see them when they occurred. In consequence of this, when the case of Robinson came into my heads, I inserted a brief statement of it in THE LANCET for November 29, with a resiant that all, or any gentlemen who might a desirous to see this case, might do so at any time they would themselves fix, during the whole progress of the cure. As I have the satisfection to know that this offer was very favourably thought of, and the case has given much pleasure to many gentlemen who here examined it, I take this opportualty to repeat that the after remains per-meterally spen during the whole time of the cure, whatever that time may be. Having s, whatever that time may be. Having a this, I shall not again allude to the se that were published in Tax Largost, before that offer we made; bet, in our greed to he free by the whole of the whole o before that offer was made; but, in one thing that I may have scomen to illustrate; I shall refer to the case of illustrate; and some others; because, whetever I may

When the cure of this case is completed, I shell give full details of the treatment by which it will have been affected; but, at wescut, i shall confine myself to showing much of the alterations that have taken, or are taking place in the muscles, as will anable me to illustrate that particular hind of muscular action which it is now intended

It is known to all, that exercise is one of the best means that can be used to restore the health of invalids or convalescents; but it has been very imperfectly known, or at least noticed, that exercise, in other words, muscular action, which is produced by the will of a living being acting mon its own body, is necessarily accompanied by exertions that produce fatigue, and, as a necessary consequence, when it is carried to excess, injures the health of that body it was intended to serve, and to improve. But, I believe it has not been known to any but John Hunter, and those who may have derived their knowledge of this fact directly from him, which I cheer-fully confess that I did, that when some parts of a living body have lost their power of acting in shedience to the will, if those parts are forced to repeat their natural tions by extraneous meens, over which the person who is operated upon has no control, the natural power of acting, in abedience to the will, will be resumed by them parts.

This very extraordinary fact hea, I research it here, makeneys to all, except these this

sknows to all, escapt the montioned a yet it is 7.300.7 az Langer dec 1888, vol. ii., p. bis pengu, for wheteger time this execution is continued, and to wheteger time this execution is continued, and to whetever degree it is

me that it may be applied with much lare daily in my hands. In the case making in the date distinct processes are t going on, but are, all being produced effect of one operation. First, the p of the house of the leg and foot which are deranged and phood in assessment positions, are being rectared to their natural libra-tions; secondly, the ligements are assuaged in their natural proportions relative: to each other, and are regularly and gradually resuming their natural powers and functions; and, thirdly, the muscles which were rigidly fixed, without having power to act in any manner, are now resuming their natural proportions relative to each other, and to the proportions relative to each other, and to the cones and ligaments with which they are connected, as well as resuming their natural functions.

物質の はなかい はまい

increased size, we produced in those suns-cles which are subjected to this execute, as way be seen in the case of Rubinson. When my treatment of his same first began, his foot and log were quite rigid, and wested so and me seg were quite rigid, and weared so as to be of the greatest paleness: in a few days some soleur began to appear about the toes and heel, amended gradually upon the foot and leg, so that new, at the end of two mentils, the foot is not only improved in form, but is increased in aim, substance, and is noteward. and in colour ; is has all the appearance of high health; this healthy appearance ex-tends upwards about a third part of the lag, above which the original paleness remains; but the healthy colour is gradually encrosesing upon it.

These facts can only be accounted for thus. The action into which my operation forces the foot, increases the circulation of was blood, and gradually enlarges those vessels which had been so contracted, that the red particles of blood could not pass, till a free passage is obtained for them, and by this means the bulk, as well as strength, of the leg is in the course of being restored: this is certainly the case, for the circumference of his leg has been measured within a few days, and found to be, at the largest part, one inch larger than the cast that was taken from the same leg two

months ago.

This petient has told me, without being asked for the information, that, before he came to me, his lag and foot were always vary cold, but now they are nonstantly in e pleasing glow, similar, and quite equal to that of his other foot; of this peculier effect, I will give another striking example.

After i had poblished in The LANCET for November 29th, my invitating to gentlemen of the medical profession to a samine the case of Rohinson, a gentlemen, who has a daughter with a foot distorted in a form that is very like that of Robinson, sent bis medisel adviser to examine that patient, although he lived at the distance of one hundred miles from London. This gentleman, ac-companied by two medical friends, came to my house, axamined Robinson's once with great care, and concluded that I should sare ainly ears him; by their recommendation ship young sary, upon whom account they came to founds, has been pleased under my sare. She is it young the host have been pleased and a tempta had been made to ours it; in consecution to the same than the same to ourse it; in consecution to the same that the same than the same tha tempts had been made to sure it; it weems proportunists, not, as we referrly useless. I stampts, the was the had suffered from these sometenants, they are perfectly useless. I stampts, the was they timened within the jave invariably found that they are so; but, tensioned began to have, on the diling-one, has a strong projection states in fareur of their relative being subtless; that have been both in the minds of that a configuration of the proposal distribution of the proposal distribution of the proposal distribution of the proposal distribution, and the proposal distribution of the prop

given; by this means health, strangth, and | to increase, so that now her leg has the increased sine, may produced in those mus- same genial warmth as her other legs has

sides being greatly improved in form,... This child's foot was as much distorted as that of Robinson, yet I have produced as much elteration in its form in one week, as was produced in Robinson's by a constant ettention of two months; this fact will sho the great advantage of strending to these. feats at the earliest periods of life, while that of Robinson, and others that have been detailed, must afford consolution to those who are further advanced in life, as that circumstance slone does not render them incurable.

The inference to be drawn from facts, as applicable to the subject now under consideration, is, that muscular motion, when artificially produced by the application of means over which the pat has no soutrol, and which do not requ any exertion on the part of the patient to produce, does, according to the declaration of Mr. Hueter, restore the natural connexion between that mysterious power, relition, and the muscles upon which it is natural for it to act; it likewise increases the size, health, and strength of muscles, to which it is carefully epplied, after they had been reduced by lineas, as well as other three days of the strength of the st causes, to e etate of great debility. This fact has been proved by the success of my practica upon this ambiect, particularly in that case which is now in progress, and is laid open to general observation.

But, it may be saked, in what does this treatment differ, either in principle or in practice, from those modes that have been previously used to produce similar effects? The abort answer is, that it is superior in efficacy to these practices, when they have been in any way aerviceable, and has been completely successful in other cases, when the former practices were quite useless. It will, however, require some time to demonstrate these facts; yet, as the subject is important, I will do what my experience enables me, to establish the superior efficacy of this practice.

The means that have been employed, in dependent of medicine administered by the stomach, to restore such limbs as I have despribed, to their nuteral powers, are clea-tricity, frictions, umbrocations, with alls and other mistures, nhampooing, and, finally, history, all these remedies may be useful in cases to the nature of which they are duly proportioned; hot, in such as are now under consideration, they are perfectly useless. I facts, which will show that these prictions!

to antirely updom, Before Robinson became my patient, he was for many months an out-patient at the Middlesta Hometal ; he was generally, if Middlesex Hotpital ; he was generally, if not entirely, under the care of the iote Mr. Show. In embeddence of that gentlemen's directions, the justient kept his log and foot furge long time logother over the steam that exhaled from a vessel of boiling water, and m directed to keep it so as to make the be this, it was said, was intended to soften the thin, the muscular fibres, the tendons, and capsular ligaments, and qualify them to receive the ails which were afterwards to be alied in order to reader them still softer.

to was furnished with a quantity of oils; s was not told what they were, but he was invested to have these rebbed all over his g and flot with great force for several is asysther, that they might very effec-ly soften his log; the small of those s, he said, was very offensive, and their both were frritating; that his mother, is operated as rubber, had her hands so includely excertated; that also was often light to facint; and, is no advantage was ined by the application, after a painful movement of more than six months, she

live team same.

It is well known to the profession and to here, that virtuesetts and embrecations of arisets kinds may be advantageously emoral; which they are properly proportioned the complishes for which they are used; as accounted electron til myphilis, and many there spon different accountes, which it is "amanance to mantion here. Mr. they." ionessary to mention here. Mr. Shaw, rise adopted a practice with this mehavine allepted a practice with this pa-lest, which, I believe, is quite original, and no extraordinary, that I should healthe is multiples it to him, if the youth is who a secret worth steeping, as well took the briefs having, and too valuable to be pinell to the prefere eyes of the pople of the pople of the hospital, to which the youth a spilled as a patient, Mr. Main direction, factories of the hispital, to the private religious to the hispital, to the private religious to the hispital, to the private religious in the Albumy; the legical desire and allowed their and allowed. to his private relidence in the Alberry; that's Street, to which he m with two hillowed temples of Escale at which the profess assististed; a a ve out of the profession, were billy azeluded, Mr. Show as mulation hild the patient at f off aftherion, Mr. Blace religion in the off left log, in the which long the a distriction, that the final is a long throught incided the courses to be warm in Blut ristley that the fixed its a long metal-latedly withday mainful the operator to total ft with both Manda, deel bear on its with of a bul

ony advantage, although desired repeated desired the second of that time he co

It is to be abserved; that during the six withs that this petions was and of Mr. Shaw, he was sue to the action of stooms to dry embrocations, which, I p frictions with mother & frictions with the absorption a oils, which the opera produce some beneficial tiflect tient's leg and foot, though it is not our discover by what contenton between a and effect my benefit could be preduced by patient; at all events they showed that 'no benefit was to be expected from these fried tions; this being the ease, it cannot be understood why brane was adopted in the material to moke this viller of, usion it was thought that metal had some apoidin victor for earing a distorted log, which the other medes of, and materials for friction, did not ceases. Of the nature of that specific virtee we are quite ignorant, and connect now be informed, because the sperator is no longer in a condition to give the informa-

I always believed, that Mr. Show was the sole inventor or discoverer of this specific virtue of caring distortions, but have lately discovered a competitor whose claim must not be lightly passed over.

At page 226 of a work published by Dre Harrison, I have found the following page age :-- The prominent vertebres and riber were then pressed, and drives in the direction of their natural situations with an instrument held in the right hand. It has a worden hatelle, into which is fixed at righ angles, a brazz ved, four insher in fought, an of strength design to bear every degree of strength

lay upon b

rary benefit; and the latter uses it in all may have is that wi Not generally shown ; at least no authoritic and rigidle proofs of his photon here yet ne to my knowledge.

entic proofs of other unsuccess ful practices that have been used to ours see: distortion & most refer to eacther atient; who is at present under my care, about his years age, a lady of mature age had an illness of which I did not get a very satisfactory account. After her recowere next a uses immediating the of her fact; this west on increasing, till her foot turned inweeds, so that she stood upon the other edge of her little tes, the ancie-joint because quitte rigid, or well as all the joints of ther foot. When I first new this lady, the foot here court manufalment in the course of the court manufalment of the court of the court of the court of the court manufalment in the court of the co r foot bore a great resemblance to that of Robinson, but was not so much defermed.

During the progress of this distortion from had to worse, the usual ineffectual remedies were resorted to; pumping upon the foot with cold water, steeping it in het weter, strengthening plasters, embrous-tions, dry factions with the hand and the flesh-bruch, &c.; as all these remedies failed; a severe course of blisters was adopted as a dernier resert; after bearing these for a month, without feeling any advantage, she discontinued them, with a determine tion to continue lame, rather than beer so much pain. The last summer she passed in Brighten, and saed the champooing bath during her stay at that place, with no more advantage than she had derived from the other remedies, and, in October, placed herself under my care. At that ti ne, her foot so exactly resembled the foot of Rebinson. which is represented in No. 274, that I did not think it necessary to take a test of it, het reference to that of Robinson will ex-plain all the appearance of the ledy's foot; plate all the representation of the few principal is degree and in sigilifity in both cases, the principal difference between them is in the age of the patients. Believen them in in the age of the patients, believen them in in the age of the patients, believen them may be the principal difference and the patients formally, existing the patients of the patients and the case was the patients. estion, venture to put her down as

meents, in the forms of whese perprosthere does not exist any delt se in seeme other completels, in defect, as well are detaining t by in which it the Society. may be used with adventure.

## LONDON MEDICAL ROCIETY

THE PART OF THE PROPERTY OF

Menday, February 25, 1889,

SUPPRESENTATION OF THE SOUTHY TO THE COUNCIL-FOLIT OF CREEK AT TRANS PROBE BRAIN SISE - PROPERT PATALITY OF SCARLATINA.

Tau Council not having made their appearance at twenty minutes part eight d'alouk, although several members and visitors were 

laws of the Society, the Council were directed to meet between the hours of seven and eight o'clock, and that the precedings of the Society were regularly to hegin night o'clock. A considerable purson time had this evening been frittered aw and he conceived the Council were not; tifiable in thus soting; and, as the l stated that when seven members were; p ent they were competent to commence the business of the Society; he should mi that some member, then present, sheald tall the chair, there being mither President at Vice-President in the room. He moved Vice-President in the reem. He moved that Dr. Johnstone should take the chair.

Dr. Jonnerous would not take the chair he could not think of such a thing ; is weal

be indecorous in him to do so,

Air. Swaaarv. I do not know have fe
could be considered indecorous for you no
do so; it certainly is indecorous in the
Council to keep us waiting here, wasting our time.

Dr. Jenneroun. We do not know how they are engaged; let every man be judged, of by his note.

Mr. Snagary. But the Society is to most and proceed to husiness at eight o'clock.

Dr. Jounerous. Well, but every one who is acquainted with these Institutions knows that moh a circumstance as this will on cionally take place; it is as greek a di intment to me as to my body, that t business has not began precisely at eight clock; but I think it is right we should first know what the cause is, Mr. Sunskir. There is a rule state

that when teren members are present, we aball go to business, and I do not know why we should not proceed.

Do Ryan. No doubt the law is such;

Dr. Ryan. No di

ort, shall enter the first the Constant policy of the Constant policy of the Constant policy of the Constant o

De. Johnstrone. I do hope and trust, an believe, it is not upon private concerns the are deteleing us, but upon the concerns of

Mr. Sanaar.r. But the Council here subject such publicity has here given, by from seven to eight o'clock to deliberate, and a reject, that il think it hight to nell on surely the Society is not to be kept pairing Dr. Ramadge is stable which in the "mis-to-tenen. After they arrive, the Minutes of the last Mosting will have to be read, which will occupy from this time till nearly who is the relative of the decreased on whose a quarter to give, and than the Society will subtract up at half-past aims; now, what use the second of the decreased on whose is there in gentlemen leaving their business of the decreased on whose is there in gentlemen leaving their business. The Ramadon. Sir, I beg leave to may, and coming a great distance to attend a their harmon. and coming a great distance to attend a Section of this kind? In a few minutes afterwards the Council entered the room.

Dr. WILLIAMS took the Chair.

Mr. Surably then said, Sir, I beg to rise to a point of order. The Society has now n kept waiting for twenty-five minotes. • humaess of the Society is to commence at gight o'clock. It has not been this evening andy that the proceedings have been thus delayed, the practice has now become, generally speaking, the same every night; and I, for one, think it excessively indecorous that our time, so excredingly abort as it is, an hour and on half, should be thus frillered away before the business can

Dr. WILLIAMS. Really, I must confess, this evening, the Society has been kept waiting beyond its usual hour, but a question of very material interest to the Society was referred to the Council, about a fortnight ago, and it has been under discussion this evening. That is the reason why the

Society has been kept waiting.
Mr. SHRERLY. The Council are to meet
from seven to eight, and I do not think it competent for them to keep the other members waiting here for twenty misutes, or half

as hour, under any pretext.

Mr. Paccros. Perhaps Mr. Shearly will be satisfied when he is informed, that this section, of very great importance to the sciety, is to be referred to him and the moral body of the Members.

Mr. SERARLY. No, I am not at all seled with that.

The Minutes of the last Meeting were

Mr. Sunancy stated, that Dr. Blundell had considered that the specimes, of mon-stresity he (Mr. Shearly) axhibited to the fluciety on the last night, would be more menful to the public preserved as a speci-men, then if it were dissected, and he had? therefore, presented it to that gentleman. This rendered it impossible for him to de-tail any morbid appearances. The twin was

that I have seen Too Lancer, and that the statement I made in the Society has been corruptly reported in that work. I never said that I had had an opportunity of seeing the relative of the docessed. I merely mentioned that I had seen several persons at the West End of the Town, and that it was reported there that the patient had fever. There is a gentleman in the room who heard Mr. Jewell state, that the patient had favor for at least five days before his death; that, he had been in the country; had taken cold, and was seized with delirium. The gentleman who told me that he had fever was Mr. Howell, and I am note he will bear me out in the statement. I did not state any thing intentionally offensive to Dr. Johnstone. My object was further inquiry into the case. I should be gled to know, whether this person had any discharge from the nostrile or not?

The RECEPTERS. I did not insert Dr. Ramadge's observation in the Minutes, becaose, after the meeting separated, I thought Dr. Ramadge would have another opportunity of dispesing of it, which I considered to be the better way. If any thing particular turns on what passed I can now make a

note of it.

Dr. Ramanes. I took the only opportonity I had of making my observations. If I had suffered the Minutes to pass over then as they stood, I do not think I should have done right.

Dr. Jonwerowa. There are two things to be considered—the statement and the deduction. I have no objection to any gentleman differing from me in deductions; but I think, if a man differs from me in facts, he is bound to produce the evidence that wasraits that opinion. I stated the symptome, and I said there was no fever; I stated the condition of the akls, of the servicine, of the respiration, and so on, and I said those the repursion, has no or or, bear and provided not exhibit symptoms of farity. Now, the Samuel in Samuel i

Ur. Ramanop. The shipment never was

till any morbid appearances. The turk was made by me. Dr. Jongerous. The delice that is the proper time to take notice of the Minutes, and though it does not appear by them that the half was discussed in the histories. The material is the histories of the Minutes, and though it does not appear by them that that he had read the statement in The sity motion was stability of a subject that was Langue, and he suppressed in utmost measurable of the last evening, yet to that

not they suchdrised me to topicat, that what jusy of the viscers, to account for death; I had stated was true, but offered to some he therefore concluded, the nervous strite-I had stated was true, but offered to come forward to prove every thing I have said. This patients that an opportunity of sec-ing the petient every day, indeed I may any every hour, and every week during the period ha lived. The young gentleman was alling for three or four weeks; for seven days before his death, he was out in the carriage, and from that time he was confined to bed, and then; I say, he had no symptoms of fever. I think it was really very unhandsome, to say the least of it, that Dr. Ramadge should have brought forward this subject behind my back; it was not only irregular, as I was not here, but I think, really, that knowing well that every thing against me is so exaggerated in Tax LANCER, (cries of hear, hear, order, end chair,) he ought not, then, to have ed-lessed the Society on the ambject.

Mr. Gosser was surprised at the time, that Dr. Ramadga should make the statement, and was more surprised at his ant being called to order by the Chair. Ha recommanded that the subject should be dropped, as he did not believe Dr. Ramadge made this statement with any intention to snoy, or to offend Dr. Johnstone, but from his not exactly understanding the regula-tions of the Society, he proceeded with it. Dr. Januarous. I am perfectly satis-

fied, and content that if should now drop.

Dr. RAMADOR rose, but

Dr. Williams observed, I think it would s better that this matter should drop; however, I heg to bear testimony to the repeated expressions of respect on the part of Dr. Ramadge towards Dr. Johnstone, and though it may appear, that at that period he may have been irregular, I am sure that Dr. Ramadge did not intend any personal offence.

Dr. Rawadon. I appeal to the gentle-men who are here, and whn were here at the tima, whether I said that I myself had had It from a relative of the decessed? I mentioned that I had heard from a gentle-man who heard from a relative of the degod, that fever was not present; and

sorrect.

Mr. Wash brought ferenced the subject of scarjetina, to accretain, if possible, the opinion of the Soulety on what produced death in some of the recent once of souris-

ture only was affected; and that death must have believe from that. He himested to find, that scarlating was very prevalent at pre-sent, and extremely fatal, in spite of the most judicious treatment.

Dr. RAWADOR had found scarlating also extremely destructive of life. He was in clined to apply leaches to the throat in the first instance, followed by large positions, to keep the bowels open, to spongs the body with vineger and water, to make use of mercurial medicine and atimulants. He did not think gargies, in the inflamed state of the throat, of use; warm water was the

simplest and best gargle. Ha likewise recommended a ten-spoonful of the infun of roses, with a little syrap, frequently.

Mr. Paccran had generally carried his patients through; and he thought sometime ought to be treated according to the strength of the patient, and very much upon the principle that would be adopted by e judicious practitioner in any other case of fever, where the nervous system was considerably affected. Is some cases blood might, and in some it might not, be abstracted. last season produced more fatality than usual in the neighbourhood where he resided. One very strong man, who had a sudden attack of janudice, was bled, and soon afterwards became partly dalirious; in less than 36 hours from the appearance of the disformed him, that five cases of the su me kind had fallen to his lot, three of which he had carried through with stimull.

Dr. RYAN had had considerable opportunity of witnessing scarlatina. In one house, two children dled suddenly, the one five, and the other seven years ald. Leoches to the throat, and treatment vary similar to that recommended by Dr. Ramadge had heen had recourse to. A third child in the same house became affected, which the pa-rents refused to be allowed to be treated in the same manner, but gave wine, and applied anapisms to the feet: he got well, There were cases la which it was impossi. what is stated in Tru Liancer is perfectly the to save the patients. Stimulating treatment seemed to have been the favourite in englant lines; and he was included to resort to the decoction of bark, wine, and singplims to the feet

Mr. Goeser had found great benefit from using the subcarbonate of ammonia.

Mr. Salmon regarded the obloride of tina, where patients had such so speedily. Ilms in the abope of a gargle as a very exities, where patients had such so speedily. Ilms in the abope of a gargle as a very exities equinormal fairfulgirly two mass, collect renedy; half a drackum of the children has had well made, in the stand little of the to o pint of water, injected children has had well made, in the standard. In some of the avery injected children had been about his large. In this pasts the standard went down throughout morteus examination that he made, he had the macrois membrane, not only of the standard had been able to detect nothing whatever in

ancoodingly services his: Lon water had wittened suggesting shounts of all he tuber ded to the state of the point the child into the worm bath, mustack, and immedi nate, not confining himself to r form of it. He had frequently m 18 or 25 minims of the o nicerometic, in a little peppermint or sirep; He recommended light positions, consisting of three parts of lineard meal and one of statued to be applied to the week, by which a had seen children retieved from a state haset pertein suffication. In more ses streks, more unive remedies were estry; but he had not, for the last three

or four years, employed leadnes.

Mr. Shears had never employed the lan-est to influte; he might have svalled him-self of the use of leaches. He objected to hes. He objected to blisters remaining on infants, so long as to eccesion much stimulating irritation, by which slongling might be induced. He essaidated an omas of the sirup of rhudos, with 12 drops of muristin soid, an axeel-lest lineaus for shidren. He had never given amments. He preferred the tepid to the warm beth. If he wished to give stimulants, he should prefer wine to ammonis.

Mr. What regretted that the object for which he had introduced the discussion, had not been attended to. He wished to have 'ad the morbid symptoms, if any had been axplained, by which death had been cansed, and these had entirely been passed over. For his nwn part, he esteemed blood-

A MERICAR, whose name we did not secertain, expressed his upinion, that there must be semething peculiar in the sesson, which some could account for the great mortality that had pravailed of late in cases of scarletins and other fevers. He had lost es without being able to account for dueth in any ather way. On dissection, he had scoored nething.

CASE BY ST. VITES DANCS FROM AN ESTRACEDINARY CAUSS. >

By EDWARD HARRISON, M.D.

Mas. Beaures, mtat. about 90, of a thin apure habit, was the mather of sayoral children. She had through life imposed excellent health, the consequence of her tenserate and methodical babits. April 90, 1812, also was seized with irregular motions of the superior axtremation; they kept in mea-creasing for several days, when the inferior it is become similarly affected. Her streams to me

i ispications of the solution take the partners may kind of which the same analysis when or within the sile. stingers with o dem hilled to explice the languistic etarder, and in which the pe her part. She would not direct her ster roceed directly to the spot. One of the pet dragged, and made a sust of semicificular term in walking. She southweed In this state, with searcely any alteration, sift the following June; when she expired rather auddenly.

The next morning, my friend Dr. Veitch, of Hornousie, and I, were suffered to examine the head. On removing the sault; we found the dura meter looking feebly and very pule, as did the tunics exceptualdes and pis mater. There was an unusual quantity of moisture lying between these several mambranes. The brain, when out in . appeared axtremely pals, but was of the usual consistence. On laying open the ventricles, we found them distanted with a finid which was nearly pellucid. A large finid, which was nearly pellucid. A large quantity of the same kind of liquid flowed freely, and, in great abundance, nut of the theca-spinshe. The chord and its membranes, as fer as we could trace them through the faramen magnate, presented a similar has to that of the corebram, and its involuces. No other morbid appearances were discovered, though we describely ansmined the different parts of the brain and its membranes. As we were not prepared to meet with any preternatural quantity of finid in the skull, or spinal tube, we incautinusly suffered some of it to escape upon the floor. We could not, therefore, messure the quantity lodged in the brain and theos, but we were of opinion that it did unt amount to less than six ounces, and probably considerably more. She retained her faculties almost to the very last; indeed, the day pravious to her death, she was thought better; and it was, upon some sudden motion, either in rising from her bed, or from the night-chair, that she expired. She had always been considered (what is called) a nervous person; but from regular habits, of avery description, she was unusually bushthy, and remained free from complaint at his advanced years, till the period above alluded to; and she had not been in the habit of eaching thy modistics. excepting, occasionally, a little sperient

The see ion of ide priserty is, us the me I know, of very race property, is an interest of the property of the control of the constitution on the full development of the constitution. Needingstands in minds the expenses, supposing it to manuals floor the histories bysics. I have not met with emether instance, where shopes operate. There was also as assembled in eight with began to pid age; at their period the nerves separate. There was also as assembled for eight from pheres, taxiel blood. The wound had been reflect ordinary signamentance. We shope three weeks before his admission, and under oranges; organisments. The present fore present instance the complaint did not originate in the usual way, but, in the serous deposite, within the brain and spine. Thet autrasous matters lodged in the thece apinulis induce very distressing nervous symptoms, we know from the former and the following cases, as also from another published by Mr. Chevalier." In the last, e girl, fourteen Operanor." In the last, e grif, fourteen years old, compleined of great anguish in her back, which was aggravated on sixting up. eThe pain kept increasing for several days. After as unusuelly severa sligot, the mother thought she discovered a slight projection of the spinorus processes, in the lumbar verteire. "I was sent for," says Mr. Chevalier," but could discover nothing in the back that was not natural, nor was any particular pain excited by pressure. The effort to air up distressed her much. Oe the following morning, to my great our-prise, I was informed that, early in the pre-ceding evening, she complained of a sudden eod violent increase of pain, and immedietely become convulsed; when the coevulcione had continued five hours, she expired. I examined ber body in the presence of Mr. Jehnson, of Mortimer-street. There were ne traces of discose in the brain, or in eny of the thoracie or abdominal viscora. I found the cavity of the spical canal, slose to the sect of the pain, filled with extrave-sated blood, which, from its florid colour, must have been arterial, and which covered the whole of the cauda vquian." The seat of the pain naturally leads to a supposition, that the effusion took place from a bloodvessel situated within the lumber tube, where, by irritating the spinal cord, it excited the fatal convulsions,

(To be centinued.)

OLASGOW ROYAL INFIRMARY.

WOUND OF THE POSTERIOR TIRIAL ARREST

Joan Bruns and aged 13, was admitted under the care of Mr. Cown (Jun. 21), with a wound nituated over, and a little to the euter side of the right leg, squalleg the size of a crown. An incision had been made directly abstracted, as inch and a had in length, and at its jamented, with the original wound, there was a lighter placed or voice directly vascel. The wome gree files with

Med Chirary, Trans. vol. iff.

followed by violent arterial has was at length sheated by pressure, bu completely; for, during the ancoredit days, it had recurred twice. On the January a ligature was epalied, but so ly with more success, for, as bee been blood still continued to some from the wo on his admission. A pad was applied. completely to restrain the bleeding, an six deschas of the sulphate of magarhage to a considerable extent took n from a vessel in the aituation of the po rier tibial, which was secured. 28th, bleeding egain took place, an removing the dressings, the lighture was found detached. Since this occurrence, the case has gone on fareurably.

### REMOVAL OF AN ADIPO-BANCOMATOUS TUMBUS.

Mrs. Kyle, aged 61, was admitted into the Hospital by Dr. Couper on the 25th of January, with a large pandulose tumour on the outer aspect of the superior third of the thigh. It measured eleven luches in length, and nineteen in circumference. The tumour itself was firm and lebulated, and was but loosely attached to the subjectnt parts. At its most inferior part, there was an ulco-rated epening of inconsiderable size, the contre of which was occupied by a brownish elough, and from this a this sanies was discharged. The patient seid the tumour was the seat of occasional pain, which was most severe and frequent during the night. veios of the thigh and leg were vericose. Her health had also been declining for some time; her appetite had become impeired, ber tongue white, and pulse 100. Her bowels were regular.

The temour first made its appearance about sixteen years ago. At that time it was loose, and gave her no uncasiness; but four years after, when it had attained the size of an orange, it became affected with shooting pales, siece which it had greduality, but constantly increased. A year before she came into the homital, the skin before she came into the hospital, the skin broke at its most depending part, end, for three months, a thin teborous fluid was diswheread. It ultimetely coused, but etter-words ulcerated, and some time after three points of blood were lost, before bleeding could be checked. Siece this eccurrance,

the sheeting palas were more frequent and necess.

13. The timeour was removed to day, by making a longitudiest incides on each side of the time, since to, and parallel with, the

thigh. Immediately afterwards, its calls life, as usual, the skin state bareging lar connexions were divided. These or four These were disasthed up for a couple televisty-sized creation continues in the couple in the couple in the couple inciden. made to bring the edges of the wound toge-ther; but this, on account of the scarcity of skin, was found quite impossible. A sector was then had recourse to, which, pessed through the lips of the wound, suled to in a first-rate nautical style. e would was afterwards drossed with adharive planter and a banasgo. A most weighed ave pounds nine ounce lester and a bandage. The tu-

Feb. 7. The wound has been repeatedly drosed, and looks favourably. To-day there was a copious discharge of healthy pus. Two ligatures, which were attempted the day before, were removed without difficulty. The wound, which covers a space equal to the extended hand, was dressed with straps and a bandage. She was ordered nourish-

ing diet.

### PROPOSIS OF THE TIGIA-AMPUTATION.

Archibeld Madintyre, aged 46, was ad-nitted by Dr. Cooper, Feb. 11th. At the upper and enterior part of the right knee joint, there was a large, foul, ulcerated sur-face, which extended downwards to seven inches plong the tibis. Ie the centre of this ploarated surface, there was a wide orifice covered with thick tecacious matter, le which the tible was seen black and necrosed. It was quits soft and friable, the probe passing easily into its substance. From this opening there was discharged a considerable quantity of thin ichorous fluid. The leg was of natural warmtle, but the foot was 4 and cedemetous.

He states, that fourteen years before, be was struck on the opper part of the knee-joint, which afterwards awelled. The inmation was subdued, but confirmed anchylosis took pisce. It is at present best, but gave him little unessiness, till Docom-ber last, when the joint and the upper part of the leg became effected with savers in-Sammation. The skis over the tible shortly alterwards broke, which was followed by a conious discharge of thin fuld, and rapid extension of the ulceration. In the begin-ning of January, several pounds of blood issued from its enrisee. The patient was sallow and much emaciated, but his appotits continued good. He also stept well, but was troubled with profuse persetration. His pulse was 140, and small. He had eight cunces of wing, m - stody or

19. Dr. Couper removes tow seems and the couper are the couper and the couper and the couper and the couper are to the couper and the couper are the couper are the couper are the couper and the couper and the couper are the couper are the couper are the couper and the couper are the couper 13. Dr. Couper removed the limb to-day

used in making the circular incision. After this was accomplished, the muscles were fiviled to the bess. A goiled was now handed the operator, with watch he de-tached the muscles from the bose for an inch, or perhaps a little more. The retrac-tor was now put on, and the bone sawn through. The femoral artery was immedistriy tied, but some time was occupied in applying ligatures on other three vessels, which, from the weak and smaciated state of the patient, had could to blood, and were more difficult to secure. The in leguments were now brought over the face of the stomp, and the usual dressings applied. While doing this, some care was coversary to keep the surfaces of the wound accurate ly together, from retraction of the skin.

When the man was removed, the limb was dissected. It seemed a complete mass of disease. The tibie immediately beneath the joint was necrosed to a considerable extent. The joint was completely unchylosed, requiring considerable force to effect the slightest movement. The cartilages

were almost entirely absorbed.

PISTULA IN ANO; STETHOSCOPIC IGNORANCE.

David M'Lardy, mint. 21, dyer, was admit-ted on the 29th Dec., Ishouring under fistels in 200; four years since had an abscess in site of present opening, which was prectured and shortly after healed; shout five months ago observed a discharge from enus, which has since continued; general health good: erdered half an ounce of castor oil immediately, which produced one stool. Fistula was laid open on the 4th Feh., after which he had griping end usessiness in bowols; on 7th, had a rigour, since which has been feverish and uneasy, with asvers pain is back and testicles; pulse 90; toogue whitish; thirst; urine high coloured; ordered to be hied to 3x9, which presented a buffy cost. The pain in testicles and other feverish symptoms continuing, the hip bath, with a pill of sale-met and opium, was ordered to be given in

mer and onem, which had the effect of slieping pain and producing profuse perspiration.

15. Had origon; pain in back just two dees; lower pairs of shatman "Silkidy type-paintie, but not painting perspiration between the standard principles between the standard principles. abdomen, after which had an enems, followed

paintal on trainents.

powder in the apening. With the exception of some delirium and a slight absocs over left hip, which was punctured, no other symp-toms occurred until the 25th, when he was ettacked with frequent cough, eccompanied by bloody expectoration, for which he was referred a blister to breast, and cough mix-ure. Debility gradually increasing; died on the 19th.

### Sectio cadaveris.

The absorages over hip had contracted to with air, and the abdominal viscers perfectly with str, and the shdominal viscers perfectly free from disease; the right long adhered expansively to the wills of the thorax, and with the exception of a portion of its enterior part, was either totally bequaised or sharing into a state of purulent infiltration. Mr. Cowan mentioned at the post-morten examination, that his ettention had been completely obtained to the state of the abdominat viscers, never having suspected disease to the Italy, though deslering at the same time, that patients labouriou under fatule in ano that patients laborring under fistule in one were very obnoxious to pulmonary com-plaints. If he were sware of the liability of such complaints, why was not the attention directed, at an earlier period, to the state of the lunge? Why not eveil himself of the stethoscope, of the use of which, he declared himself perfectly ignorest? What spology has a surgeon, filling a public situation, for such ignorance, and that too, when it could be so essily remedied, in this instance, by transferring e portion of the servile obsisance paid to the prectice of Liefranc and Dupuytren, to that of Lannace?

COMPOUND PRACTURE; IMPROVED PLAN OF

. TREATMONT. James Birney, mtat. 30, labourer, a' man of intemperate habits, was admitted Jan. 7, with compound fracture of right leg, in which both hones are fractured; the tibis laid bare to extent of two inches; two detached portions were extracted, and about a quarter of an inch of its upper sheft sawed a quarter of an inch of its upper shoft sawed cat, after which, the edges of wound were bringht together and splints applied. The pulling was in e higher degree of azofement the good have been produced by the quantity of wise he received previous to administ of wise he received previous to administ of wise he received previous to administ of wise he received provious to administration below in the majoring; after which the pitlant regrimed in its good a condition as could be expensed, until the 20th, when he had a minister, is nosbuquence of which, it me could be expected, until the 25th, when I was mentioned, at the post-norten exhibited necessary to dress the leg, for Sait time. This is still appear, though the same the leg for Sait time. This is still appear, though with mistion, the two patients had been hed after her admission; the delirium tramens was more than the was affected being decreased times and the same affected being decreased the affer her department congestion. Query I is it would to bleed patients affected with devance, points had attact from 100 to 56; the same and estensive burn I why was not affected with the same and leaf t ed Dorer's powdet..

\$6. Diarrhos and griping accompanied with tenderness of abdomon, on pressure, but, which was pertially relieved by spium. Leg dressed, after which, it not being very accurately fixed, he was desired rether roughly to "turn his foot." (Who ever heard of a man with a fractured leg being desired to turn his feet ? Oh i spirit of Mr. Pott, what would you oxclaim on seeing such treetment!) Celomel end opinm were er-dered in large doses, with a hister to abdomen, which had no effect in relieving diarrhos.

28. Leg dressed; discharge healthy; no bony union; whioffsppeared to be prevented in a great degree by the leg being always raised from its pillow, during the dressing.

Feb. 2. Dierrhora continues; complaine of debility; countenance sharp end anxious; pulse 100; taugue dry; wound dressed; discharge healthy; apper shaft of bone pro-truding; medicine continued, with the ad-dition of sulph. quinine, during the day.

6. Slight cough ; no pain is chest; expectoration einks in water ; would as before.

7. Petient left the house, having the fool-hardiness to believe that " sound chirurgical" might be had elsewhere than within the walls of a hospital.

### BURN,

Mary McCosh, mtat. 40, a woman of intemperate bahits, was admitted on the 2d Feb., with severe burn, extending over the integuments of face, right side of neck, greater part of thorax, and considerable part of right arm and shoulder. The left hand and forcerm, and enterior parts of left knee are elso scorched and slightly vesicated.

4. Violent delirium during the night, with

tremor ; pupils contracted ; tongos furred ; thirst; bowels open ; pulse 116; four sunces

of alcohol during the dey.
5. Constant delirium continued until the

6th, when she fell asleep.

9. Involuntery motions; sores dressed; slough undetached; slight purulent disoberge; medicines continued. The symptoms remaining unabated and the deblity increasing she expired on the 16th. Sectio cadave is.

Serons exhalation over the hemispheres of brain, with a collection of bloody serum in base areal; partial hepatiantion of right lung, of long standing; two or three small obsesses under integuments of abdo-mon; liver in homo parts cartiloginous.

the flour applied.

5 B

## THE LANCET.

London, Saturday, March 7, 1829.

- A Manical Journal has recently been established at Paris, under the title of La Limestte Française; the Editors of which state, that in the conduct of their publication they impartiality and independence which characthrine the English Journal whose designemain objects le to present the Medical Profession to France with faithful reports of cases occurring in the public hospitals. Hitherto, reports of hospital cases have, for the most part, been transmitted to the Editors of French Medical Journals by the hospital physicians and surgious themselves, and the consequence has been that no reliance could be placed on the adelity of fit of their own approbation, and avaid giving and some other hospital surgeous, but of unnecessary prominence to unfavourable scribed to pay the expenses of a pass tion of hospital reports by hespital shydricals feetimes. We the make no better see and surgeons themselves, leads, of accounty, upon this admission of Mr. Barers, the

i percent representation of the facts of the cases relected. Even in the best conducted hospitals errors must be secondarily sommitted, but no man will relunturily become the historian of his own blunders; and the amount of fraud practiced on the profession and the public, by the suppression or misrepresentation, of cases, which sout exist to some extent, even on the most favourable sopposition, will be less or greatwill be governed by the same prioriples of or in proportion as the hospital function. aries are more or less competent to discharge their official duties. It this country, where tion they here adopted; and that one of their the system under which hospital patrousge is distributed affords no security for the competency of the persons appointed to discharge the duties of hospital surgeons and physicians, and where we find a single individual able, by diat of corrept infuence, to quarter his whole family upon two charitable institutions, to the exclusion of men of vigorous intellect and unpatronised talent, what would be the result if the reporters. It is not necessary to resort the profession and the public had no other to the avidious supposition that the French records of hospital proceedings to look to, boughtal functionaries stand lower in point of except such as were supplied by the parties bosour and morality, than persons holding who are interested in consealing their own similar situations in other countries, in order inefficiency? We are not left to conjusture to account for the system of garbling and the consequence, for the experiment which misrepresentation, which, it seems, has long has settally been made by some of the heanotoriously prevailed in the reports of hospi. | pital surgeous, has enabled such members of tal cases, as published io the French jour- the profession, as their lucubrations have nals. It is a law of humon nature, which reached, to estimate the degree of honosty most men discover and act upon without and impertiality with which they have the help of Purrencony, or Guorses, that recorded their own professional exploits. wherever they have the uncontrolled power It will be recollected that, at the late trief, of praising or occasions themselves, they we effected from the mouth of Mr. Bective, will generally give themselves the full beneat in the witness-box, an administra that he, particulars, or, in other words, suppress flos, which gave them as apportunity of whatever mey tend to injure their own in- becoming their own pantity cites, and of terests and reputation. Hence the politica- paying weekly homings to their own perto unfairness in the selection of sease fald but which is adopted to our hands, hi a before the public, and, for the most pure, to procing of life James Squerast's book

learned gentlemen's address to the jury, affords an instance of the curious infelicity with which his arguments tended to strengthen the case which he was instructed, and, peradvanture, peid, to oppose.

"What, if in the law in every assise town, persons were employed to publish the fame of their own particular efforts, and not to allow that fair competition in a court of justice, to determine who is the advocate the public should employ, but to give it out beforehand, by suppression and false repre-tentation, would not that destroy the honeur of the ber, and would it not tend still more to degrade that hounnable profession, if among themselves persons were found capable of making reports of their own exhi-bitions? Such a thing cannot happen in the profession to which I belong, but it has an example in the medical profession."

. We may observe here, that before eny concinsions on be fairly drawn as to the degree of animadversion to which the persons styling themselves the heads of the medical profession ought to be subjected, from the manner in which the public are enchled to judge of the abilities of gentlemen practising at the bar, it must first be seen whether there is any thing parallel in the state of the two professions. What, if Sir JAMES SCARLETT were shie to proque silk gowns for half a score of his nephews and immediate countrions, would not such a fact of itsalf raise a strong presumption, that there was something radically corrupt in the system under which the honours of the legal prefession were distributed? Who ever heard of a family pixels of King's counsel, or what power has even the highest law afficer of the Crown to copier pre-aminent deret station upon his relatives and conmaxions ! Sir James Scanzart could hardly have faller upon a more foreible illustration of the difference between a profession in which the sole claim to distinction is superior ability, and a profession where of deid station is procured by family influence

a passage which, like many others in the BRANSHY Coopen. In the profession of the law, the race can only be won by the strongest; in that of medicine, the weakest ere emuggled up to the goel at the moment when those who rely upon their own exertions receive the signal for starting. We believe there is hardly on instance on record, in which a lawyer, who has distinguished himself in his profession, has seen a sen or relative acquire honours in the same oereer; a proof of the condition upon which along honours in that profession are to be obtained. But what is the case in the medical profession? In two of our principal cheritable institutions for the relief of the aick, we find a single individual openly evowing, that the official situations are ell held by himself and his immediate connexions. We find Sir Asrzey Coorge, and his pephew Trunker, and his nephew Kuy, and his nephew Baareng, and his godson GEREN, and his epprentice MORGAN, and his apprentice Travers, all fourishing upon the same stalk et Guy's and St. Thomas's Hospitals! Under such a system as this, is it curprising that medical science should be at a lower abb in this country, than in any other country in Europe? Under such a eyetem as this, is it surprising that the degradation to which the medical profession has so long submitted in this country; should heve influenced the estimate which men of science on the Continent are disposed to make of the character and pretensions of English medical practitioners ? Of what metarials, it is natural for the uninitieted to ask. must that profession be composed, of which nephew Transit, and nephew Kny, and sophew Buareny, are the heads? The system speaks for itself; and Sir James SGARLETT. one would think, must have shackled intercally at the grossness of the sophistry by which a jury of merchants sould be persuaded, that there was the smallest analogy between the means by mid socraption, then that which he named which honours are obtained in the profesdisals amplesed in behalf of his client him sien of the law, and those by which many and noodles are sanggled into office in lightened orator indignantly denounces as the medical profession. There are other one of the most awful signs of the times. reasons, perhaps, which may account for the Sir Autnowe Cantusen complains that he good understanding which subsists among bes not received that treatment at our hands lawyers, besides that which is founded open to which his ege, his keighthood, and his the result of free and open competition. Next to the odium theologicum, the wrangliog among members of the medical profession has have immemorially noted for its corimony; hut lawyers have been likeced to Swiss mercensries, who get too moch hy the quarrels of other parties, to lose time and money by engaging in quarrels among themselves.

The Galenist and Paracelsian Condemn the way each other deals in; Austomists dissect and mangle, To cut themselves out work to wrangle; Bot lewyers are too wise a nation T'expose their trade to disputation. They have no interest in the cence, For whicht' eogage, and urge the lawa, Nor further prospect then their pay, Whether they lose or win the dey.

This, it must he admitted, is rather a vulgar, common-place view of a profession, the members of which, as Sir James Scanzerr has assured us, are honourably distinguished from onmmercial "hirslings," who are sordid enough to receive money in exchange for their lebour; it is, however, the view of a poet, and of a poet whose wit, and fanoy, and unrivalled power of making human learning subservient to the iliustration of human folly, will excite admiration, when even Sir James Scanlett. and his Poor Bill, shall be utterly for person in the world who has a right to comgotten.

Among the hospital surgeons there is one siogularly-gifted individual, whe, if we may propose that obstetric practice throughout judge from the display of intellectual power the kingdom should be transferred to the which he made when he delivered the seln- wives and daughters of medical men; that brated Oysterian Oration, would derive bit the besences, as fire as in him lay, to new little benefit from the privilege of reporting the seeds of domestic misery, and to min his own cases. This eminone person has the peace of facilities, by insinuating that threatened, it seems, to withdraw his com- secondarie were in the sometent habit of tenance from the profession, if its members committing the ferlest and most atrosicia abould continue to manifest that horrid pre- visitations of the confidence repeated in the dilection for THE LANCEY, which the PR.

oratorical acquirements, fairly entitle him : and we are free to confess, that, sweet orater, we humbly conceive fiir ARTHORY to he the most unmitigated ass that ever disgreced the character, and axhaosted the petience of the professioo. Estimation his intellectual aise hy the Oysterian Oration, we know of nothing low enough in the animal or vegetable kingdoms which we should not disparage by likening to the capabilities of Sir ARTHORY: judging of him by the Oysterian Oration, we should have no hemitation in sayiog, that be atsade confessed the Thersites, the jack-pudding, the wooden apoon, the boots, of the medical profession. This is our honest opicion of the sayings of Bir ANTHONY; but se to his doings, we will pledge ourselves that on the few occasions on which it has been necessary to notice them, (for let it be borne in mind that he visits but twice a week the hospital of which he is one of the appointed surgeoea,) these have been faithfully recorded to the pages of this Journal. He has not vectured to point out soy inaccuracy in our reports from the Westminster Hospital, and notil ha does so, we shall not ooties the impotent twaddle which fell from him, on a late occasion, further than hy observing, that he is the last plain of the licenticonness of the press, seeing that he has had the indecency to With people to se observation which is

reported to have been made by Mr. Gorunta, | was the first person who had given it my meo, seems to think it assential to his fears, at the time of the operation, "that the teriure of the gut coold not withstand The force necessary to restore it ioto thn abdomen." The aubstantial question is. whether so much violence coght to have been used; and not whether Mr. Gornain correctly foretold the consequences of that violnocs. There are no prophets more dengerous than those who have the power of folfilling their own vaticinations.

WESTMINSTER MEDICAL SOCIETY. February 28, 1829.

Dr. A. T. THOMSON, in the Chair.

BUTFINESS BY BLOOD-NEW THEORY.

Dr. Gasnosy introduced to the Society the autiest which had been so often postpon-ed. It was one which he enusidezed worthy their attention, and related to the well-known appearance of huffiness in blocd. Of all the important toples connected with medicine, there was not one, perhaps, on which the miods of medical man were less clear; it ideas could be more ludistinct than those they was loose, and their apeculations were vague; and it cartainly deserved a better consideraought to be considered the index of the state of the body ! and to this day there were differences of opinion on the question, some

at the Westmioster Hespital, we have but serious attention, and he, in speaking of one word to add. That gentlemen, in al-blood was materially consected with disease. luding to a case of strangulated hernla, lo He first ooticed the fact of one cap of blood which he had the misfortune to burst, or out, the patient's intestine, lo endeavour-ing to return the gut luto the abdo-ovarinaded the doctrine wish its importance, that at length it got into disrepute. More modern times had redocad the subject withreputation to state, that he expressed his | ln more resonable limits, and called attention more to the pathology of buffy blood; still the dectrices were so various, that they perpetuelly contradicted each other. Simpson io his De re medice, saserted that buffy blood was owing to the blood being stagnated in its motion. He noticed that when a ligature was pot on a vein, and the patient was bled fram that veio, the blood became huffy; from this fast he deduced that ell huffy blood was e the sizest of ategnation. But there were other philosophers who denied this alto-gether, and said that bufficess was the result of a great rapidity in the circulation. Next there spread a nation that hoffiness was owing to the blood baving become too glutinoos; and then Howson rose up and said that it was because the blood was too limpid. This was now the more geosral opinion; but there were some who said, that buffiness was owing to too munh fibrin, which a third party wholly contradicted; and thus the medical world had gone on from pariod to period, contradicting and opposing each other, and involving the question in obscerity. Here were six theories on the subject, but not one of them near the truth. In fact, the phano-menon was to be contemplated in a very different view to what had yet beso taken nf it, and it was los (Dr. Gragory's) opinion that we must examine it es connected with its circuletino. Peuple lonk at beffy blood when it has been drawn, and form their conjectures and theories upon it accordingly, considering that the buffiness results from came delly under their notice, and yet no the abstraction of the blood; but he contendad that the ooly proper light lo which to axentertained on the subject; their reasoning amion it was, what were its state and effects while circulating in the system, It was a remark of vid authors, that the blood to the tion than had yet been given it. Habberdine, spring had a greater tendency to bufficers, is 1765, had gone so fax as to sak whather than at my other period of the year. Now hully blood was a thenomenous of sufficient ha did not believe this. His opinion was, Importance to excite the attention at all in that halfy blood could not circulate in the other words, he had saked whather slay blood body without inevitably producing disease; but disease did not always exist at that period in which it was alleged that huffness was most prevalent. If about now draw answeriog it in the affirmative, and some in the attention of the Society to his views of the negative. He would take a short roview the ambject; the basis of these was, that of the uprations which had from time to time buffy blood was the cause of disease. Buffy the attention of the Society to his views of the subject; the basis of these was, that existed on the subject, and which perpetually blood differed in its kind; it varied in in-sontialisted each other. The surjects had remain; sometimes it had very little inten-devoted but little attention to it; Sydenham sity; at others it was highly intense. Ha

had seen it in all its degrees, and it was from taken, was deeply buffy. Here the blood personal apperience that he had drawn his had guite so the arteries; sad pipulaced its conclusions. His observations had been affects, but not to the brain. We aften chicky made at the Small-Pox Hospitsi, but not to the brain. We aften chicky made at the Small-Pox Hospitsi, but not to the brain. We aften chicky made at the Small-Pox Hospitsi, but not to the brain. We aften the could are to the could be brain. For his was the result of inflammation. But if buffiness depended on an increased action of the my of them to account for disease. Here system, how was, it that the blood was not knew of nothing which could account for always buffy in small-pox. During the the symptoms which appeared but the buffs beight of pustulation, and when the inflamms—ness of the blood, and it was upon this that tory action was greatest in that disorder, there his views of disease rested. He should next. was no buffiness; but there came a period afterwards, when it was most prominent, he was of opinion that there was wanted a and that too when the inflammatory action medicine which would alter the hefiness of curred from that very moment. He did not There was nothing for the cure of budy pretend to any in what that change actually blood—that is, for the cers of disease—but onnaisted. He could not have been of totally are the could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy, but he could not tell who it was budy. had really subsided; and it was curious to the blood, and if this could be obtained, a it was hully, but he could not tell why it was blood from the system, of the hulliness from so. One of the first things, however, which the blood. When the last drop of this might be noticed as the result of this change, could be drawn away, then the patient was the occurrence of purulant ophthalmia, of indummation of a purnlant character about that colchieum, nitre, and such ather medithe eyes; the moment the blood became cines, were the most complete for this purbuffy, that moment the ayes became affected; the total disorganisation of the eye first com-menced, and then the brain became disturb-ed, the buffy blood began to circulate through the brain, and when it was most buffy, life examined, there were no appearances to learn, observed that Dr. Gregory bad account for death, but those of the existence comitted to take into account one cannot be buffy blood in it. Now the theory which d on this subject had been forced mon his mind; so prominent were the rally produced by increased hast of the facts connected with it, that he could only body; whether disease was present or not; draw; one general conclusion from them— a man, who had run with anticient violence draw one general conclusion from them— that buffiness was the cause of disease and of death. Other facts he had no ticed especially, were those of the state of the blood in rhaumatism, and they all tended to establish the same principle. He of the blood in rhaumatism, and they all Mr. BENEFIT would not follow Dr. Gre-tended to so blish the same principle. He gory through all his arguments, but content was convinced that, in chronio rhenmatism, himself with objecting to the new theory, the blood was as buffy as in acute rheumation; and if the opinion he hald were convect, this could to be the case; and so it was. He had heard people talk of materials and an apute rheumatism. Now he assessed that this never took place until the blood became buffy; but the moment it did go, metastasis occurred. The buffy blood penetrated the heart, and it immediately brought on pericarditis and rheumatism of lite heart, then it was that inflammatory action commenced. He had been lately extending a case of acute rheumatism, in which the huffiness had been carried to the highest grads of intensity he had ever seen. nigness grans of intensity in son ever seem, saxinan in rune neutra natural in such as it was almost; always in the yenous system, and buffy, and yet there was no discase. If Discrety saldom in the arteries; but this case Oregory was seemstoned to rend Tun Length cocurred in Wardom; Street was the set of the Cocurred in Wardom; Street was the set of the Cocurred in Wardom; Street was a set of the property was not, he would have found

say a few words on the ambject of its cure, would be well, and only than. He believed poss, in eases of rheumstism, that had yet been obtained, but they were not fully effectual. There was wanted some other medieice, and be should now be gied to bear the opinions of such mambers as were willing to

sions, and that was, that huffiness was genato heat himself, would always axhibit buffy blood. He should like to have Dr. Gregory's remarks on this fact.

that if we allowed ourselves to use our senses, instead of our imagination, we should find, that the attempt to discover any really important difference between buffy and healthy blood, was almost unavailable. There was, in fact, no physical difference between them. The only real distinction was a difference in the red colour of their globules. He thought there were far too many terms used in speaking of the blood. Congulable blood had only jost the red coats from its globules; in other respects, the blood was just the same thing. How could buffy blood be the cause of disease, if it often existed in rude health, as it did in pregnent women. In cases of lightwee, the blood, was

a paper on the sobject of inflammation, in which he had stated, that in the first stages of inflammation, mere serum was effused. and, finally, that the whole blood was offused; and these facts were decidedly opposed to the prosent views of Dr. Gregory. Mr. Tuonson inquired of Mr. Benoett, whether he considered that blood lost its reduces (the suit of iron) before bleeding or afterwards; he thought himself it last it afterwards, and that this difference had no effect on the circulation,

Dr. GRANVILLE expressed bimself deeply disappointed at the result of Dr. Gregory's communication. This was the third ovenmight have been thankful to Dr. Gregory, if he had told them once more, that be was married, and could not come. The question, however, was now fairly before them. Dr. Gregory was o mao of great talent and preeminent shility, but he had expected much more from him than Dr. Gregory had given them that night. He particularly coosidered that he was deficient to his remarks on the physical state of the blood. He bad passed this over in the most superficial manner. He ought to have given the Society his opinions of what buffy blood coonisted, and its effects to the circulation—the mode in which it produced disease. He should have shown what was the texture and coodition of the blood, whether the blood was or not a living fluid. These were the really important questions to funud a theory upoo; and he considered, that Dr. Gregory's views being thus deficient, were not entitled to any attention. Dr. Granville having then disposed of one or two "episodes" in his peech, impeaching the opinions of Mr. Bennett, returned to Dr. Gregory, and dis-puted the "practical" portion of Dr. Grehe yielded his ared ence to the theory, that it arose from the buliness; and the more so, Dr. Gregory forgotten, that in blacking, the affect or cause of disease ! Dr. Gregory

some time since an account of some supe- | bufficess was often got rid of in the third riments by Mr. Vines upon animals, exhi- cup, and yet that it often respected. It riments by Mr., vines upon animals, exusting upon yet that it ortan respicated as biting buffy blood, very strongly opposed to often happened, also, that a first our would his sheary. He agreed with him, that if he buffy, a seco. not, a third buffy, and a the globules of blood had not got their red fourth not. How could he explain this? social, that the blood would not support like I yet that this was the fact, he would expect and that if it was sent to the brain it would to the morrest type that serv wielded a lamentary of the second of blood in the second over significant the second over significant would be a support like the work of the second over significant with the second over significant would be a support like the second over significant which have the second over significant would be a support to the second over significant with the second over significant with the second over significant way with the second over significant with the second over significant with the second over significant way with the second over significant way with the second over significant with the second over significant with the second over significant way with the second over significant way with the second over significant with the second over significant with the second over significant way with the second over significant with the second over significant way with the second over significant way with the second over significant way with the second over significant with the second o to the merest tyro that seer wielded a im-cet. Dr. Davy lead witheased, over and over sgain, on bleeding soldiers, that he were or eight ressels some would be buffy, and others not at all so, although the diet, tempersture, quietness, and overy thing also, were alike. The opinions of Dr. Gregory as to its penetration of the heart and brain, and producing such knocking down effects on the patient, were equally groundless. But, ficelly, if any proof ware wanting that Dr. Gregory had not fully considered the subject, although he bad taken all this latitodo of timo for it, it was to be found in the opininos he had savsoced as to the cure. If "eradiention" was the oure, o and a third cap was free from it, tha disease ought to cease; then why did the ing he (Dr. Granville) had cume, urged by huffiness sometimes appear again? (Hear.) his great desirs to hear what it was Dr. In short he (Dr. Granville) considered the Gregory had to lay before them; night after communication of Dr. Gregory full of overnight he had attended with the greatest im- sights sod errors, and be trusted he would patience, but now he thought the Society renonsider his views on the subject.

Dr. Copland made some remarks on the nature and aime of the globules of blood, which he considered as very various. Ho thought the bloud partook of the vitality of the whole system; that the appearance of the blood was an iodex to the state of the system. There was oo circulation of buffy blood in the vassels. Inflammation often existed without buffy blood, and often with it. Io cases of febrile action, we seldom found buffiness in the blood prominent, but as soon as inflammation attacked the serous and fibrous structures, then it became buff As to the cure, he thought that instead of attempting to abstract the buffy blood, moderate blanding, with large doses of depressing medicine, by diminishing the excitement of the vascular system, would gain the proposed end more rapidly. Upon the whole he thought that Dr. Gregory had brought forward his theory, more to show

his ingenuity than any thing clae.

Dr. Jonasroux hoped that shough six systems had fallen to the ground, lie seventh woold be arected more firmly. Dr. Gregory had said he could distinguish by the gory's opinious. It was true, that where symptoms of a patient when the blood was bully blood was present, there was, gene-bully, if he could really do this, he had relly, disease; but he should healtate before; made a most important discovery. The blood was generally buffy in pregnant women; now he thought it fair to expect that when-ever a ledy was pregnant, Dr. Gregory could discover it by the blood; and this was because his appriance went to prove, that over a ledy was pregnent, Dr. Gregory no such thing as buffy blood did circulate in ould discover ir by the blood, and this was the vessels of the body. The indicates of a highly important thing. The real questions which was assistant. Head tion, however, must be, is buffy blood the

said it was the cause; Dr. Copland, that it | dealy fell and injured kimself, the blood; on was the effect. Now, Dr. Gragory had instanced amail-pox in preof of his views, and had said that it was a pure and beautiful instance of inflammatory discase. But he (Dr. Jehnstone) asserted that it was not. In fevers, there was great excitament of the boad, lungs, &co. and yet the blood had no sppearence of infammation. The arguments, therefore, drawn from small-pon cases were net good ones. He sltogether disputed bls conclusions drawn from the inflammation of the eys, and he coosidered also that the buffiness of alternate cups of bleed in chronic and scute rheumatism, was not secounted for by this seventh theory. Fasts, too, were epposed to the total abstraction of buffy blood curing disease. Rheu-matism was to be cured batter without blood-letting than with. Where then went Dr. Gregory's theory. And so to the sed-don penetration of the heart and brain by buffy blood, producing death or near it, ha was autonished at the argument. The truth was, that the blood must circulate through these equally slike at all periods of disease, and there were not the leest grounds for the new epinions on the subject.

Dr. Gangnay stated, that he had introduced the subject marely to have the opi-nions of the Society; but he saw new that this was out of the question, for, according to the four gentlemen who had spoken; buffy blood actually did net circulats in the system at all. Now, if he know any thing whatever of physic-if he know one fact better than annther—it was this, that the blood was dif-ferent at different parkeds in the body, and that beffineas was one of its states. There were inflammatory conditions, in which no earthly power could obtain buffy blood; and there were other states, io which ceme it would, trickling down the arm, and nething could prevent it. Dr. Gregary then reca-pitulated his opinions, and would not admit that they had been refuted.

A discussion erose as to the buffiness of blood in pregnant women, the facts connected with which were, in a long argument, brought, by the speakers, to beer against the theory of Dr. Gregory. It was considered that the buliness naver arose out of mere pregnancy, but from some specific derange.

ment connected with it.

Br. Strwaar inquired if Dr. Gregory. considered that buffy blood was, under any circumstances, a patheguemouic sign of in-

being drawn, was not buffy."

Mr. Sawwell said, that horses, on being bled after exarcise, always gave buffy blood; that when they had been some time quiet, it disappeared,

After a second discussion as to the air of the red and white glabules of blood,

Mr. Neura expressed it as his opinion; that Dr. Gregory's theory could not sur-mount the fact, that pragramt women, win were in perfect bealth, often yielded buffy blood.

Dr. GRANVILLE having taken an epportunity to state, that he bad delivered, nr superintended the delivery, of more than 26,000, wamen. (A general laugh.) Dr. Johnstone having stated, that if his memory did not fail him, he had soon an artery yield buffy blood—and the Chairman hav-ing asked Dr. Gregory if, in all inflammstory disease, there was net a disposition to form naw parts; and baving hinted that buffy blood was more or less, according to its intensity, connected with the formstiva process, which bint Dr. Gregory considered an invanious one—these things having passed, the meeting saperated, with a bape from the Chair, that the subject would not be sllowed to sink into oblivion, without further discussion on another evening.

A petition to the House of Lords, on the anbiect of anatomy, laid on the table,

STATE OF THE SOCIATY .- TREATMENT OF SCARLATINA BY MERCURY .-- EXTIRPA-TION OF MALIENANT TUMBURS OF THE RTE .- THE SUCISTY'S ANNUAL DINNER.

ir this Meeting it is usual to make a disclosure of the state of the Society, which is generally done by the President. On the present occasion, the Registrar officiated. The only statement worthy of notice, respects ed the funds. A year since, the believes in and the tunes. A year succe, the continues in hand was 1004. 14s, 1d.; since that period 2066. 12s. 6d. have been received, making in the whole 3671, 6s. 7d. The capenace for the past year have been 3991, and a fraction, leaving, therefore, the Society in dobt to the circumstances, a pathegremoule sign of inflammation; methar member saked if its
appearance nught to regulate the treatment
of disease, and whether the pulse-was not
a better guide.

A Bissusca again referred to the fact of which with which will be with the pulse without
disease; and stated, that when a man and
the cash. The Registrar had on doubted
lines to the fact of which were the principal means of should be
fing the cash. The Registrar had on doubted
linesse; and stated, that when a man and amount of 321. A considerable aum badas it had hitherto been.

The Registrar read the minutes of the last

meeting.

Mr. Asswert and Mr. Susanty objected to the correctness of the minutes in so points, which were afterwards; corrected accordingly.

Mr. KINGDON wished to know from Dr.

Ramadge, if he recommended the use of meroury, invariably, in scarlatine. It appeared to him that culargement of the salivary glands frequently accompanied scarlot faver,

and this had raised a doubt in his mind, as to the propriety of the nes of mercury.

De Ranange considered the effection of the salivary glands as simply sympathetic.

Enlargment of those glands frequently mok place also in destition. It was in the early stages of scarlatins that he recommended

mercory.

Mr. Kingbow was hoppy to hear this explanation, because ito had known cases where the salivary glands had been anlarged, whore they had gons into suppuration under the use of mercury, had been benouted by the black wash, and when the marcurisi application had lisen laid saids, had got better.

Mr. Gosast read (rather unusual smong tho members of this Society) from a masuscript the particulars of two cases of what he cocaldored malignant tumours of the eye, which he had satirpsted. The first patient was forty-aix years of age. After the eyo it might be for weeks, months, or even a had been extirpeted, he had used a pisce of your. Ho had known an iustance where a sponge wrapped in linen, as a plug in the globe, by which he had suppressed tho hemorrhege, and which he considered much bettor than dossils of lint. As the parti-bealed, discossed surfaces presented themactives again, which were subsequently seamed to proceed under the shibition of removad. A third time diseased parts mercury, than, after a reasonable time, he showed themselves, to which concentrated would lay it aride; but he should regard an mitric gold was applied, but the diseaso still went on until the pstient sunk. On axami- tive. nation, It was found that the disease sa- Mr. Callaway sgreed with Mr. Gosset bended through the ethnoid bons, and was on the propristy of hoving removed the tuonly separated from the brain by the dura mour in the case he had last related. There was a coloulus found in the gell-bladder, as large as a pullet's egg, which, with the parts that had been removed during life, were exhibited to the Society. The liver had the melanoid appear-

The next case was that of a young lady who had accidentally received a blow on the check and eye; inflammation followed; the cheek and eye; inflammation followed; performed, and, in two of the chaes, with it subslied; inflammation came on again, complete success, and afterwards presented every appearance. Dr. Ranada was quite autonished to of what hire. Wordrop had called fungue the hear of its having been uncessary to keep a medication. In extinguished, it was found that patient spitting a plant and a half a day for the restaurance of the results were cannot be any length of time, or even for one day. Ho regarded corrying the use of mercury to such an include the results with th

Mr. Typastr bad seen a great many . The Passepart informed the Society,

amount of debt, if it continued as prosperous cases of this description, and was much into clined to doubt the malignity of the two in the case last related. He was also extremely averse to operations of this kind-Taking the average of operations for medi nant tumours of the eye, it would be found that by far the majority of cases proved unanoceasful. He strongly recommended the exhibition of mercury, having witnessed the best effects to result from lt. Scarcely in any case, except where the disfigurement was vary great, or where the patient's life was sebject to much risk by hemorrhage, would be recommend the removal of the morbid parts. Where the operation was performed, there was no necessity for a compress, either of sponge and linen, or any other thing. He recollected four cases, two in which Mr. Grean, one Mr. Lawrence, and one he himself, had operated, where simple pressure with the finger for five or ten minutes suppressed the blacking, nor did it aver return; besides, a plog was greatly calculated to produce irritation, and thereby increase the chance of failure in the operation.

Mr. Callaway inquired to what extent Mr. Tyrrell would recommend the use of mercury, supposing it did not seem to re-press the disease, end supposing it affected

the salivary glands?
Mr. Trassil enswered, as long as the constitution of the patient would bear it; patient had been kept spitting a pint and a half avery day for aixtaon weeks, without the constitution afterwards baviog provad to be at all injured by the moreury. the disease was not suppressed at all, but operation lu such e case as only specula-

Mr. Asswrit bad seen three cases of this kind ; in one, the putient had been kept under the influence of marcury for aix weeks, in another for two months, and inanother for three months. The disease in all proceeded. After a short pariod, when the mercury was supposed to have been got out of the constitutions, operations were performed, and, in two of the cases, with

SERVICE OF THE BLOOD IN THE VEINE

# To the Editor of THE LANGET.

S1s, -In the report of the proceedings of the Westminster Medical Society, for the 7th of February, No. 285, Mr. Bennett offered some opinions relative to the siroupeared to think them, sither unnecessarily numerous and capacious, or that they per-formed some other function distinct from the more passage of the blood. It appeared also that the generality of the members did not agree with Mr. Bennett's ideas on the ect ; at the same time it does not appear that any astisfactory reasons were advanced in apposition to Mr. Bennett's upinions; indeed there appeared a dani of obsenzity concerning the increased valority of the blood through the veins, &c. If the following observations on this subject may be thought not unworthy of a corner in True Lancer, I shall feel highly flattered by their insertion. It may be said that I have not offered my thing new in these observations; that is not my intention, but merely from what we mirredy know of the circulation of the blood, and its mechanical contrivances, with the effects known to arise from a derangement of any of its modes of action, to deduce a sufficient reason against Mr. Bennett's opinion, and to show good grounds for beliaving that there does not exist a greater quantity of veins then is necessary to return the blood to the heart, and that they do not perform any function distinct and independent of it.

I am, Sir,

Your obedient servant,

Feb. 26, 1829.

highly active reasel, provided with measurar pol-street, of this place, and consequently poissoning gives labour for twenty-large pol-street, of this place, and had been force in itself; the fluid in the artery has amount of force in itself; the fluid in the artery has amount of force the least, on-twent to its destination, and this expedience is smalled its heatest polymer of the random per veginess, I found the liquor kept up by the contracting owner of the random small dis. hangesty the on place district, and caller fibre surrounding shearers. The vain It must be resollected that the artery is a

that an their Dinner would take place on a very and introducing a tube, the blood Menday next, the Society would, of course, will few in whatever direction you choose to manual Twenn, where he keped to see a prevent the blood from requestions, were powerful number. great difference in the force and rapidity of the flow of blood between the entery sad the vein. If there were generally but one vein to an artery, the rein would be unequal to the task of conveying back the blood as fast as the artery expelled it; the balance could not be kept up, the heart would have sent forth more blood than it sould procure again from its veice; the equilibrium would be destroyed. But we see that from the facility afforded to the return of the Llood. and the mechanical contrivance of its conduits, the heart is, in a manner, eachled to regulate its admission. Of what great im-portance this is in the mimal scenomy, fully appears from the errangement of the vessels of the head and apine; the blood is sent to the head by masns of the vertebral and internal cerotid arteries, which isst ere not ermitted to enter the cranium is a direct lina, but are obliged to take an exacedingly tertuous course, opposing same degree of resistance to the flow of blood to the brein. But what is provided for its exit? Large sinuses, which, communicating with the internal jugular veins, afford an sany and immediate passage to the blood. In five, let the immediate danger be remembered that would arise from an abstruction to the reflux of the blood from the brain and spinal cord. and there can no longer appear a superfinity of veins for the mere passage of the blood.

SEDOT DE RES IN LINGSBIND LABOUR.

#### To the Editor of The LANCEY.

Ste,-Being a reeder of your invaluable Journal, and perusing your reports of the late discussion at the London Medical Society, na the effects of the secule cornutum, or ergot of rys, I beg leave to trouble you with a case in which I made use of the enget. I was called to Mrs. Hitton, Chapkept up by the contractile never of the meeting six and the superior secular fibres surrounding six artery. The vein, seel inhomend, the presentation neutral, on the contrary, is an entirely positive recer. I waited two leave, and the pains still being vein, totally unprovided with macular fibres, is effected, I determined to try the ergot, partly from the impulsive power gives to it of susier, building it down to ten; of this by the strery, and partly from its equality I gave ber up heaf; the four contraction of the presence; for by making an opening into elegand, and the pains still weak, I gave her the remaining portion; strong pains came on, or director motion of the forecas, they must, and in twenty five minutes hoth child and in the after part of the operation, to be explanents were expelled. Had it not been transed without injury to the juw or faces; placents were expanse, results from off-for the ergot, she would, judging from off-commissions, have been hours longer. My accommissions, have been hours longer. My opinion is, that the ergot englit hot to be need if the on uteri be not dilated, at least

to the size of half-a-crewn, or if the ideor ameli ba not discharged, or if there be any preterestural presentation, or if the pains

be totally wantieg. Your obedient servant, EDMUND TAYL B, Sergeon, Middleton, near Manchester. Middleton, Feb. 18, 1829.

RETRACTION OF TRATE.

# To the Editor of THE LANCET.

Srn,-The only excuse I can fied for the positive and illiheral remarks of your correspondent, Mr. J. Du La Font, respecting myself, is, that he only read a short paragraph for two of my unper on the Extractice of Teeth. The large forceps, as I particularly stated, two for the very large molutech only, the small one being generally used for teeth of all kinds. The large learnment is lengtheeed in the java, that is, in those parts extending from the joint to the short extremity, for the express purpose of making them more convenient to use, the loss of power being compensated by the additional thickness of it in the fore parts, which, however, adds but little to its bulk or length, this latter being precisely the same as the key; so that the "ludicroes extent" of it exists only le the imagination of the writer bimsalf, who seems to have mistaken the word jaws for claws. It will be evident, upon a single perusal of his first paper, and a glance at the diagrams, that my opponent did not confine his remarks on my opponent did not confine his remarks on the use of the key to the mojer tech; but now his arguments are disputed, and his objection on the hots doubted, he has taken from a confine cond, and winder to make that of their alone. There is no conston, but I should have an objection to must him there, not, estably, in he somewhat were energity descript, in order to give buildingly to defeat on after side, but for the laudable purpose of elicities ir truth. of eliciting truth.

The following conclusions I believe to be

be lifted out in a direction perpendicular to heir sockets.

S. That the forceps is the safer instru-

ment of the two.

4. That fawer teeth are broken with it." 5. And, above all, that the application and nse of it are much lost painful than those of

the key.

In press of the last assertion, I have the concurrent and valuable testimony of many of my patients, who having submitted to the application of both instruments, would not allow the key to be used afterwards; dreading, as they truly observed, " that herrible wrench."

Let any person carefully examine the boasted diagram, and place in a similar one, nut a conical, but such a tooth as I have now before me, whose fangs are half an inch in length, and f of an inch in breadth from fang to fang, the diameter, at the neck, being an more than I of an inch, when he will have ocular demonstration, that to be extracted skilfully, it must be raised perpen-

dicolarly out of the socket.

Talk of "sciolists," torturing," and " cavillera," indeed! Let Mr. De La Pous; before he attempts again to teach old practitioners, pay some deference to the opi-nions of thust who are not so ignorant as

he supposes them.
Relying, Sir, on your usual impuritality for the leaertien of this, I beg to say, that I am an admirer of your poblic spirit, and Your humble servant,

J. PROWER.

Bristol, February 18, 1829.

WEED-STREET SCHOOL OF AWATOMY.

### To the Editor of THE LANCET.

Sin,-As you have inserted in Tun Lawcar, of the 14th lust., a communication from a pupil of the Webb-street School, falsely accoming Mr. Grainger and Mr. Pilcher of having refused gentlemen admittance to the machine which they have lately opened, pro-tenselly for the benefit and accommodation of their pupils, I hope you will, in accordance with your usbal liberality and atrict impartiality, allow but marly insertion to a few observations, in relutation of a charge so tetally Jas following conclusions I wentwo to be various, in relatation of a charge so tetally unfounded on fault.

That is it is seen out of 50, in which the last is seen out of 50, in which the fault wild be seen to see the seen of the last in the seen of the last is seen of the last in the seen who is seen to like the fault of the fault of the fault of the last is seen of the last of the last in the seen who will apply to him or to Mr. Pilcher. I can by the wrench of the key, or by the lateral most positively subscribe to the securecy of

this american, as I have not only been per-mitted to visit the museum myself, but have generally found several other stadests there sage of whenever I have been there. It may at first enjoyed great celebrity for the manufacture sight oppear stronge, that any individual of microscopes, during the 17th neutroy, should presume to write no mirro a state? Of course, since that period, great improve ment i hat I think the general expression of ments have been sume in their power and your correspondent's letter, and a brief ex
toostruction. posure of some few individuals who, for the sakn of anneyance, have wished to go into the museum whilst Mr. Greinger is preparing his lectures, wili convince you, and your numerous readers, of the badness of the feeling under which the letter was penned. To whom your correspondent intended to apply the spithets "high and mighty," it is diffi-cult to conjecture; if he wished to assert a plain fact, why not write in e plais and in-telligible language. This species of scribbling is highly characteristic of the positionimity of its author, and strikingly expressive of the becomess of the motive which it is intended to clock. The persons sliuded to heve, of late, been frequently in the habit of ebuning Mr. Appleton, in the most ungentlemanly menner, and even conducting themselves, whilst in the museum, in a way more becoming children than gentlemen. Should those pupils still continue to disgrace themselves by insulting Mr. Appleton, and injer-ing the preparations in the museum, I hope they will forbear calumnisting the character of Mr. Graieger, whese conduct, both as a man and a teacher, is unimposchable, and altogether undeserving the slander of so coetemptible an essailant as your correspondent, "A Papil." Vestras.

#### SPERMATIC ANIMALCULA.

Tax invention of the microscope is a subject of very great interest, and the immense advantages derived from its use, in the discovery and knowledge of minute structures, are so important, that we need not be autonlahed to find several countries wishing to ettribote the glory of the discovery to themselves.

Fontana, a cative of Naples, is said to have been the inventor, about 1618; but Borelli, in his Microscopical Observations, beste we the honour on Zechary Jamen, of Middleburg, in Zealand, who, he says, first made it known in 1990. But this statement of Borelli's is suspicious, as he was anxious to bestow the merit on that stay, to the an-thorities of which he had dedicated his

relle." Comiens mentions this circumstance in his work on the nature and present of comets. Hook, of the Royal Scelety,

Both Hartsoeker and Louwenhoek, claim the merit of having first noticed ant-malcule in the seminel fluid, but the latter was the first who published any account of them, which will be found in the 142nd Number of the Philosophical Transactions, in a letter to Brounnker, the then president; it is duted Nev. 1677; and heeded,
"Observationes de Natia è Semine genitali Animalculia." I ambjein an extract I ambjoin an extract from that letter :-

" Esadem materium (semen virile) non mgreti alicujus, nen diuturne nenservations corruptum vel post sliques momenta fluidiorem sartam sed sani viri etatim post ejectionem no inter labentihos quidem sex srterim pulsihus smpiuscule observavi tautamque io es viventium animaloulorum multitudinem vidi, at interdum plura quam 1000, in magnitudine erenn sese meverent. Non in teto armine sed la meterie fluida grassiori. adherente, ingentem illum animalculorum multitudinem phaervevl; in crassiori vero semine meterie quasi eine motu jacebant."

liartsocker's account did not appear till the following year, when it was published in the sixth velume of the "Jeurnal des Sevans." He there says, that in urine, which he kept some days, there were onrendered little animals, much smaller than those he noticed in gonnrhoal discharge, and which have the figure of small cels. He examined the semen of a cock, and describes the animalcule found therein as resembling, in their form, young tadpoins (grenouilles naissantes.) Needlam heatows the merit of the discovery on Hartsooker. "I shall take, writes Needham, " sa little notice so may be, in this short summary, of the simost inevitable mistakes others have mads, in this matter, before me, and the heaty consequences they have drawn from appear-ances that neterally surprise, by their no-velty; such surprise is but too spt to exptivets barsons, syan of the most series thought, much more the young and incr-perioused, such as Mr. Histocker was, when he first discovered the spermatic animalcula "

How Nootham could have made this statement is to see act outshing, for I see act a shadow to believe that Hardsocker win the thorities of which he has dedicated his a shadow to better that therefore was me writ; bealeds which, he gives to the late and the source. Seen before my account was named to be a superior of the taveston state of the manual seen to be a second of the past have a second of the past have a second of the past have in grain, sat his in a work entitled " Do'th alage Nam. Journal des Savans, while me mention is the 30th Number of the see published, where will be found an extract of a letter from him to the editor.

That Hugueea knew of opermatic ani-malaula, when his letter was written, may be judged of by the following observation: "I am shie, (says the editor of the jour-nal,) to say, that these animalcula are engredered by corruption and fermentation; ut there is another kind which most have another principle, I mean those discovered by the microscope in the semen of animals, which appear to be horn with it, and which are in such great numbers, that it seems he analysis composed of them." Im many parts of Hartsocker's works, mention is made of Leuwenhoek, with whom he appears to be extremely voxed and sanoyad, and speaks of his letters to the Royal Society as " bee at rampant," and containing, says he, useless and chimerical observations. In Hartsocker's " Soite des Conjectures Physihs states, that Leuwseboek's first commosication to the Royal Society was mublished on the 23th April, 1679. This published on the 23th April, 1679. is net true, for the letter of which I made mention before was prieted, as I have said, ie the 142d Number of the Philosophical Transactions, whish Nember is for the months of December 1677, January and . Fabruary 1678.

Animaloula are found in the samen of all

animals, sed almost at all times; they differ materially from the infusory animalcule, and, in fact, are confined to this animal secretion alene. Their dimensions are different in different seimals; neither do they correspond with the size of the seimal, as might be axpected. For, io the space of a grain of and, 50,000 may be rounted in the semse of a cock; ie the roe of a codish, 10,000; whilst the roe of the ruff (s fish a thou-sand times smaller than the cod.) the snimalcula are as large as the others. Ie oysters, muscles, and other shall-fish, aninaloula have also been noticed, resembling those found in the nemen of higher unimals,

. In man, their form is not always the same at different periods of life; for if we examine the fuel contained is the vesicules of mindes of an infant, which is not yet proper to generalize, we shall find animalous, but not of the same lagine as those in the adult. There is a because little ballon is not infant. There ire, however, little bodies, in which Hartschker presumes, are planed and exist loped the spermatic unimalsule, as insect are inclosed in their nympha. Again, in old men, the namen will be found to have a those enimals, and in some they are sit these minush, and in some they are either all dead, or so dall, so to survive but fore yery short period. Beninet Luid resembles, at first, congr-

made of any animalcula by Hartsocker till | lated milk; when examined with the magne journal was nifer, the saces of the opacity is not disnovered, but when it begins to disselve, and assume the colour of scapy water, if los at with a microscope of small power, the irvegular parts seem to he in an indistinct slow motion. This is from the action of the enimalcula, infinitely more minute, of a globular figure, with a sort of filament, or short appendage.

> The little animals possess a double m tion, the one oscillatory, from right to left aed from left to right, the other progress to the oscillation of the appendage. According to Spallanzani, is twesty-three micutes, the motions of oscillation and progression diminish; and in an hour and a half, but few of the mimalcule possessed, is the experiment he made, any visible mevement, and those that still retained the power, were conficed to the oscillatory, the progressive baving altogether ceased, from want of power is the tall, I suppose, to propel the body onwards. When all are at rest, by diluting the semen with water, you may more readily examins their figure. Est corpuscula is not preparly globular, but alliptic, and the appendage is not only longer than it appears, but the breadth is not equal throughout.

The motions of the suimalcule are instantly stepped, if rain or evan distilled wa-ter be added to fresh samen. Saliva, how-ever, does not seem to affect them. The ever, does not seem to affect them. temperature of the surrounding atmosphere has great ielluenes on their esistence, for Spallensanl noticed, that when the thurmomater stood at 36°, the mutions of the animaicels ceased in 45 minutes; when at 47°, an heur aed a helf; in two heurs at 45°; two bours and a half at 5t°; three hours at 54°; and when at 55°, after the lapse of three hours and a half. He constantly observed, that as the best was greater, the duration of motion lecreased; so that in the middle of summer the corpuscule continued to move for seven and three-quarters, and even eight hours. If the humidity be lost, they immediately become motionless, nor can they be revived if saliva be added. Naw Needham, and with him the illustrious Buffon, etate that thay, on examining fresh somen, abserved long filaments, g on avery aids; these opened ad divided into moving globules, trailing mething resembling tails, but after them so after them constitute resembling talls, but so far from being such, that they caused an escillatory motion, sed were nothing more than, the visoid sersinal asbatance. Buffing they does, choose them with the influery snimalouts, and mys they are vither produced by an evolution of organical parts, or by real vegetation. That this is not

#### LECTURE!

OR THE

DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT GUY'S HOSPITAL BY

DR. BLUNDELL.

Lacruna XIX.

Of Scirchau of the Operies.

In the same manner es women are liable to be affected with scirrbes of the uterun, d ffused or tuberose, se also they are obnexicus to scirrhus of the overice, a discase mere frequent, I think, in those viscers, than in the uterus itself. Of the two forms of disorganisation mentioned, it is, I apprehead, the tuberne which most frequently situcks the every, sed, therefore, when this viscus is anlarged, frequently it is the bumpy or tuberose surfece which characterises the disease; sometimes, hewever, the scirrhoun change which occurs is of the diffused kied, the whole mass of the overy selarging, and the nurface remaining equahie sed smooth. Under either from, the every may celarge very much, becoming aucremively large as ace egg, large as the head of a focus at the full term of gesta-tion, large as the fectus itself at the close of aine months, and, altimately, even larger than this. The rapidity, also, with which this enlargement takes place, is liable, to much which the colories. mast of the using be represed of solid material sely, without dropey, the growth with I believe, be generally slow; mantles it will certainly occupy, and more frequently years. When the every becomes activious. one side only may be affected with the dis-case, or the overy on the opposite side may also he involved in the disorganisation, the two being affected in very unequal degree r is this by any means uncommon; and irrhis of the every may be associated with

a similar disorganisation of the tubes, the womb, and the remoter parts. These extenaions of the diseases are or no ance. In pure scirrhus, of course, as the disease supervision, but new and than we meet with cases in which other disesse combines with scirrbusinflammation more frequently—abacess more raraly—ovarian dropsy not uncommonly; and when the inflammation is superficial, the ovaries are vary apt to contract adhesions with the aurrounding parts. When the overy is large as the closed land, being of a size to fall into the recto-vaginal cavity, so as to ob-struct the vagios, it may become completely fixed there, so that you may not be abla to press it shove the brim; or where the every is lying above the brim of the pelvis, superficial adhesions may taku place, ao az to connect the viscus with the intestines, ementum, and parts contiguous. In differ-ent cases of scirrhesity, too, thern may be much variety in the condition of the basis of the every; that part, I mean, by which it is attached to the sides of the pelvis in the healthy condition of the parts; for sometimes the counexien is stander, (in this preparation not thicker than the fuger,) and sometimes it is as broad as the palm of the hand, and the uterus and the every may be so far consolidated with each other, that to detach them is a work of some blocky, The whole of this subject, the merhid anatomy of the scirrhous overy, I mean, and more especially that part of it which relates to the extension of the disease into the contiguous viscers, sed to the nature, axtent, sed vascularity of the attachments, is well deserving of further investigation. So long discased parts, under any circumstances, is unitatifiable and hopeless, so long these inquiries may be looked upon as of specula-tive interest, rather than of practical importance; but if an expactation may be rea-sonably cherialied, of improving our abdominal surgery, so on to render the axtirpation of these parts upon the whole successful, in well-actected cases, and to enable as at the bed-side to discriminate the individual scirriogities in which success is te be expected, then it must be evident that

R

men of leigure or activity in the profession works. An account of dissections, drawn up in a view to these points, if brief and dia-criminating, would not occupy much space, and it might have the advantage of occupyiog a black which might otherwise be filled up with the workings of frivolous or fretful the mied of the same readers, and their juxta-position would probably give no small addition to their value.

Characters.-The characters of scirrhous ovaries are diversified, according to the ege of the scirrhosity and its coosequent bulk, so that, in practice, the two varieties of the disease must be distinguished from each other. Patients may sometimes came to you labouring under overien scirrhue, ne large as a nine months' uterus; and where that is alone the cause of this enlargement, they will generally tell you they have been labouring ouder the disease for several years-a very characteristic circumstunce, the patient adding, (when you come to in-quire more closely,) that this tumour, in the early period of its appearance, has seemed to lie, as we should have expected, rather in the inferior than in the appear part of the abdomen; and moreover, that in the earlier stages, wheo she has examined herself, by laying her band upon the abdomen, as when lyiog in bed for example, she has felt the eelargement more so the one side than un the other, though you, perhaps, when you come to examine the intumescence, may not so olearly perceive this Isteral inclination. To ascertain this disease with certainty, an examination becomes necessary, in conductieg which, you must proceed on the principles prescribed in a former lecture; but without their use :- Should you examine internally, and flud a scirrhoeity of the os internally, and find a softrhosity of the os reprinting assestion in the course as we were untern, or the regions, you must not histily infer that the overies are free from disease, for they too may be involved in the disease, with this variety of the disease, you will together with the womb. When you examine externelly, on placing the woman in the resumbent posters, having the supposting wint its nature is, yet may the resumbent posters, having the supposting wint its nature is, yet may the resumbent posters, having hubricated

the hreadth, the vascularity, the nature of the abdomed, you may distinguish the inthe attachments, the degree in which the
disease may apread into the other parts of
the body, together with the average frequeocy of these circumstances, may all of
them be looked upon as of no small interest, even in the mere practice of our abdomen is much more selfs and unyielding,
att, and I would, therefore invite work. ert, and I would, therefore, invite your and sometimes this hard substance may apattention to the inquiry. As the disease is pear perfectly equable, or nearly so; but in not of uncommon occurreoce, all the neces-other cases, and perhaps oot infrequently, sary information might, I canceive, be obtain-ed in a short compass of time, provided the lumpy feel, which is so frequently the effect of tubercle, and where this tuberose form would favour us with their communications olearly exists, it is a great help to you in through the intervention of our periodical marking the nature of the case. Now, where all these obsracters coecur, and I think, io the majority of cases, you will find them e-incerrent, if your patient have a tumour in the sbdomen of long standing, lying in the inferior rather than le the auporier half of the abdomen, and inclining, is its earlier formfeelings. By confining the communications stion especially, to oun or the other side, to some two or three leading publications, If, again, on examination, you find the upper they would be brought tegether onder part of the abdominal tumour centains the ietestices, in he distloguished by a little tact, while the lower part of the awelling is large, solid, and unyielding, and if this aurface, sometimes equable and amouth, abould be, as often happens, distinctly tuberose, with such characters there can be little doubt that s,scirrhous disease of the ovaries exists, either a scirrbus of one every enly, or together with the scirrhos of this overy a scirrhus also of the tubes, the uterus, and the overy on the other side.

But sometimes patients will come under your care labouring under the disease in its earlier atages, and they apply, perhaps, when the tumour is no higger than the closed hand; and, in those cases, the enlarging scirrhous everies may fall down between the vagina nod the rectum, and givo rice to symptoms which, if misunderstood, may occasion atrange missppreheesious reapecting the nature of the disease. these cases there may be a great deal of forcing, aching, and dragging, and s facling satif the interior parts of the body would come forth; and if we inquire whether the urine may pass or not, we learn that an ohatruction exists; and of the rectum it may be observed, that the compression there is so great, that solid evacuations will schroely some away. Your patient may also complain of a good deal of numinous in the lower limbs, with weakness, infacting her to be much on the solid; and the may have severe pains along the lains and thighs, with a ripping sensition in the course of the nerves.

a inmour filling the pelvis, with the vigina | I believe it naver happens that a well deve-passing before it and the rectum behind it, loped scirring of the overy becomes shell when there can be little further doobt that ed, in consequence of the use of any mediinterposed between the vagina and the bowel. But, again, it more frequently happens, end there is a tifled variety of the discase, that where the tumour is not of a very large size, it is, however, so large as to take place above the brim of the paivis, lodging either to the one or other side, in the case, the patient frequently auffers so little inconvenience, that the does not apply for help at all, until, et longth, pain aod infi@nmstion are excited, when she is lod, by her uncesiness, to consult the accoucheur, telling him, perhaps, that she feels as if the heed of a child wers lodging in one side of the pelvis. On hearing this, you lay the hand upon the abdomen, the woman being in the recumbent posture, and the bladder being evacuated, end the abdominal coverings being thoroughly relaxed; and then, perhaus, the tumour may be distinctly felt, sed where this is affected, it gives at once a pretty decisive character to the discuse, for in most, though not la sil coses, where you here a round firm tumour in the side of the false polvla, and more especially if tuberose, a scirrbosity of the overy will be found to exist.

In scirrhous overy, sometimes, indeed generally, the bealth is not very much impaired, and the woman suffers but little, and, thorefore, the less it is interfered with the better. Now and then you will find a good deal of pain in the contre of the hody, about the pelvis I mesn; and sometimes there is cedema of the legs, perhaps of one leg more than the other, and this cede I should rather wish you to ootice, becau if you are either incautious or iocurious, might lead you to confound the disease with might lead you to contound the little that is produced droppy of the peritonoom. As little that is produced the peritonoom is shown cases of over the little that is produced the little that is produ effective can be done in those cases of ovorish scirrhus, I will not detain you loog on that subject. What I stated of the scirrhous

there is an enlargement of the overy, pro- cina at present known, though I acknow-bably of scirchous nature, the overy being ledgo myself nueble to judge decisively by the iodine. Those who have seen most of this disease, will, I conceive, in this state of our knowledge, couline their medical treatment morely to the palliction of the symptoms to be treeted on general principles. It has been observed already, that the disease of the ovaries sometimes occasions but the hollow of the ilium; and where this is little distress, except that which arises from its bulk and pressure; sometimes, bowever, on inflammation of the overy le excited, and then you must treodit, I think, in the same maonor sa you would trest the inflamed soirrhus of the uterus, by leeches, fomentations, iszatives, diaphoretics, and digitalis, perhaps in operativa quantition, bot cautionalyputting the patient on the antiphlogistic regimen ; sometimes bleeding from the srm may be proper, though, in general, with three diseased ubdominal growths, much bleeding is an ecogenial. When the tumour is lodging between the vagins and the regtum, it may then give rise to a great deal of distress by compressing the bladder, the gut, and the origin of the nerves, the sciaties mors especially. The most effectual mode of relieving all these symptoms, is by replacing the tumour; and the bladder may be avacusted, (by cotheter if necessary,) and by e method of procedure very similar to that recommeuded in cases of retroverted uterus, the overy may be pushed shove the brim. By evacuating the bladder, the operator obtains a full extent of room, particularly if the urine have been allowed to eccumulate, and if he can once urge the swelling above the brim of the pelvis, much of the distress may he permanently relieved, because the abdon above being designed to receive tuas the enlargements from pregomey, ample, it is of course adapted to the

Progress.—The prognosis of this disease mey be dismissed in few words. The scirrhus of the overy you are to look upon as, probably, feetrable by known medicioes; and I hold it as a sort of axiom, that of that subject. What I stated of the scirrhous rule of the overy you are to look upon as, uterus, I would repost respecting the overian probably, feedrable by known medicioes; scirrhous—I meen, that if the tumour have once acquired the bulk of the fetal head, where is no reasonable hope of a dissolution of the scirrhousty, by any medical treatment which you can reasonable hope of a dissolution which you can reasonable by means of the private of the produce; I would not allow it in my own dropsy, not the edictions, is destroyly the family, and I would not therefore, have battlent. I may be added, too, that if a new to be the the family of edicts. I wouldn't meried, the returned position

of the overy becomes a cause of considerable placed in pure water, to serve for compari-danger during the child-bearing, because son. The flowers of Berberia rulgaris, if falling down between the ractum and the placed in common water, retain for several vegins, and obstructing the passage of the days the habit of contracting their stamins pelvia, it gives rise to one of the most dan- at night, and the same periodical movegerous obstacles in delivery, often proving ment, as well as the poper of contracting fatal both to the mather and child. Indeed, after any machanical impulse, is also reif a patient is known to have one of those tained by the leaves of the Mismag, under tumours, she had better far remain in the its name divenuatances. If, instead of unimpregnated state; for pregnancy would, water, a solution of prussic acid, or of opium, perhaps, cost the woman her life, unless the used, the irritability is by the first defining could be accepted.

probability is, that the parts will contract our substances, which was done by plasing adhesions with the aurrounding viacers, which may make it difficult to remove the lation of the extracts, or expressed juices, overy. Add to which, where you have s activhus of the overy, it may he so firmly they very soon alrunk, nod died within an imbedded in the pelvis on the one side or hour or two, while other leeves, placed in the other, as to make the removal of it im a solution of gum, underwent no situration practicable, or, ot all events, a work of con-whatever. If the roots of the plants in other.

# FORBIGN DEPARTMENT.

#### EFFECT OF POISONS ON PLANTS.

M. Macaina Prisane has lately made some interesting experiments on the sbcorption of poiscoons aubatances by plants, and the changes which they subsequently undergo. The flowers of violet and columbine, (Viola ederata and Aquilegia oulgaris,) the stalks of which were plunged into a solution of the acetate of lead, became of a graen colour, a considerable time before their complete death, which did not take place for two or three days. In a solution of the exymuriate of mercury, these placts died within nearly the same time; but shearp-tion appeared to be much less active, and did not exceed a gertain degree; those flowers only, which were very near the surface of the liquid, being changed in colour. The solutions of mineral scids were sbserbed so rapidly, that the flowers of violet became red aven before they had lost their

permaps, cost its woman her life, unless he used, the irritability is by the aret demiscarrisge could be ensared.

I sometimes hear my frieoda talking about cond in about double that time, the dealer removing the scirrbous every by a scalpel, a bility of the leaves and flowers remaining practice to which, in the present state of inhormation, I abould not myself sasent, at of the ameniste of sods, or expandiate of the ameniste of sods, or expandiate of the site of the ameniste of sods, or expandiate of the site of the ameniste of sods, or expandiate of the ameniste of sods, or expandiate of the ameniste of sods or expandiate. potient, then you had better wait; bot if hysechamus, or momeralies eluterium, were sub-there are fever and inflammation, the high mitted to the oction of their own poisonaiderable difficulty and danger, not to odd question were meistened with a solution of that the disease may not be confined to one their extracts, they gradually lost their viovery only, but may extend itself into the gour, and died within a short time. It seems, then, that the juices of the plants in question, which are deleterious to other vegetables, are poisons to the very plants from which they are entructed. This presents a striking snalogy between the animal and regetable kingdom; for it is well known that renomous serpeuts are poisoned by thair own bite.

According to M. Macaire, the results of the latter experiments are to be explained either, ist, By the chemical siteration which the. vegetable juices undergo when exposed to the atmospheric sir, and which consists in the absorption of corbonic acid, and the emission of oaygen; or, 2dly, Bysupposing that the deleterious principle is, in the plant, contained in peculiar causls, and saparated from the sap by a sort of scorstion. -Annal, de Chim, et de Phys.

DESCRIPTION OF THE RUNIMENTS OF A PICT. TUS, EXTRACTED FROM THE TRATECULE OF A CHILD SEVEN MONTHS OLD.

### By Dr. Waynt, or Basslav,

In the neighbourhood of Glogan, in Silesia, the wife of a labourer was la. Dacember, 1827, delivered of a basithy male child, which during six months enjoyed odour, and the course of shoppion was dis-good health; but having after this period timetly visible by the progressive discoloura-tion of the stalk. In all these experiments, some flowers of the same species were been removed by the operation, the testicle rapidly increased to size, so that the sorrotum at last hung down to the knees; that amour had an uneven surface, was very hard, and tender on pressurs, and as it continued to grow, was on the 9th of July removed. The ligature came away on the 12th, and the wound was completely healed by the heginning of August.

The extirpated testiels was four ioches sud a quarter in length, and two and a quarter in diameter; it weighed seven ounces, and its parenchyma was infiltrated with a gressy, ichorous matter, of a yallow colour. No shoe of the epididymis coold be found. The tunica vaginalis being opened, a solid oblong body was exposed, and on a closer inspection, found to be a thigh bone, without its periosteum, one inch and a half in length; in the circumjucent tissue, the rudiments of several other bones were found, which on a more scenste examination proved to be the pelvis of a feetus at the fourth month; the os coccygis was very much curred; the sa-erom terminated in a ligamentous mass, which appeared to represent the rudiments of the lumber vartebra. The head of the right thigh-bone was much compressed, without any trace of the nack, although two prominences, resembling the truchanters, were visible; its lower end terminated io two tuberosities, representing the inter-nal and external conductes. The left os pubis and the ischium were totally wanting; the llium, which was well formed, had attached to its semiciscular line the left thigh bone, which was only three-fourths of an inch in length, and its lower estremity bent backwards; the tihis were almost entirely on tileginuus, and were separated by a very thick inter-osseous ligsmeut; the foot was represented by a confused cortilaginous mass, without may distinct traces of toes. No other radiments of any fatal orgous could be found in the testicle, the substance of which was not in a morbid state, except from machanical pressure. The child from which it had been removed was, five years after the operation, in the enjoyment of ex-cellent health.—Bulletin des Sc. Mfd.

SWILE-FOR—BYIDSMY AT MARSEILLES IN

Fruit the efficiency which the Science Regula de Médécha of Maraellies has included published, on the mortality from small-jox during the last epidemy; and on the comparative frequency of the disease after vaccination; its appears, that of 50,000 vaccination is appears, that of 50,000 vaccination is appears, that of 50,000 vaccination is appear, that of 50,000 vaccination is appear, that is appeared to the varieties are right on which in 20 cases terminated fatally. Of 3000 persons who had neithed them vaccinoted her inschileted, 4000 were infected with ministroper, of whom no less than 1000 died. Of 3000 who had

been removed by the operation, the testicis is een affected with small-pay, either from rapidly increased to size, so that the scrotum inconsistent or spontaneously, 20 had a seat last hung down to the three; the tumour conduction of the disease, and four died.

EXOSTORS OF PRE MAXILLARY SINCS. Maria Faella, a peasant girl at a village in the neighbourhood of Pavia, had from her infency beeo in the habitual enjoyment of good health up to her eighteanth year, at which period a tumour, of the size of a filbert, appeared on the laft upper jaw, and gradually, though slowly, increased in size. Her menses had siways been regular, and as her general health was undisturbed, she married in her 20th year, and soon became proguent. The tumour had, at this time, attsined a considerable size, was free from pain, very hard, and evidently scated in the bone. Several external remedies having been applied without any effect, Dr. Atti, of Piss, was consulted, who perforated the tumour, sod by introducing a needle, endanvoored to produce caries, and a subsequest exfoliation of the axostosis. This was also attended with no success, and the discess was left to itself for four years, during which time the tumour incressed in breadth and height, so as to project about two inches, and forcibly to compress the nose, orbit, and mouth. The repeated attacks of inflammation of the eye, resulting from this preasure, had produced opscity of the cor-nes. The amell on the left side of thu nose was destroyed, the month distorted, the palate depressed, the movements of the tongue and deglurition impeded, and hearing conaiderably impaired on the affected side. The patient was examined by MM. Vocca, Ucelli, and Paletts, who declared the discase to he a fungous growth of the musillary sious, and proposed its removal from the covity of the mouth. An incision was made into the depression of the palste, and an oval piece of the osseous paries having been removed by means of a scalpel, the operator was going to detach the tumour from its adbesion with the booe, when a violent humorrhage from the substance of the morbid growth occurred, sod produced repeated attacks of syncope, which suspended the further progress of the opera-tion. The hleeding was arrested by the introduction of him, dipped in ice-water and vinegat. From the small piece of bose which had been removed, it appeared that the tumour consisted of so osten-fungoid mass, and was covered at Its-lower part by s very thio osseous luming. Three days after the operation, the aurgeon codesnoured to introduce his finger into the opening, and to detach a lorger portion of the fuegous growth, when the humorrhage recurred with the same violence on before. further attempts were accordingly desisted from, and the hamorrhage having been ur-

resied, the wound was dressed with belsam, and, in order to check the ulterior growth of the tomour, it was thought advisable to keep up supporation of the parts; bot on the eighth day after the first operation the wound, and, within a short time afterwards, the neighbouring organs became gangrenous; a line of demarcation soon formed, bot all the teeth of the upper jaw, the alveeler process, two thirds of the bony palete, a great por-tion of the vomer, the left nasel and infarior turbinated bona, nearly half of the molar bone, and the greater part of the upper jaw, either came away for were antracted by the forceps. The lacrymal bone was discharged from an obscess which formed on the check, the other bones by the mouth and nose. The operation had been porformed on the 22d of June, and the purts were perfectly healed on the 14th of September .- Annali di Médicina.

#### DOUBLE PUPIL IN ONE XYE.

A remarkable case of double pupil was observed by Professor Pacial, of Lucca, in a young man who, in his childhood, had, from an unknown axternal cause, been affocted with chronic Inflammation of the left eye, which had left it in the following atate: The axternal parts of the aya are healthy, the cornea is parfectly transpa-rent, eacept at its axternal part, where there is a small pteryglum; the pupil is elliptic, the fourth part of a line in height, and one line in breadth, and immorable evec in the atrongest light. The upper aye-lid being raised, another papil, three lines and a half in its largest, and one line io its smallest diameter, is discovered at the upper portion of the iris; it is somewhat directed towards the internal angle of the eye, and likawise insensible to light. The parts hebind it are perfectly transparent. The young man is loog nighted, and equiuts, the left oyn being constantly turned towards the nose; whenever he looks at an object with both eyes, he seen it simple and distinct; if the healthy eye be closed, and the scoessory popil covered, the object appears confused, but if seen with the superior pupil only, it appears simple and distinct. When-ever he looks with the morbid sys at an object placed before him, he sees its right helf only, and that double; in order to see it simple, he is forced to direct the eye towards the axternal angle, and even then the right half is seen more distinctly and some-what higher than the other. Objects ap-pear of the same size, whether seen with the markid or healthy eyo; and contioned exer-

" MEN" AND "MEASURES."

Dyan "Dua,"-Having wasdered through that fairy-land of romantic vituperationthe second volume of your fellow-graddite's miscellany-allow as to present you with another offering of Sowers, selected from that " Araby." of the heart, so which you and your brother Roderick moy ragale yourselves, like the two kings of Brenta, smelling to one rose. Should this houquet of the affections terture the senses by the union of its odours, pray do not give ne credit for your " aromatic pain," for, as Mr. Moore sings of his harp,-

- 'tis your glory alona; We are hat as the wied passing heedlessly

And all the wild swartness we wake is your own,"

In the former volume, which we examined on a late occasion, your friend hischeod, the meil coach doctor, seems to have laboured under some restraint-to have dreaded the indulgence of his natural feelings; but, in the present, his innata propensities operate unchecked, and he riots in all the end-less axuberance of his dulness and malig-Low as had been his estimate of his nity. disciples' tasts and disposition, the axtent of the vitiation of both appears to have been, even to himself, a discovery of which, howaver, he certainly makes the most lo his subsequent use of the accret. Adapting, in the commencement of his career, the viralence of his comments to the ecojactured capacity of his constituents for slander, he gradually increases the strength of the dose gradiany fortrains are actuaged to the same of the same on, he revives, intrilectually, the physical phenomeron of Mittridates, by demonstraint on that the faction, to which he are become potent areader, one submit on seman alone, without a revulsion of the special system. without a revulsion of the attental ay industry, no qualma of moderation mitigate his malevolence; the affected mildress of timidity and reserve, with which the first products of his labour were blended, has mertid or healthy eyo; and communes was tion of the former produces a disagrassible his malier, and we have here consesses an ensation in the interior of the globe, so that this foul reserveir of envious sourcility, the he is obliged repeatedly to close the system. In the administration of blacks the system of the system o

does not altogethat forget the rules of his make the statement, through a netural ap-

the doctor's composition is entirely removed ; and such imputations as " delicquency, detraction, imposture, and strocity," become sence; these terms of percocal reproach being, of coorse, intended to axpress something different from their ordinary meaning.
We agreeably avail ourselves of this clos to
the mysterious labyrinths of his style to lead was represented by the solution of the following parameter and the design of the following parameter and the solution of the following the solutions, logical identity (inclinative physically); and honology in depution of the following parameter with the writer's professions.—\* After a month's proposition, as seawer has been published, to which we should not have reslied, but for the purpose of pointing out the impudence of its misrepresentations."

inmolous philter to his deloded admirers, he even if he thought so, he would hesitate to does not altogethat forget the rules of his make the attement, through a neutral agovact with which he sweetened the potoc;
"measurea, not men," is now the corrigent belief, but, depending, we presume, on the
employed to make it ait easy on the atomake of his victims. Let us see how he
keeps this promise to the ser, sed hreaks to the other to the maderatanding.

In his preface to the volume before on,
we find him sparing "men" and essailing he inclined to save sppearunces, whatever
"measurea," with a promisty of fealing his real motives might be by sasigning the we sad him sparing "men" and essailing he inclined to save appearances, whatever "measures," with a propriety of fealing his real motives might be, by assigning the aed precision of stiquette at which the error of a proposition, and not its impospees to the House of Commons might; dense, as or reason for its reduction; bot no mostoke unbruge:—"We have fearliessly scota specieus artifice influences the condect denounced the system of literary plunder, of the doctor, who relies on the motonymical personal shase, which had degraded on powers of his pen to transmute the immedical literature; and opposed our cereest judices of on opinion, not only into a good and sincere efforts against the tide of de-lengument for its correction, but close withtransico which was so repidly undermining out giving the allubrat offence. In the the reputation of the profession. With a following passage he extends his arbitrary view to offect this, we have not henitoted use of language still forther, sed is dulges in to tear the mask from the face of the im-more daring figures of speech, thus:postor, and abow bim to his natire hideous-ness." This, indeed, is not had for a begie-ing, coesidering that "measures," not ascribed, and gloats on the victims of a "men," were the objects of attack! The cew calumnistor." The art of persuasion, mail coach graduate in mediciue, however, as rhetorin has been defined, sanctions no appears to he more of the rhetorician than bolder means of attaining its objects than the reasoner; he addresses himself more to that by which a writer, or speaker, exthe imagination end the passions than to changes identity with an opposent, and the understending. By some rach hypothesis alone can be be rescued from the "cnemy's camp." This grand manusure dilemma of self-onntradiction : thus, in the of orstory is not only exemplified, but even reseat instance, by a skifful use of that exceeded, in the sentence quoted by Rodolively figure of rhetoric, called metonymy, rick, who, having insincated himself into which enables a writer to dispense with the his actual natural attention which enables a writer to dispense with the his actual natural at the literal interprepation of words, he insensibly substitutes the agent for the ant, and feelings. After this aplendid specimes of seasonis "measures" by the figurative appears to the actual properties of "mea." With the ossistance of this explanatory key, the obsumity of Editor of The Lanesr, the next quotestic the decrease composition is natively empanyed. should neither surprise us by the audacity of its searction nor by the virulence of its sentiment :- " In the records of literary atrocity," he says, " we have mut nothing more monstrous than the cooduct to which the Editor of The Lawcar pleads guilty in his last Number." We were wrong in preparing the reader against surprise at this palsage ; on reconsidering it, wa perceive it contains a difficulty which is scarcely explicable by the help of even the doctor's scentions use of rhetoric; for, though it may be allowable to represent a man guity of monstrous strocities, the improbability of his acknowledgment of such crimes is not so readily digested. We have no doubt, however, that the author of the subsequent fragment of elequence, is the pathetic line, . .

the judigment rhetorician, " the unprovoked | with a halter, it is execuble! The reason-London.

lume, we arrive of a new era ie the philan-interpie laboura of your smiable friend Rode-rick. As opportunity, worthy of the eacr. The jory-system being thus aummarily che of this talents, fortunately presented disposed of, the character of the defendant tuelf about this period, to the legal pro-naturally comes under that suathems proceedings of Mr. Bronsby Cooper, to prove conunced egainst an institute, to eay suy to the people of England his skill and dex- thing in the praise of which would be nearly terity as a lithotomist. To discuss the de-tails of this "Waterho" between the me-dical press and thu hospital surgeons of the defendant, we are told, that, "like London, with the name of whose hero Cobbett and Hunt, ho folcode, on this ou-British ourses scare their babes into repose, casion, to conduct his own cause." Tho as Mohamedan mothers used to do formerly facilities which the rales of rhetoric supply, with that of Scanderberg, or Sobieski, would for lowering or exalting any subject, are be now a work of supercrogation. The one perpetually tempting Roderick to their alone which has been made of the occasion show, even in matters of law and common claims our present consideration. To qua-sense: the just application of the "simile," lify himself for the office of an impartial in this instance, is truly admirable, being judgo, and a competent legal autority in faunded un the slogle polot of resemblance, the pending cuit, he first facoura us with of Cobbett or Hunt having pleaded his his upinion of the merin and demorits of own case, though, in overy other circumstraint by jury." We have always (asys itanly dissimilar. Nothing easier then to a civilian as a rhetorician) looked on trial make "similes" on this principle, so much a cicilian as a rhetorician). looked on trial make "similes" on this principle, so much by jury as a bulwark against political ions, so, indeed, that we are tempted to try one vation, rather thus as the nost desirable inned at one. Thus and jury as many many the bearing justice between men and man. This object, we think, would be much better attained by referring the matter automated by referring the matter at issue to the decision of one intelligent; callicated mind, accustomed to view such cases in all their bearings, and too sents in estimating the value of reguments to be regulated by the opecial pleading of councel or standard of similates; must be a perfect either side. From the chard which the minustrel strikes in this prelods, the classes that of the subsequent performance may be true to the life; being the production of predicted with tolerable occurracy. Trial by the true to the life; being the production of his own recommendance, and the subsequent performance may be true to the life; being the production of his own recommendance, and the subsequent performance may be true to the life; being the production of his own recommendance, and the subsequent performance may be true to the life; being the production of his own recommendance, and the subsequent performance may be true to the life; being the production of his own recommendance, and the subsequent performance may be true to the life; being the production of the dispassing justice between man and judgment, and should not expect as be

aggressions of bold, had men, on the feelings ing, on Roderick's part, is conclusive; and property of individuals, do we not glow though we may not be sufficiently scure to with judgmation, and long to see justice perceive now trial by jury should be useful done to the injured parties?" Poor, virtuous people?" axelained Robespierre, at the same time, for dispensing justice with a peculiar anction of inicoation, on between man and man, the prevention of seciog the Sace Culottes ornameuting their oppression and the parties being precisely pakes with the heads of their victims, durishes in both cases. An institute, which is ing the French Revolution. " Do we not here emsidered competent to protect a peolng the French iterosection. The we not here considered compresses to protect a pro-loog to see justice done to the injured par- ple from the ancroschmeats of despetians, ties?" crica Roderick, on casting a sympa-might, by my less enlightened justist, be thetic glance on the calumniated execution—thought galter powerful enough to shield ers of the London Happitals. Congential on individual from the aggressions of an aprintis speeck a kindred dialect, though born ther. Roderick, however, thinks other in diatact countries; the hypocritical phrase wise, and would prefor the caprice of oue of the sanguinary jacobin of Paris admits, "cultivated mind" to the opinian of twelve at least, of a casy translation into the Pho-incost silent. Had the recollection of the rissical cant of the cat's pew of corruption in jury, which awarded him five pounds damages, on a recent accession, any thing to do With the commencement of enother vo- with the tirade against trial by jury? We

for dispassing justice actively man and judgment, and about not support to be man; that is, when its utility does not prested man leatently than the jury and place our own neck in denges, it is excell defendant, by the Rhadementhus of rand-tent; but, when it threatens that member poster Row, who hands the whole hands

whatever to perjury. In the next instance, Roderick is equally bappy in his retiocinetion; another of the witnesses, he represents as heving lived with a gantleman who married a relation of the defendant i orgo, hia abjuration is incredible, The proposition, therefore, staeds thus: relationship, metrimony, false ewearing! The married men eed the hackelors are deeply interested in this convincing argument; the formor should take care how they yield to the matrimonial temptation to derjuy; the letter should remain in a state of aingle hieredues, lest their versality should be seediced, along with their liberty, an the alture of Hymon and Cupid. Upon aleese substantial grounds, Moderick is petrifed with estonishment that any jury

over to the penalties of infamy in the fol- An oath pre, and an oath sen, however, are lowing mermiul assistance:—" When we two very diffurent things is the logic of paslook on the list of witnesses for the defentimeship; so much so, that the one is alalant, we are lost in astiniament at his
audapity in attempting to substantiate, a making every allowance for this friendly
serious charge by such incompetent witfeeling, it is extremely odd that Roderick
messes. We know not at which most to should have objected to the testinousy of marvel, his effrostery is acknowledging classic in the case of the defendant, and such worthless associates, or his folly in pass that of the plaintiff over in allenee, trusting to them, oes of whom only seems whose witnesses were ell, one wer or to have been less ignorant of the matter another, polluted by connexion and patro-than Aimself. Such are the friends of Tax nage. The second count in the indictment LANGET—such the pane who have dured to pass their judgmout on an operation which carly one of them had ever performed!"—fisses never performed the operation of From this grave indictment two charges littletomy, thorefore they were incomperative that the witnesses are clearly deducible: tent to deliver an opinioe on the question at the first implies that they were, from their issue! This decision bolds out rather a character, unworthy of helief on their oeth, fearful prospect for young lithotomists, and the second asserts that they were incom- ald martyra to the atone; it prevents, in petent to give evidence on a subject of fact, the former from ever attempting the which they were ignorest, mover, themselves, operation, end, by infersmoe, precludes the having perfurmed the operation of hitho: latter from the hopes of relief. For, if it be tomy. Of the circumstances which render unjustifieble to presounce on opinion on the them unworthy of credence, we can notice images it which the operation, should be but a few, which, however, may serve as performed without actual experience, it specimens of Roderick's reasoning on these onglit, surely, secording to all ideas of protopics. One of them, says Roderlok, was portion between punishment and crime, to a potatoe merchant; erge, his oath goes for he nothing less thee death by the law, to nothing! The aylogism put into form, attempt the operation itself without this therefore, atauda thus: merchant, potatoes, qualification of experience, which, however, perjury! The cheiu of induction is com- no operator, in his first incisions ie the peripleto; hut, if selling potatoes teeds to felse neum, can ever possess! If an operator is awearing, what man, according to Rode, never to andertake the task of cutting fur rick's logic, can believe the guilty wretch the stone until he has first responded one, whn eats them? For the honour of that why he may remain all his life with an untruly Irish roet, we must demur to itode stained scalpel in his hand, suspended berick a conclusion, that either selling, buy-twene the hope of success and the fear of twens the hope of success and the fear of ing, or esting potatoes, has any teedecey failure, like the metaphysical donkey hetween the two bundles of hay, which was starved while deliberating on which of them hn should regale himself first. On the other band, if n student's knewledge qualify hlm, (as indeed it always must,) for putting in jeopardy the life of a fellow-creeture, would not any one, less refeed in his notions of proprinty then Roderick, think that the information which was sufficient ie a case of life or death, would be more than satisfactory in a mere opinion on the manner in which the operation should be exeouted? Did not Mr. Bransby Cooper himself extract his first calcolus on the atrength of this presumption ? Nay, does not Roderick himself, who, we dare say, naither over performed this operatino, nor was present at the one in question, consider himself peris pairied with autosupment that, any jury at the one in question, consider numeric per-would pay the alightest regard to the eath in facely competent to discuse and decide on of individuals who were known to liere here.

The jury of the crimes of dealing is potatose and fundant, and his witnesses, being severally the "fair same." yet it is a melassiculty fact, as taide, Sir Junes Sentlett is introduced that ajury would sak no better avidence than on the canvass, in all the pomp of panogyrie.

The oath of say one of these statistics with "Naxt in order of successioe," say and the legst time, in front of the Old Balley. Junes Scullett, probably one of the most aver was made le For some idea of it we must refer to our report, but an words can convey an edequate conception of the masterly and impassioned manner in which he eketched the education and career of his client, and contrasted them with the obscure origin eed warthless career of hie tracriticism of another head would be quite what light a counsel's pleadings are viewed

the sin, and love the sinner, is an effort of recusant martyr in its from ambrace, end, feeling, and a distinction in athics, beyond even his intellectual aubtlety to attain. Had he not become the dupe of his own sophistical speculations, Pope might have informed him, that " to reform and not to chartise, is impossible; and that the best precepts, as well as the best laws, would prove of small use, if there were no examples to enforce them. To attack vices in the abstract. without tooching persoos, may be safe fighting, indeed, but it is fighting with shadows. My greatest comfort and encouragement to roceed, has been to see that those who asve no abame, and no fear of any thing a he, have appeared touched by my satires." Or, if Pope could not coovince him of his folly on this head, he might have consulted Junius, who says, " Mussures, and not men, is the common cant of affected moderation : a hase counterfuit language, fabricated by knaves, and made current smoog fools. Such gentle censure is not fitted to the present degenerate state of society. What does it avail, to expose the absurd contrivance or pernicious tendency of measures, if the mao who advises or executes shall be suffered to escape with impunity?" It is not, therefore, to his personalities that Roderick is indebted for his complex character, but to his attempt to combine the extremes of tempersuce and scurrility-to improve on the morals of the School for Scandal, and appropriate, in his own person, the opposite vir-tues of the two Surraces. The struggle perpetually betrays him into blunders and monaintencies too indicrous for force; for, withla the sphere of his vocations, there was no absurdity within his reach which he has not ambellished, nor folly, which has not come magnified from the extravagance of his pec. Setting out on the principle of "impersonality" every page of his labours is a record of the violation of his own professions; as if these promises of forbears work but mockeries of decency, intended to reeder him the more acceptable secrifice to that demos of slauder to which he has sold ima ermon or sinuer to which He has sold himself. Were a painter to represent that "ideal model," formed by Roderick for his Journal, from contemplating its imitation, instead of au allegorical symbol of "fearn-ing, judgment; and good feeling," embo-died, perhaps, is a Minerva, he would probably give us a full length potrait of Apage, wife of Nabia, the Spartes tyrens, who, when all other means of desputic pernonalon failed to convince his victims of the justice of his extortions, introduced them to

through the emblems of amenity and benevolence, stung the wretch to death. Itis the fengs of his viperous engine under the dripery of a humane moderation. But just observe the reptile in any one of his contortions, and you are sure to find blin coi-lecting the slaver of his slanderous mania into personal projectiles; spinning his slime into threads of sophistry for the atrangula-tion of some victim; or, overcome by the writhings of revenge, bursting and scatter-ieg his venom about him in indiscriminate but harmless showers. No matter how ir reconcileable the nature of the subject with the spirit of vituperation. No matter what may have been the views taken of it by an opposent: irrelevancy of abuse, or justice of opinion, mokes oo distinction with this Theraites of the piess, who finds, in every object, food for his slanderous appetite. Were he, indeed, as efficiently noxious as his purposes are malignant, the lavity of satire, at the conclusion of its task, might well sadden into sobriety of reflection on cantemplating such a portentous union of essevolence and power. But the providentiel laws of nature preservs us from any such metancholy misgirings, by decying a specimen, in all her veried works, of such a comhiaution of mischievous design with the faculty of execution. In the foulest and finest of her tribes, she iss wisely limited the sphere of their operations, and thus saved the milder classes of beings from the fital hostility of so ruinous a misture of strength and evil. To the serpent she has refused the wings of the engle; to the engle, the deadly fangs of the serpent: thus prudently fixing to the certle those venomous properties which, if possessing the power of diffusing themselves in proportion to their intensity, would render animal azistence pracarlons, if out soon extinguish it altogather. The fearful gift which she has withheld from reptiles, she has not bestowed un "lordly man;" to a Nero she has not given the talents of a Corsar or so Alaxan-der; nor to Corsar or Alexander the samgainsty instincts of the tyrant; otherwise, instead of a canquered, we might have been of a depopulated world; and that, if the Residual people could not have been decayabled by a single stroke, they might have fallen beneath; a repetition of well-continue. saults, Throughout the whole scale of being, that priociple of optimisin seems to prevail, which limits the efficiency of malignity; an apparatus of torture io the shape of his and in man, in particular, makes the stiri-loving apouse, which, arrayed in the sailes, butes of the head generally in an inverse, and decearated in all the beautiful finary of ratio to the beauters of the heart. When, the original, but supplied interiorly with walker a broken of this universal law atjanumerable points of stud and other infer- unded by the efforts of the riper to become nal devices of refined creeky, clasped the imageitously notions on the wings of the eagle, or a tyrant's endeavours to accome with buff; whother young practitioners olish the destruction of a people, by pre- might not be led into very serious error by tending to the genius of a general, we na-turelly smile; and cannot halp applying the illustration to the frestrated malice of that phantasmagoria, wrising out of the baffled manifestations of ovll disposition which wo have quoted, like one of those thin, bodiless, spectral appearances, sometimes seen ascending out of the phosphorescent sorruption of the grave, and amusing the beholder by its fitful, gloomy, but innoonous transformstions.

ERINENSIS.

Dablin, Fab. 27, 1829.

# WESTMINSTER MEDICAL SOCIETY.

Saturday, March 7, 1829.

Mr. Casar Hawkins in the Chair,

BUFFY BLOOD -- BRIEATED BLEEDING . DUFFINESS AT FIRST SIGHT-INDEX TO PREONANCY-BETERTION OF URING.

Tuz discussion this evening was, in great part, a repetition of the arguments adrunced, at the last meeting, for and against Dr. Gregory's new theory, and, on the whole, more of the amusing then the serious was elicited. Amongst the speakers was Dr. Wrastan, who mestioned the case of a lady whom he had lately ettended in pregnancy, who was liable to ioflammation of the ebeat, but whose blood being drawo, did not cahibit a buffy sout.

Dr. GREOORY supressed his musicty to have the general opinion of the mombers un the universality of buffiness in the blood of pragnant woman. He called on Dr. Locock, as a gentleman of great experience in these

Dr. Locock had so seldom bled pregesnt womes, excepting for some discuse sitendieg the pregnancy, that he did not wish to supress an opinion as to the appearance of buff in health. In those few instances he had yielded to the prejedices of the patients, who, said they were necustomed to it, and became alarmed if not blad. The blood en-hibited buff, but it was different in all in character from the buff of indimparion. With reference to arterial blood, the buffiness of which was disputed last evening, Dr. Locock mantioned the esse of a child of a modical man, which had axcited great attention, in consequence of the estrems buffiness of blood which had been drawn from the temporal artery.

Mr. Jawant thought there was one ques-

depending on the eppearance of the blood or relying on the presence of the buffy coat in scute disease. In many savere diseases there certainly was no buff, while, in mild ones, there often was. There were many dissames exhibiting the buff, in which a directly opposite treatment to the antiphlogistic must be pursued. He spoke particularly of puerperal somplaints, in which depletion would be a great error, for these did fret prise out of inflammation. The blood drawn in these disasses would be buffy, and the young prantitioner acting on Dr. Gregory's theory, would bledd again, and the blood being again buffy, he would bleed again and ngaie, until the patient was bled almost to death. Teo much relisaes ought not to be placed on the appearance of buff. Ho bad sean it stated in the report of last evening's discussion, that Dr. Gregory thought some madicine abould be employed in cases of buffiness, to reduse the action of the pulse. It was en uld-fashioned medicine, but he (Mr. Jewell) thought the nitrate of potash was the best that could be smployed for this purpose; he was accustomed to give it in doses of fiftsen grains or scruples three times a-day, and was seldom disappointed in its effects.

Dr. GREGRET disputed altogether the position which gentlaman had taken up, as to draining the body to death, in attempting to draw off the buffy blood, because it was impossible to drain the body to death. came a point in bleeding, after which not a drop of blood could be drawn; e hele might be made in a veln large enough to drive a eart through—nay, a limb might be re-moved, and yet the blood would not come away. He had a sass last night in proof. The patient bad had buffy blood for six wenks, and was then sinking. Now he knew he should do no harm by the eapariment, and he therefore opened a vein to see if it was possible to drain the body. He was pretty sure beforehand that it would not give up Its blood, and so it proved. (A laugh.)
The CHAIRMAN asked if Dr. Gregury

alluded to bleeding from small vains only, but Dr. Gregory did not seem to think it mattered whether great or small.

Dr. Massiall liall having been re-peatedly called on by Dr. Gregory for his opinions, stated that he did not consider that buffy blood was, in many caces, a guide to the practitioner; in many illaesses, it would be decidedly wrong to est upon it. He differed wholly from the upiulon, that the body could not be drained to death from a vein; for, io fact, the more the body was drained, the more it would give up. If a parson in perfect health were blad day after tion of great practical importance connected day, a great reaction in the system would take place; but, by and-by, there would be | was worthy of notice elso, that where the no reaction, and the patient would be worn out, and yield blood to death. He bad seen sueb s case; he thought, however, the whole question was one of great difficulty. Having detailed several disesses, in which the presence or absence of buffy blood could be no guide to treatment, Dr. Hall referred to the experiments of Mr. Vines, published in The LANCET, on the blood of the harne; one conclusion to be drawn from them was, that buff on the blood was rather associated and that there was no danger where buff with an increased circulation. With re-| was not present. He could tell the existgard to arterial buff, he (Dr. Hall) considered that the only region why it was not often seen, was, that blood was so seldom drawn from the arteries. (Hear.) It was sitery was opened.

Mr. Wanz stated e esse, in which a man having enlargement of the heart was bled; buffy cost appeared, and obtaining relief from bleeding, it was repeatedly performed. He never recovered the last blooding; this was from a veio in the arm. He recullected a case of apoplexy, in which the blood from

the temporal artery was buffy.

vein, which Dr. Gregory answered in the saved.

in obtaining blood from a veiu, it was must be seen to be understood. The coloar, owing to cutanrous stricture. Indeed, unless the skin was cold, he never knew of a difficulty. If the foot was put into warm red blood in veins was seldom buffy. He water when blood was wanted, it would invariably bleed, and the same of the arm.

Dr. GREGORY. Was not cutum ous stricture an index that blood should not be drawn; that Nature was chary of her vital

fluid, and bleeding improper?

Dr. Hall. No If a man fell down and turned cold, he was not easily bled; yet were we to wait till the skin became warm,

before bleeding him?

Dr. MacLeuu. How did Dr. Gregory reconcile his statement, thist blood woold often ceuse to flow, with his theory, that huffiness should be eradicated by abstraction of blood. He (Dr. Mscleod) thought the size and consistence of the cosquium, and the proportion it bore to the serum, of for more importance than any other ques-tion which had hear started. There cor-tainly was no rule in the buff. Its councilion with the farmative process was worthy of attention. When a part had to be built was siwaya shown.

Air. Thousen. How was it possible to tion in aying, that abe was projected about or measure the amount of the relative (Moch marriment.) proportions of congulum and serum? It Dr. Johnstons, after a preside of the proportion of the congulum and serum? proportions of congulum and serum? It

blood was drawn into a metallic, an earthenware, or a glass vessel, it would congulate more readily in one case than the other. This threw the whole question ioto the derk.

As there appeared some doubt as to the real basis of Dr. Gregory's theory, Dr. Gregory stated it to be this, that he considered the existence of buffy blood added to or increased the danger of inflammation, circs of birff the very moment he opened a vein and asw tho jet of blood. (A general smile, and "Dear, dear.") Any body might know it.

Dr. SHIEL. Did Dr. Gregory mesn to say, that so long as blood was buffy, depletion was to be continued, and eradication

sttempted ?

Dr. Gazconv did mean It, but not by the lancet. Purgatives, distreties, and diaphoretics, should be employed.

Mr. Thomson and Mr. Hunr wanted to know the appearances of the buffy jet. Mr. Hunt thought both sexiors and juniors Mr. Thousox asked Dr. Gregory, if the would be instructed by Dr. Gregory's let-pulso was distinct at the extremly of the ting them know bow to detect buff so in-linb, when he could get no blood from the stantaneously; much blood might thereby be

Dr. Guronsv. It was difficult to be de-Dr. HALL. When there was any difficulty scribed. This was one of those things which for instance, was one proof; the boff was marked by a bluish tiut. The extremely considered this as nothing at all uncommon of detection. In Edinburgh they would tell it in a moment by a wave of the lancet in the air, when a little blood was on the point. If any gentleman would strend him at the Small-Pox Hospital, where the plunomena were strikingly manifested, he would at any time show him a jet, and tell him at once if it were huffy.

Dr. WEBSTER corroborated the case with which Dr. Gregory could detect the buffy

jet.

Mr. MARLEY could often tell the buffiness by the durk colour of the jet. He neers have unra count of the jet. He never knew upregnancy without builtheist, and instanced the fullowing proof of his situation on this fiend. A lady had contain to towich to the seach a week since, and applied to him two of three days other, to have if he had he had been the seach a week with the containing the had been the seach to the seach to the seach to the seach the seach to the seach know If he, Mr. Merley, thought she was pregnant, as she was attractly anxious to lears. He thought she was, but the lady said she should like to know pusitively. up, or when the budy was wasting, as in said she should like to know positively. pulmonary consumption and actively, buff Having the discussion of lest avening in his mind, he bird her, and had then no l

other.

Dr. STEWART thought buffiness a very expricious and accidental index to the state the body.

Dr. GRANVILLS and Mr. Jawell said that preguent women dld not slwsys yield huffy blood.

Dr. Jonnerous thought that the grand critariou to a repetition of blending was not the hulliness of blood, but the relief which it afforded the patient.

At the close of the dehate, Dr. Gregory made an inquiry relative to the quantity of urine which would sometimes remoin in the femele bladder in pregasacy, la consequence of pessure on the neck by the impregneted womh, A case had lately occurred to Mr. Robert Clark, of Farnham, in which the retention had smounted to seven plats; the bladder bad not yet reenvered its touc.

Dr. GRANTILLE did not consider this impossible; he had known retention for 24, 36, and even 48 bours; but he had never himself known seven pints to be retained; but such cases were on record.

#### ON FOOT LAMBNESS IN MORSES,

By Mr. C. MOROAN, VETREINARY SUROBON.

Much has been said and written on that universal complaint with all horsemen," foot lameness." Yet, after all, there is a circumstonce which has not had sufficient attestion pald to it, but which I am convinced is the primary cause of lameness, in the majority of lame horses. We have had quartos written, lectures given, and letters ad libitum, to prove that it writes from contraction, concussion, asvicular disease, malequinrestion, high keep ! and, shove all, the pace, the telling pace! I And as the gen-tleman who styles himself "Nimrod," io the Sporting Magasine, has anticipated my remarks on most of those who have favoured the world with their luminous Ideas, on this inness. It was a most just observation of which the foot of the horse is liable. Those the late Dr. Fordyce, that "theory is the practically acquainted with it, know very well those of medicine," and had be hered till it is charpled shoeing which fills the mershes make the late of medicine," and had be hered till it is charpled shoeing which fills the mershes which the mershes and the late of the la much seltated question, I leave there in his being ag medicine, and hed he lived till it is shapped shoeing which fills the mershes being he have added with great truth, in the vicinity of Loudon, every spring, with of large shapped have added with great truth, is many hundreds of horses; the same causes letters' strains, beside occupy more of year produce the same effects on their test as or the salpest will warrant, believing, as on the vein, or to be more scientifo, that 1 do, that shert and few are the actuences protion of the sensible sole immediately that may be said on this salpest to detail covering the sharp edge of the cosin bour-sall that is practically useful. I will state This lette primary cause of the infimumatory calls the fact There all the methods.

years, could not tell a builty fet from any I where we have been in the habit of averaging from eighty to a hundred homes per day, and often a much higher number, for some years past. I thernfore hope that I shall not be deemed presumptuous in mot subscribing to the fashionable theories of those who think themselves our oracles on

these points.

The sice, its form, or opplication by interrupting the natural functions and economy of the foot, either hy suspending these parts intended tu carry weight, or by throwing the weight nn the ports which cannot hear it, is the primary cause of the majority of lume horses. For lu spite of all that hus been asid of the notural mal-conformation of the foot, I maintain that it is equal to all the purposes required of it, and if properly shod, will last as long as any other part of the animal. And that the defect lies not in the font, or the wisdom which so admirably adapted it to the and designed, but in the theorising, meddling interference of man; with his improperly applied, and badly formed shoes. . 'i his, I repest egain, is the cause of so many defective feet, and lama horses.

I take my stand on this hasis, backed, as it is, by the feet of numbers of burses I pledge myself to produce, that have been shod for years with the shoe we use, and whose feet are as good now, and in the sumo form, as ever they were; but these bornes here not been shod by incaperioucod appresticce, but hy gnod men, and the term good is of some import, or all the respectable farriers are sadly mlataken to pay the price they do for them, if a set of inexperienced and uniaitiated mechanies would do as well, Great stress is lord on the " pare, the telling pare," and it is seserted to be above all others most conducive to foot-ismeness; and among other supports to prop this "pace theory, Nimrod adduces his own cart horses; this happens unluckily, for to the cart horse Lappeal for the complete refutation of the whole theory, and I am amply horne out by the feet of the London eart horses ; with them the pace cannot be adduced, and yet we find them ohnoxinus to avery disense to only the facts I have witnessed, and the re-colt they have produced in my mind, during; from having been shristened with such fine, some years of close and devoted attention high-sounding names, have led to much the to this particular branch of my profession, ony and confusion; not but what other causes

occasionally operate in producing grogginess. I shod with this shoe for years; but fail in This pressure is most frequently produced in the above particulars, or let an by the foot not being properly prepared to receive the aloe; at other times by the form or make of the abou itself, and fre-lineases that will icertishly arise, though quently by both combined, acting at the licels and producing corns, of which the cause may not be very easily detacted beels and producing corns, of which the distinct or in apperienced.

seated shoe is a fruitful source.

It frequently exists, action equally and alike upon both feet, and may not incapacitate him for allow work ; but give him a halfhour's burst across neomitry, a two mile heat, for stopping the house's feet is well known or a rattling trot at the top of his speed, and to all practical men, when kept in a dry hot then you will find it out. It is no uncommoo stable ; the fact also, that he takes good thing to hear the inflammation and its train care to stop his own hind-feet, prompted by

# THE LANCET.

London, Saturday, March 14, 1829.

Sixes the spenieg of the present Parliamentary Session, patitions have been pretomy; and Lord Carriours; in presenting ings or prejudices, of the community. has ao long complained; but it is to be have occurred since the Home Secretary burgh murders may have affected for the tion has accomplished for the Cutholic ques-

price at which their corpses might be sold, sod that aixteen human beings have been atrangled, in succession, to supply the shamblas of a single anatomical teacher ;-- Mr. PERL will no doubt see sufficient cause for changing his opinion, and be ready to acknowledge, that the time is arrived when sented from Surgeons io all parts of the the Legislature must either advance or recountry, praying the Legislature to adopt eeds-when dissection must either be put sech measures as may facilitate, or render down altogather by rigorously enforcing practicable, the continuence of the study of or increasing the severity of the laws anatomy. Mr. Wannonron has given no. squicat it, or else be permitted to be practica, in the House of Commons, that it is tised under such legislativa provisions as his intention to prepose a measure founded mey, at any rete, chance the safety, if they upon the Report of the Committee on Ans. caonot he wholly reconciled with the feel-

a Petition from the Surgeons of Suffolk, io We observed in a former Number, that the Heuse of Lords, moved, at the same |" unless the executive government took time, that a message he aent to the other immediate steps for petting a stop to all House, requesting that a copy of the Report dissection, until the Legislature should have of their Committee might be communicated placed the supply of the schools of sustomy to their Lordships. All these preliminary under due regulations, no man in the movements seem to justify the expectation, country was completely secure from the that the Anatomical, as well as the Catholic koives of the assessin sed the anatomist." Question will be settled in the present This language has been called unprefereional; Session. It is true that Mr. Prel gave a and a writer in the last number of The Westreluctant or lukewarm easent to the Re- minster Review intimates, that the aurmises port of Mr. WARBURTON's Committee, and in which we have indulged, have been put that he expressed doubts as to the practice. forth for the purpose of excitiog slarm. bility of devising a legislative remedy for though he does not heatate to use the arguthe evils of which the medical profession ments by which those surmises were justified, as freely as he has appropriated, recollected, that the Edinburgh murders throughout his article, most of the arguments and suggestions which he has found took this view of the subject, and the Edin- in the pages of Tuz Laxont. The question is not, whether such observations are calouanatomical question, what the Clare elec- lated to excite slaym, but whether they are jostified by the circumstances under which weit may have convinced the Govern-bodies are furnished to the austomical nt that country. The denger is at it is assertained that the supinemes and our doors; and if atrocities, similar to those indifference with winch this question has which have been perpetrated at Edinburgh, bitherio been trested by the Executive Go- should be repeated in this metropolis, they versuent have led to the perpetration of the | who have endeavoured, instead of exciting a most strocious crimes—now that the appell salutary alarm, to full the public into a ing met is made known, that men have been false security, will be deeply responsible for systemetically butchered for the sake of the the part which they have taken, and for

that which they have neglected to take. | be say doubt dust they would have recourse and looking to the possible-nay, the probable consequences of a perseverance in the dissection of human bodies nader the existing system, we regret that the public feeling has not been expressed is a tone which tha teachers of anatomy in this metropelis might have been compelled to respect. The schools of anatomy, under a system rendaring probable, or even possible, a repetition of the horrors perpetrated by Barko and Hare are public nuisances, which ought, in our judgment, to have been shated by the Government, and which no man, who sets a just value upon human life, would have felt subprise or regret at seriog abated by the bands of the people. Teb works have olapsed since we recommended the closure of the dissecting-rooms; for ter weeks, notwithstanding the dreadful warning held out by the Edinburgh murders, ac to the consequences that might result from encoaraging men of abandoned character to aupply the schools of snatomy with subjoots, the same disgusting, neferious system bas been persevered in, and, upon the hundred human bodies have been delivered ever to the knife of the anatomist.

Supposing only two hundred bedles to have been supplied within this period to the anatomical teachers, the sum of nearly two thousand pounds will have been paid to a class of miscreants, whom Sir Astrav Coorse has described in his evidence before the Parliamentary Committee, as the " iowest dregs of degradation." Enhumathese two bundred bodies can have been procured; and no purchaser can be cettain, been abtained by fouler means. If the out off from one source of supply, one there | security, then if his name were had

We wished, undoubtedly, to excite slerm; to another? If exhumation filled themif the graves were so vigilantly watched as to render it impracticable to disinter a sufficient number of hodies, can it be sapposed that men; who are described by the persons with whom they carry on their datestable traffic, as belonging to the " lewest drega of degradation"-can it be supposed that these deprayed and callous wretches would abrink from the perpetration of any crime by which their unballowed gains could be secured to them? We repeat that, so long as the present system is tolerated, no man in the country is completely secure from the knives of the assessin and the anatomist. Men are apt to despise daugor which can only, by some remote contingency or paculiar malevolesce of fortune, befall themselves, batthis contempt la oot justified by reflection. The chance of a healthy man dying within the twonty-four hours, has been calculated at one to ten thousand, and Burron infers from our disregard of this possibility, that so remote a contingency will never affect the hopes of fears of a reasonable man. But suppose, it lowest computation, not fewer than two has been suggested in answer to this ressoniog, a public lottery wers drawn for tha choice of an immadiate victim, would the men, whose nems was lascribed in one of ten thousand tickets, be perfectly easy? llow meny thousand inhabitants of the city of Edinburgh heve held their lives upon a tenure far more fearfully precarians than that we have supposed during the period, is the course of which, sixteen human beings bave been hutchered, one after anotian is the least oriminal process by which ther, to supply the shembles of Dr. Mannet And now that this most atropic comparatively every and inde park in pain or, indeed, here any mainfactory means of presenters, threegh the meturitry of the ascertaining, that some of these have not origina of Bathe and Here, all the invitations of a common highway to the reckless abandoned and reobless miscreante who and shandened reffices employed by our trade with the teachers of anatomy, were enatomical teachers, who can that greater

a lettery of blood? who can feel completely | fermance of what are called the great apasufficient to justify the people in viewing unqualified disgust and abhetreoce.

Tha austemical question, if we may so cetinua to tarm it, passesses this io commen with the Catholie questlen, that It things cannot remain as they are. Dissection must either be completely suppressed, er it must be protected and enconraged. The Logislature must uither strictly enforce, nod perhaps increase, the penalties against dissectionists, or it must make condissentien cannot be practised lo this coontry without exposing the King's subjects to assassination, we supposa there 's no one in or out of l'arliament, except the traffickers in human bodies, who will not at once say, " Lot dissection be suppressed." Again, if dissection caneot be practised in this country without tolerating or consising at the disgustion offects of exhumstice, we have ne besitation in saying, " Let dissection be suppressed." We are not disposed te enderrate the importance of human dissections in the study of austomy, but there is no benefit which may not be too dearly purchased; and we think that the systematic encouragement of the abandoned edators now paid by our austomica; for violations of the law-to say nothing of the outrage committed upon the feelings of individuals by such violations is too high a price for the banks that medical science may derive from the practice of dissection: That benefit is, no doubt, great; hole his few medical men who can contery effects that; except in the per-

assured, that he may not be marked out as a rations, their knowledge of disease, or their victim for the dissecting table, and that a power of combating disease, has been much price is not already set upon his corpse? assisted by the practice of dissection. The The bare possibility of a repetition of the chief evil, therefore, which would reacit Edinburgh strocities in this metrepelis, is from the suppression of dissection, would be the loss of a few lives, which might be saved the practice of dissecting the human body, by a dexteroes performance of the capital under the existing system, with the most operations. We take this evil, great as it would be, to be incomparably inferior to that resulting from the systematic enconregement by our anatomical teachers, of a gang of dapredstors, burglars, and assassina: seems to be admitted on all hands, that In Ediubulgh, during the time that sixteen human beiege have been soccassively butchered to supply the pupils of oos sostomical teacher, it is probable that not one life has been saved by the performance of what is called a great operation. We wish to sea due facilities afcessions, and grant facilities to them. If forded to the study of snatomy, and that such facilities may be the more readily afforded, we wish to see the question impartislly, or to adopt what is cousidered a term of reproach by some of our contemporaries, unprofessionally stated. A professional report is, seconding to the theory and practice of these geetlemen, a report in which truth is sacrificed to the credit of the professioo; and, by parity of reason, a professional statement of a question is an ex-parte statement, Anatomical teachers may see nething io the suppression of dissection, but the loss of their pupil-money, sed the deterioration of medical science; but legislators are bound to look to other, and perhaps higher considerations, and if in balancing one evil against the other, they are satisfied that that which anatomical teachers regard with a professional eye is the heast, thay will be justified in protecting the lives of the public against assassination, and in chacking the progress of immorality and crime, though in so doing they may diminish the means of but it may be, and has been overrated, for alleviating human suffering, or saving human life in a few diseases espable of being miligated or oured by surgical operations.

must be immediately adopted.

The plan liable to the fewest objections is that which has been so often recommouded in jected to because murderers are dissected; but of the truth of this supposition I enterthis and other medical journals, namely, the appropriation of unclaimed bodies to the locar to he the slightest foundation for the purposes of dissection, accompanied with somn provision for the more complete suppression of calumatinu; such as making the possession of a body under other circomstances than those sanctioned by law, punishable with transportation; but we foresea that in the present state of the public feeling, there may be difficulty in carrying such a plan into effect. It cannot be denied that there is some force in the ubjection, founded on the cruelty of making as arbitrary disposition of the bodies of the poor, after their lives shall have been worn out in the service of their tunkmasters. We endeavoured to answer tisis objection by auggesting that all unchaimed bodies should be appropriated, without reference to the rank or wealth of the deceased; but the equality of the principle would be merely verbal, and it is obvious that whatever of hardship belongs to the measure would fall exclusively upon the poor.

But before this or any other plan for faci-

The avil which has grown out of a system | litating dissection can be rendered effectual, under which the practice of dissection, the clause in the Act of Geo. II, which makes though declared to be criminal by the law, dissection part of the nunishment for the has, in effect, been consided at by the Go- crims of murder must be repealed. That werement, is far greater than any which this enactment has had the effect of increascould arise from a rigorous enforcement of ing the prejudices against dissection, or the penalties against dissection. The prac- rather of superadding to the natural avarsion tice of dissection and that of enhumation to dissection; as applied to our relatives and are, under the present ayatem, convartible friends, an artificial prejudice against disterms; dissection cannot, under the present section, as applied to any innocent insystem, be carried un without exhumation, dividual, no rational man can doubt. It has or a substitute for cubumation, at which been asserted, indeed, that the practice of human nature shudders. If dissection, dissection the bodies of murderers has no therefore, is to be carried on at all, if the influence on the public mind, as rugards dis-Legislature should decide that dissection, section; but, with the exception of Mr. instead of being suppressed, should be per- Gurnara, nobody has offered any proof of mitted, and, under duo regulations, en the assertion, and Mr. Gurunia's proof is couraged, it follows that a change of system rather a quaint specimen of ratiocivation-Here it in:

" It has been said, that dissection is obtain great doubt : indeed, there does not apwhether of the rich or of the poor, is solicited by a physician, when did he receive a refusal, on the ground that murderers only were apened !- Never."

if the bodies of executed murderers were opened for thu sake of antiafying their friends that they had come to their death by atraggulation; or if physicians were in the habit of asking and chtaining leave to dissect and anatomise the bodies of their patients, Mr. Gernaus might take something by his argument; as it is, we can only say, that his reasoning is worthy of one of the heads of the profession.

Letters on the Study and Pro and Surgery, and on Top the Medical Profession adon address and Young Practitioners, Perents, Guardians, and the Public in general. By JAMES WALLACE, Ass. Surg. Glasgow, Griffin; London, Underwood. pp. 210.

THE critic's task is not on all openations an cost one. The mexits of some works are #0

superficial observer, but even the experienced inquirer, is deceived by the flattering oppearance of the surface. But Mr. Wallace, like all great geniuses, bas despised art, tack, and finesse, and has, therefore, fairly presented as with a true pieture of the workings of his great mind. Hence the peculisritics of his thoughts, and the originality of his discoveries on the science of Education, are so jucidly placed before us, that it is impossible that the critic can be charged with misrepresentations or injustice, on the one hand; or that the reader can withhold from Mr. Wallace the dne meed of approbation, on the other. Without, at this moment. questioning Mr. Wallson's espability for executing the severe task which he has selected to perform, we may be permitted to following extracts. remark, that it is not s little singular that men of great talents have uften considered themselvee to he the hest qualified to discherge duties, for the performance of which they have not possessed a single adequate requisite. It is said, that our eelehroted Mutthews made his first appearance on the stage, in the higher walks of tragedy. " Neveya" and " Nocdies" helieve that they shine most promicently as lecturers, hospital aurgeons and lithotomists. Joe Burns laughs at the wit of Shakspeare, of Sterne, and of Built. "Old Backs" and " Dubs," have stanted as editors; Liston, of Drury, once played Bones; and Boh Lieton, of Edinburgh, has advertised, that there is no other Liston in the world than himself; nofortunately, however, for many of the same name, his statement is untrue. This extraordinary notion could only have had its origin in the bollet that his abilities so far sorpessed a service. As it is gratifying to be made the abilities of all other persons inherit ing his name, that he alone is to be re-

observed either by the bad taste, or the da-| garded as the true, the original, the fective style, of the author, that it is difficult genuina Bob Liston. Light, says he, may to render him justice for his actual talents. proceed from other quarters, at second Sometimes, on the other hand, the fithiest hand, but still it is not the true light; trash is so polished, and is presented with or, if derived from the original source, auch an illusive glere, that not only the you have it of in its pristine aplendour. Sunshine alone, says he, proceeds from the aun; you may have, indeed, light from the moon, but that is horrowed from the sun : and, therefore, it is mere moonshine, after all. " I, Bob Liston, am the only true light," and Robert Liston has found a worthy imitator in this countryman Mr. Jamos Waliace; for if Boh Liston be so delighted with his attainments, and so pleased with himself, as to e on temm or despise and even to decy the existence of other Listons, so, we apprehend, is Mr. Wallace so much delighted with his aplendid work on education, that he would be wont to say, " I am the only Wallace," Should there be ony other Wallaces, will they not immedistely claim a relationship, after perusing the

As the "Dedication" is to the memory of a deperted brother, we shall pass it over in ailence, although it contains two or three euriosities worthy of translation to this place. The first half of the first sentence of the preface then, is the first part that we shall transcribe; and it presents a pretty fair sample of the sort of stuff with which the author has endeavoured to regale his readers throughout the whole of his two hundred and ten octavo pages,

"It is undoubtedly of essential service to a person about to begin the study of any branch of science to have this subject full explained to him by one who understands it.

This is one of the new discoveries of our profound anthor, Mr. Wallace, Hence, as he understands the aubject of medical education, he proceeds to "explain" it to the medical pupils of the united kingdom, and we hope they will be grateful for so valuable acquainted with the most trifling locident, or the most simple thought, which has con-

historied in any way to a great result; we | enough to admit, " that the majority of shall here goote the passage in which the medical men could have executed the task author describes the important equips of reflegtion which led to the production before

"I am far from saying that teachers of modicine will not give the noccasary edvice to the pupils, when it is saked of them. I know many who are glad to do thin; but it is not the custom to sek it of them, unless there is some acquaintaneoship between the times deserving as much praise as he who parties; and even those from the fear of giving trouble, we sometimes keep from asking what we are really enzious to know. It is necessary, therefore, that the student should have a book of instruction, to render him, is come measure, independent of every one. (Aye, even of Mr. Wallace.) In east he chould have no friend to direct him, he should then have a book as a directory, which will, et any rate, give him ee idee (will it ?) of the path he should walk is; and what I here say does not alono apply to medicine. In many other sciences, the learners stand much in need of some good hooks of references. (Such as this?) After a good deal of re-Section on these matters, I formed the resolution of putting a few thoughts to-gether on medical advestion."

And we must say that the "resolution" of King Alfred, to found the University of Oxford, was nothing to it.

Mr. Wallace then proceeds to tell us what we are to fied in the subsequent pages of his great work; and, says he, " after heving get done with the etudest and surgeon, I then give some hints to the public in general on the study of medicine, as a part of a liberal education-on the conduct of the public towards modical men in the practice of their is not to be influenced in his selection of a profession-and on the opinions which preyail in society, with regard to the exhumation and dissection of the dead." The be governed? Our learned author states, public " in general" will, doubtless, consider it kind in the author to favour them more by the desires of others than by their with his hints on their "npiuions;" and own desires, jog on together on the road of that each particular set of hints may be life, just because they are obliged to do so; readily found, he says, " it will be easy, just because they are tacked together, and without any further instruction, for each party the tacking is of such a nature, that when concerned to pick out what particularly relates once made, it cannot easily be undereto then ;" and as the work professes to be on medical education, we think this is a pre- learn, that fools, under the influence of

better than he has," and in this we fully agree with him; but he consoles himself with the hope, that his book will give hirth to a better from an chler pen. He is delighted, however, et having projected the thiog.

" He who projects," says ho, " is someactually earrice into szeoution; for, without the hint from the humble originator, the aubjact might have remained unthought of, and its execution, of course, could not have happened."

The author concludes his preface with stating, that these letters were written on board the ablp, Ocean; that " the writing of them beguiled some hours, which otherwise might have been tedious;" end, in allusion to their great value to others, he says, with esviable self-complseency, " I have even profited by them myself."

We shall now pass on to the letters, aed must trouble the reader with a few more passages, and they shall, isdeed, be few; Letter the first opens thus:-

" All the prudent egree that, in the choice of a wife, the individual should be allowed to judgo for himself, and that nothing should be done contrary to inclina-tioe." Thee says our nother, "that man, indeed, hardly deserves to be happy, who would make his marriage a matter of interest or convenience."

Now we should like to know, if a man wife by considerations of " Interest or conveolones," by what motives his conduct is to "that the man and wife who are many

Our author, probably, will be gratified to cious " pick out." Mr. Wallace is condid " their own desires," frequently marry;

and should he ever honeur the public with lean to procure for his son a sollege adse second edition, we hope he will favour the world with some information on the subject of a few of such " tackings togsther." Let him fairly place in contrast what he will hear from these persons, with what he will hear from those who, praviously to magriage, had the folly to think of " interest or convenlence."

Whon speaking on the "choice of e profession." our author observes. " Surely then it should be a point with those who have the allotting of youth to professions, to leave them, (the boys,) in a great measure, if not altogether, to themselves." Surely, then, it should be a point with parents and guardians to yield to no such maudlin feeling. There are few subjects on which more twaddle has been written than on this. How can an inexperienced child decide with proprinty on a matter of so much importance. If he were to decide, it is ten to one that his election would be influenced by some circomstance so trifling, that it would not be worthy of regulating his conduct one month, much less during his whole life. No, it is the guardian's duty, after he has well conaidered and duly weighed the capabilities and future prospects of his charge, to decide on the profession he should adopt : and then. without even consulting the bny's inclination, furnish him with the materials for acquiring a knowledge of that profession which has been selected, and then mildly, yet firmly enforce obedience. The gratitude and prosperity of the child will amply rapay a considerate parent for his additional labour and maxiety,

Mr. Walker deprecates, and with great justice, the manie which in modern times has reged amongst families to have their sous brought into the learned professions. There in judged, in almost every large family of respectability, one son a surgeon, another a lewyer, and a third a parson. He mays Astley Cooper. Dr. Babington. What inthat many a father "arrapes" together all he dividuals can be more purely innocent of

ontion.

"Instead of putting him to a respectable trader by which he would secure to him a moderate tivelihood for tips, he seeds him to learn branches of knowledge fur which, probably, he has neither taste nor talent, and what is the consequence? Why, when he has fluished his curriculum of education, he goes huck to his father's house but half learned, there to remain unemployed, and to be himself, along with the rest of his family, perhaps through life in difficulty. And thus it is that many a respectable family has heen kept in poverty for ever, without any actual good accruing from it."

No actual good from poverty for ever l This reminds us of one of Simox Pune's notes which he appended to our copy of Sir Astley Cooper's Lectures. Nevey Tyrrell remarked, with his usual aspecity. that when leeches, on being emplied to the eye, occusion great irritation and erysipelatous inflummation, they do little or no good. We do not know whether Mr. Wallace be a "Nevey," but he and Mr. Tyrrell are ooviously members of the same family.

While descenting on the great advantages of "General learning to the physician," the author holdly throws out the following " venture :"-

" I venture to say, that the heat informed man would get two patients for every one that the other (the unlearned man) would cet, even allowing them to be equally capable of treating disease."

This "venture" is of a piece with the rest, and shows most clearly that Mr. Walless is lameotably ignorant of the matters on which he has presumed to write. Had he been in the lesst degree acquainted with the history of his profession, or with the state of medical practice in this country, he would not have risked such an sasertion. unless he had determined to publish that which he knew to he untrus.

The bare mention of the names of two liviog practitioners will be sufficient to expose the utter folly of Mr. Wallace's venture-Sir

the charge of learning and general acquire- report, which will be creditable to himself, meats, than these gentlemen. Their extreme ignorance of all extra-professional matters is not only proverbial, but, in many instances, even must amusing. In one of Sir A. Cooper's surgical lectures for instance, the worthy Baronet endeavoured to elucidate the action of Reid's ayriege, by a comparison with that of the hydraulic press. " If," asid he, " water he forced from a large tube into a small, I believa ecormous powar in gained!" And egain, what is the worthy Baronet's keowledge of even the literature of his profession? Did he not ewean on the late trial, that he had never heard of the operation en deur tems? Such in the general learning of Sir Antley Cooper, who has unquestionably been the most successful and the most eminent surgeon of his day.

Dr. Behiegton, it is notorious, has had the most extensive prectics of any physician ie this metropolis during probably the last twenty years; yet so far is he from being a learned man, that he requires the appendage of pettisonta only to convert him into a mere old woman. Leaving general information altogether out of the question, we are not aware that Dr. Bahington, notwithstanding his immeuse opportunities, has added a single fact to our stock of medical Luowledge. Mr. Wallace's "venture," therefore, can only he viewed as one of the innumerable pieces of nonsense with which his book is crammed.

It was our intention to have selected several other passages remarkable for their folly, but we have already devoted more apace to this prodection, than our limits justify. Another extract, and we have done. Mr. Wallace, of course, touches upon medical jurisprudeece, and, with his customary acumen, remarks,

and we to the prisoner!"

Thus, in cases of poisoning I murder!! and repe!!! our ingenious author would have the medical practitioner deliver an opinion which shoeld be safe to the prisoner !

In conclusion, we have only to observe, that, although we believe Mr. Wallace to have been infloenced by the heat motives, auch a work as the one before us would be matter for sidicule, if written on acy subject of the least impertance; but auch n production oo such n subject as medicai edication, is worse than contemptible.

A LETTER TO THE YELLOW GOTH.

From the Author of " Professional Sketches," in the New Monthly Magazine, in toply to his Fulminating Article, in the Medical Mouthpiece of Messrs. Longman & Co.

" Lies! fies! Hes! from beginning to end, lies" RECTRALD TRESPS, Vol. I, ch. ii. p. 48.

Bath, March 5, 1829.

Sir.-I was sitting comfortably at my breakfast this morning, when a packet, bearing the well-known superscription of a very dear friend, was put into my hands. I eagerly opened it, whon to my treat auto-niahmeet, I found a copy of your Green Journal, and a letter directing my attention to your leading article. I know not whether joy or surprise sgitsted me most, when I and that you had thus honoured me, hy devoting your helidomadai benne bouche to as handsome an abuse of me, as any drunken poissarde could possibly have flung forths. Wky, Sir, you have made me vain of a self, for, God help me, I never, for ver moment, imagined, that my humble lieuhardons were worthy or belog, a grossly mirrepresented by a geotleman of your sur-passing sank and calents, natifier could I ampoon, with all my vanity, that I had any protections to no eviable an elevation. But you Editor folks are so cunning, that, like "How important is it, that, in cases of l'aidy O'ltaficrty, you find out things that murder by the infliction of wounds, poison-inever existed, and your penetration in the ing, rape, &cc, the medical man should present instance, has accomplished spain have a clear and correct knowledge of the wonderful discoveries, as have tended very auhject, so that, in a judicial examination, canaderably to make me this knach better the case he shie to give an opinion, and of myself than I otherwise should have done. But, pleased as I am with your you much credit for professional knowledge, attention to my "trash," (eight columns or, indeed, knowledge of any kind; but occupied in exposing "trash!" Will your mawkish observations on the present Somers, lide thy diminished head!) I should subject, have exposed your ignorance mater have been much more so, had you not in-decidedly than ever. If you will refer to dulged the powers of your imagination, (at all times, we well know, peculiarly quick and fertile,) to so very great an extent. A little misrepresentation, a few lies woll bandled, with as mony garbled extracts as you please, would have been rather piequant and amusing, thon otherwise; but auch whilesale dealings as your's are really disgraceful even to your green conterntogthe meretricious medical mouth-piece of Messieura Longman & Co.

But let me, if I om, have some serious talk with you. First, then, on to Mr. Abernothy. Can you say that he is not "the most celebrated (mind, that is the word) practitioner now living? Yan need not be icalous of "glorious John," because he prescribes blue pill, and curea medical casea; and, for heaven's sake, do not exert yourself to defend his vulgarity. He does not wont your defence; for he has too much honesty in feel gratified by such gratuitous impertinence, in one wurd, I have the impertineoce, In one word, I have the matiafaction of knowing, that the "Sketch," which you have so elumaily and so maliciously corbled, is extremed by the nearest con-nexions of that "veteran," eq the most characteristic and condid which has yet appeored; and as to the "various scenes evidently drawn from the imagination of the writer," (oh! thon most oracular of asseal) they are oll true-true to the very letter, and you know it. But your readers may be aquesnish, because, taking you for an oracle of the " atricteat verneity," they would not please to doubt your word. Now, " they to astisfy them, and shame you, were such a consummation practicable... I will, if you wish it, produce so utidavit, regularly sworn and daly executed, hofure the Right Hon. will you urge me to such an extremity?

Ynn are a hungling fellow, Sawney, after all. You quote, coward as you are—the mode in which Mr. Abernethy has not visco to eminence; but, knava na you are, you installingly suppress the manner in which ne hardward like celebrity. Independence and integrity, with profound according knowledge (took wall to the skatch, Sir Oracle,) are well-known qualifications, exceedingly the skatch, and the skatch, and the skatch, and the skatch of the sk akingly suppress the manner in which he scurce among the Fellows of the Collagewe du not meen the aurgeons, and their satellites; but hang it, men, ye might as weel ha' been a lastel condid.

of that gentleman? No one has ever given fraternity.

the second vol. of Bell's Anatomy, (third. edition,) and read the first two paragraphs in page 351, you will see the passage which you accome me of wrongfully attributing to Bell. Why dn you do your work se elum-aily? Depend upon it, that so long as you continue to blunder on in this awkward manner, you most look in vain for any profit from the concern; no advertisements will adorn your covers, But those which Mesars, Longmao ond Co. give you at helf price.

The fact is, Sawney,—and you cannot deny it,—that your bone, and aballow, and eringing mind, your oristocratio devotion to the "Collego," and your dreadful abhorrence of anything savouring of independence in the profession, will not allow you to sonetion the praise of honest men, or to bear unmoved any reflections upon the Fellows and their dirty behaviour. You do not like the public to be mode acquainted with the monstrous humbug, that exists in our profession; or that the true state of the ease should be explained. You are too moch of a jesuit for that; and so you bristle up your back, and endeavour to look awful; but why tell lies about the matter? If you culist yourself in the bad cansa of these " Goodies," do be honest if you can,-do'nt add to their diagroes by playing the fool, or acting out of the pale of truth and justice. I can easily imagine your motives; and, doubtless, at the last conversations at the college, you received aundry gratulations and augarpluma for giving that "pettilogging indi-vidual," that "blockheud," that "anonymous sycophont," that "nuther of puffs," (with God knows how many sweet names besides,) such a glorious trimming. Enjoy your bon bons; bo a good hoy and behave the Lord Mayor himself, attesting the feet; | yourself decently, but do not, for fear of the rud, tell any more lies.

Neither my time, nor my inclination, nor the limits of this valuable Journal, will permit me to retaliate upon you in your own gentlemaoly and college-like atyle. But in my own defence, and just to allow you up in your true colours, I will run over your misstatements, sud then leave you to concoct another batch of falsehoods if you like, and to earn another pocket full of augar-pluma;

<sup>\*</sup> I have in my possession a very curious and interesting correspondence between one Do you remember what you have said of those Follows, and a young General Pracabout Mr. Bell, and the scandalous misre-titioner; and if they do not mind, "I'll presentations that you have so basely per-shame the rogues and print it." Rest assurpaired in your remarks apon my "Sketch" ed, if I do, it will reflect no credit upon the

but mind. I shall not condescend to favour out, in avery point of view, a reasonable

"If these skatches (oul 2.) be continued much longer, the number of great men at present flourishing in London will exceed s of all past times and of all countries." Of course; but could not you learn better grammar than this at Aberdson, most sapiont

other provision unconnected with "Nor is this all (col. 4.); there is annerves. For unconnected, reed connected. Prob, pudor? Sawney. A pleasing specinen of your base perversion of the sense. Beware again, aspient sir, of the rod!

Col. 1. p. 424. " Dr. Armstrong is stated beware the rod!

With regard to Dr. Harrison, will Sawney tell us why he was prosecuted by the Colloge, and why they gave up the contest? Will he, moreover, inform us why St. John Long, the Consumption-curer, Dr. Lang, the Water-doctor, Drs. C. and J. Jordan, "oun mukis aliis," who do at much mischief as Dr. Herrison has done good, are not prosecuted? for the reason that I have stated to the "Sketch," because the process would be too expensive. Sawmey may try to curry their to the see what a pitiful figure you exhibit favour with the Fellows, and why not? But then see what a pitiful figure you exhibit favour with the Fellows, and why not? But the server the surreptitionally to cast he is marvellously mistaken if he expects to do so by such contemptible mesns.

And for Mr. Brodie, (col. 2. p. 425.) "Mr. Brodie, by our author a secount, (that is, by the secount of this pettifogging sycophent,) has actually proved that artificial respiration will support the circulation of the blood for meny bours after the heart has whelly comed to heat!" This is Sawney's statement; and now for the actual fact. "He (Mr. Brodie) has proved that, in small suincels, artificial respiration will support the circulation of the blood for many hours efter the heart bas wholly crused to heat, and even after the heads of the animals have been setually out off." If Saumey will refer to the Philosophical Transactions, for 1812; or, what is more casily accessible to him, Gregory Practice of Physic, 2d edition, pages 466, 2, he will find this passage. "The application of artiscial respiration in cases of pure asphysis holds

you with a single syllable more; I have al- prospect of success; and that it has been ready defied my flugges by meddling with effectual in seatoring seapended summation. numerous observations concur to assure us. Bichet meintained, but apparently on theore-tical grounds only, that this operation can never restore circulation, that has mos could; in other words that it is effectual only in those instances where the heart still pulsates, though carrying on the ofreulation of vacous blood. According to the statement of persons worthy of credit, besserer, the action of the organ has been RENEWED by artificial respiration, after all marks of it had whomen coused; and here it is probable, that the left side of the heart, which could be no longer excited to contraction by venous blood, was atimulated by blood, which had become erterial during this process. Mr. Brodie has shown, that it will Cot. 1, p. 424. "Dr. Armstrong is stated process. Mr. Strote has shaum, tast it with to be the only physician since poor Dr. support circuloitoe for many hours in small autiBallite's time, who is warthy to succeed mats, even glet the complete destruction of orimulations and learned man;—the only life by cutting off the head." Now, friend physician who behaves with proper cou-Sawney, what sayest thou to this? Is there sideration to general practitioners," and so my blood left in thy crawen bosom to munnt on. This is false; atterly, basely, designing the false, in the river of the false is not a support circulation of the support circul sideration to general practitioners," and so my blood left in thy crawe boson to munt on. This is false; utterly, basely, designedly felse. I said, and I say it again, that monstrous fellow art thou, "thus to expose mented Builtie," in his liberality, his cantide of the "Fellows" by strempting to of cant and humbug. Once more, Sir Uracle, mangle a poor harmless devil in this hungling manner.

One word,-one serious word at parting. To fair criticism no honest man can object; towards the base and cowardly perpetrator of falsehood and salumny, no honest man can entertsin may other sentiments, than those of the most supreme scorn and contempt. Fortunetely, the publication, which contains my "Sketches," ranks so highly in the periodical literature of England, se to be accessible to every person who wishes to an adium on the veracity of one who would scorn to take the mean and despicable advantages of which you have thus sumefully availed yourself. I'lume yourself, air, upon your supposed prowess; hug yourself to the fall bliss of your imaginary triemplu; but bewere, sir, how you spain ladulye in misatating my meaning, or perverting my object. Another achievement like this will be provided in another manner, not with the page of the in acciliar manner, not with the pass for the shulking and anasyment cowers will not one for that, but with cometing which shall cases o contra on a diagram, which he smaller propers of the whole College will not be able to compage.

I am, Sir, Your very obliged servent, The Author of "PROPERTONAL BERTONES. SCOTCE DUSS MOT ALL SCOTCE MEE.

# Ta the Editor of Tas Lancar.

Sin,—Though far from wishing to throw a veil over the vices of my countrymee, I am still enzious the public should be aware, that James Johnstons, editor of the lais Quarterly Journal, although an "Aberdeen duh;" Is not a Scotchman, but a child of the Emorald isle,

However infamous is many respects the dub system may bo, and however fortunate it be that The Lancar is employed for its mannament, it is but Tair, Mr. Editor, that you give a true account of the extraction and education of the worthy members of this Dub Ameeistion. Now James Johnston is a nativo of Carrickfergus; be has all the characteristic features of the Hiberhian resc. Any of your readors who may wish to examine his phremological development, may find an opportunity any evening is the shop of lurgess and fill, where they will find him entircled by innumerable unsold copies of the "bundles of trash," end of his dyspette volumes.

SAWNEY.

March 6th, 1829.

#### DELINQUENCIES OF PUPILS.

# To the Editor of THE LANCEY.

Sin,-As I look upon you to be consorgoneral to the professioe, sed as you have particularly excrted yourself for the welfare of medical students, I do not thick it nocessary to make any opology for ietrodecing the following subject to your notice. Your atrictures on public characters, and, amongst the rest, on public teachers, have been by no means deficient, either in frequency or severity; and, I trust, that you will not besitate to exercise the same setherity and enlutery castigation, towards pupils, whon you ero made acqueinted with their dalinqueucies. Not a few evils have aprung up, and are fortered with wanton inconsiderstenses among them; but the one which it is now my object to place before your follows attention. dal attention, is the practice of interindicate attention, is the practice of inter-regime our lesswer in the midst of their du-tice. This they regularly do without any regard to good feeling, according or self-interest. They infies by it a direct failury on the lessing, their follow-singarts, and themselves. There needs no assument to prove this. Dien those who, with children interests the property of the children in mischief, indulge in the babit to which I allude, must, if they do not find it too souch trouble to reflect at all, immediately be con-vinced of its truth. It would, perhaps, celles too much credulity to anypose they

gentlemen would do woll to remamber, that they have cessed to be boys; a sed, further, that they have antered a profession which boasts of its good disciplins, honourable behaviour, and liberal manners. Their present cooduct Intimates that they have forgotten these things, and they seem blindly unaware, that the part they are now daily getieg is arbitrary, ungentlemanly, and allogether nowarrantable.

I make this protest for myself sod fellowpupils, sed it may not be smiss to assert, that eo lecteror has the slightest knowledge

of what I now do.

A Partholomew Puril. Fob. 25th, 1829.

BARTOOLOMEW'S MOSPITAL.-TOE CESTIFI-CATS TRADE.

For a coesiderable time past the demonstrator, and the pupils who are regular in their ottendance, have been very much disterhed and annoyed, by straggiers cettering the theatre of this hospital, during the demonstrations, at intervals of every few minutes, and somstimes until within even five minutes of the hour of breaking up.

Mr. Skey, oe Wedeesday morning, felt It his duty publicly to notice this nuisance. " He believed, that of most, if not at all, the schools throughout Londoo, as well as this, there were such things as certificates, and that those things were considered by a great masy, as merely things of farm,—matters of course. He was sorry to add, that hithorto the form had proved victorious. Many gontlemen had come to him for certificates who he keow perfectly well had very rarely, if ever, heard a demonstration. By the irregular attandanca too of those who were's little more in the lishit of making their appearance, not only was he very inconvenicetly interrupted, so as, at one time, not to have had the opportunity of demonstrating for a full hour, but sech geetlemen as were sexious to sequire a knowledge of their profession, and were punctual to the hour, were insufferably an-Under these circumstances, however painful it was to him to complain, he begged the class to take notice that certificates of attendunco should not, as far as regarded himself in future, he matters of form and of course, and that the late system of isregularity shoeld not be pormitted to proceed, if even, to put a stop to it, recourse wors to he had of shutting the doors at a given period every morning."

alsohief, indulge in the habit to which I These observations might fall very acasilude, must, if they do not find it too much somably from the lips of the anatomical trouble to reflect stall, immediately be convinced of the truth. It would, perhaps, far, as panetuality to the bour is concerned, either too mach credulity to suppose they why not adopt the college rule of shutting would acknowledge their conviction. Those the doors at the moment the clock atrikes t

Before, however, this could be done, he had lost an immense quantity of blood, and was succeedingly, exhausted. Measur. Viscout the succeeding the pale.

8. Took a dose of house madicine, which healthy ovacuations.

9. Tongue moist; pulse 83; complained within pale.

doing it. A lighturn was put above and belaw, and the lutermediate space afterwards divided. The edges of the wound were thun brought togethur, and four nunces of brundy administered to the patient. He Las continued to do well ever since.

## ST. THOMAS'S HOSPITAL.

#### LITHOTOMY.

TROMAN KITMAM, a carpenter from Hastings, setat. 52, with pallid countenance, enmulute the Hospital about three weeks since, with symptoms of atone. The patient atated, thut about four years ago, be wes uttacked with violent pain in the region of the kidneys, &c., and took medicines for the grevel; a short time after this, it he-Luwrence. The patient was then removed came apparent that be was the subject of atonn in the bladder, which, on sounding quence of the integuments having been left him, was readily ascertained to be the case. tou short, or the muscles having retracted to An operation was performed by Mr. Tyrrell, a mare than usual extent, the end of the on Friday, the cits of February. The intefemur forced its way through the dreasing, guments, fascis, fat, and superficial mus-nor has it been practicable to again cavor, cles of the perineum, having henu divided it by the soft parts. The wound has dis-olarged, and continues to discharge, conolargee, and continues in most parts it presents wards into the obstuer; too intentity bid aiderably, though in most parts it presents wards into the obstuer; too intentity bid aiderably, though it most an extension of the produced, and thu standard in the continues of the produced and the continues of the cont a healing appearance. At the writing of then introduced, and the most thin mean thin report, (March 7.) the end of the fourt woursble manner in which it was graped, when the manner is which it was graped. remains uncovered to the extent of about an it ascaped from their hald three or four incb. Examination of the diseased atruction accepted from their hald three or four ture, after the limb was removed, fully times an reaching the mouth of the wound, previous to its extraction. The stone was of large sian, flat, and of un oval figure,

but moist; bowels open; no pain of the deribes of the abdomen. Not slept quits so well last night, but, upon the whole, appears to be going oil remarkably well.

The patient upon whom Mr. Tyrrell operated on the 20th ult., it now almost con-

valestent.

#### EPILEPSY.

#### (Emma Wayman-continued from page 638, No. 285.)

Feb. 11. Had one slight fit at 4, A.M., and a severn one at 2, P.M.; enmplains of pain in the stomseh, Cafter taking milk; pulse 108, compressible. Powdered valerish root, half a drachm, with camphor mixture every six bours. Dry diet.

12. Slight fit, 6, A.M.; no headach; perfectly free from pain.

15. Has continued fren from pain, but

had a fit this morning; pulse 100, smell.

19. Had a fit yesterday, and non to-day, but comparatively slight; howels regular, and general health improved.

21. Had two fits.

March 10. The patient still continues in the Hospital, and has occasional returns of fits; but the attacks are feeble, and couti-

She is now taking two grains of ammonisted copper three times a-day, which is being gradually increased. The bowels are kept open, and tastar ometic ointment has been tubbed into the nape of the neck.

# HOPITAL DE LA CHARITE.

CASE OF DECITERATED ILIAC VEIN, WHERE CLUCULATION WAS CARRIED ON BY COL-LATERAL BRANCHES.

on secount of diseased hip, stated that from her 15th or 16th year, she had been aubject to swelling of the left leg, and had, in consequence, benn obliged to yould all coefiderable exertion, especially continued walking. How-ing married in her 20th year, she was, during her first proposacy, affected with addms of both legs, but especially of the left; after delivery the swelling of the right leg disappeared; and that of the left diminished, but 

10. Pulse 88, rather full; tongue white, | deprived of the use of the limb. On examimation, the left hip was found swelled, cover-ed with varicose veins, and very tender on pressure, the whole limb was almost two inches shorter than that of the other side, the greater trochanter was much higher than usual, and somewhat draws forward; the knes was very painful. A butious elicom-stance was remarked with respect to the venous circulation; a very large vein was seen running from the left crural vein over the abdomen towards the unvol, where it turned round, and having descended on the other side of the abdomen, was loserted into the right erural vein ; it had a very tortuous course, and at one place divided into three branches, which, however, soon remited. When the patient was standing apright, it stialned an extraordinary size, almost equal to that of the little finger; seconding to her statement, it had not been developed until the hip be-gan to he affected; the blued circulated from the left to the right side, as was ascertained hy pressure on the vessel. The patient, whose general health had suffered much within the last two months, died about a fortnight after her ndmission; on examination the left external iliao vein was obliterated for about four inches below its junction with the internal iliao, and aurnue a much shorter period than at the time rounded by o esneorous mass, closely adberof admission; her bowels are regular, and lag to its parietes, which were changed into general health tolerably good. some degree, to partake of the curcinomatous degeneration. The internal iliac velu and its principal branches were also ablita-rated, and involved in the cancerous tissue. Near the insertion of the vena supliena, tho crural veln being enlarged, gave origin to a branch which formed the communication with the crural vola of the other side, as has hoen described shove ; besides it, a amalier tela want in a more transverse direction from the left to the right orarsi vois, disease by which the abiliteration of the iliao vein had been produced, seemed to originate C. B., wtat. 61, admitted on the 22d of July, from the bono, the concave surface of which was, to a large extent, denuded, and covered with unhasithy, pus; the cellular tissun surrounding the vain and artery was infitrated rounding the vain and artery was innitrated with purulent matter, and concretions of carcinoisatous appearance; the actory wise only slightly distinctived in its distinctive, with the property of the contractive of the con

had hever menstruated, she inableen in the the clarm, on account of its extrema sensi-continual enjoyment of good health, until bility; the laryux is reseed, and the epiglottis her eighteenth year, when she begin to feel is accurately and spasmodically placed over a constant pain in the left imbar region, the glottis, which entirely prevents the dewhich gradually increasing, at last became se intolerable, us to preclude almost any exercion. I wo months before her admission an abscess had formed over the left anterior and auperior spins ilei, from which, when opened in the hospital, a large quantity of thick, healthy pus was discharged. This was followed by ne alleviation; the pain contioned, profuse supportation ensued from the wound, lectic favor succeeded and the patient eventually died, ofter auffering a long time. On examination one of the lumber vertebres wasfound carlum, communicating by a field-lous passage with the absens; the lineus and passa muscles were for the granter part destroyed and changed into a reddish pulp, the crists ilel was at its siterior part denuded and carinus; the upper portion of the thighbone, particularly at the trochanter minor, was surrounded by a large quantity of purulest matter; the espenie of the joint was eroded at its anterior surface, and the hend of the thighbone exhibited traces of incipient caries. The nterus was nearly as large as in the sixth mouth of pregnancy; and being opened, a membranaceous and of con-siderable strength was found adherent to its liner aurface, and containing about four ousces of yellowlab-grey pus. The external surface of this sac was covered with a semi-putrid matter; its internal lining had the appearance of a mucous membrane ; and communicated neither with the nack of the uterus nor the fallopian tubes; ita posterior part only exhibited some ulcerations leading into the softened substance of the uterus. The fallopian tubes were very small, and no communication could be found between their cavity and that of the uteras; the ovaries presented some corpers lutes and evident signs of previous inflammation.— Journ. Habdoniad.

BRATH FROM DROWNING.

To the Editor of Tax Lancers.

had a four think the following worthy a place to your valuable publication, as insertion will oblige

W. Durron.

I believe if it is that they want incleasined, that, on immediate of the body ander places during life, the person does not the incleasing flows into the lungs, but that death is produced by safe-tended; for when water or any foreign indy approaches the giving, it installed the safe in the produced by an extended in the produced by safe tended.

scent of any extraneous substance on the person's respining; deconquestly the water passes over it, and down into the storage. The conclusions which may be drawn then, are, 1st, That if water be found in the brunchie, the person had not been immersed during life (provided decomposition has not taken place); if found in the stomach, that immercion had taken place during life, provided, also, decomposition had not occurred. March 2d, 1829.

REAMINATIONS AT REDRARS MALLA

To the Editor of THE LANGET.

Srn,-Amongst the numerous difficulties which present themselves to the medical student in the acquirement of his professienal knewiedge, there is one in particular to which I wish to direct your attention. Every one, I think, will allow, that pre-viously to attending lectures, the rudi-ments, at least, of the different aclences should be well understood. In order to soquire these tundsmental principles, medical authors must, of course, be consulted. Now, as the peas of these gentlemes are for ever at work, and sa they all discover some grand desideration in the works of their predeces-sors, it is no easy matter to select from we h a horse pocus, a clear and concise system. Thomsen's Conspectus affords, I think, tho host comprehensive view of the Materia hiedica; but here, after be has given the Linusan name, he wenders into a helyrinth of classes, orders, and natural orders, which I strongly suspect he himself does not understand, inasmuch as he is not unfrequently incorrect in his terms. Now, Sir, I should eataem it a favour, if you or one of your mumerona correspondents would inform me, through the medium of year valuable journal, whether this long rigmarble of Linnman classes, orders, &c., in actually necessary for the actualaction of the did ladies of Rhuburb Hall, or whather the Linneau name is sufficient without further presimble. I shall sho feel obliged, if you or they would paint out at the same time, (as far an possibly can be done,) some underinting course for the attainment of those other brauches of medieina and surgery, the knewledge of which is so essentially necessary to the welfare of the general practitioner, and the safety of society at large. By inserting these few remarks in the next Number of year jouraal, you will very much oblige.

#### OSITUARY—MR. MARTINEAU,

#### To the Editor of THE LANCEY.

Srn,-On the 1st of January, in this year, died, Philip Meadows Martineau, Eaq., aged 76, the most successful lithotomist that ever lived. As it has not been recorded in any the Madical Journals, and as hir. Martineau belonged to the class of the profession styled GENERAL PRACTITIONESS, I do not know where his obitnery can be so well inserted as in the pages of your Journal.

Having been indebted to him at the com-

mencement of my professional studies, for many opportunities of sequiring surgical knowledge, I shall feel obliged by your inserting the caelosed paragraph from the

Norfolk Chronicle.

I am, Sir, yours, &c., W. SIMPSON.

Hammermith, March 3d, 1829.

"We cannot insert in our obitnary a re-cord of the death of Philip Meadows Martineau, Esq., without feeling that a tributary mark of respect is due to the memory of one, who, by a long series of unremitting professional ottantion to the surgical departmeet of a noble institution in this city, has founded the strongest claim upos public gratitude. Mr. Martineau was one of the first surgeons to the Norfolk and Norwich Hospital from its erection in 1772, and that charity continued to have the honefit of his pupil whom he suspects has had no share tulent and skill until within a few months of his decesse. Pro-eminently successful as an operator, and most intimately acquainted with the theory of his profession, Mr. Martineas at the Theatre of St. Bartineas's name has not been confined to the comparative small appears of practice in this district, but is colobrated in every part of England and throughout Europe, and may be said to rank with the highest of the same faculty. By the exertion of such men, the character of our hospital has been raised to that of the first class of surgical practice out of the hietropolic, particularly in oaces of lithetomy, a branch of study to which Mr. Martinasus had sally directed the rigour of his mind with such distinguished success. To the extern of the members of his war profession he united the respect of all classes by the general courtecassers of his magners, and he may truly be said to dis universally regretted."

Mr. M. P. Moyle-Mr. Liston-Mr. Pewtress J. B. It is probable, that a hospital capable of

coutsining at least 200 beds, will be erected on part of the foundation of the London University, in the course of the ensuing

We did not insert, or take any notice, of the letters sent to us by Mr. Liston's nomesake, because we regarded them no a weak attempt at a hoax. Can the man get twelve of his pupils to sesert on their honour that the lecture, or at least, that the substance of the lecture on ansurism, was not

delivered by bim?
"G. P." The index to the contents of each Number has been omitted on the gorap. per, in order to expedits the hour of publi-cation; and it has been omitted in the last page, because we are of opinion, that the pace can be occupied mure beneficially to the reader, and because, as there is a very copious index to oach volume at the end of every sis months, we consider that an index

to each Number is not required.
"Truth and Equity." The letter signed thus, cannot be inserted until it is suthen-

DRIFFERED AT GUT'S MOSPITAL BY .

DR. BLUNDELL.

LECTURE XX.

Of Encysted Accumulation and Dropsy of the Opery.

As water may accumulate in the peritoneum, so also it sometimes collects to the overieo venicles-those small venicles with which the ovary is filled, and which constitote the eggs of the human species. At first these vesicles contain but little finid; only a few drops, or drachma, or ounces; but the disease proceeding, at length piots, and quarts, and gallons, and larger monsures, may accumulate, and the overy may become of a size anormously large. To the late Mr. Cox, a senious and very diligent inquiter, and a great loss to curgery, we ere all of us indebted for the obstetric curiosity here shown you, consisting of overy, capable of containing several pailfuls, if I may be allowed to use a homely measure. In several crate the accumulation may take they may be sented in one eyat only, as a principal, though it should always hap-wellist ather cyets are more or less filled; to some few ounces only, while the it treatains many gallons. It dropsy consists of an accumulation of water in several cycle, it sometimes haug the cysts are to communication william other, so that the water flows out of the une into the other. The late Mr. Cline used to men and uncommended this sart, observing lany diagnostic by which the continued, excepting that, if you tapped one of the cysts in this monumulation may be determined, excepting that, if you tapped one of the cysts in this man the factuation is change that which is taken from factuation; for the continued of the cysts, you would, of coase-

but this is the only case which it has been my lot to witness, for in many-cysted ova-rian dropsy, it far more frequently happens in nine cases out ten at least, and, probahly, in larger proportion—that the cells are not in communication with each other, the tapping of one cyst producing a pertial relief merely. Forther, in ovarian dropsy, the inner surface is not always equable, but ie, we are told, now and then covered with those azerescences which have, by Burne, been compared to the cotyledons in the uteri, of the ruminating animals; and I would the father notice this io giving you the morbid anciomy of the disease, because we have been edvised to axcite the adhesive inflammation, so as to occasion a cohesion of the sides of the cyets to such other, and these irregularities must throw in our way an impediment to such a practice. In the anatomy of overien dropsy, it is important, too, to recollect, that the oysts vary considerably in the thickness of their sides; and sometimes we find them no thicker then a piece of hrowo paper, and sometimes, as when scirrhus concurs with dropay, their thick-ness may equal or axceed that of the hand, a peculiarity of atructors which must materially obstruct rue operation of tapping. When the enlargement of the overy is

cyctic, there mey be real variety in the nature and consistency of its contents, which may be fuld, viscid, or firm, like water, treacle, or conserve-a difference of no small importance in relation to the place, and in all the cysts pretty equally, as operation of tapping. Nor ought you to the he led away with a notion that, in the first tappings, the accumulation will be watery, becoming more visuid as these tappings are repeated; for, m more than one instance, I have myself found viscus in ovarice, which have never been tapped at all; nor is the occurrence by any means infrequest. Add to this, that, in many-cysted enlargements, there may be much difference io the consistency of the contents of the different receptucies in the same overy, nor, with the exclusion of tapping, do I know of se i sitheogh, when the fluctuation is obscure, we must not hastily infer that the contents domen, and that it fluctuates more or less of the swelling are not squeous, we may disticely; and has been somewhat rapid in safely conclude that they are of this cou- its growth, there can be but little doubt sistency, when the necessition is found to be that the effection is a dropsy of the overy, lively and distinct. Where a woman has pure, or combined with scirrbus. Rapid been tapped frequently under this disease, growth, when it drows is an excellent I strongly ampet that axtensive adhesions diagnostic; for though alow growth is no in the parts adjacent will be by ne means certain disproof of encysted accomplation, infrequent; het if the disease have heed we may he slmest sertain that the avary is unattended with much inflammation, it does enlarged from dropsy, scirrho-dropsy, or, certainly sometimes happen that the adhes at all symba, an seepated accumulation of sieces of the enlarged overy are very slight, one kilof ar another if the growth have taken so that the whale mass may be taken away. place in the course of a few mooths. The immense every here shown, probably the largest preserved is any museum, setting aside its healthy comexion with the side of the pelvis, was bound to the adjacent parts by one adhesion only, a part not bigger than two of my fingers, and which could have here easily out, through the whole of the of you hereafter are dissecting the hydropic overy, I would recommend you, in a view to extirpation, to observe how fer the hesions are of frequent occurrence; and istence. Io dropsy of the overy, too, let it he remembered, that the disease is not al-ways simple; with avarian dropsy, southes the overy itself, or in the nterus; the sombination of scirrhus and dropsy, in the same nvery, being by no means ancommon; add to which, that when the overy on ane side is effected with dropsy, the overy on the other side may be effected with dropsy too.

Character -- When a womao labours under gether; and you examine the abdomen, and find that it fluctuates—if the oysta be thick, obscurely -if thin, as distinctly as io ascites, or a drepsy of the eterna, or an accumulation of water in the bladder, and therefore you should be on your guard. Ferther. On making impoiry, you learn that the tumour is lying more on one side of the pelvis then the other (a great charse-teristic of the disease); and unless, indeed, the inferior and middle, rather than the esperior, part of the sbdomeo; and now and thee, indeed not uncommonly, the sur-face of the cyst is teherose, as in the prepa-ration here exhibited. Now, on examine-

Again. Wheo patients labour under ovarian dropsy of serlier formation, the whole ovary not being higger than a child's head, as is the oses of scirrbus, the tumnor may fall down between the vegica and the rectum. In these cases symptoms similar to those before enumerated may be produced; snermons overy, excepting these two parts and, on examining with care, you find a being perfectly datached. Now, when any swalling which fills the pelvia, with the vagius in frost, and the rectum hahind, sed n certain character of fluctentien nhvious eneegh, if the awary he thin; so that there are three absrecteristics by which the rectowhere they do occur, whether they are eif- vaginal dropsy of the avery may be known: a numscribed, or of extensive kied, and what temour within the cavity of the palvis, with are the symptoms which precede or accom- the vagies in front, sou the rectum poste-pany them, and which indicate their ex- rinrly; o fluctuation more or less palpable, and an essemblage of symptoms more namarous in some cases, of amaller number in others, but most of them referrible to irritamay be combined, whether this he seated in tion, obstruction, soil compression of the viscers withio the pelvis.

In avarian dropsy, of earlier formation, however, the enlerged overy generally lies above the brim, and there, in the ilian foses, to the right or left, it may usually he feeed forming a tumour, not inaptly compared to the fotal head, of tuberose sordrepsy of the overy, of longer standing sed face, or squahle. A dropsy of this kind it of greater size, also tells yoo, perhaps, that may not he so easy to distinguish as the present has been ill for mosths or years to-degether; and you examine the abdomen, and monatrable through the abdomical coverings. Nuthing, however, is sesier, that to escertain that the overy is enlarged, and if at the end of a few months there be a great iocrement of bulk, we may be pretty certain that the enlargement is from effusion, whether watery, viscid, pariform, or of other charge, ter; for, as before observed, there is much variety here.

Where there is a dropsy of the overy, the tumour be large enough to fill the whole the general health is not infrequently cavity, you find, moreover, that it cocupies good, especially in the middle or earlier period of the disease; the wo an sometimes becoming much reduced in the latter person, and suffering much from cochezia. In some cases, the quantity of the trine se-creted may be considerably diminished, tion, if you find an abdominal tumour of though a pretty free near-tion is by no means tuberone surface, or even of surface round unnomation. Mor is it to be forgottan, that and equable, or if you find that the tumour is stelpey of the vory; as is eiterine, the inclines to the one or other side of the his-ingly be an administrate reveiling of the bigs, must be taken that this do not decrive you the over, more especially; and it does not iato a belief that the woman labours under follow, because you have once tapped a woexample of the common kind. The colonia seems to be the result of presents on the vessels above, and this is, perhaps, the rea-son why one side awells more than the other, namely, that side on which the tu-mour is principally seated. Wemon once tapped, often fill rapidly afterwards, but the first growth of ovarian dropsy occupies vary different periods, varying from a months to years, for I have reason to believe, that large collections of water may take place in the course of o few months only, and, in the inter case, the general health is more

likely to suffer.

Treatment.-Tho treatment of this disease may he divided, I think, into three kinds, that which is proper in the way of pallisting the affection; that, again, which is proper, with a view of radically ouring the disease; and that which is required, if, indeed, any be required, where the ours of the disease is taking place spontanoously, for such oures do now and then occur. in medicine, I bolieve, you have no effectual moans of pallisting these ancysted scenmulations, and, in general, those may do best, who atruggle least. The dropsy of the overy cannut he oured, in the general, by diuretics, cathartics, ometics, mercurial ection. or the like; and, therefore, you ought to bu very cautious how you have recourse to any of those means, at least with violence, lest you should leave the petient in a worse condition than you found her. I will not venture to say you are not justifiable in making gentla attempts with these remedies, but experience shows, that from these msdioines so little good is to be obtoined, that, in attempts like these, the constitution ought not to be injured. The most offectuel means of palliating the disease is by tapping, and, in the ordinary modes of practico, aven this is to be dolayed as long on may be, for if a woman is once tapped, she often fills very rapidly again; it may be ears before she requires the first tapping, out she may require to be tapped the second timo, in the course of a few days or wacks, or, at the most, of a few months, so that if e operate injudiciously, we are making but works. In performing this operation of tapping where, it seems, from the large bulk of the tritions; to be absolutely necessary, I would reschanned you in all cases to be careful to know whether the women is pregment, and whether the tumour srice from the retention of units; for great scandel, if I may be allowed the expression, has arisen to our profession, from neglecting inqui-ries of this kind. Distended bladder has

or of one leg more than the other; and care | man has been pregnant, and, in dropsy of man for overian dropsy, that, therefore, a se-cond time the operation is to be performed, without prayiously imquiring whether the uterus or the bladder be full; for when the second tapping is proposed, the supposed ovarian dropay may, in reality, he an enlargement of the womb or hiadder: be on your guard, therefore. In all cases where tiroumstances lead you to suspect that there may be an accumulation of water in the bladder, a cathoter introduced, with cautions formerly given, will give the disgnos-tio; and, in every metance, when the uterus is auspected, let a careful examination be instituted by the vagina. You should remember, also, where you are thinking of the operation of tapping the overy, that the water is sometimes collected in several cyats, as in the preparations on the table, and that those cyats are not always, nor, indeed, geoorally, in communication with each other; these oysts, whether communicating or separate, are more especially to be looked for, provided the tumoor in the abdomen have a tuberose surface, as in the preparation have exhibited. Hydetida too, may, I believe, form in the overy, but the accident is rare; and bence when, from tho form of the tumonr, many cysts are suspected, it may be proper to mention to the friends, though not to the patient herself, that there is a chance of your not being able to empty the every completely, so that disappointment may be provented.

I have already observed to you, that in many cases where the overy is hydropic, the oyst may be very thin, and tapped as ossily se the common integement; but, further, when going to perform this operation, remember, that sometimes the front of the overy is thick, and that if you do not push the instrument far enough, on withdrawing the trocar, you are surprised to find that not a drop of water is coming away, and this though you know the case to be dropsical; whereas if the trooar is pushed further, the water will flow, and readily enough; cases of this kind are not, on the whole, very uncommon, and they not only occasion more difficulty in tapping, but there is the more risk of a dangerous inflammation, provided the instrument is pushed through a good deal of diseased substance. All this should be well weighed before you operate; indead, in these cases of schirro-dropsy, it may, I suspect, be better not to operate at all. When a woman has been tapped often, It is said that, after every operation, the fluid which issues may become thicker and thicker; thick as seep suds, thick as treacle, or of been misteden for everien drepsy; ney, the denser consistency than this; but though misuse itself has been tapped, when the wo-tide may be true, you are not to suppose denser consistency than this; but though

viscid from the very first, and this becomes very probable, provided you find that the fluctuation, is vary obscure. I remember once seeing a woman in the East of the town, labouring under a dropsy of this kind, for which tapping was recommended. On seeing this woman, I told the friends that the contents of the overy were probably viscid; for, though the growth bad been rapid, the fluctuation was obscure; nor did I regret this cautionary opinion, for when the overy was tapped, there came away enough to show that encysted eccumu-Istice existed; but still the discharge was sparieg, viscid, and the tumour remained unreduced. Mr. Abernethy afterwards saw this case, when the urgency of the distention led the attendant to operate again, with as little benefit as hefore; on observing this, Mr. Abernethy prudently discusded from further ettempts, observing, as I was informed, that it would not do to go un boriog boles in the beily, agnose hominem, and ulti-mately the patient died. When you are going to tup, let it be further remembered that, after all your best care, infismostion of the eyst may occur, slight, or in that degree which may earry off the patient.

The iste Mr. Chevelier once bad noeasion to tap on neary containing seventeen gallons; in this cose it was thought proper to proceed with caution, and the water was drawn off, not all at once, for this sudden collapse would have been dangerous, but at three or four different times, yet notwithstanding the prudent manner in which the operator proceeded, extensive inflammation of the eyst enseed, and the woman died heetic, et the and of e few weeks, with one ur two gallons of puriform matter in the eyet. It is remarkable that no infismmatory tenderness accompacied this attack. When a woman is tapped, aha may also siok in a few days from symptoms of exhaustice,—symptoms very similar to those arising from floodings, or ebolers morbus. And this, I soppose, more frequently happens when the overy fills again very repidly, asy in the course of a few weeks; iestances of which I have my-Some women sick in this manmer after the first tupping, or thus many siok gradually after they have been tapped some five or six times, which may, per-haps, be an average number; in a few rare cases they mey live to be tapped much menifested itself in the veins, which be

that it is only after repeated tappings that and the general health and spirits flagging these thickenings occur; for, as before observed, the contents of the overy may be by Portal, eight-ind-twenty times; and in a case related by Ford, the patient was tapped forty-nine times, 2649 pints being taken forty-nine times, 2649 pints being taken from her; by the late Mr. Martinesu of Norwieb, a woman was tapped eighty times, and from her thirty hogsheads were extracted. For a reference to these cases I sm indebted to an exocilent and laborious obstetric writer, I meas Burns. Aithough womee do live now and than to undergn these frequent tappings, and other instances have been communicated to me, yet they more generally sick; and hence, ic ordinary practice, the ionger the first tepping can be delayed the better, for there is nothing more unwise than to ground your geeeral practice upon the exception to the rule, though the error is not infrequently committed. Make the best of it, and tappiog, after ali, is but an nesatisfactory sort of remedy; dangerous in scirrho-dropsy-of partial relief in dropsy with many cysts—of no effect when the encysted material is viscid—obnoxioes to iefsammations — adhesioos — suppuratioes —exhaustioes - repetitions - end death, even in cases the most favourable; and the more I have seen of this operation, the more I have felt inclined to whisper to myself, when the surgeon has taken np his instrument-"I wish he could do something better."

## FOREIGN DEPARTMENT.

BFFECT OF PONSSIC ACID ON PLANTS. By M. R. GOFFFFET.

THE experiments of M. Macaire-Prierep, the results of which we detailed is No. 289 ure, for the most part, confirmed by those of M. Goeppert, of which the following is short secount.

Plants, with their roots immersed in a solution of prussic seid, (five parts to 400 of distilled water,) died in a shorter, or longer period, the maximum of which was five days, (Sensele suggerts,) and the minimum siz hours (Fumeria supresists). In all plants the stalk became discipleured, contreeted, and, et last, shrunk up; the effect un the leaves was rather slow, and first. oftener, and, indeed, there are cases which seems of a brown colour; graminaceous you should treat with peculiar attention, in plants seemed to be the least succeptible of which the constitution seems to seffer but the poisonous action. In fully plants, as vary little, and where the woman may be the suphorbic, research, i.e., the juice tapped a surprising number of times, very cassed to flow from the lower parts, which great quantities of fluid being taken away, were affected by the poison, while, in the

this difference being evidently not pro- eight o'clock, the patient was seized with duced by the chemical action of the acid, shivering, fellowed by heat and profuse (as was ascertained by mixing some acid perspiration; at the same time, the beadwith the juice,) the author infers that it set became more violect and throbbing, depended on its destructive influence on and though, at first, command to the right the centractility of the lactiferous vessels. The vapeurs of prussio said were found to be as deleterious as the solution; in either of which became swelled, and covered with easo, the poisoneus action was not commn- an erysipelatous redness; the right eye was nicated from the leaves to other parts, axtremely painful, and incapable of bearing sitheugh the point being applied to the the light, and the conjuncture violently inroots, the rest of the place was always jected. These symptoms, which were conmore or less rapidly affected. The leaves fined to the right side, having lasted for
of those plants which contain prussic said, shout three heurs terminested in profuse
affeatrel, &c., being submitted to the action secretion of tears, after which the patient
of hydrogyanic vapours, died as quickly as was perfectly well for the rest of the day. of hydrocyanic vapours, died as quickly as those of other plants; a small quantity of providered learns leaves, or bitter almonds, sees sufficient to kill branches detached from the same trees, while no effect was observed to take place, if branches, recently separated from these trees, were brought into contact even with the most delicate plants. As to the means by which such a volatile substance as prussic acid is retained in the living plants, though emitted slowest immedistely after their death, we are perfectly ignorant of them. From some of M. Goeppert's experiments, it appears that clevation of temperature increases the action of the prussic seid; in ne case was it found possible to restore the plants which had once exhibited signs of heing poisoned; the carbonste of ammonia was often employed as an antidote, but without success. From chemical analysis of the poisoned plants, it appeared that the prussic soid was directly abserbed, and all parts of the plants seemed to contain nearly the same quantity of it; on carefully dissecting them, It was found that the cells were shrunk and contracted, and their green coluur completely destroyed, while the spiral vessels had undergone no siteration whatever. This explains the circumstance of enonocotyledoneus belog less affected than dicotyledonnus plants, the former containing mere spiral vessels and cellular tissue than the latter .- Annales des Scienc, Natur.

INTERMITTENT OPETEALMIA ODEED BY THE ADEPHATE OF QUININE.

This case is related by Dr. Heuter, of Marburg. A labourer, about 68 years of age, of a robust and plethoric constitution, was, in August hat, affected with a slight -bronchitis, which was followed by coryna and violent headach over the right frontal sinus; at first, the pain was but slight; and as it never lasted for more than a few

upper, it continued to scope as before; [latermittent character; every morning, at and though, at first, comined to the right half of the forehead, gradually extended over the right side of the face, the skin General and local bleeding, as well as diaphoretics, emallient ponitices, &c., having, for a long time, been employed without any effect, and the periodical affection of the eye heceming still more intense, the selphate of quinine was, at the condition dering the intermission; after a few doses, the attacks became less frequent and vielent, and hy coetinnieg its use for a few weeks, the patient was perfectly cared.-

#### **VOLUMINOUS VARICOCELE;**

Successfully treated by Tying the Spermatic Arteries.

Nicel. Rigneri, a native of Grobce, of a robust constitution, had enjoyed good health up to his fifteenth year, when he observed a tumeur ferming on the left side of the scrotum, which gradually increased, and at last attained such a size, as almost entirely to prevent him from walking. Several surgeens had been coosulted, who recommended absolute rest and cold lotions; but, as the tumeur centinued to enlarge, he applied, in October last, to M. Amnest. Fifteen years had then olapsed aince the first appearance of the tumour, which had new become of the size of a child's head, and, although free from pain, and unaccompanied by any general constitutional disturbance. rendered almost every movement so difdealt, that the patient was anxious to have it removed by so operation. The nature of the enlargement having been clearly as-sertained, M. Amuset resolved not to remove the testicle, but to place a ligature round the spermatic ertery of the affected side. The lucision through the skin having been made, as in the operation for luquinal hernia, M. Amusat experienced consider-able difficulty in laying bare the artery, which was closely covered, and surrounded hours to the morning, hardly prevented him by the salarged veins; but he at last age-from continuing less work; but it gradually seeded, and seed all the arteries going to the because many intense, and of an apparently testials; the wound was aimply dressed.

Shortly efter the operation, inflammatory symptoms, and, on the following day, a conaiderable edematous swelling of the scroniderable occumatous swelling of tha scro-tum ensued; but, after copious vanesce-tice, and nuder the application of hot fumentations, these symptoms subsided; and, on the fifth day, the wound presented a healthy supportating surface. On the evening of the same day, hewever, an ab-aceas formed on the left side of the sorotum, and, when opened, discharged a large quantity of very fetid, purulent, and gangrenous matter; a great portion of the acrotum became eventually gangrenous, but, fortunateand the large ulcer, resulting from the mor-tification of the skin and collular tissuo, was at last completely hesled. The wound of the operation was cicetrised on the eightteenth day after it; the ligatures having come away a few days before. At the time of the report, (on the 2 tat of February.) tortuous chords.-La Clinique,

#### TELLOW PRYSE AT GERALTAR.

This formidable epidamy has at last ceased to rage; and, and aloce the 16th of January, it has been desmed unnecessary to enforce t entered in the official accounts; 1412 the absolute number of deaths was 1658.

most scrupulous revastigations he made, during his stay at Gibraltar, with respect to the contagosity or nea-contagosity of the disease, have only contributed to confirm his fermer opinion on the subject. M, Chervin was accompanied by M. Louis, who, seen after his arrival at Gibraltar, had a slight attack of the disease, from which he recovered within a short time. As soon as the official report of MM. Chervin and Louis has been laid before the Académia Royale, an extract of it shall be given to our readON THE

EXPORTATION OF DEAD BODIES FROM IRRLAND TO ENGLAND AND

SCOTLAFD.

#### To the Editor of Tuz LANCET.

Dank Sin,—Had space permitted me, I intended to have concluded a late communication with a few observations on the exportation of dead bodies from Ireland to Great Britain and Scotland; a subject, I asenra you, of equal, if not of greater, importance to the intereste of the medical achools of Dublin, than the repeal of ray old, or the enactment of any new, law, for the regulating of supplies for enatomical pursuits. This novel branch of Irish commerce, for such it may be designated, without any intention to exaggarate, has recently increased to such an alarming extent, that its evils are deeply felt, and its extincthe patient was perfectly cured, except that tion anxiously desired by the medical prothe left testicle had become atrophic; tho feasion, sed the whole population of Dublic. spermatic verns were changed into hard and Netwithstanding the injerious consequences. already resulting from this traffic, for which the word neisunce affords but a faint deficition, I confess i approach its discussion with diffidence, and for two obvious reasons. In the first place, it is impossible to coesider this topic fully, without a disclosure of details, of which, perhaps, it were better that the public, impressed with its present foelany longer the quarantins, and the other sa-nitary measures. The number of patients who were affected with the yellow faver, on us the necessity of having recourse to amounts to 5,270, to which, it appears, no measures for its attainment, the divulgence less than 1300 most be added, who were of which is calculated not only to awaken a still stronger sentimental hostility to our of the above number were soldiers, and pursuits, but also to enable society to smonget them the mortality was 1 to 3.41; avenge the violation of its prejudices, by smonget ather patients, it was only 1 to 4.15; defeating those masses which are essential to acquiring a knowlege of an indispensable M. Chervin, whose researches on the art. In reforming, therefore, the abuse of nature of yellow fever have been given in a these objectionable measures, it strikes me former number of THE LAKORT, was sent that care, if possible, should be taken to by the Academia, Royale de Médecine of evoid this twofold inconvenience; and thet. Py the Accounts, royals as accordance to be reliable to the register for the repair of director. In his last commitmication to the of its machinery, we do not imprudently and a separate the disease at Gibraltar to be identical with the yellow fever the whole to popular destruction. In the of the West Indian; and asserts, that the second place, I am awars that any extempt on my pert to prevent this priestice, may ne-turally subject sub, perhaps, as the officer of mas in other places, which is an irritable simile, might liken me to size who, having an abendance of provision, officionally steps forward to deprive a garrian in discress of the means of subsistence. I admit the force of this pathetic argument; sud, as an admirer, at least, of science, I should regret being in any manner instrumental to the curtailment of its spreading illumination. No law, however, either humas or divine, with which I happen to be acquainted, or-

s quastion of convenience between two parties, where one of them possesses the power of accommodating himself, even at the expense of the uther, the moral duty in such s ease has been long since defined by Clouro, is bis illustration of the two men in danger of drowning on one plank, the stronger of whom he advises to save himself, though his companios should slak. I would, therefore, justify my luterference on the eclish grounds of copediency, orested by those ovils that, I shall horeafter show, arise out of this enstom, so inimical to the welfare of the enatomical schools of Dubliu, which, to me, ere netioually of paramount enosiderstion; for though " I respect Caser. I lave Rome still mors."

Such ere the reasons which would have ioduced me to decline the discussion of this theme, if they had not boan opposed by uthers more cogent and convincing. To the sholition of the usage on its own morits, an chicotion has hear started which deserves some attention, and it is this:-That the exportation of dead hodios is precisely as justifiable as the exportation of dead or live bulloole; ur, in short, of any other commo-dity which Ireland imports into England or Scotland. To adding this novol Item of dead hodies to the "day netes" of our c stom houses, if honestly obtained in the way of business, there oppears, at first sight, in-deed, no valid objection as an abstract proposition. A vory convenient preceduct, too, for this argument, is found in the conduct of the proprietors of the schools, who are wall known to purchase dead bodies, and to retail them to their pupils et a considerable profit. The greet adventage, also, scorning to science, from an export trade of this description, has been adduced as an additional ground for its toleration. I am willing to allow the weight of these end all other reasons which here been sevenced in favour of the commercial disposai of the dead; but the decision of the question in this manner, appears to me to be one of those mighrespets examples of false reasoning, in Which the utility of a measure is judged of Which the utility or a measure is juaged in by its particl, instead of its general, conse-quences. Expering dead bodies would, no donbt, be at escellent arrangement, if its good offects, alone, sould be secured with-out its wills. It should, however, he recol-lected, that the exhumbiton of bodies, and senotion for the export traffic, ere by all, system. It is, consequently, ucfair to view even on this small state, considered great which is a circumstance which I deem it unnested, from which it differs is ell casential conserve to prove, as I have never met with features but the one common to both, vis., one septimistance with the kind, and what Having thus disposed of the objections

daine that we should hove our neighbour will be the general result? Simply a multi-better than ourselves, and when it becomes pilostion of these evils to an indefinite extent. For the supply of the Dobin schools of present, e few absudened characters are competent. Allow the exporting project free scope, sed you increase, to an unlimited amount, the number of those dissolute men, to the manifest danger of society, hy familiarising their minds with scenes and actions which exercise the werst moral influence on the bumen heart. The local evils of this; moral deterioration of obsesster are now, la s greet messure, kopt within asie boueds; the resurrectionists are checked by the vigi-laceo of a respondible order of mon, to whom, as servests, they ere amenable for their conduct; but in the export trade, no such salutary control could be exercised over them, the pertias concerned rasidiog at s distance of several hundred miles. A new race of resurrection men would undnubtedly he erected by such an arrangement, without any respectable hody to watch their conduct. The home and foreign branches of this species of commerce differ in this important respect, that the former is conducted under the inspection of moral nod educated men; the latter would fall into the heads of e band of ruffien speculators, who might indulge their dangerous propensities without fear of punishment or dejoction. Wore tho trade, indoed, candusted by philosophers, as one might suppose that the advancates of it intended or thought it would be, from their nususpicions opinions, there would be very little ground for such apprehensions; but, estrict on hy its present egents, or by per-sons of their description, (and by such man certainly would it be transacted, for, as anciety is at present constituted, no reputable character would embark in it,) the worst consequences, I fear, might be justly anticipated. Not the loast lojurious of those consequences would be the lowering of the medical prefession in the eyes of the public, who would inevitably confound the punno, who would inevitably confound the outsivator of science with the spoilator of the grave, the "receiver" being, preverbially, "as bed as the thind," If circumstrances, therefore, resider the exhumstion and the sale of bodies mecusary in a given place, I think the exigencies of that particular place should be the measure of the evils of the system; and that it is too much it is strong that any months would market a transfer of the system; and that it is too much it is made that any months would market a transfer of the system; and the strong that the system is the system of the system of the system. to expect that any people would permit the extension of these evils for the accommodation of the inhabitants of another country, the sale of them by the proprietors of whe would thus have all the advantages, behools, which are assumed as a smilicient without my of the inconvolutions, of cock a sametion for the export traffic, ere by all, system. It is, consequently, unfair to view seen on this small scale, considered great this question as a more mercantile transactivitie; a streumstance which I deem it unnetion, from which it differs is all casential

adopted for its total extinction.

Anterior to the introduction of ateam wavigation into the Irish Channel, I am not ewere that this traffic was practised to any considerable outset. The facility of con-veyance by steam resease—the vast increase of medical pupils in these countries of late—the expenses and searcity of subjects lo England and Scotland-and the abundance and cheapness of them in Dublin ; all these concurring circumstances pointed out the exportation of bodies from this city as a lucrative apeculation. But whatever may have been its origin, it is now reduced into a reguler system; and if we may judge of the can efford it, are the consequences of this quantity of bodies which reach thair deati- indiscriminate invasion, and injedicious disnation, by the number of those which are intercepted on their passage, the amount exported must be beyond credulity, for there scarcely passed a week dering the present medical session, in which the queya present medical session, an according of Duhlin did not witness some disgusting disclosures of this description. principal character concerned in the husinees, and who cojoya the wall-carned infamy of its invention, is a Mr. Wilson Rac, a Scotchman, I believe, by hirth, and, as it would appear from his worse than Simoniscal been reversed. pursuita, one also by disposition, a member of the London Collego," one of his Majesty's half-pay surgeons, and a resident of Irishtown, e small marino village, about three quarters of a mile from Dublin, and most sanching. By the add of bribery, this car-ity. It aftentions already inconvaciences one-more than account of the em-lim, by rendering scarce those materials of see, whom he personally accompanies in mes, whom he personally accompanies in or the anatomical soncess of Junuar, by scheduler loss and the latest potential of the city; and makes ap for any putation, if not their very existence. It accidental deficiency of plonder, by purchasing bodies from the servests of the private section, by the frequent disclosures to teachers, which, by engagement, should be which it is accessory, that I have no doubt delivered into their respective setablish- bot the public will take such precedents ments, in which some of those men are paid as, in time, may render this mode of obtain-weekly throughout the whole year. For the ling subjects abortive. It will create a naw seeption of this parily-pulifered and paid-fax bless of despenders, whose oncontrolled prey, he has had a succession of depôts, pursuits offer at once an inducement and . mode of conveyance has offered, which he has generally found in one of the steem-houts traffic, and cannot be continued without on the Glasgow station, the ceptain of which affixing a dangerous and offensive stigma on

From this short account of the practice, eny unprejudiced person will see, I canceive, sufficient reasons for its sholition. It raises the price of subjects on the native atudent, who is certainly entitled to the ac-cidental advantages conferred by his local-ity. It oftentimes already inconvaciances ployment of some of the proprietors of ner his study, which would be otherwise shun-shutomical achools, a band of resurrection dant. It is highly injorious to the interests of the anatomical schools of Dublin, hy shuntil a ergo is comploted, or e convenient an indemnity, for the perpetration of the mode of conveyance has offered, which he hes worst of orimes. It is, is likelf, a detastable

we transport seaton, the suptain of which is well known to shart, in the diagraceful is observed of the profession is Dablin, profits of this traffic. The memo of this Such are a few of the possible cvils of this pastice. I doubt make if they are sounter-beautiful of the profession in the state of the profession is not the pastice. I doubt make if they are sounter-beautiful of the profession in the state of the profession is and profession in the pastice. It is appeared by its advocatic and profession in the profession is and profession in the pastice. It is appeared by its advocatic and profession is well as the profession in the pastice. It is appeared by the pastice in 
which night he treed against the discas-sion of this question, and of the arguments adramand in favour of the system, I shall (despicable as this other mercenary Scotch-proposed to describe the neture of this traf-fic as conducted in Dublin; its pernicious arms in.) I should not wish to be the in-strument of making himself and his crew the effects, and the means which should be victims of popular indignation. From the reckless manuer in which the miscreant Rae conducts this busiosse, both in securing and disposing of his plunder, the indignation against anatomical pursuits has ax-tended through all ranks of society in Dah-lin. So perfectly indifferent is he to every other consideration, a scept the gain of his infamous avocation, that he end his man leave the greves which they have rehbed, open; and have the audecity to send ficir plunder down to the vessels at needlay. A scarcity of aubjects, at an advanced price, a general alarm in the public mind, and a gnard to protoct daceased friends, by all who posal, of the dead. Before the existence of this execrable trade in Dublin, exhumation was attended by faw or none of these disagreable circumatacoes. Every attention was paid to conducting it with decreey and acerecy; public prejudice was rarely offended by apposure of the dead; subjects in ahundance were to be obtained, according to size, at from ten shillings to a pennd; but since the wholesals vampire, Rso, embarked in the trade, all these facts have

pears, indeed, but poorly calculated to di-missish the inconveniences in which it ori-business, until the misogram, sew is expery ginated, and for which it is proposed as a face an enemy, and, at avery coveremely. No bodies, for instance, experted faction of his leatheams identif from Duhlin, allowing for the neavoidable delays of conveyance and procuring them, can possibly reach Edichurgh or London earlier than a fortnight or three weeks after eath, unless, indeed, they are mardered have per sentract, and served up "hot and hot" to the teachers of those two cities, as thay were to that eminent anatomist, physicologist, and pathologist, Dr. Kuox! Bodies kept for such a length of time, and submitted to the inflasuce of high temperature in the held of a steam-vessel, must surely he fitter for interment on their strival in these places, then for the purposes of anotomy. But in whatever state they reach these cities, the recent disclosures at Edinburgh provs, that expertation is no remedy for the deficiency of sobjects in that city. The the deficiency of sobjects in that city. existence, therefore, of this traffic is not justified even by the accomplishment of its own objects. The scheme, in fact, is an inversion of the rule which should be observed in the case; for, to all unsophisticated mortais, it would seem a mure rational proceeding for the living to go to the dead, than for the dead to march for the conveoisnce of the living. It would surely be better in this case for " Mishamet to go to the mountain, than the mountain to move to Mahomet." By such a common-sense view of the matter, Scotch or English stndents might dissect in Dublin at anstentb of the expense which they have to pay for putrid carcasses at home.

It only remains to add a few words on the masns of preventing this traffic, which has hitherto baffled the exertions of the profession in Dablin. The prevention of the practice is certainly a matter of some diffioulty; for, as the law now stands, the propristors of the schools would, undonhiedly become the victims of their own prosecotions, should they undertake to pusish the individuals engaged in this diagneting traffic. A consciousness of these consequences has deterred the teachers of Dublin from actively opposing the system, has they should no longer be intimidated by such approhensions. Even the impertiality of justice will make some distinction between the cases of the marcenary robber of the grays, and the cultivator of science. Mactings of the lecturers of the public and private echools of the city should, therefore, e held; and resolutions, supressive of

means of this kind should be taken within late society to diagorga itself of this foul monster; the apprehended injury of expo sure would soon die away with the removal of this walking nuisence, upon whom the punishment imposed by Mesentius on the soldiers of Eness should be inflicted, by coupling him to one of his own corses, and parading him through the streets, notil his carcaes and its companion were amalgamated by putrefaction. It is idla to talk of moderation with auch a fellow: he who violates the best feelings of society, and preys on the remains of all that is degreat to it, should axperience no mercy at its bands. This gentleman, balf-pay resurrectionist has not the plea of poverty or of ignorance to excuse his damning pursuits; he has volumtarily descended from a respectable prafession, to unite himself with the very dregs of vice; converted the sources of cumpeteecy into the mesus of indulging is the excesses of dissipation, or of gratifying the still more disgraceful love of fucre, by speculating in a detestable traffic; thus bringing to the aid of the reckless, impalses of crime, ignorance, and pennry, the oftentimes injurious sesistance of wealth, education, and an enlightened intellect. No massures ought to be kept with such a comoned of dangerous qualities, who cauots his profits by the echoes of the tomb; cooverts the lamp of science into a dark laotern, for the more affectual direction of his guilty parsaits among the dead; and dis-graces its temple by the invantion of a new and detestable species of servitude. Should such a character be tolerated as the menial, satler, or purveyor, oven of the leathsome materials out of which the splendid structure of our science, ascends? Ought not a partion of the glorions and beneficent light of that science to be reflected back on its sources, if not to earoble the humility of its origin, at least to save its meanness from the contamination of crime?

#### Sincerely yours, 44 . ERIMAMATA.

P.S.—Since the preceding observations were written, which you may perhaps publish, though unfit to meet the public eye, being thrown together io a hurry, I have fearned that this Mr. Rue has been committed to Newgate, for want of bail, by nne of the their horror, and axplanatory of the usture of these proceedings, be adopted. These police magistrates, on a olarge of having dispersion of these proceedings, be adopted. These proceedings, be adopted. These proceedings, be adopted. These proceedings, be adopted. The newspaper his Dublish, and accorded by placenta in all parts of the town, stating the a planeforte case, and brought, in the neoperation, the proceedings of the town, stating the appropriate case, and brought, in the neoperation, the proceedings of the state of the town, stating the police magistrates, on a olarge of having dispersion of these proceedings, because of the state of the proceedings of the state of the proceedings.

respectably dressed female, who, it is pre-sumed, was no other than the wife of this soundrel, whom he employs in these offers aboundrel, whom he employs in these offers abounded, whom he had, even to a triling amount, and the employment of his wife in this disquating traffic, are more than sufficiently cient to justify any severity I have used towards the ruffian, and the case which I have made out for the ejection of this, and every such succeeding, wretch who may embark in this trads, out of this city.

Dublia, March 14, 1829.

CASE OF INTORMITTENT PRYER, IN WHICH BLEEDING WAS EMPLOYED IN THE COLD

By John Macointone, M.D., Lecturer on the Practice of Physic, &c., in Edinburgh,

(Continued from page 493.)

Case 13.—Stay in the hespital from the 2d Joly to the 4th in the evening.

François Pompei, mt. 19, was seized, ou the 1st July, 1822, with en eccession of fever, in consequence of a sudden chill which he experienced on entering e coal grotto when his body was covured with sweet. He was brought to the hospital on the 2d July, at six e'clock in the uvening. Before he arrived he had a considerable epistaxis. He was in the fullowing state: —Profound come, eyes widely opened, directed to the right, fixed; expression benotted; gaocral immobility; decubitue on the hack; insensiblity of the estremities; when pinched they were quite fieriths. Hu did not maswer that questions which were put to him; the direction of the syes did not change, even what one approached him; hu manifested pain when his stomach was compressed; skie barning hot; a white codematous swalling of the face. His parents said that this tumefaction had come on since the disease, for previously he had rather a thin face. This access continued until Wadoesdey morning, the third July; he then took an ounce and a half of hark,

4th July, Thursday morning. The paroxyter returned, at the commencement of which he could still give answers to the questions put to him, but the come went on increasing, and with it ell the symptoms above described. The pulse was strong, vibrating, full, beeting 84; the same direc-

might have weighed a pound. General en-le gorgement of all the vessels which ramify upon the convolctions; the brain, still covered by the dura mater, gave a feeling which made as helicro that there was a fluid in the interior, nevertheless there was only a little serosity in the ventricles; the substance of the brain was of the natural colour. All the intestinal tube, without say exception, presented, on opening the belly, a red sppssysnes, which was owing to a general injection of all the vessels, even io their smallest ramifications. It would be difficult to inject so perfectly the vessels sither of thu intestions or of the mesentery, as they were in this body. The intestival tube, although a little transparent, was pensirated with this coogestion throughout its whole thickness; avery thing indicated the first stage of a violent inflammation, that is to say, of a sangoineous onegestino.

Casz 15 .- Stey in the hospital from the 23d August to the 24th io the murning.

Thomas Adami, mt. 20, was brought to thu hospital on thu 23d August, 1822. Hu was delirious; they were ubliged to secure him. After mid-dey the dulirium subsided. A profound and intensu come succeeded; th pulsu strong, berd, 55; thu extremities were fiexible, hat motionless; dacubitus upon thu hack; pupils immoveshlu; factures swullen, and intensely hat; general insonaihility. Body covered with a clammy ewest. In the uvaniog the respiration was more hurried, and very much emberrassed; pulse not to he fult; froth was discharged from the mouth; he was insensible even when his skin was pieched. Died at one o'nlock in the morning.

Dissection, eleven hours after death .- General inflammation of the srachnoid, of which the very smallest vessels were injected; no serosity; the cortical substance was of a deup red, cumpared with that of a cobject dued from a shivering fever, (la fièvre algide,) which we shall notice by-acd-by, &cc. &ce.

CARE 16 .- Stay in the hospital from 23d July to 25th.

Autoine Turianne, et. 12, of a good constitution, was brought to the hospital on the 23d July, 1822, at four block in the efternson. He was in the following state:---Commencement of stuper, his snewers are alow, end not quite correct; the questions where described. The pulse was strong, slow, end not qoite correct; the questions vibrating, full, besting 84; the same direction of the eyes to the right, the same immobility of these organe, end of the extra-nites; respiration short; eight leeches to the sears. Died at ten o'clock to the evening.

\*\*Lieuwiss.\*\*—Several ounces of blood flowed for such a purity of the scale, purity of on pressing the bally. Sinsplems to the idening the night, remiting, and had a

24th July, in the morning. Continuation of coma; poles 124; head intensely hot; flaxion of the fore arms; it is impossible to dopress the inferior jaw; bled at the fact to eight ounces. In the evening, remission of the fever and of the convulsive symptome; skin slightly moist. It was necessary to pinch his nose to make him swallow 3ij of bark.

25th, in the morning. Roturn of the fover, and the flexion of the forearms : centinuation of the stupor; does not reply to questions; insensibility of the skin of the legs, that of the arms sonsible; head intensely hat; dooubitus on the back; eyes open. Boiling water applied twice to the feet; the patient did not feel it very scutely, Pediluvium during six minutes; snow applied to the bead; the pulse fell to 82. Return of intelligence; he awallowed voluntarily the bark; but a little sfterwards, violent sgitation of all the body came on: the inferior estremition, which from the commoncement were cold, were neither heated by the bath, nor inflemed by the application of hoiling water sod sinspisms. Of the four ounces of bark, which they made bim take, he vomited mure than two; neither could be retain the bark injections which were exhibited. He remained in this state till six o'clock in the evening; the coma re-

turned, and ho died at sevon o'clock. Dissection.- A vory vivid injection of all the erachnoid; hotween its folds there was a membrane produced by the coagulation of offused blood; much serum between the coovelutions, and at the base of the cranium; the cortical substance very red; the etomach netural; the amail intestinos contsined a prodigious collection of warms; the inflammation was sufficiently iotense in this pert; the colon was contracted, its walls very thick, and the internal membrano much inflamed, of a dark red colour.

Case 30.—Stay in the hespital from the Stat till the evening of \$2d of September.

Joseph Maoloney, set. about 60, came to the hospital on the flet Sept. 1875; ho had been sick for five days. His answers were so earlying that it was impossible to find out what had been his previous state, further than that he said he had vomited some bitter stuff; that he was tormented by thirst; that he had enfered great distress, and had pains in the epigastrium. In the evening, tongue day, vividly red round the odges; constipution, neuses without vamiting, heet netural over the extremities and the therax; a barning heat in the epigastrium; anguisb;

22d, in the morning. Poles more expended; the ideas still confused; diminu-tion of agitation; heet natural every where; tengue dry, thirst. Some treatment. About half-past nine o'clock, he had vomited the tienne, with muous, hile, and several lumbrief. About half-past eleven o'clock, atupidity, pains in the epigestrium increased. At three o'clock z.m., impinating pain of belly; pulse smell, frequent; extremities cold, and bethod in cold, clammy perspiration; inferior extremitios bent up to the belly. Bled from the arm; died in half an hour afterwards.

Dissection,-Injection of the vessels which ramify upon the convolutions of the brain; substance of the brain presented an isfinite number of email drops of blood; three or four cances of weter at the base of the cranium; lunge natural; crepitating. In the belly there were fifteen or sixteen ounces of dark blood, running like oil; apleen ruptured at its inferior part, not by a fissure, as in the other cases, but presenting an opening the size of a dollar, out of which came a dark and putrilegioous substance; it was impossible to raise the spleen without break-ing it, it was so difficent; it separated in the hand into two portions, of which one, when placed on the table, became flettened like jelly, and the other portion remained attached to the disphragm, which they were obliged to out out to expose the splean completely; it was not much increased in volume. The stomach was of a reddish brown, in the greatest part of its extent; inflammation of all the rest of the intestinal tabe; rose-soloured within; bladder matural; liver gorged with blood.

CASE S8 .- Malignent, shivering, intermittent fover. Stey in the hospital from the evening of the 29th to the evening of the 30th July. Antopsy; arachvitis; en-

tecitia ; eplenitis ; gastritie ; pericarditis. Angelo Galetti, et. 18, nf a good constitotion, was brought to the hospital on the evening of the 29th July. The patients who were near him said, that during the night he complained continually of charp pains in the boily. Took un ouoce of bark; the whole of the body was as cold as ice,

30. Eight a.m. Legs, thighs, forestms, srms, cheeks of an ioy coldness; the bally, chest, and forehead were of rather e lower temperature than other parts of the body; pulse insensible at the wrists; I could feel it hot very feehly in the crural syteries, it beat 100; the patient trembled and complained cootinually; his most common posisevere pain in the stomach under pressure; tien was on the laft side, with the thighs pulse small, frequent; lavement of harley bent on the belly. He understood what water, gum water, fomentations to the belly ; questions were put to him, but not suffi-

half-past nine.

Examination three hours after death. The small intestines, slightly distended with gas, were externally of a purplish red. The intorns! membraca was of the same colour, so that the violent injection of which they were the seat, had existed throughout the whole thickness of the substance of the intestine. This injection was recent. Inflammation of the upper half of the cheam. The whole of the great intestine was white oxternally ; on being opened, it presented an jufammetion, the vinlence of which was greater towards the rectum, where the muceus mem-brane was so intensely inflamed, that some blood had been effused, which, mixing with the muous, furmed a thick custing, which adhered to the whole of its surface. The colour of ell the interior of the colon, and especially of the rectum, was of a lively, intenso red; in e word, the most vinlent degree of inflammation that can easist without disorganisation. The atomach was pale; after being washed, it presented, near the pyloric extremity, an infinity of little da-pressions, from half e line to s line in dismeter, and some of which contained, in their bottom, e small spot of blood, which mucous membrano were, hesides, nasrer each other, and more namerous than ordinary. The muccos coat itself was thickened; the liver was haalthy; the spleen large, and pretty hard, but of a redecas of of the body; axpression dull. Two ounces the less of wice. Slight adhesions of the right lung; the same between the whole surface of the heart and paricardium; they Injection of the were easily destroyed. arachnoid, engorgement of the vessels which ramify on the convolutions, end of those which compose the cheroid plexus.

Case 39 .- Malignant, shivering, intermittent fever. Stey in the hospital from the 19th to the marning of the 94th August. Autopay ; arachnitis, gaalro-enteritis, spie-

Viscent Crescenzi, st. 60, of e thin but healthy bubit of body, fell sick on the 19th August, 1829. He was ettacked with fever, which set in with shiverings, followed hy extreme heat, pain in the head and belly, vomiting of bilious matter. During the night, the peroxyam termineted in a wonting. He was brought to the hospital of St. Esprit on the 19th August, 1822. The fever returned in the morning, preceded likowise, by shivarings, in the evening; the etomech was painful on although not so cold as the limbs, preserve; the patient experienced e great Evening. Same state; he was not sensi-hest is the inside; enziety; depressed ble of the coldness of his legs; but could

ciently well to give proper answers; he the face was natural, the supression dall .-never antered into any detail, and died at Half an ounce of bark on the decline of the paroxyem.

Eveniog. Decline of the symptoms; ekin wet, with e cold clammy awest; pulse small, frequent; general shivering; pain at the epigastrium; tongue red, but moist; ne thirst. Half an ounce of bark.

Night. The skin remains moist and cool.

The patient has vemited the bark.
20th August, morning. No fever; dis-20th August, morning. No fever; dis-eppearance of the pain in the belly; quiot, sapeet tranquil. Towards mid-day, return of the fever, preceded by rigours, and so-companied by heat greater than on the previous evening; the extremities remain cold; the skin was covered with livid spots. Saline draught, barley water.

Evening. Handa and lags wet, with a cold clammy sweat; the fit began to decline. One ounce of hark, which he

vomited.

Fist morning. Generally calm, no faver, but the extremities continus cald. Epigastrie symptoms s little marked; pulse atill small and frequent; towards mid-day return of the fever, always preceded by rigours; axscorbation of the preceding symptoms. The cold continues in the ex-tremities, the patient is not sensible of it; was easily removed. The folds of the he is as if henumbed, sed in a torpid state. One number of bark to take at night.

22d morning. Skin less cold, but not yet at its natural warmth; pulse small and frequent; clammy ewest on the whole surface

of bark.

Towards ten n'clock. Return of another paroxyam; palse insensible at the wrist, 140 et the crural artery. Icy coldness of the extremities; the shdomen is flat, empty, and resting on the vertebral column; pain in the stomach, excessive sufferiegs; egitation; the patient, who hes never lost his senses, is in e state of torpor, so that he can scarcely answer questions; colour of face natural. Twelvo locohes to the epigastrium, blister to the arms; eight ounces of bark to take in the night, which he vomited.

23. Remission well marked. Towards nine o'clock, return of coldness, like that of marklo; pulse elmost imperceptible, 246.
Pais of stomach more argent; most stiffering; anxiety; eyes hollow. The cold
which had at first only attacked the extremities, had now reached the shoulders, and 196 August, 1822. The fever returned in the was axtending towards the base of the morning, preceded likewise by shivarings, skull. The head cool; the thorax end eband accompanied by the same symptoms as domen were below neutral temperature,

countenance, the features were as if finiten- distinguish, when touched, that the person ed to the bones of the face; the colour of was warmer than himself; more violpain in the atemach; he lies entire. Cup-membranes, and administering the secals plog glasses applied to the opigastrium, cornutum will, in almost every case, subsinepisms to the feet, blister to the thighs, nice grains of the sulphate of quinins, which he has oot vomited. During the night, increase of all the cymptoms. Dead, He was sensible to the last moment, which was shout three in the morning. Eight house after deet the body was etif, the limbs herd, se if they had been frozen, the belly hollow. The temperature of the sir was above 20° Resumur.

Dissection.—Slight injection of the arechnoid; engorgement of the vessels which ramify upon the convolutions; an effusion ellowish serum botween the foldinge of the erochnoid; cerebrum end cerebellum, naturel; heart and lungs heelthy. Stomach grey externelly, and contracted. Innor cur-face of a hright red, deeper still towards the pylorus. Foldioge of the mucoue membrano better marked than usuel. Smoll intestinee grey extornally, and ocotracted. Internelly their reduces was brighter theo thet sively, incressed. At ten o'clock, F, M., the of the abdominal muscles, which efforded ue labour had considerably advanced, and the o point of comparison. To give on idee of bead wee gredeally descending into the pelthis inflammetion, the colour of the largo intestioes could be compared to thet which they would receive, were they soaked in from that time till six o'clock on the follow-black blood. This inflammation increased in moraing. At that period the petient se it approached the S., end the rectum; heenme considerably exheusted, sod the liver healthy; spleen of a middlieg consistence, between the state of degocers-tion and health. This inflemmetion could he compared only to that of the 50th case.

das humorrhego before lebour. Sdly. Thet though meny women, in spite

of the caution and efforts of the accoucheur, will always have hemorrhage after labour, the administration of this medicioo hofore

lsbonr will generally prevent it.

Cace 1 .- Mrs. N.; a stout, heelthy woman, requeeted my attendance. This was the eight time of her pregiancy. In her two first lebours, she hod been ottended by another medical man, who delivered her with the forcepe. In the three following labours I had recomme to the same instrument, end, in every loctance, I imogino the difficulty to heve sricen leee from the narrowness of the pelvie thee the preternatural size of the head of the child. about twelve o'clock in the day. I found the oe uteri dileted to shout the siee of a shilling, the membrenes protruding, and the pelos netural, which slowly, but progresvis; the membrenes were raptured, and the child remained wedged in the polvis from that time till six o'clock on the followpains lees violent, and I thought, from the exieting circumetaccos, that it was time to deliver her. I admicistered the "secale cornstam," one scrople, in powder, with some werm mlk; io thirty mloutes the child was copelled; the alter-hirth came away, and both did well.

Case 2 .- Mr. ---, on the 21st October, at seven A.M., requested me to visit his wife immediately, so the nurse coosidered her to he in extreme deoger. Oo visiting her, I foued her citting on a chair, supported by two women, to all appearance deed; coun-tenouco pele, setremitice cold, and no pni-setion distinguishable at the wrist. I immedietely caused her to be laid on the hod, end found the os uteri very little dileted. She had felt a slight paio previous to the commencement of the flooding, just suffi-cient to show that the labour had com-meeced. I ruptured the membranes, and administered a scruplo of the powdered secele cornetum in a little warm milk, as before, and this I find to be the most effica-cious made of administeriog it. As the case eppeered elmost hopeless, and it was im-possible to torn the child, I seet for a neighbouring practitiones, who immediately el-tended. As the first dose had produced a little cootraction, sufficient to supprese hamorrhage, it was thought edviseble to repest it. This was done, and for en hour tho

ON THE USE OF SECALE CURNOTUM, IN DIF-FIGURE LABOURS AND RESING BANDO. RHAO 6.

#### By June Kimenti, Esq., Surgeon.

No medicine has yet been discovered thet will, in my opicion, be found more certain in its ection, or more beneficiel to the community, then the " secale cornutum," if administered in proper cases, and et proper times. My experience of its henoficial effects has thoroughly convinced me of ite great utility in the most important sod disagreeable cases of midwifery, and I am induced to publish the results of my observetion and experience in this widely circuletod Journel, through the medium of which I first became acqueinted with the propertiee of thie invalueble medicine. The coace I have to adduce will, I think, fully prove the truth of the followlog propositions :-1st. That it will generally supersedo the

ky of using the vectic, or forceps. Ed. That whom the placents is not stshed over the os uteri, and there is a pre- labour advanced; but the constitution had disposition is the nterus to act, repturingt he suffered so much, that there was little power

Cass 3.—In this case the petient was a healthy woman, whom I had strended in five labours, all of which were followed by slarming hamorrhage. I arrived at the house et five, P.M., July 6; the labour appeared going on well; pains natural, and becoming strong. I ruptured the membranus, and administered a scruple of the secale comutum. The child was expelled in twenty-five minutes; the placenta immediately followed, and no fooding ensued. The patient experienced no inconvenience, and the child did well.

These, Sir, are a few out of the numerous cases which I have met with. If I have ever heen disappointed, the failure is to be attributed rather to myself, than to the medisine; for I consider it to be nertain in its action, unless the patient has not been properly prepared, or the oil which it contains has been absorbed by remaining too iong in the paper in which it has been enveloped. If there is a disposition in the uterus to act. and there is pressure on the os uteri, and the mambranes are reptured, the increase of action is certain, but if, on the contrary, the pains are apeamodic, and the membranes en-tire, on effect whatever is produced.

It has been alleged by many, that thu secolo cornutum is by nu masne certain in its effects, and that though in many cases they have been astonished by its efficacy, in others it has produced no elteration whatever. This, however, I ettribute to one of the two causes above-muntioned.

In the first case I have related, I am of opinion that the secale cornutum aupursedad the use of the forceps, and I will vouture to say that it will, very generally, have the same salutary effect. With regard to the same salutary effect. With regard to the second case, it may, perhaps, be objected that rupturing the membranes, and evacuating the liquor amnii, might have continued the uterus round the child, so as to suppress the hemorrhage. But the slight labour pains which ware present, were materially in-creased by the secolu cornutum, which, indaed, was the only medicine that could have saved the patient, for the constitution was so much exhausted by the discharge, that there was nothing left for it to act upon; but when nurrishment had been given, and the system roused, two or three pains terminat-

ed the labour. The last case taude to prove, not only that the secule corrutum administered before labour, will prevent humorrhage after, but

left for it to act upon. Monrishment was use of the medicine, is so continued and so gives her in smell quantities, frequently severe, as frequently to expel the child and repeated, sade complained of pulo; the long (aven for boars after labour, if not deed child was expelled; the placents onne combranted by opium), as to preclude the away, and the mother gradually accovered.

Case 3.—In this case the matient was e said, that the increase of notion produced by the medicies, will be attended with onederable danger, either from the repture of the uterus, or the isceratine of the perineum. With respect to the first objection, the wells of the uterus are so thick, that rupture is a case of very rare occurrence; and even should the pelvis ha small, and the head large, the effect produced by the medicine may be easily counterected by a dose; of opium. As to the second, evan is cases where the external perts are so rigid as scarcely to admit one finger; in a few minutes, the perinaum appears to participate in the predisposition of the uterus, and gives way in a most extraordinary manner. I always administer the ecoslo cornutum in puwder, one scruple in warm milk; sed though onium very speadily puts a stop to its action, it would, I think, be highly impredent to administer it where the pelvis is small, or where there is a preternatural presentation.

There is one thing I wish to observe. the regular and continual action which is so remarkable after the administration of the secale cornutum (and when, in addition, the regular periodical labour pains are increased), the placents is sometimes retained, and will greatly emharrass the eccuucheur. In these cases upium may he edministered, and the ntcrue with soon axpel it. Hamorrhage,

in this case, cannot pussibly ensue. Knowie, Warwickshire.

ON THE USE OF GOOD OF RIG IN SCIENTION OF THE PLACENTA AFTER ABORTION.

Be MORGAN D. NUGERT, M.D.

The patient, a woman of weak, spare babit, mtst. 35, in the fourth month of her prognancy, had a fouse couche, in enusequence of an accident. On the morning after the exrhage ensued, which was chucked by dold applications to the abdomen, and did not recur till she attempted to walk on the third day following; from which period it continued at intervals to the filteeoth day, when manted. In the evening of this day I was first nonsulted, and prescribed a dose of laudanum (sixty drops,) which for a time reliaved the symptome; but on the following murning the hemorrhage returned with increased vinlence. I then ordered an infusion also that no unpleasant inconveniences will of the ergot of rye, two eccupies to found on the contrastion, increased by the ounces of water, half to be taken immediate.

ately, and the remainder at the expiration ately, and the remainder at the expiration | Sincerely thanking you for your great of an hour, if necessary. In about twenty kindness to me while under your care, beminutes after taking the first portion she felt lieve me vary truly yours. strong uterine pains, which lasted nearly half an hour, and were followed by the expulsien, to use her nwn words " of a false conceptioe ;" from that time abn has had no return of the hamorrhage, and is now in good bealth.

Cork, 15th January, 1829.

#### QUACRERY.

#### To the Editor of Tue Lancar.

Srn .- Allow me, in common fairness and justice to myself, to request your attention to-the following explanation, in reply to an article signed "M. D.," from Plymouth. The late Mr. G-K-, alladed to la that letter, hecame a patient of mine, at a mo-meet when every hope of his recovery was declared to have been given up, as you may perceive from his letter to me as fellows:-

" Sir,-Aithough you cannot give me et present any hopes of cure, I em sucious to place myself under your care, exenerating yeu, at the same time, from any blame in case of a failure, as the faculty have for some time given mo up, my lunge being in a tuberculated state.

I am, Sir, &c. G-K-."

This most amiable young man's life was considerably prolonged by my mode of treatment, and his father has acknowledged the fact in his letters to me. After he had been under my care for some time, I entertained strong hepes of his ultimate recovery; but from his having remained out for several heurs on a very wet day, he caeght a severe cold, attended with inflammation. Diarrhos succeeded, the progress of which I arrested, and I had him in my house, not as an eshibition of my skill er suncess, but as a matter of personal convenience to himself, while r the infinence of his recent disorder. While under my care, he expressed an anxious wish to visit his family, and undertook the Josepsey home in the most severe weather, directly contrary to my advice, and that of his mother. He promised to return in e few days, and, on his arrival in Plymouth, he wrote to me the following latter :"My dear Sir,-I arrived here with less

fetigue then I axpected; but in case any thing unforthuate should occur, I think it my duty to declare, that the journey was undertaken without your advice, you not considering me perfectly cured. You will, therefore, he perfectly azonerated from any consequences.

Does your correspondent, M.D., mean to say that actual lafallibility abould distinguish my system in every case of the hundreds which come before me ? Does he suppose that I should withstand the sarnest entrepties of the friends of my patients, while my channe of life remained?

As to M.D's ungentiemenlike remarks sbout Mr. K. having been invited to my house as a guest, at a time when the diarrhos was so severe that he could not venture home, surely he can attach nothing criminal to this mark of my ettention and regard to a young gentleman whose amiable qualities obtained for him the kind wishes of all who knew him. Let M. D., If he he a man of honeur or courage, show his unjustifiable ettack on me to Mejor K., the father of the deceased gentleman, and let that henousable and grateful man tell my defamer, that since the death of his beloved son, he has written e letter full of gratitude and kindness, and acknowledges in it that his son had expressed to the last "his obligation to me for my ettentions, and that every thing that could be done had been done for him." I want no favour from M. D.; all I seek for is the plain statement of focts, and I cheerfully and fearleasy shallenge the impartial, and honour-able investigation of the public and the faculty. I am, Sir, . Your obedient servant,

John St. John Long. 41, Harley-atreet, March 11, 1829.

Mr. Jehn St. Jehn Long, should not write thus while he talks of "my mode of treatment," end while he keeps that treatment a profound accret. Had Mr. St. John Long eny means of euring consumption, he would not healtate to make it knewn. Concealment in such cases is a bad feature, and, to the well informed, a sufficient proof of nunevo .- Ep. L.

#### REMEDY FOR CRILBLAINS.

#### To the Editor of THE LANCET.

Sta, Being asverely afflicted with skilblains, and having had recourse to the vaoccess, and queries unas recommended, without benefits | sendra trial of the tine-ture of lodine. It suawered my fullest appetations, for alter two ru three applications to the effecting parts, it restored them to thir natural state. As your Journal is widely oirculated among the community at large, will you have the goodness to give publicity to this communication.

I am, yours, &c. Haver Day.

PATALITY IN LITHOTOMY.

# To the Editor of THE LANCET.

Sta.—Having lately seen an account stating that M. Vicenno di Kern, Surgeon to the Emperor of Austria, had operated 354 times in lithotomy, and with such auch cess, that only thirty-one individuals sunk under the operation, and Sir James Scarlette haviog stated in the case of Cooper v. Wakley, that the average number of failures in England was two out of every fifteen cases, I beg to state that the late Professor Deane, of Dublia, has performed the operation above one hundred times, and nove failed in a single instance. This fact is wall keown to all the surgical faculty of Dublie.
I am, Sir,

Your obedient servaet, MEDICUS.

MERICAL ASSISTANTS.

To the Editor of THE LANCET.

Sta,-Erewhile you had writers who advocated the cause of medical assistanta, hat they, alas! have rotired into the shades, wanting principlo, apirit, and energy, to anable them to prosecute a slightly ardaoas tank. It is much cause of regret, that such writers aprang forth; for, having but au aphemeral existence, they served only to strengthen the handa of those who monopoline the profits of what is salled " a liberal profession." Madical assistants, hereabouts, profession." Medical assistants, hereabouts, are nearly on a par with journeymon tailors, having, for their aslary, 30l. to 35l. per annum, whilst they are worth ? or 800% a year to their employers. I know of acmo earnings for their employers are from 7 to 800% a year, and yet their employers have the audscity, the baseness, and meanness, to offer them 30% each for their services. for hops, and for which they presented him to offer them 30t. each for their aervicas, for hops, and for which they presented him. This is downright oppression, Sir, and we with their alivor medal. I can attest as to carneally sak what are we to do? We long it a proving an excellent accordancem in for your appealy ancess in the cause of this respect; fur, about the year 1820, medical reform, we loud your cadeavoars, when hops were at an exceedingly high and acknowledge our obligations to you. price, I prepared a considerable quantity of If I were not trespassing upon your pages, I surrect from the plant, of which I said a would say more, but I know the value of great deal. your columns, and therefore iry saids my pon, after having merely called your attee-

tion to the subject, hoping, nevertheless, that my humble statement may rosee the energian of some of my fellows, with whom I will gladly co-operate, for the purpose of raising to a more worthy aed respectable grado, that persecuted but useful class of beings, the English medical assistants.

I am, Sir, Your humble servant. A MEDICAL ASSISTANT, AND COMSTANT REACER. The Potterias, Feb. 27, 1829.

We continue to receive a great number of letters on the distressed and degraded condition of Medical Assistants. The writers all complain bitterly of the wretched mannar in which their aervices are rewarded; but no adequate remedy for this evil (for it is an evil, and a very great oce,) has, so far on we can perceivo, baen yet suggested. The subject is one of great difficulty; and, for ourselvon, wa know not how to treat it, so as sither to do juntice, or to give antinfaction. The supply evidently exceeds the demand. A correspondent, (" Disciple of Esculapins,") auggests that Medical Assistants abould hold a public meeting, in order that their grievances may be fairly and fully discussed.

#### AVESTITUTA FOR HOPS.

To the Editor of The LANCET.

SIR,-In Tuz Lancet, No. 287, (Feb. 28, t829,) it is stated that Mr. Yosy made a communication to the Medico-Botanical Society, respecting the use of the common buck-bean, or marsh trefoil, as a substitute

If I be correct ie my remembrance, a small pill boa full, containing nearly two drackma, was soonidered equal to one pound of hope. What tends, in some degree, to establish the approval of the article in the

Oar correspondent should recollect that Sir James Scarlett's colculation referred to the fatality in the practice of a "Nessy's process of brawing is, that they were prisurgery" at Goy's liespital; and we think vute householders only who purchased it. the worthy knight was rather under then over the mark. Mr. Lawrence has lost but two patients out of fifty, and Mr. Green has been mearly as successful, ... Ep. L.

#### THE LANCET.

Landon, Salurday, March 21, 1829.

Mr. WARBURTON has obtained leave to bring in a Bill to lagalise and regulate the sapply of subjects for anatomical dissection, and his motion received, as we had anticipated, the unqualified support of Mr. PERL We observed last week that, as the Edinbuggh murders had occurred since the Home Secretary axpressed doubts as to the practicability of devising a lagislative remedy for the cyils of which the medical profession has so long complained, the Right lioo. Gentlemao would no doubt see sufficient cause for changing his opinioo, and be reedy to acknowledge that the time was arrived when dissection must either be put down altogether, or be permitted to be practised under such legislative provisions as might ensure the safety, if thay could not he wholly reconciled with the feelings or prejudices, of the community. With respect to the first branch of the alternative, namely, the appression of the practice of d'esectioe. Mr. Prat daclared that .--

"He considered it an unnecessary waste of the time of the House to use arguments for the purpose of alawing that there existed a necessity for the promotion of the science of anatomy. This was a point which he conceived to be unquestionable, and, if such a necessity existed, it followed that the want of bodies to accomplish the objects of teaching anatomy must be supplied. At the present moment the laws did not permit that want to be supplied from any legitimate source, sed the consequence was, that the professors of anatomy were sampelled to procure a supply from paramis, who carried ou their traffic amids the most outrageous violations of casecoy; of the floust sed most powerful belongs of human nature, and oftentimes by the parportetion of the flustest crimes."

These are indeniable truths, but they are truths which have been week after week, and menth after month, pressed upon the attention of the Government, during the last are years, and it is to to regretted

that the necessity of applying some ramedy to the evil has not been acknowledged, until the Government has been awakened to a same of its own subserces by the discovery of the dreadful structure so the discovery of the dreadful structure accompitated at Edinburgh. That the Edinburgh mardors have wrought a decided change in the opicions of Mr. Prat regarding this sobject, and that they have, as we anticipated, accomplished for the anatomical question, what the Clarc election has effected for the Catholic question, may be interred, we think, from the following passage in the Right Hon. Secretary's Speech:—

"After the experience—the more than melancholy experience they had abtained of the nature of the crimas to which the bigh price of bodies gave rise, he would ask, whether it had not hecome absolutely necessary that somathing abould be done for the security of the public, and for the preservation of those feelings which he was inclined to treat with the highest respect? Something, it was acknowledged, most be done, and it appeared to him that nothing hall yet heen devised which ascemed less objectionable in principle than the measure proposed by the Honourable Member for Bridgort."

The object of Mr. WARBURTON's Bill in to give legality, io certaio osses, to the proctice of dissections; and the principal features of the measure are to be, first, a provision declering it to be lawful for persoes duly sathorised to practise sa physicians end surgaons, to receive subjects for dissection in those cities or towns where there ere universities for the taking of degrees, or where there are hospitula large enough to receive fifty patients et a time; and, secondly, a clouse making it lewful for the overseers and managers of poor-houses and work-houses, and fur the governors of hospitulato give up to surgeons and tauchers of sustamy the bodies of those persons wher thiving died in such poor-houses, work-houses, or hospitels, ore not claimed within a spacified time by some friend or reletion. As soon anythis Bill is printed, we shall be enabled to by a enpy of it before our readers; at present it would be

presenture to enter fully into the inquiry, | unclaimed bodies for dissection, though it is how far it is likely to operate as a remedy one which we were among the first to rofor the oxisting evils; but there are two commend to the adoption of the Legiclature, points on which we are desirous of making and which is liable to fewer objections than one or two observations, because Mr. Wan- any other which could be taken as a basic Everyon has been wholly silent with regard of legislation, will not, at the same time, to one of them, and has expressly stated hear hard in its operation upon the poor. that his measure will not embrace the But if the Legislature subjects the bodies of other; we allude to the repeal of the clause friendly paupers to dissention, at the same which makes dissection a part of the time that it sanctions the infliction of dispunishment for the crims of murder, and the section as a stigms and a degradation upon adoption of some penal enactment for the the bodies of executed murderers, the more effectual suppression of the practice of messure, proposed by Mr. WARBURTON, exhumetion. We here repeatedly stated would not only involve that degree of herdthet we believe the first of these points to ship opon the poor which is inseparable be of such importance, that no legisletive from the difficulty of legisleting on this submeasure for facilitating dissection can ever ject, but it would be a mossore of injustice be rendered effectual, so long as the cisuse and cruelly to the poor. Dissection is which subjects the bodies of murderers to either a fit punishment for crime, or it is dissection remains upon the statote-book. not. If it he a fit pasishment for crime, If that clause remain unrepealed, dissection with whet decency can friendless poverty will continue to ho, in the ays of the law, a be declared equivalent to crime, hy a punishment, and the Bili proposed by Mr. solemn Act of the Legislature? That provision in Mr. WARRURTON'S Bill, which is to give a legislative sanation to the practice of dissection in all the large towns, is one which we are, perhaps, entitled to regard with the more estisfaction, as It is evidently founded upon the evidence which we gove before the Committee on anatemy, and as it is directly nimed sgainet the mesepoly of the Cellege of Surgoons. We stated to the Committee, which follows this article, that the diffi- | Surgeons, in detailing the beads of hie Bill, adopted by the College since the year 1822, sion. So fur so good; but care abuild be

The provision intended to be introduced by Mr. WARDURTON will have the effect of restoring the system which existed previously to the infamous regulations of the College, and will strike of the root of the Collego monupoly; for it will be impossible to maiutain that monepoly in the teeth of an Act of Parliament, or to continus the present odious prohibitious and restrictions, after the Legislature shall have declared, that anatomy may be taught, and dissectlens performed, in all parts of the kingdom. It is worthy of observation, that Mr. Wanas will be seen by a reference to the evidence MUNTON made no mention of the College of culties of chitsining subjects for dissection, nor was the slightest allusion made to that were mainly attributable to the regulatione corrupt body in the course of the discus-We abowed, that before these regulations taken not to give to hospital surgeons the

power of appropriating to themselves such our condition in a future state; but the confirm their monopoly. It would be well, perhaps, to establish a general receivinghouse, to which ell unclaimed bodies should be taken, and where so officer, suppointed by the government, should register the subjects so conveyed, and distribute them in a certain fixed proportion, to such teachers as might be authorised to receive them. We strongly recommend also, that we money should be allowed to be received for the subjects. Let there be no buyars or sellers of the remains of our friendless countrymen. Let the deteatable traffic in human flesh at once be suppressed, and the supply of subjects for anatomical purposes will then be placed ou a better, lostead of a worse footing, is this country than in any other country of Europe. We are sware that this will not be a palatable proposition to bospital surgeous and monopolists. They have declared that they do not wish to see sobjects chesp; still less do they wish to see the traffic in subjects completely put down; all they desire is, that the traffic should be reodered safe and profitable to themselves. Thenks, however, to the enlighteeed spirit in which Mr. WARBURTON bas entered upon his task, their base god morceeary purposes are likely to be defeated.

There is another omission which it may be worth while to ootice. Not a word was said, in the course of the discussion, about the burial of the bodies, after they shall have undergone dissection. Is it latended to dispense altogether with this coremnov? Nothing is more likely to put to heard the success of the messure, sod to excite the popular feeling against it, than the manifestation of indifference on the part of the eristocracy, as to the performance or neglect of this ceramony, as applied to the bodies of the poor. It is true, that the doctrines of Christianity do not enjoin the belief, that the rites of burial have any influence ever

a proportion of the subjects to be applied vulgar seldom distinguish with much assesto acceptifie purposes, as would, in effect, racy between the ordinances of churches and the revelations of Scripture, and are scenstomed to look apon Christian burial as a part of the Christian religion. Even philosophy dictates that, theogh we may be indifferent as to the burial of our own bodies, the feelings and customs of mankind, as connected with this ceremony, ought to be respected. " De humatiene," says Cicero, " unum tenendum est, contemnendum in nobis, non negligendum in nostris; its tamen mertuorum corpora nikil sentire intelligamus, Quentum autem consuctudini fameous dandum sit, id curent rivi." At the present moment, when there exists a strong impression among the uninstructed classes of the community, that a blow is aimed at the religion of the country by the great measure now passing through Parliament, it would be indiscreet to allow it to go forth, that the Legislature was at the same time passing a bill to debrive the bodies of the poer of the rites of burial.

Since the foregoing article was written, we have received from our exteemed correspondent Enimansis, the communication inserted at page 774, on the subject of the exportation of dand bodies from Dublin.

FUOM THE REPORT OF THE PARLIAMENTARY COMMITTER ON ANATOMY, MAY, 1828.

Mr. THOMAS WAKERY called in, and examined.

\* \* \* \* \* \* 1351. Will you point out in the regulations of the College of Sorgeons, dated the 15th of January, 1828, which are the regulations that you cassider tend to increase the difficulties of obtaining a supply of subjects for dissection !- I will read them.

I. " The only schools of austomy and physiology, recognised, are London, Dub-lia, Edinburgh, Glasgow, and Aberdeen."

1V. - Regulation. - "The following certificates will be required of enodidates

for the diploma of the College :"-

1st-" Of having been engaged six of attendance on dispections, would be re-

domonstrations, delivered ut subse-quent periods."

years, at least, is the ecquisition of pro-feasional keowledge,"

2d,—" Of having regularly attended in the Universities of Edinburgh, Glasgow, three or more winter sources of ana. Aberdeen, and Dublin, or from persons who tomy sed physiology, and two or more were physicians or surgeons to the hospi-winter courses of dissectioes and tals is the recognised schools, or from persons unless recommended by the medical catchlighments of those hospitals." This Section 5.- 'And of heving attend. regulation had a most extraordinary effect ed, during the term of at least one upon the private schools in this town, and I year, the surgical practice of one or have the authority of Mr. Brookes for more of the following haspitola, viz. stating that it was nearly his ruin, I have St. Bartholomew's, St. Thuman's, the further the authority of Messra. Brookes Westminster, Guy's, St. George's, the jand Carpuc (whom I have seen since I re-Losdon, and the Middlesex in London; ceived the aummons of this Cummittee) ficthe Richmond, Steevena's, eed the stating, that previously to 1823, (compara-Meath in Dublin; and the Royal Interpretation of the presence of the Collago Abordeen; or, during four years, the of Surgeons having limited the apost of the Collago Regions In the Collago Regions I was a surgical practice of a recognised pro- which authors abould he procured to Louvincial bospital, end aix mouths, et doo, and the time in which dissections least, the practice of one of the chove- should be performed, to seven, or at most named hospitals in the schools of soa-jeight, months in the year, the difficulties of temy."

procuring subjects had increased to such a
1332. Will you atste in what way you degree, that their rooms were often unfurconsider these regulations to interfere with inished with the requisite materials for prothe sepply of subjects !-- If I were to do secuting the study of anetomy. I have the that, it would be coly offering my opinion; authority of both of these gentlemen for parhaps you will silow ma to state the facts stating, that, in the sammer, they could as they have occurred since 1819 or 1820, always obtain subjects for dissection with le 1815, and from that period to about greater facility than in the winter. The 1822, there were very few difficulties experimental motion of the College for enseting enced in this town with regard to obtaining the law restricting dissections to the winter an adequite supply of subjects for dis-section. In 1823, the College of Surgeoes, which dissections in the summer endanger-in Lieconia-Ion Fields, cuasted a by-law, ed the live of the students, does not appear stating, that certificates of dissection would to be the real one; as Mr. Brookes has lecnot be received by the Court of Examiners, tured during the summer season, from fifteen unless the dissections were performed during to twenty years, without having had a single the winter season; this by-law had the pupil die from the practice of sommar dissection of the flowing the pupils from every part section; and, during the whole of his expected of anatomy to that extect which section, and that pupil died at Christonas, would enable them to undergo their examilation for the diploma. In consequence of sections nearly twenty years, and he has the extraordicary flow of students leto not lost a single pupil. It will have been London, at that period, the disacting-elready perceived that the hy-law passed in rooms became very much crowded with 1923, and that passed in 1824, had the papils; as there was an increased demand direct tendency of throwing all the fees which, for bodies, an increased prica was saked by sould arise from teaching of anatomy in the resumtation men, and, ultimately, the this country, into the pockets of the London unless the dissections were performed during to turnin years, without having had a single the resurrection men, and, ultimately, the this country, into the pockets of the London price became so exceedingly high, that a hamital surgeons, and their immediate da-number of individuals, who before had not pendents and relatives; and it is not a little embarked ie the practice of exhumation, singular that the members of the Court of entered upon it; hodies were raised and Examiners, by whom these by-laws were precured for a time in the mast invoscent ienected, were themselves, at least seem of manner; and at last the chorchyards, and them, Loudon hospital surgeons. These manner; and at least the circulyside, and them, Loudon nospies surgous. Present avery description of hyrisl ground, in the laws, continuing in operation at the present neighbourhood of Loodon, were so watched, that to obtain any subjects for the purpose with rigard to the cultivation of anstomy, of dissection, was next to impossible. In a st the period when they were first 1826, tha Schinge susceed the hy-law enacted. Before they were enacted, disNo. IV. section 5, in which it was further; sentions were practised any where, and constated, that " no certificates, in testimony tificates were received without any specialcations as to the time or place is which, or been weaks, and even months, without a at which, the dissections were performed; subject; yet in the summer, when the leavery body that could be obtained weatings: turas are altogether prohibited, or at least triably opplied to the purposes of dissection, not recognized by the College, subjects are and eagerly sought after by the professional procurable with the greatest facility, and men, not only of London, but of every part is the same price as formerly. riably opplied to the purposes of dissection, and eagerly sought after by the professional men, not only of London, but of every part of the kingdom; and atments as easily answered the questions proposed to them In their examinations at the College at that period as et present. Certificates nos being raceived by the Court of Examiners from any part of England, except London, all the pupils necessarily resort to this place; con-sequently, the changes of an adaquate anpply of subjects to most the increased de-bad the effect, or nearly so, of entirely mend, have, of course, been, and really are, putting a stop to the teaching of anatomy vary much lessened. The Court of Resemble. vary much lessened. The Court of Essminers eppear chiefly to rely on the certificates of atudents as the most important proof of ability; but, at the period when the last bylaw was ensoted, and sobsequently to that period, there was scarcely a subject to be procured for dissection in the snatomical achools of this metropolis; yet the Court of Examinerarequired from the pupils certificates of dissections which had never been sbout to apply for examination at the College, I was asked by a fellow-student what number of certificates I had to take with me, and I told him very few; on which he said that was a pity, bessue the examination was generally proportioned to the quantity of certificates produced by the pupil. I mentioned to him that I had entered to one lecturer at a distant part of the town, when I first came to London; bot finding it inconvenient, after three or four moroings, I relinquished the attendance; of course, I said, i could get un certificate from him. "You had better try," ha replied; "I think you enn." Accordingly 1 did apply, and received a certificate from the lecturer, stating that I had "regolarly and diligantly attended one course of his isotores on anatomy, physiology, and sur-gery, and one course of his dissections, although I had attended but four or five of period more fit for dissaction than the sum-bis lectures, and no dissection whatever mar, on account of the rapidity with which The effect of the by-law to which I have the subjects become unfit for examination? already alluded, directly tends to destroy tha value of certificotes, bacques from the manner it has erowded anatomical thautres and dissecting rooms, it is utterly impossible for the facturer to know whather the popil has been attentive to his studies or not. Subjects, up to the period of 1825, before the sister course of dissection were required by the College, could be procured elmost without difficulty, and to any extent, at four guiness such; but sizes that period, many of the dissecting rooms of this town have law admitting only attendance at winter

1353. Have you say further observations to make upon the regulations you have printed out?-A petition now lies on the table of this Honourable House from the great body of surgeons, praying for the repeal of the regulations in question, on account of their injustice towards country surgeons in the large provincial hospitals, as they have in the country; that petition was presented to the House the year before last.

1354. Have you any observations to make upon article 5. of by-law No. IV. ?-That clause recognises the attendance of pupils on the practice of the bospitals of "St. Bartholomew's St. Thomas's, the Westminster, Guy's, St. Gaorge's, the London and Middlesex, in London; the Richmond, Steevana's, and the Menth, in Dubperformed. To show the fallacy of relying lin; and the Royal Iournaries in Edinburgh, on cartifinates as a proof of the quantity of Glasgow, and Aberdeen, or during four dissections accomplished, I may instance an years the surgical practice of a recognised occurrence which happened to myself. When provincial hospital." The manner in which this regulation is calculated to crowd the hospitals of London, and to draw off the pupils from the provincial institutions, where they have equal, if not greater opportunities of acquiring professional knowledge, may be understood by the fact, that although one year's attendance is deemed sufficient at the Westminster Hospitol, four years' attendance in a provincial hospital is required; yat the Westminster Hospital cootsius only eighty-two bads, while some of the provincial hospitale contain upwards of three hundred; still the required attendance at the Westminster Horpitul is only a fourth of the period required at the others; but two of the four surgeons of the Westminster Hospital are on the Court of Examiners, and the whole four are members of the council from which the Examiners are elected.

1355. Is not the winter, of necessity, a i think not, to the extent generally believed; because, with proper oare and attention, subjects can be preserved with antiseption, for all the purposes of diesection, nearly as well in the nummer as in the winter season. I have this morning seen a subject at Mr. Carpue's, with the muscles still on the bones, which has been dissepted upwards of one year, and I cannot see that it is offensive even now.

1356. Bafors the college passed the by-

courses of lectures, did as many pupils attend 1367. Do you not consider, that in one the summer courses in London !-- There is a respect the present regulations are better difficulty is answering that question, because than they were formerly, instance as they no many of those lecturers who lectured in require to be a recified the number of courses

winter did not lecture in summer.

357. But although the same lecturers did not lecture in the winter and the sommer, was the attendance upon the summer leatures as great as upon the winter lectures 1-Greater, at least with Mr. Brookes; but that gentleman and two others were, I believe, the only lecturers is the summer.
1338. Was the number of lecturers who

1358. lectured in the summer less than the number of those who lectured in winter !- Far less.

1359. Therefore, upoe the whole, the number of pupils who attended summer lec-

tures was less ?- It was less.

1360. When it was equally npen for pupila to receive certificates for their attendance at summer as well as winter lectures, to what do you ascribo the greater number attending the winter courses ?- It was a matter of greater convenience. The medical sessions commenced in October, sed terminated in May, and for many years there was only one lecturer to any extent in the num-Fier, and that was Mr. Brookes, whose theatre was always foll. While I was at St. Thomas'a Hospital, Sir Astley Cooper, at the end of his course, invariably recommended us to go to Mr. Brookes's durieg the summer seasoe, "if we wished to leave

1361. Were the other lectures which are usually attended by studeets upon materia medica ned physiology, given in the summer months !- in summer and winter also.

1362. You stated, that the pupils receiving certificates from various freterers formerly passed their examinations at the college as easily as at present; does not the facility with which they puss depend as well upon the strictness of the examiner as upoe the qualifications of the examines !-- Unquestionably; but with one or two, or three exceptions at must, the same examiners formed the court then as at present.

1863. Do you apprehend the examinations were as strict then as they are nuw !-I have he meens of knowing; they connot be less strict. I had no question whatever in anatomy proposed to me when I was ex-

amined.

1364. In what year was that?-In the

beginning of the year 1817.

1365. Were you required then to procure certificates !- Certificates of this kind (producing one,) as to becomes and dissections, without stating where the former were attend-ef-or the latter perferred. This is the cer-tificate, bir. Curpus justime me, which he was in the juilities giving at that time.

1366. Indices not state how many courses,

or the laught of each course !- No.

of lectures on anatomy and dissection that the candidates for diplomas have attended !---No ; I think they are much worse, because they compel the student of talent to devote or much time to the study as they do the student of ex-treme dulness, who may require a period five times as long.

1368. If the committee correctly understand the nature of your answer, you would not recommend that the time during which the pupil has attended dissections should be eny qualification; you would desire that the knowledge of the pupil should be ascertained at the period of his presenting himself, by a more strict course of examination !- Certainly; I would neither require that the time the pupil had ettended, ear the place where he had attaiged his information, should he as ecified; I concrive that every thing

should be mude to depend on an efficient, PRAC-TICAL, PUBLIC EXAMINATION.

1369. Are all the private lecturers, who now give lectures on sestony or a course of dissections in London, accredited by the medical catablishments of recognised hospitala !- That is a questions I comet snawer. The by-laws have been ultered ANNUALLY these

fire years last past.

1370. I do not observe in this copy of the regulations, deted the 5th of January, 1823, the same limitations which are found in the copy duted February 1826. It is not stated in the copy, bearing date the 5th of Janeary 1828, "That certificates of attendance at lectures on eneromy, physiology, theory and practice of surgery, and the performance of dissections, be nut received by the court, except from the appointed professors of anatomy and surgery, in the Universities of Dublie, Glasgow, and Aberdeen, nr from persons teaching in a school concected with or accredited by the medical establishment of a recognised hospital in one of the schools of auntomy, or from persons being physicians or surgeons to any nt such buspitals?"-No, it is expunged; and the enrificates of a gentlamen who is present, are now received by the Court of Essimiours; sithnigh they were refused by the Court of Exeminers in 1823, 1821, eed 1825.

137 t. Then you believe the certificates of private between, although not secredited by the medical establishments of the hnapitels, would be now received ?- Yes.

137 v. You stated, that this morning you eaw a ambject which had been dissected a year a,o, and by the use of antirepties, the muscles still remain on the hones; in that mode of prevaration generally known !-- ! believe me; but the only means used to preserve it, is common salt. It was at Mr.

most free from smell.

be procured in a sufficient quantity from the term in any of the provincial hospitale, as Continent, and if prepared in the manner above described;" the shove hospitale, just described, they would be fit subjects fur anatomical parposes 1-Yes; but I thick we cen obtalo, without difficulty, much better subjects here, and without violating any of the Westminater Hospital, although you of the teelings or prejudices of the public. I believe that nut more than from 500 to 700 subjects are wanted in London for the purposes of dissection in soy one year, and canrider there ere more than 1000 unolaimed persons who die in our public inatitutions, such as hospitals, workhousea, and prisons, during the same period. If we event of a wer, the supply would be instac-taneously cut off. If, on the other hand, we were to have the budies of unclaimed persons for dissection, we should be certain of an abundant supply, and there would be no outrage to public feeling, because people are quite indifferent, as long as the subjects ere not their own relutives or friends. The great prejudics which exists in this country against the practice of dissections, appears to arise from that conciment of the legislature which consigns the bodies of MUNDEDENIS to dissection; also from the disgustiog and filthy practice of exhumation, which employs, I believe, nearly 100 meo, who are continually violating both law end deceney.

1374. Sioce the number of pupils attendiog the winter courses, has at all times been considerably greater than the number of those attending the summer courses, should you anticipitate much dimioution of the scarcity of subjects now existing, provided certificates of the automer cuurses were admitted !-- Certeinly not, if London is still to be the only school of auatomy recognised in

England.

1375. Should you maticipate may considarable diminution of the scarcity, if certi-Soutes from provincial lecturers were admitted more freely !- Certainly, a very great diminution, if the period of attendance on the provincial hospitals were reduced to the same atandard on that on the hospitals of London.

1376. Under the present regulations, is the period of ettending the provincial · courses required to be double that required to be in the London schools !- Certificates of attendance on provincial lectures on anatumy, are not admitted at all; but the period of attendance in country hospitals un sur-... gical practice, la four times as long as that · required to the Loudnu hospitals.

1877. In the regulations dated February, 1826, this passage occurs; " Of having die | don !- Yes.

Curpus's. He had one subject also dissected | ligently attended, during the term of at least obout a fortnight, and in that the muscles one year, the aurgical practice of one of and other parts were quite perfect, and al- the following hospitels;" and then follows a list of the London, Dublin, Edinhergh, 1373. Do you think, that if subjects could and Glusgow hospitals, " and twice that meaning such bospitals as aball contain, on an average, 100 patients?—Strictly apack-ing, that regulation amonets to an archusics will perceive in Regulation 5, it is recognised.

1378. How is it that the period of attendance as described by you to be required in the provincial hospitals, is four times the pe-riod that is required in the London hospitals? -I caunet say; but the demand is contained in the last copy of the regulatioes, dated the 5th of January 1828. The regulations were were to rely upon a foreign source, in the altered in 1027. They theu atsted, that event of a wer, the aupply would be instanded or a two years' attendance in a provincial hospital would be received by the court, provided the pupil had previously attended two conners of lectures, and two courses of dissections in one of the recogniscd schools, London being at the time the miy recognised school in England.

1379. Do you happen to know how many patients there are in the hospitel at Lecds 1-I do not; but I should think from two to three hundred; at Manchester there are

sbout three hundred.

1380. Are you aware of any reason why so much longer a period should be required for walking the country hospitals ?- None whatever; unless it be that it is to FAVOUR the Examiners Themselves. Indeed it is generally considered that where there are ouly a few pupils, they have a better opportunity of acquiring information than where there are many.

1381. You think, then, that a shorter time would be requisite in the country than in

Lundon ?- I oo.

1382. Are you aware of the following heing the by-laws of the College of Surgeons in London, us long ego na the 25th of Februery, 1819 :- tat. Condidates must have certificates, first, of having been engaged for five years, at least, in the ocquisition of professional knowledge; 2nd, Of having regu-larly mitended two courses at seast of nnstomies leetmes, an lako meer more courses of surgicul lectorea in London, Dublin, Edinburgh, or Glasgow !- I am aware of some such regulation lawing existed.
136.2. What is the reason for the different

forting upon which Aberdeen and Dublin are pot from other cuentry hospitals !- I canuse por trom over country magnism - com-unt say; the Royal Infirmery of Aberdeen is resp inferior as ulachool of surgery to many of the m. arcecopied provincial bequitals. 13814. ON THE POTAL CIRCULATION IN THE MOREY. ASS, COW, OLC., AND THE MANNER IN WHICH THE POSTER IS SUFFORTED.

By R. Vinza, Esq., Mr. Coleman's Assistant at the Veterinary College.

In the carly part of my enstomiaal atudies, on looking into the different veterinary works for information on the subject of the fortal circulation, I found so little stated respecting it, that I was induced It is effected; and as, I believe, no anthor or lecturer has hit lerto correctly dein his "Veterinary Outliess," and Mr. Boardman, in his Diotionery, have only briefly alluded to the subject, and sppear to Percivali, one of the latest of our veterinary compilers, has not even meetioned this interesting subject in his " Elementary Lectures of the Veterinary Art." Hitherto the forumen onels, in the feetal heart of the horse and ess, like that of the human anbject, has been described as being formed by au opening through the partition be-tween the right and left enricles of the heart, and that a valve is so constructed and from the left to the right.

Now, in the fetal heart of the borse, als, find something of this kind of appearance, by the voine usually termed lymphatics and but it is only when esemined previous to its lactuels. (See Tue Lancer, No. 284, p. 591.) being injected; and if the suricles and ventricles be injected through the medium of the posterior cave (the vene cave ascendens in the human subject,) and the connexion between the surioles then completely divided, no foremen orale, or opening, of any kind, is to be sean, and if the posterior cava be examined close to the suricles, it will be found to open into the left, so well as into the right suricle, thereby showing that the blood which is brought from the placents and posterior parts of the body, enters partly into the left, and partly into the right suriole of the heart, and consequently the blood

of the placents, which enters the left ouricla, neites with the venous blood that is raturned from the lengs by the pulmonary veine, and by thus uniting, becomes of the arterial obgreeter, it then enters the left ventricle and norta of the heart. I hat portion of the blood of the placents which enters the right suricle, unites with the blood of the anteilor cave, (the vens ceva desceedens of the buman subject, and which likewise thus hecomes of the arterial character; it then enters the right vantricle, from which it partly stated respecting it, that I was induced goes to supply the substance of the lungs to well investigate the manner by which by the pulmosery ertery, while the other it is affacted; and as, I believe, no an protion, excepting into the sorts through the ductua arteriosus, or opening formed beacribed it, I beg leave to ky the result of tween the pulmonary entery end the acrts, my researches before the profession, through | bucomes united with the blond of the sorts, the medium of your Journal. Mr. Blaice, to supply the various parts of the body, as in the perfect sormal. The blood of the pulmonary artery, ofter having given off n briefly alluded to the subject, and oppear to supply to the substance of the lungs, is re-have taken what little they say, from writers turned to the left suricle of the heart by on human anatomy. But Mr. William the pulmenary veins, to be renovated by comblaing with the blood brought from the placenta by the umbilical vein, and posterior CSTO.

The blood of the sorts in the focus, when circulating through the body, like that. in the perfect suimal, assumes different ap pearances, which vary eccording to its degrees of vitality; In the strongest parts it appears of a red colonr, but in the weaker or finar parts it is white, from possessing a aituated, that it allows the blood to pass lower durree of vital power; the red, or from the right to the left surrice, but not stronger kind of blood, is returned to the right suricle of the beart by the so terior and Now, in the fortal heart of the horse, als, posterior cave, as in the perfect saimal; and likewish that of the calf, we entainly and the white, or less vitel blood, is returned The blood of the sorts, which is sent to the placeota by the umbilical arraries, is for the purpose of supplying the membranes which envelop the factus, to furm the liquor amnit, and also to earry on the circulation of the vescular system of the placests. The nuchilical exteries have several termiuntions, 1st, in the minute ramifications of the umbilical vein, through the medium of the chorion sed amnion; 2dly, on the sur-face of those membranes, and, 3dly, in the cellular substance of the meternal and ficial pertions of the placenta.
The umbilical veins, on the other hand,

have different origins, first, from the miunto ramifications of the umbilical arteries of the nembrance; secondly, from the surface of those membranes; and, thirdly, from the cellular substance of the meternal and fietal portions of the placenta.

ceets, I am fully sware that it is contrary

<sup>.</sup> M. Biancini, in his communication to the Medico-Physical Society of Florence, the latest writer I have met with on this subject, (asn The Land 17, No. 247, p. 231,) states, that the blood-value is of the mother and futue have on impediate and direct and fortue have en implediate and direct Io steting that the arterial and venous communication, with erch other; but my systems of the fortus both terminate and experiments have led me to entirely differ arise from the cellular substance of the plafrom him.

voins terminate or arise from the collolar mother, though not hy a direct, but so indibilical arterles ramify minutely through the membranes, and the fotal portion of the placents, and terminate wholly in returning veins, and that these ultimately units and form oue trunk, the umbilical vein; and, also that the uterine arteries and volue both terminata and erise from the callular sabstance of the planauts; that the uteries arteries daposite blood into the cellolar substence, which is absorbed by the sterina vsins; that the umbilical arteries and vaius ramify minutely through this cellular substance, and come in contact with the maternal blood deposited in the cells; that the being received into the mioute remifications of the umbilical veln, assumes a brighter colour, similar to the blood of the pulmothis is produced by the absorption of oxy-

On minute examination, from numerous and repeated experiments, both by injecting the parts, as well as by coreful dissections, I ternal membrana of the uterna, " which is described by writers as being dieided into fortal sed maternal portions," to ba composed of a minute cellular toxture; that the cella communicate frauly with each other on both sides, that the use of it is to give origin and termination to the arteriol and venous ays. tems, both of the mother and futus of this part; that the vessels of the festus, and those of the mother, have no direct or immadiste communication with each other, but that the umbilical atteries and veins both terminsts and arise from the placeats, and that, oe the other hand, the uterine arteries, ea well as the veins, both terminate and arise from the fintal, as well as the matereal portion of the same placents. From the fact, then, of these versels not communloating, I infor that the ection of the arterial and vanous systems, both of the mother and feetus, are independent of each other; that the uteriac nod umbilical arteries deposits blood into the enjular substance of the placeote, and that the maternal and feetal blood, after combining, is absorbed by the minute extremities of the umblical and uterine veins, and thus the mother imparts blood to the feetus, and the feetus to the mother; the mother also absorbs blood from the futus, sed the foctus from this mother; the blood of the mother likewise

to the generally received opinion, which is, combines with the blood of the feetus, and "that neither the umbilion arteries or that of the feetus also with that of the substance of the placects, but that the um- rent, communication of vessels, via., through the medium of the cellular substance of the

placents.

The blood of the umbilical your does not, therefore, derive its brightness of colour by the absorptice of oxygen from the maternal blood in the cells of the placents through the coats of the vessels, but by the direct absorption of the maternal arterial blood from the cellular substance of the placests, by micote origies of the umbilical veine. The blood of the mother thus both excites and supports the action of the vescular system of the fatus; and the vescular system of the mother is both excited and supported from blood of the umbilion arteries is dark in autrounding objects, as the various kinds of colour, similar to the bleed of the pulmonsry food atmospherie air, &c., which, by enterartery of the perfect animal; and that on ing into combination with the fluids of living animal bodies, produce a live animal matter, termed blood, and which, ultimately, both colour, similar to the blood of the pulmo-excite and support the vescular system of nary veice of the adult lungs; and that the fectus. The axeitability or vital principle of the ownm, precious to its impreggen from the maternal blood of the placento nation, exists io the mother; but, by the through the coats of the feetal vessels." becomes possessed of an excitability or vital principle, independent of the mother, and this excitability is both seted on and have found that the cellular substance improved by the arterial blood of the which forms the bond of union between the mother, to form the various important or external membrane of the fetus, and the important of the animal, as the brain, nervous

system, &c.
The fectus, therefore, derives its support by absorbing the maternal arterial blood of the placents through the minute ramifics. tions of the umbilical vein; this, on entering the liver, posterior cave, and, ulti-mately, the left and right surieles of the haart, and there combining with the ve-nous blood from all parts of the body, again obtains the arterial character, und restores it to a proper state to again circulate through the body, to nourish and support the growth of the various organs, in the

manuer already stated.

Royal Veterinary College, Feb. 9, 1829.

P.S .- As a ducius venesus la not found la the borne or ass, and as the ombilical vela terminates in the vens perturum, the blood from the placents consequently unites with that of the vens portarum, previous to its circolating through the liver.

## ST. BARTHOLOMEW'S HOSPITAL.

#### LITERTOMY.

James Marsu, et. 55, was admitted into Darker's Ward, Merch 5th, labouring under calculus of the bladder, for the purpose of submitting to the operation of lithotomy. This is the balf year during which all patients coming to this Hospital, afflicted with stone, fall to the care and meangement of Mr. Viocent. The present patient was unacqueicted with soy of the sur-geoos of the Hospital, but was recommended, by a gentleman in the aeighbour-hood in which he lived, to put himself under the cure of Mr. Lawrence. Mr. Vincent was accordingly applied to, to permit Mr. Lawrence to receive him, and to allow him to be uoder Mr. Lawrence's care. After a expressed a elight desire to have the uporashort interval both applications were complied with, and he became the patient of the latter geotlemen.

general health speems to be, as be etatee it performance, and ordered him to lose six-has always been, excellent. He came from teen onnees of blood from the arm. the neighbourhood of Davar, and performed 11. The arm was so thickly covered with sbout three years; those symptoms have gradually become more urgent, and for the last fourteen monthe ho has been bed-ridden. the operation, but is desiroue of having it pital. performed, either that his existence may be made a kittle more comforteble, or that he may be chirely freed from the wore and formed in day was posted yesterday at the itle of this life. Notwithetanding his inor- door of the anstamical theatre, where all dicato aise, he decimes himself to have been, for a loog period, una, of the poorent posted. Many procedimers who had beerd livere; that he has never taken ony thing of this patient. (remarkable for his extra for breakfast, except a little gfoel, eating depth of perineum and plethoric condition,)
afterwards, in the course of the day, only se well or the pupils, being intensely anxa small portice of dry bread, with occasion, ions to witness the operation, long bofors a small portion of dry bread, with occasion. sily a little becno, and never indulging in the use of whies, melt prespirituous he crowded to an unusual degree. quors. Except his general healthy oppearance, he exhibits nighting to cacourage a patient was placed on the operation table, hope that he will recuver from the operation required from minutes were occupied in tying and

be of magnitode, or should any difficulty arise in the performance of the operation.

9. Fenls as usual; bowels not very open; toogue rather white. Ordered, five grains of blue pill every night, and half se nuoce of castor oil every other dey; catreme irre-gularity of pulse of both arms. Hea always beeo informed by his medical attendants that that irregularity exieted. Never recollects having been the subject of illocas, with the exception of slight stracks, until his present disease arose; never experienced any particular palpitation of, or unplea-sant sensation about, the heart.

10. Has a slight attack of coughing at times, in the course of the day, but feels to particular inconvenienco from it—never has it at night; eleepa soundly; tongue eun-tianing white, but moist. Has bene bled in the coorse of his life from the sem, with a view to relieve him from headach. Has tion performed soon, elmuld Mr. Lawrence thick right to perform it at ell. Mr. Lawrence, therefore, nut regarding the state of The patient is six feet is height, im-the tongue, nur the elight eough, se neces-mensely fat, and must weigh above twenty larry to delay the uperation, hes appointed atones. His complexion is fair, and his Thursday, (12th.) ot half-past une, for its

the neighbourhood of Dovar, and performed 11. The arm was so thickly covered with the journey is two days, io a carriage loot fot, and the voic, when reached, so small, expressly to convey him, by the gentleman that the dresser could scorcely get any blood who wished him to be treated by Mr. Law- to finw. Continues as usual. The cough rence. Ho, has a wife, but no children. Ha is not more troublesomo; and but little can has laboured nuder symptoms of atone for be judged from the condition of the pulse. The alatoen nunces of blood to be taken by cupping from between the aboulders.

12. Was cupped yesterday, as directed. He was sounded in the country, and assored Is in good spirits, and perfectly prepared, of there being atone in the bladder. The as far as his mind goes, to so mit to the principal pain he describes to be at the operation. This mureiog his bowels have commencement of the urethra, and this is been cleared, by an coems. Mr. Lawrence, much aggravated on overy attempt at mic- aware of what is before him, has gut made turition. He vaids his urino in small quan- a knife, (Pilizasrd's.) a staff to correspond, tities, and frequently. He seems to be o and a pair of forcops, oil of extra length, mass of intelligeous and respectability; and and considerably longer than the longest considers himself rather notavourable for that have been hithered used to this liou-

Operation. Notice that this operation would be peruotices of operations ought regularly to be the patient was brought in the thestre was

tion, especially should the atone provo to sounding him, sod in preparing to make

the iocision. At twenty-eight minutes be- | shaken nerve, regular, bold, systematic profore two, Mr. Lawrence commenced the ceeding of the operator throughout the operaexternal incision with a double - edged tion, secured to him the greatest admiration; scalpel, which was four inches long, and extended deep into the fat below the akin; with the fourth oot of the instru-ment, he resched the staff, which was held hy Mr. Earle. Bliasard's knife was then introduced into the wound, osrried forward to the staff without delay, conducted into the bladder, and this was followed by the usual guah of prine mixed with blood. The operator then withdrew the knife and staff, and lotroduced the fore-finger of his was then able, by urging them forward as far as they would possibly go, to lay hold of the atone. Coutinged great force, if not vio-lence, was kept up in the extraction of the calculus. Almost immediately on laying Agoin it was grasped; and wheo it sppressed his warmest thanks and gratitude, and was carried to hed.

the potient. The perfect self command, uo-

the ultimate extraction of the atone created universal satisfaction, and its enormous size, corresponding with the size of the poor man from whom it had been taken, occasioned the utmost astoniahment. The bringing out of the atone resembled more the extracttion of the head of a feetus by the use of the forceps, than of a calculus from the bladder. In shape it greatly resembled a large lemon, rather flattened at the side on which it had rested in the bladder; at one end it had right hand, with the extremity of which, a projection point, similar in aise and op-and with the utmost difficulty, he was just pearence to that which is sometimes found oble, distinctly to touch the atone in the put the extremity of a lemon, hot which probisdder. Withdrawing his hand, he carried jection was afterwards unfortunately broken forward the longest common straight for- off in being handed through the theatre, cepa helosging to the hospital, with which he used great efforts to enlarge, by dilata- exactly eight inches and a half, and the tion and laceration, the opening that had abort, as inchas. It was stated to have hear praviously made, he was humane as lithic acid for its hear with a candidarheen previously made; he was, huwever, as lithic acid for its base, with a consider-he declared at the moment, otterly qualie able deposition of triple salt forming to ley hold of the calculus with them, ovon around it. After the projection was broken when introduced to their fullest extent. He off, and without the small pieces that were withdrew them. Pausing for about 10 or 12 afterwards taken out of the hladder, it seconds, he introduced thu lung straight for weighed four concess seven drachms. It exceps, which he had got made expressly for hibited indistinct marks of huving been adthe dernier ressort. After they had entered the interest to the hladder. All present seemed bludder, the operator surning them round and to agree in regarding the manual dexterity round, in a semicircular form, and opening of the operator on this occasion as unequalled, and abutting them with apparently grat; but thought the violence used in dilating the force, considerably enlarged the wound, and opening, and pulling out the stone, extreme, if not unjustifiable. Mr. Lawrence, however, observed io the ward to- which the patient had been returned to bed, that it was impracticable for any operator to have removed that atone with a less degree of hold of it, it slipped out of the forceps, force; and that a comparison of the dimensions of this enormous stone, with those of peared to have been pulled a considerable the inferior aperture of the pelvis, would way along the wound, autortunately the for-eopa slipped off it again. A third time, He stated, that the incision in the prostate and without the least delay, the operator and nack of the bludder, whatever instrucaught it, and at length it was extraored, ment is used, and however freely it is emthe operation occupying, from the commencement of making the incision to the stones, even of ordinary magnitude, with header was thee iojected through the wound with warm water, as a few pieces of the stones, even of ordinary magnitude, with header was then iojected through the wound with warm water, as a few pieces of tracted through the perineum without great the atone were found to have been hoteen force. In proof that the dilatation of the wound by the forceps, by which this object mention. The accop was nest introduced, but nothing removed by it. Thu patient quantity of wice nod water administered; the highest representation of ordinary magnitude, with of ordinary magnitude, with of ordinary magnitude, with the account met more of east of drawing the distance of ordinary magnitude, with and met more of east of drawing and that larger atones cannot be extracted through the perineum without great force. In proof that the dilatation of the wound by the forceps, by which this object was then instantly unbound, and a small quantity of wice and the larger atones cannot be extracted through the perineum without great force. In proof that the dilatation of the wound by the forceps, by which this object was then instantly unbound, and a small quantity of wice and the larger atones cannot be extracted through the perineum without great force. In proof that the dilatation of the wound by the forceps, by which this object was the more proof that the proof that the dilatation of the wound by the forceps, by which this object was the more proof that the proof that the dilatation of the wound by the forceps, by which this object was the more proof that the dilatation of the wound by the forceps, by which this object was the more proof that the dilatation of the wound by the forceps, by which this object was the more proof that the proof that the dilatation of the wound by the forceps, by which this object was the more proof that the the operation occupying, from the com pluyed, will not ellow the extraction of pushing it un into the hladder, after he had d was carried to hed.

From the commencement of the operation ing in the forceps on the gorget, and trustprofound allence prevailed, broken only by ing to dilatation by the furceps slone for the expression of Mr. Lawrence alluded to making a sufficient aperture to allow this above, and a few ejaculations on the part of extraction of the stone. The patient was ordered two grains of

grade opium, which he took, and a common | Economistion of the bedy sight hours after death.

linctus to keep his mouth moist.

13. Two o'clock, r. w. Is lying on hie right side. States that he elept well during the night, and e great part of the forencon. He says he feels as well as he could pessibly have expected, after undergoing such an operation; "It was abarp work, Sir," said the poor fellow, chaking Mr. Lawrence by the hand; "It was sharp work, my friend, indeed," replied Mr. Lawrence; "but you now are deigy very well." "Thank you, Sir," talk the patient, " and hellawe I shall du very well." I I am only ellowed to ho kept quiet; but there is a great noise in the ward, which burts me." Thet pulse is still irregular, and much the same as before the oporation. The tengue is white, (but not whiter than before the operation,) sud moist. The water has flowed freely through the wound.

The eister was directed to keep the ward quiet, and not to allow any person to go to the patient's bed, except the dresser. If an symptoms come on requiring it, the patient is to have oothing given to him, exespt small quantities of nourishing food, should he wish to take any. Should any nrgeut symptoms towards night require it, then give castor oil, and five or seven grains of the scap pill, with apium.

Nies, r. w. At six o'clock the petient complained of uncasinoss about the lewer part of the ebdomen, and in helf an hour efterwards esuses, sickness, vomiting, and biccup supervened, which have continued until now. The seap pill, with opium, has been given. Mr. Lawrence has been sent

for to see him, and orders

Calomel, 4 grains. Jalap, 12 grains, immediately. And then two table spoonsful of the following misters, to be taken svery two hours :

> Sulphate of magnesia, 1 on-Carbonate of magnesia, 1 drachm. Mint water, 8 em.

Twalve e'clock. Part of the above metinine has been given; bet the stomach coelina sign to raises savay thing. The un-favourable symptoms are proceeding. The house angle symptoms are proceeding. The house angle to a hea nedered fifty lesches te be applied to a hea shomon immediately, and the grains at a shomon immediately, and the grains at the same of the same of the same grain of opium, to camel, with one-third of a grain of opium, to camel, with one-third of a grain of opium, to camel, with one-third of

14. Half-past five, 14. resurptions and a Having continued in great palm, and a. Having continuous man his just a spind suffered much, the play with the least the state of the state The last time they we bowels never seted, the injection on the cers relieved, was by morning of the aperation.

At helf-past and the post-morten examinetion was commenced by Mr. Lawrence, in the presence of Mesers, Earls, Lloyd, and e great number of practitioners and pupils. Mr. Lewrence first made an inclaion in the usual way from the clavicular end of the sternum to the pubes, through the skin and edipose substance, sed then a transverse acction immediately below the ribs. A bloody, purulant fluid, in small quantity, escaped from the cellular membrane connecting the muscles, and also from hatween the muscles and peritoneum. The convo-lutions of small intestino in the lower part of the abdomen presented very slight sppearances of peritoneal inflammation, and the peritoseum lining the muscles was in e similar state in the same situation, but no effusion had taken place into the cavity. Soveral convelntions of the fleum were adherent to such nther, and to the fundus of the bladder, by old adhasiens of almost tendineus firmness; the extent and closuness of these preternatural connexions occasioned aurprise that the functions of the perts should have been so wall perfermed. lirer was connected to the disphragm by old firm adhraious. There was considerable acchymesis in the lower part of the sheath of the right reotne abdominia; a alighter degree in the adipose membrace at the sides and fundua of the bledder; and atill alighter, and quite superficial patches of aimilar effic-sion were feuud under the peritoneum lin-ing the lower half of the abduminal muscles, particularly un the right eide. Excepting the slight increased rescularity sod the aid adhasions siready neticed, the ademinal cavity and its cooteets were natural; the perituneum was net even inflamed in the pelvie, nor where it covers the bladder.

An incision was new made slong the right eids of the scrotum to the snus, the symphysia publis divided, and the bledder, with the wound made in the operation, and surrounding parts, removed, that the view might be es distinct as possible. In deing this e great quantity of purulent fuld fewed from the cellular mambrano around the fundua of the bisdder, and the different other parts out through, Bruises and auchymoses of the cellular membrane immediataly in the neighbour-hood of the fundus of the bladdar, perfectly apparent. I he bladder was long, correspoeding in ahapa with the atone, and very nurrow at its upper part. On laying it open the mucous membrane, in two parts to which it is supposed the calculus had adiared, were torn, as if done in the act of pulling out the stone; three smell fragments were found; the edges of the wound into the bladder wers torn, contused, and scehymosed.

Tho mathra next out apen, and this was gorged with coagulated blood. The prostate

not sularged; nearly but not chits separated from the membraneus portion of the urethra-The edges of the wound into it torn, bruised,

and cochymosad.

The kidneys were next examined. Externally they presented a light grayish eppearance, somewhat like the kidney described by Dr. Bright to be generally found in drugsical subjects. Both rather small, but not merhidly so. On laying them open, tha pelves, and excretory parts, were unusually large. The mucous membrane on the Inside enrisce of the right kldney rether vassular, and slightly tuberculated 1 that of the left more pale and healthy.

The heart of an immense size. In situ, it seemed en large an a bullock's. When removed, the left ventricle alone was quite as large as a common heart. The orifice of the coronary vein was large enough to admit the little fager. The coronary artery perfectly healthy. The llning of the acrts of a rich creamy colour. The whole of the heart healthy, and exhibiting nothing to explain the irregularity of the pulse.

The right lung alightly adherent to the parietas of the chest; but both lungs, on

the wholr, healthy.

It was concluded, that the inflammation of the cellular membrane, at the lower part of the obdomen, had been the censs of deoth, that this had excited the partiel peritoneal lefammation, and that the violent disorder, of which the commencement was disclosed by dissection, could not have

ended otherwise than fatolly.

The extent of the adipose substance of this Individual was almost inconceivable. Ou dissection it appeared to a greater degree than was even expected. Over the steroum the fat was full two inches thick; thence downwards, and over the pubes, it measured five inches from the skin to the bone. The meaentery on being ont through, was full two inches. Oo the luner, as well as on the external, side of the rectus abdominis, the fat was amazingly deep. The patient was the most corpulent that had ever sobmitted to o capital operation at this hospital; the calculus the largest ever extracted; the instruments the longest ever used; and the Interest, from the moment of his edmission to the termination of the post-mortem exemination, the greatest ever excited.

Some reason existed, when too late, to auspect that the patient had been lobouring under unfavourable symptoms, on Fridey, shout mid-day, when Mr. Lawrence saw him, and when he said that he felt well, and was going on well; but that under a dread of having to take medicine, he esp-

present the true state of his feelings.

#### HOPITAL DE LA CHARITE

SINGULAR LESION OF THE RYS.

Louis B., mist. 23, of a very strong co stitution, was, on the 2d of January, dentally etruck by a whin over the left check and eye; although no external wound could be discovered, he felt a violent pain, and was immediately deprived of the sight of the eye, which subsequently became inflame so that it was impossible to ascertain the condition of the interior of the globe. Under an antiphlogistic treatment, the infermen-tion subsided, but when it had disappeared, three weeks after the semident, eight was not restored. He consulted M. Faure, who immediately observed a copaular cataract. and after having continued for some time the use of leeches and emollient poultiess, took the patient to the Hopital de la Charité, where he was examined, and the aye found to be in the following state: the cornes, conjunctive, and sclerotice, were bealthy, and offered no trace of any previous woond; the iris presented, on its external part, o transverse division, four lines in breadth, from the edges of which, membranous filaments were seen running towards the capsule of the lens. The his was not et all changed in colour, hut did not eentract, even in the strongest light; the squeous humour was perfectly limpid. The lens was of o milk-white colour, with mother-of-pearl coloured apota; its circumference was rather irregular, and resched almost to the external margin of the iris, between which and the cateract, a space of about halfs line was uncovered, and formed a sort of artificial pupil, through which the rays could pass to the reting.—Le Clinique.

OBSERVATIONS ON MR. VINZE' TRECKY OF THE BLOOM.

#### To the Editor of Tua LANCET

MR. VINES, in No. 272 of THE LANCET, having desired the hypothesis that the blood is e compound fluid; I happle knew through the medium of this fourth, is what manner that gentlernar imagined the various secre-tions of the body agromphished, or from what source he think they are serived. If we admit Mr. Vine's theory to be true, we must his out the long received opinion, that the accretions are derived immediately from the blood. He further states the send to be "living animal matter, capable of assuming either a fluid or build form." But, \$\mathbb{C}\$ presume, while in its proper vestels, and while the natural heat and circulation are combined, the blood never exists in a solid form. Again he says, "I consider the bese of the blood to be originally white, and that it derives its occur and congulating properties, from the combination of atmospheric air, whilst circulation through the lungs." It is admitted that the blood is readered red when circulating in the inage, from the action of the air, but it is of a derk colour before, and not white. As to its deziving its property of congulation from the sama canee, I shall say nothing, as I hope Mr. Vines will, at a future time, explain more fully, in what manger this is effected. He continues, "I consider that its different colours indicate its various degrees of vitality, for in the strong parts of the body it appears rad, from possessing a high degree of vital power; while in the week, or finer parts, it is white, from having only a much it ion table upwards of a quarter of an hour lower degree of vitality." In what sense of before the surgeon made his appearance, the expression is vitality to be understood? This is too bad. By vitality, is generally understood the life or nourishment of a part or parts; but surely it cannot be advanced with reason, that the parts, in which colour less blood circulates, are not couply nourished with these which receive the same support from red blood. If streogth be meant, the objections will appear evident. HENRY DAY.

CALCULI.

A PATIENT of Mr. M. P. Moyle, of Helston, has lately passed from the urinary bladder several fragments of a calculus, one of which was nearly two-thirds of an inch in leagth. This fragment was retained for a short time in the wrethers, and was, at last, expelled by a violeot gush of urine. The penis and acrotum were much swelled and inflamed. The age of the patient was 73.

#### \_TO CORRESPONDENTS.

As the reject saot to us by Mr. Thomas Proctor is not castly suited to the pages of this Journal, we like forwarded it to the

LECTURES

ON THE

DISEASES OF WOMEN AND CHILDREN.

DELIVERED AT GUY'S ROSPITAL BY

DR. BLUNDELL.

LECTURE XXI.

Curs of Ovarian Dropsy-continued.

Unnen ovarian dropsy, as observed at the close of the former lecturn, most women sink at last, and this rofluction it is which leads mu to consider whether any thing can bu done for the radical cure of this fatal and not infrequent disease. In the Physio. logical Researches, you will find, together with some other memoirs, a paper on the subject of shdominal surgery, in which I have put together the principal facts which wern then come to my knowledge, all concurring to prove that it is possible to lay open the abdomen more or less extrusively, not without danger, for this I would never assert, publishy or in private, but without necessarily destroying life in the way that some of our astablished surgeons seemed to imagina, capecially in this country; and this principle has now received further corroboration from forther observations on the human body, in cases where the abdomen han been laid open, more or less a remaissly, and where the patients have not died. A ouse occurred in which Mr. Lazars, an able and intrapid surgeon of Edinburgh, operated upon a women on the other side of the Tweed, removing from her a dropsical and scirrhous overy, of which he has given drawings. In this operation he laid open the abdomen from the ensiferm certilage to the crime of the penia, the woman completely racovering afterwards; and this case I atete

from the north, and remained a considerable. timust my own house, when I took occasion to present her to my professional friends, who made their own inquiries respecting the nircometaness of thuoperation and its rasults, and had an opportunity of inspecting the scar -nor is this the only instance in which Mr. Lizura has laid open the abdominal cavity to s considerable extent, the petient surviving notwithstanding. To lay open the abdoman, therefore, not being of necessity, nor perhaps generally, fatal, it becomes important to consider whether, in a desperate disease like dropay of the overy, we may not divide the coverings, and ramove the eyst, more capecially after we have reduced the size of the fumour by a previous abstraction of the water? Now, in some faw cases, I have no doubt that this operation might be per-formed with success; but I wish to state it, as my own opinion, that those cases are faw, sod require sciention; otherwise, if you go to work at random, you may infliet these extensive wounds upon the abdomen, and may find, after all, that the diseased mass cannot ha taken sway. In this, as in all other capital operations, we must, of course, coosidar whither the system is favourable for the use of the scolpel, nor must other points be neglected—somn of the more important of which I may here toneb: and, first, whon you are thinking of extirpating the overy, let it be renollected that sometimes the uvary is not alone the sent of the disease, for the womb, the overy on the opposite side, and the vagins, too. may be effented, the two first not uncommonly; and if you have reason to anspeot that other parts are involved, such cases, in the present state of knowledge, may be regarded as very highwourable for operation. It is to be be olicated, also, when you are thinking of this operation, that the eyst may have formed extensive adhesions, and that the endhasions may foil you. If the admisions do not exist, or if they are slight, and may be broken easily, then, indeed, the cyst may be casily drawn thou of the ganeral principle—I mean, that furth and abstrauted; but should it so hapit toos not necessarily follow; because there pen that the adhesions, were extensive, it
are extensive wounds in the abdomen, that would, I conneive, he impossible) so far as
death must ensue. This woman came up we know at present) to extirpate the cyst

No. 291;

with that degree of safety without which the however, be it remembered, are in most, if operation would be unjustifiable. It is, toe, oet all instances, the mistakes oot of the to be remembered, that when the dropsy art het of the artist—the mistakes of those chaoces to be associated with soirthus, the who are negligent, or of those who are as banis of the overy may become broad and yet is experienced in this part of practice—large, and its remeval may become proin some cases the mistakes of those who portionally difficult—a large internal wound are at once too value to give their attenremaining to the abdemen, onless the means tion to obstetrica, and too forward to re-of contracting it can be devised, the danger frain, when asked, from giving apinions on can take the whole away; indeed, the dex-imitakes here might be pardonable eneegn, series and interpridity of Mr. Lisars, a very in eensideration of much valuable knew-abla surgeon; seem to have set the point; ledge which they possess in the other parts at rest; but in the present state of our of the healing art, were it not for an immontant amounts the most favourable for axideration and axorbitancy of vasity and inso-that umours the most favourable for axidence, which have not hitherto received, tirpation, are these which contain only a few before the public, the castigation which powers against each other the takes of the paration, and the danger of ovary, it will be of me and help to us to the disease. Ovarian dropsy is geosrally that the ovary first, making our observation, it is true, but not always, nor immentions afterwards through the abdominal distely: it may onlarge alowly, it may been coverings; for myssif, I have now been repeated tappings; this more especially if repeatedly called on to make observathe general health is not much impaired. tions of this kind, and from all that I As the artirpation of the ovarian cyst have haso able to chaerve, I should infer, must, of necessity, in the present state of that they may be instituted with facility, sargery, be an operation of great danger, it So that, to sum up aur observations on gift, I conceive, to be reserved for those important point, if we have reason to berapid progress, and the health is decidedly ration, and that the patient most soon perish on the declice. In obstetrise, every where, if nothing he done—that enlargement of the to intermeddle is had ju chaterice, on all every really exists beyond all doubt, and cocasious, oor operations are an evil; and that there is no grave disease in the parts hence in this, as in every other case, it becomes us to ponder daily, whether the remay not be removed—that the every is medy or the maindy is to be regarded with wholly datached from the adjacent viscers, the greater appreheosion. When an extir- or io good measure, sod that it is not affected the greater appreheosion. When an extinpation of the overy is under consideration, with a massy activitue, likely to give rise

found bears about appearance of the onlargement, the conservation of the colories, too
found survey unflavouries for our operations,
sauch to assert, that of practitioners, the
obstetrioless alone are the best judges
of this, nor certainly are awen these to be just adrepay of single cyst, and with eneysted contestablis some are the near judges! I have somermose mought, thus in over-of this, nor certainly, are awen these to be risa drepsy of single oyet, and with encysted depended on, onless they possess the re-quisite knowledge, desterity, and oxperience, attempts in hills thou might, is some ones, he open the shdomen; oo timour could be the cyst, so as to smalle it; to evacuable its found—cases, and repeatedly, I have seen coatso is into the performed sec. Suppose in which the inflation of the intestices, has I could not extirpute the overy, provided I here mistaken for an hydrogic overy; these, found the vestels were not large, I quite

of the operation must be greatly increased of points respecting which they ought to know consequence. Nor most we forget, what they are really incompetent to decide; the consequence. Not most we torget, was instructive server in the server in distely; it may enlarge slowly, it may bear coveriege; for myself, I have now been cases only in which the enlargement is in lieve that the system is favourable for ope-

easily remove a small piece of it, say to the the tumour be lying between the vagina and extent of a crown piece, and after this there rectum, I think we might easily accomple ture would not close up spain, but that the ficiant, and our cantien great, would it, pen-water would be affused through it, so as so haps, be impracticable to effect all this, come under the operation of the peritoneal even when the tumour isy above the brist absorbents, with the prospect of an occa-sional cure. A lady, the anhiest of ovarian For this purpose, might not an opening be dropsy, was advised to improve har general health, and in this view occasionally took the air in an open vehicle. In one of these exentsions she was thrown from the earriage, and fell upon a large atoms on the tirely freed from her ovarian dropay. Cured as aha was of this disease, she married, and, in the earlier months of pregoancy, she died of a retroversion of the uterus, which could not be raplaced, when it was found, spon an examination, that abe had lahoered under an ovarian dropsy; that the eyst had been hurst, and had discharged itself loto the peritoneal ane, and that the inflammation had produced such a change that no further effusioe had taken place ; or, if any, that on entering the peritoneum, the fluid was absorbed.

There is yet another practice which may be thought of in these distressing cases, and this consists in the very early extirpation of the overy, for though, in ordinary practice, we ought to delay the tapping on much as ossible, yet it may bereafter be worth consideration, whether early tapping before a large oyat la formad, might not have its advantages, performed with all due caution, and of the necessary knowledge. is it that the abdomen fills so slowly in of the dropay may occupy six or seven aix weeks, abe may require the operation again. Now there are, as it oppears to me, the exhalant vessels; and the other the small estent of overian surface in the commence-the many unlappy individuals who now fall ment of the disease; for its superficies at victima to the disease, you will, indeed, be first may be of a few aquate lockes only; but a large overy, recently tapped, may and the least affending; an of our species. present a surface of many square leet. Now refreeval of pressure from the exhalant res-sels, may, after a first tapping, give rise to us the apoutaneous cure may be aupposed a rapid estudies; and hence, if in cases of to contain within it the principle of an ef-hydropic overy-we could always up; when feetual remedy for this disease. I have the sumsur is no larger than a whild a head, siready observed that by accidental rapture but the patient might not suffer so much, as no other known remely will remove. It, if the coury were allowed to grow to a great | The lady who fall from the chaise, and whose the but how can this be done? Why, if case her just been narrayed, was effectably

might be a reasonable kope that this sper- it; nur, supposing our knowledge to be sufmade in the abdominal covering, large enough to admit the fore finger, like a canuls, and might not the point of the linger be placed upon the surface of the overy, so as to ascertain that no intentine was interposed, side of the road. She was taken up, car- and then, when sure that the intestines and ried home, suffered a large discharge of bladder were not interposed, might we not water through the kidneys, and was en- pass a very small trocar through the openpass a very small trocar through the opening, and into the overy, so as to evacuate the contents in the very commencement of the disease. Understand, however, clearly, that it is not here my design to recommend this operation at present; I throw it out as a hint merely, for further consideration. In real hands, sech an operation might produce fetal consequences. In cases ill obosen, it might be et once dengerons, and of nn use; yet, after all, perhaps, it may admit of im-provement; and in a disease so frequent and so fatal as the overien dropsy, every hint which promises to give greater efficacy to uur treatment, may deserve from na that unwearied and pertinacious consideration without which, in these perplexing and very deplorable cases, nothing effective can be accomplished; for, on this occasion, as on meey uthers-- " Seggendo in pinma

In fema noe si vien ne sotto coltre."

Here, then, are the different modes of treatment recommended in ovarian dropsy-the chatraction of the water, with the ecutions the first instance? Perhaps the first growth before prescribed—the extirpation of the ovary in the earlier and in the later periods of months, or even six or seven years; but if ite growth—the removal of a circular piece you tap a woman with an overy of large of the cyst, an as to lay open the cyst into size, in the course of three, four, five, or the peritoneum—and the prevention of the dilatation end growth, by early paraceutesis. In the present ill success of our practice, two priscipal causes to which the alowfill- all these operations are well worth your ing may be attributed -one; the pressure on consideration; and if you can brieg one of them to much perfection as the ure asme of

Allow me now to offer a few remarks rethe wide extent of ovarion surface, and the apecting the apontaneone cure of ovarian we should; perhaps, have to tap it often, of the oyet, a oure may be obtained, when

relieved by ruptore of the overy. A wo-Burns has referred us to esses in which man at New York, attended by e practitioner well known to my friund Mr. Gaitskell, happening to suffer e severe fall, (for women are very liable to this accident when the abdomen is lorgo,) she ruptured the cyst, and recovered, ot least for some time; hence a question arises whother there are no means that we could employ occasionally to burst open the overy by pressure, however applied; nor is it unressonable to suppose applied; nor is it unreasonable to auppose In concluding my observations on overian that, in some cases, if the substance of the dropay, let me add the fullowing miscellaovary were thin, it might be ruptured, though to auggest the means of effecting this, is no easy task. A woll-known surto have been removed by mere absorption, excited by mental perturbation, but which I look upon to have been nothing more than an ovarian accomplation, cured by rupture of the cyst. In this case (as he tells the tale) an old lady passing over London bridge, chrmed by the cry of " mad bull," made the best of her way into one of the receases on the bridge, and jumped hostily on to one of the benches; the bull passed; she descended, her slarm continued-she got home-a free secretion from the kidneys fullowed, and the dropsy disappeared. Of this case, it may be said, that the miod was exceedingly disturbed, and that the absorbants were excited in concequence; but I think it for more reasonable to presumn that the sebstance of the cyst was very thin, and that hy leaping upon the

beach in the recess, a rupture was produced. There is yet a second mode in which this disease may relieve itself more or less effecteally, and that is by apontoneous opening into the intestines. When I was attending the wards of this hospitul, a wnmon, of tho name of Myers, came here with en esceedingly large abdomen; this culargement was occasional, and the woman got hetter, repeatedly, after large spontaneous emptions of water by vomiting and purging. Now I have no doubt that in this case the dropsy was crariou, and in all prebability the oyat occasionally oponed into the intestines by ulceration or rupture, a sort of natural tap-

ping being performed.

It is said, too, al. " the ovorian dropsy has sometimes disoppeared apontaneously, without acy obvious cause to winch the disappearance of the discan could be attributed. The patient very large, for a while, has, as length, been agreeably surprised to find that ahe became less and less, week after week, till at length she has shrunk eway to her healthy dimensions ... Now, some of these caseo, I

it seems uncondid to doubt the feet, provided the verocity of the author can be relied upon, In these cases, it has been said that the water has been removed by the chaorbent oction of the lymphatics of the cyst; but I think it mere probable that the cyat has been of membranaceous kind, and that laceration and effusion into the peritoneum bas

been the real cause of the cure.

nenus remarks :-- A flat trocar and conule diminish much the pain of paracentesis. this, is no easy task. A woll-known sur-gical lecturer, as I hove been told by one of coverings ore, I believe, frequently indicated his pupils, relates a case which he cou-by soreness felt ofter moving the abdomiusl ceived to be dropsy, and which he imagines coverings over the cyat, and by a sort of crepitus, sometimes very distinct, orising, probably, from ruptured, adhesive fibres: of course the less there is of this disturbance the better. With ovarian dropsy a peritoneal eccumulation, to the amount of two or three gallons, sometimes occurs. The pressare of the overy is ant to occasion an avercharge of the intestines, to be relieved by entharties, end by laxotive jujections into the howel. On dissection, I have observed feculent accumulations, in quantity for greater than had been suspected during life, and three may occur though the howels act every other day. Be careful not to confound the large masses of the leaded bowel with those tuberose enlargements of the overy which are the result of dropsy or of scirrhus. Thu encysted matter in the overy sometimes becomes mure uttenuated as tapping proceeds. In the twentieth operation, I have found this motter of more oqueous consistency then in the first. Sometimes on topping the dropsical overy, lorge quentities of pus, or of some puriform substance, are discharged, especially, I suspect, if inflammatory symptoms have preceded. Inflammation of the diseased mass, after tapping, is elways to be regarded with apprehension; it may destroy suddenly, or by hectic cachexia; yet we are sometimes surprised to observe how little the constitution sympathises with the inflamed portthe inflammation of this diseased mass, and the peritanitia of purperal, exert, indeed, very different effects upon the constitution. It is said that evarian dropsy has been known to disappear after electrification. In so forlors a case, the remedy may be worth trial, but my faith is weak. Astringent injections into the oyst are, I Sa-lievn, highly dangeroos; but this opinion may require revision. General inflammation of the oyst in hydrocele (as I learn from an eminent surgeon, and a very excelfear, have not heen dropsy of the overy at lent man, Mr. Green) may suppress further all; they may have been dropsy of the peri- effusion, even where adhesions fail. The tones sac, or mere intestinal inflations; but cases before narrated, seem to prove that

he same change may be produced by inlemmation in the effusive surface of the svarian eyst; and I would fain perauade myself, that hereafter we may he able to produce this inflammation at plansure, by nasns, on the whole, tolerably sefe. Stimu-ant injections, and a canula, or some-hing analagous, left in the wound, have one tried, but hitherto, I believe, with the worst success-beware, therefore. In Mr. Chevalier's case, gallons of matter were produced by adhesive inflammation. Would the patient have recovered had this been drawn off by tapping? I suppose not; for when the overy has supparated, and the enatter has escaped spontons ously, death has, at least sometimes, ensued, and you moy see a case in point, in Burns' Midwifery. The existence of more than one cyst in most ovarish dropsies, is a great bar to this mathod of oure. Dropsy of the tuberose kind is very unfavourable for the treear, and in these coars more especially, tapping ought, I pre-aume, to be delayed till the last; it is the remedium anceps potius quam nullum. Extensive adhesions may exist, although a woman bave never been tapped; but I suspect that repeated tappings tend to produce such adhesions.

Other diseases, and not without their interest, sometimes assail the overy; but of this bareafter. laftammation more or less! scute, suppuration, connected or not with the puerperal state, culargements of the overy, with formations of bair, boncs, testb, extra-nterine gestation, scrofula, sponguid tumour, sebuceous and other substances may all occur; and the fallopiun tubes may be dropaical, scirrhoos, offected with extranterine gestation, and so an; but the principles hare laid down will, I conceive, with a little modification, apply also to these cases, so far as they udmit of remedy. Extra-uterine gestation has been considered already; ovarion inflammation may be considered herenfter; the rest roay ba dismissed without further remark. In elementary instruction, too much minuteness bewilders-ers longo; vite brevis. A man doce not last so long os one of these glass bottles, ned had need make the most of his time.

[Here 1)r. Bluudell showed various preparatioos.]

#### RUSSIAN MEDICAL SERVICE.

WE are authorised to state, that the va-

### FOREIGN DEPARTMEN

#### CASS OF POISONING BY CHEESE

DR. WESTRUMB of Eimbeck, in the kingdom of Hanover, was, on the 10th of #0vember, 1826, called to a family, consisting of a middle-oged man, his daughter, a girl of ten years, and a female relation, about sixty years of age, who, so bour after having enten of a cheese lately bought, had been auddenly seized with symptoms of poisoning, ss violect colic pain, vomiting, diorrhous, teocsmus, &c. Ou his arrivel, he found them with the abdomen swelled, very paid on pressure, especially in the hypochondris, the pulse very amail and frequent, the pupils dilated, and complaining of violent headsch, vertign, great debility, and sickness; the rejected matter had the smell of chaese, and was apparently of on alkalius nature. An emetic, and sperient injections, were immediately ordered, when Dr. Westrumb was sent for to another family, consisting of four persons, who, a short time after, having eaten some cheese bought at the same place, had been simultaneously affected with similer symptoms, but in greater intensity. Besides the remedies used in the first cases, very strong coffee, and a solution of boracie acid were ordered. After this treatment had been continuedfor two days, five of the patients perfectly re-covered; in the other two, in whom the symptoms had been most violent, the offection of the head attained to such o degree as to require the application of leeches, and cold affoxion; ofter chout a week, they were slao convaluacent. M. Sertuerner having been requested to examine the substance which had been the probable cause of the symptoms of poisuning, eame to the following results: under the continued oction of alchohol, two different substances were obtained, the one of a black colour was pracipitated, the ather of an oily consistence, brown colour, astringent, nouscous taste, and a very penetrating, runcid small, col-lected on the surface of the liquid; it wes found soluble in hot water and olchobol, changed the colour of litmus to red, and, when mixed with olkslies, formed o soapy mass. The black substance was liquid, insoluble in hot water nod elcohol, and being submitted to heat, goye on extract of an acid nuture, caseous amel, end containing an ammoniocal sult, the acid of which could not be ascertained. The maceration of the cancles which had been found to exist in residuum in het alcohol produced, at first, no the Medical Departments of the Imperial change; but after some time a grevish white Russian Army and Navy, having heen filled substance spontaneously precipitated from up, foreign medical gentlamen will not be the alcohul, which neeled at a slight degree received hereafter into the Imperial service. of heat, and was also apparently of an acid

parad, but especially the two former, were found to be very powerful poisons; fifteen grains of them injected into the stomach of a large dog, osused a violent inflammation of the intestinal canal, and the subsequent death of the snimal.

Dr. Westrumb regards the deleterious principle in the cheese as belonging to the class of narcotico-acrid poisons, and attri-butes its production to the following names:

1. The milk being furnished by cows, which have estee of poisonous vegetables; this will, however, be but very seldom the cause, as, under these circumstances, the socrotion of milk is greetly diminished, or even entirely suspended.

2. The preparation or conservation of the cheese in metallic vessels. In some names of poisoning hy oheene, troces of copper and tin were actually discovered in it, although but in very small quantities. The Gasette de Santé, of 1766, No. 22, contains o case of this kind.

3. Adulteration of the cheese, especially with the seeds of hyosciamus, which had insevertently been mixed with it, insteed

of cemin seeds.

4. The formation of a poisonnue substance by the chemical decomposition of the cheese. This seems to have take place in most instances, end, as is showe hy M. Ser-toernor's auslysis, did so in those just doscribed .- Horn's Archiv.

#### THIRD CASE OF CHOREA.

Communicated by a Medical Friand to Dr. HAR. RISON, and by him to THE LANCET.

Ir was no the 2d of January, 1815, that I was first spoken to far the young lady, whose case I now send to you. She was then thirteen years old; and hero I may mention, that it was not till more than three years afterwards, that the menses first appeared, and then without any particular circumstance. The symptoms of chorea had then been noticed for a fortnight, and they wara so slight, that though I was attending her sister at the time, It had not been thought necessary to mention them to mo. Indeed they were still comparatively slight, affecting chiefly the left arm. It appeared, too, she had had very desultory motions in Both arms some years hefore, which had sought in nothing serious. She was at this time getting one of her lower molares, which I was led to remark, hecause the late

nature. The three sebstances, thus pre- however, I was not able to trace the connexion.

> At first, I was disposed to trust to purgetive alone, from the free exhibition of which, in chores, as well as in several other spasmodio affections, I had repeatedly wit-acasod the hest effects. But, in the present nase, though it was found necessary to be giving moderate doses almost delly, and though their operation was frequently foilowed by o marked remission, yet I must add, that in no stago coold I perceive either indication or encouragement to much them to any thing like the extent which Dr. Hamilton recommends, and which I had myself found so beneficial on former occa, sions. lo fact, it soon became evideot, that the cases was deper seated, and the pro-gress was rapid. So early as the 8th, moc-tion is made of the emjunction of both eyes, but ospeolally the icft, being suffused with some puriform secretion, but no inflammstion, or soraness, and the agitatioes very great, affecting the whole frame.

In this stage, recourse was had to icechea several times. Once she was bled to six ounces, and all with good effect. But the season when it would have appeared justifishle to be taking blood in any mode, soon passed sway; sed for about three weeks, the obief dependence was on a succession of blisters, applied, for the most part, to the head and neck; hat once or twice to the arms and legs, though nertsinly with less apparent heecht ie the two latter situations.

Although this sort of practice was repostedly followed by a striking temperary effect; for instance, on the 10th, the agitations were excessive, and she could not muck; but after lossies, and a purge, and a hister to the head, also had a better night, and could speak, and remaised considerably bettor all the next day. Nevortheless it was evident that the disease was fast gaining ground. Oo the 14th, it required two persons to prevent her heing tossed out of bed in the night. From this time it became necessary to have her constantly secured by straps. Still it is added that the pupils contracted and di-lated naturally. On the 16th, a worse night than over, with meaning and grinding of tects. Papils considerably dilated, but can tell the hour by my watch, though she can

as if the symptoms were kept in chuck, or even giving way. She was more onmposed, and could aprak bettor; but, in reality, nn-

thing was gained.

24. Askesp now; akin very cold, but dry.
Has complained of coldness, and has vo-mited. Had two stools to the night, with-Dr. Mouro use to reckon the getting of the out being conscious of them, but was quite second set of the out mong the exciting sensible holors falling salesp. Wino whey causes of chores. In the present instance, was ordered. The warmth was restored.

vithout difficulty. For a faw days she was axtract from my notes must speak for thememone as usual again, only it sacemed as if solves.

We shall, I think, be able to explain the phonomena which munifested themselves 18th Dec., 1826. I found my old patient on this occasion, by pursuing the anatomical very well yesterday, nor has she had any distribution of the apinal cerves, from their cutchings, or other symptoms of chores, commencement in the back to their ultimate ramifications. The voluntary muscles derive all their nervous energy from the spical morrow, and the involuntary are chiefly amplied from the same fountain. Irrita-The capalid narrative of the ingennous tion affecting my portion of this delicate writer furnishes, I think, shendant proofs substance are occasionally propagated from of the real source of this distressing ma- it overy other. The nerves proceeding lady. The attendances cummenced on the from themse, carry the impressions slong 2d of January, 1815. The young sufferer their subdivisions, and agitate the muscolar bad for a fortsight heen slightly afflicted structure, in which they terminate. The with chores. It kept increasing from the chorea was, I think, excited to the arms third visit to the fourteenth. Her afflictions through the saillary plexueses, and to the were these an distressing that it had become lower extremities, by means of the crutal necessary to confine her to the bed with nerves. The same reasoning will explain necessary to common ser to the near with percea. The same reasoning wint extending the continuation of the month, when it prites an affered an abstract which as the writer patted. One of the symptoms were patted. She apoke intelligibly in the night considerably dilated. Still also could tell of January 31, desiring to be moved into the hour by a worch. In subsequent attacks, bed, afterwards also slept two hours. The meotion is made more than once, of her eyes next morning, she was able to take "a bason being bloodsbot. The same symptom is of boiled milk, and bread." We must out again noticed in the report for December,

One of the complaints efflicting Miss

<sup>\*</sup> See Dr. Harrison's Essay on Spinal

Porch, whose case is stready described, was marry made to regard to the eyes will apply information of the opages cornes. Though equally to these latter symptom she had frequent returns, while walking about, the horizontal position was nearesty commenced before the ophthalmis left her: and shough several years have intervened since her restoration to good health, it has never returned.

In another patient, with a large gibbonity between the shoulders, the eyes had been a source of unuainess for several years. This sight was always weak. The eyes were often inflamed, and the palpebres gonerally became glued together ie her sleen. This young lady found her vision improve as the distortion abated. The inflammatian also left her during the treatment, and the

palpebra no longer cohered.

I have already explained the nervous communisation between some parts of the eyes and the spine. In order to account fur the symptoms just enomerated, we must take into account that the ayes are supplied from different sources. One portion of the ophthalmie branch of the fifth pair unites young lady, who had a considerable gibbowith a ramification of the third, to form the ophthalmie ganglina. Numerous fibrils, valrous description of the unfortunate con-called ciliary, issuing from it, run to the nort of Louis the Sixteenth was strictly eyeball. Having pierced the selerotic cont. applicable to what I beheld. "It is now they creep along between it and the choreid, to supply the iris. Other branches of the same narve proceed to the palpebrae, tunica conjunctiva, and lackrymal gland. Hence it fellows that, insamuch as a direct intercourse subsists between the spinsl narree I saw her just above the horizon, decorat-aed the fifth pair, also madistely through ing and cheering the elevated appears also the great sympathetic, the subsciens glands just began to muve ie, glittering like the will be disordered in their secretions, the murning-star, full of life, and aplendour, and tunica conjunctiva will also, occasionally,

"On the 16th, the pupils were considerably dilated, but sha cae tell the hour by my watch." Soch is the complicated atructure, and so various are the uses, of the eyes, that no fewer than five pairs of narves are distributed upon this curious organ; each is andowed with its peculiar office; that of vision is performed by the second or antic nerves. As the sight was little impaired, I conclude that branch of nerves did not suffer in any considerable degree. Indeed, such an exemption might have been seticipated, because these nerves have ne sustomical cunnexion with the spice, or great sympathetic. Net so the iris; it is furnished from the fifth pair, and thorefore, when lintims are of frequent occurrence among that becomes affected, the pupils are liable, from that cause alone, to be preternaturally expanded or contracted.

During the paroxyams of pair she grated her teeth, and gnashed them together, with force enough " to indent the silver speon used in faeding ber." As the jaws and teeth are sopplied from other divisions of the fifth pair of nerves, the semarks for- in France.

The writer adds to this melanchely train of symptoms, " every muscle of her face was in a state of almost constant establing. Se extensiva were ber sufferiegs, that all the voluntary muscles were subjected to the nucontrollable influence of a powerful excitation.

Besides the parts of the face already mentioned, it is supplied with nerves from the 5th and 7th pairs. Ilaving spoken of the former, we need not enlarge upon the details. A branch of the latter, onlied pes anserinus, or nerve-of expression, anas-tamoses freely with the spinal nerves in the neck, end under the jaw; it is through this branch that the countenance suffers so distressingly to spiest complaints. Persons familiae with these defarmities have little difficulty in ascertaining their presence, or in judging pretty currectly of their magni-tude, by marely seeing the visage.

In early life I accidentally met with a sity between her simulders. Burke's chisixteen or seventeen years," he observes," " since I saw the Queen of France, then the dauphiness, at Versuilles, and surely never lighted un this orb, which she hardly seemed to tauch, a more delightful vision, joy. Oh! what a revolution! and what e heart must I have to contemplate, without emotion, that elevation and that foll."

More than twenty years passed away before my second interview. Never can I forget the changes which disease had wrought in this fescinating beauty. Not only were the lilies and ruses faded, thu eyes had lost their lustre, and the face, which beamed with animation and enchantment, was become lenguid, contracted, and furrowed. The clear and bright tints of her complexion had been exchanged for a dull and muddy hae. She was mereovae feeble, and almost worn out, at the early age of forty. This is by no means a solitary instance of the kind. These premature spothe fair sex. and have been eften noticed.

a 30. Difficulty in giving food, the tongua heing drawn to the roof of the mouth." It is alleged, in the separt for Fab. 14th, that " she cannot put her tongus out of her mouth." This organ, so useful in modulat-

Examples will beresfter se givee of this must estamitous failure iu these functions, and of their perfect restoration, by rectifying the spinul column.

WESTMINSTER MEDICAL SOCIETY.

Saturday, March 14, 1829.

Dr. Somenville in the Chair,

RESIGNOS IN A TAN YARD, AN ALLEGED HAMEUT FOR POLMONARY CONSUMPTION. Dr. Doon read his promised paper on the exemption of tanners from phthiais pulmon-alis, and the efficacy of the aroms of oak bark in the cure of that complaint. It atsted that his attention had for some time been directed to this subject, which he believed was, in great measure, new to the profession, though, volgarly, the business of a tanner had long been regarded as particularly healthy. The result of his inquiries was, that tauners enjoyed a peculiar freedem from comanniptice, eed that this examption was to be traced to the nature of their calling. The following circumstance had first drawn his ettention to the subject. He had had a patient, a weaver, twenty-five years of age, who was suffering under all the symptoma ef phthisis palmonslia; symptoms which were so merked, that he only thought of mitigating them, not certing the camplaint. He treated him accordingly, but at the end of three weeks the man accidently quitted his residence, and weathe knew not where. Tweive months after, he met with him agale, and then found he had become a tanner, because, as the man said, " I'smers were never affected with consumption." To the troth of this the man's appearance bore considerable testimony, for instead of a nonsumptive patient; he was then a strung, atout, healthy man. This case produced a considerable impression on his (i)r. Dadd's) mind,

th its nerves from the 5th, the 8th, and facts, he proceeded to institute the followings th pairs. These several nerves, being inquiries. First. Are tenners more exempt from consumption thee other men ! Seconding. To what cause is such an exemption to be traced? Thirdly. Can this cause be extended, as a remedy, to all consumptive patients ? The answer at which he had arrived to the: first lequiry was affirmative; for after most oxtensive observations of his own, sided by the concurring testimony of others, well qualified to furnish him with facts, he had not discovered one unequivocal instance of the death of a tenner from pulmanary consumption. As Bermundsey omployed the largest number of tanners in the kingdom, bis chief inquiries lisd been directed to thet place. The testimony of Mr. Steney, a resis dent practitioner, was, that for thirty years he could not remember a death from this cause among the tunners; nor could Mr. Castle, during a prectice of twenty-three years. Neither did the hospitals afford a single case. The tanners themselves said, the disease never occurred emongst them. There were shout seven hundred tanners at Bermosdsey; of these, perhaps, five in every hundred died snausly, sed, scoording to the usual calculations, three out of these five might he expected to die of phthisis pulmonalia. In Mr. Steney's practica that would have given him ulcety deaths of this complaint: yet not one of the medical men knew of a case. lie (Dr. D.) was persuaded the same held good in other places. He had met but with three instances to the coetrary; one in Scotlend, one in London, and one in Devonshire; and each of these was complicated with other diseases.

Dr. Dodd than proceeded to show that the families of tanners, especially the females, were nut equally favoured,-that those who lived ie the neighbourhoud of tan yards were remarkably free from consumption,that tunners being taken frem the lower renks, were as liable to disease as other operatives,- that their exemption from consumption axisted in unite of the low, damp situation and exposure of tan yerds,—and that their moral habits and mede of living were on a par with those of other men. As ta the immediate canac of this exemption, he thought it was the aroms which arose from the bark, which aroms oppeared to him to ha a campound ambatance, of a puegent, soid natura, possessing antiseptic preperties, with a tendency to heal pulmousry tuberoles, and fortify the lunge egainst disease. But the most important part of the subject, Dr. Dodd thought, was the possible, artifiof plathiais palmonalis; and he had eccordingly contrived an apparatus for communiceting it to the lungs. It consisted of a cask \* Ses Dr. Harrison's Essay, &c., Case 9. with a slowe cover, having bellows beneatly,

speam of impregneted air might be evolved for their exemption from disease, and hrasthed by the petient. This subject Mr. Garan had impressions in he now sobmitted to the consideration of Dr. Dodd'e theory, and releted two osses the society, expressing his feeling, that if in which the atmosphere of ten yards had there were any just grounds for his views, been efficacions. The latter, which was the question was a most important one, and elaborately detailed, end highly picturesqua that in an inquiry into it, at least fifty un- in the iocidents, greatly interested the successful cases ought to be thrown into Jounger members of the society, and much the scale, before e final decision should he emused the sculors. The subject of the

effects might be due to the entiseptic dicabilis harbis." Specifics were absurd. Pubqualities of the putrid skins. Butchers and lie etteution had been lately much drawn to gluemskers were very free from consump- anew one. He keew e case in which it had tioo. The occupations of tanners in the been tried. It consisted in en application open eir were favoureble to heshill.

Mr. Hunr considered, that rhough the erome might heal pulmonary ulcers, it might not care the disease. He did not think hutchers more exempt from it than other published. men. Did Dr. Dodd think the aroun pre. Dr. Dodd were very important; whence them when they oppeared.

Dr. Jonnstone thought that theorists very easily found facts to support their doctrines; but did not eo readily discover those that were against them. No man, perhapa, was less likely to be bigoted to an opinion than Dr. Dodd; but human neture was the of tunning bark, was cured of consumption same in all ages and countries. He did not in three months. He else knew o gentlemen agree with Dr. Dodd's views, and thought who resided near a ten yard, who was in-them ill supported by facts. The everage variably affected if he left the neighbourfatality of consumptive patients was one in bood, but who, oe hie return, found relief four end a half, not three in fire.

Dr. MILLIOAN could not agree with Dr. Dodd. There were other things in the occupations of tamers besides the aroms, suffic but from medical practitioners. He should cient to preserve them in health; he had, however, some public patients on whom Dr. Dodd might make some experiments with he renewed on the next evcoing, if there his epparatus, if he chose. There was, however, little hope for such persons, when meeting odjourned. tubercles or hectic fevor had once eppeared.

Dr. Stewart considered the general

communicating with a tin tebe, by which a occupation of lanners sufficient to account

Mr. GREEN had impressions in favour of pink hlush, and ell that delicacy of form and the wages of the tanners were anch as to allow of their enjoying many counters, and whether they were at all dissipated men.

Dr. Dupp said that they carned fifteen shillings a week, and that they were rather than otherwise. upon his memory; and he was rejoiced to say

Mr. BUENETT ridiculed the idee of aneoilies in consumption, and especially satirized the attempts to cure it by exposure to the aimosphere of cows, as ettempted by Dr. Beddocs. He thought Dr. Dodd's peper very deficient in facts-the only true ed with the estringent particles of the bark, peper very descrimt in facts—the only true could be of eny use in the complaint. The basis of a theory. As for consumption, whet fluid applied externally might be a specific Orid hed said of lore, might as appropriately he pet into the mouth of the consomptive Mr. Bingnan thought that the supposed patient: "Heimihi! quad phthisis, unlikest merabbed on the chest; the patient went on using it for three weeks, then got worse, and then died. This wee one of the many unsuccessful cases which had never been

Dr. Dunn, in general reply, reiterated bie opinions, and alluded to e case in which e man, who took to the employment even as soon on he was within teo yards of the pits. His estimates had not been de- . rived from the atewards of benefit societies, pursue his inquiries, however; and the Chairmon having hoped the subject would were no other topic of more importance, the

## LONDON MEDICAL SOCIETY.

Monday, March 16, 1829.

THOMAS CALLAWAY, Esq., President, in the Chair.

Induction of a new President, and other Officers-The Non-Fover Case-Insufficiency of the Registrar's Minutes-Inaccuracy of the Report in The Lancet-General Meeting to take into consideration the Question of Reporting-Vate of thanks to the late Officers-Dissection -The Melanoid Cases.

This being the first meeting of the Society after the celebration of the lifty-sixth onniversary, Mr. Callawny, the newly-elected president, took the chair. It is the first time that the chair has been filled by a surgeon as president, since the formation of the Society. New members of the council, treasurer, secretary, &c., have been elected since the Society met, a fortnight ago.

Tho President, on taking the chair, addressed the members thus:-

Gentlemen,-It is impossible for me to when I look around me, end see many inlust friends; b. cause, by that circumstance, the appuintment is rendered the more flattering. As far es regards myself, I am convioced I shall be deficient in those nunlities that have distinguished many, if not all, who have filled this chair before me; but whatever those debciencies may be, I hope

batter shall we support our Society, and the more shall we show our respect fur our profession; whenever differences of api srise, frequent meetings, and frequent of cussions, will assuredly lessen them. far as I am personelly concerned with this Society, I shell, I hope, imitate the example which so many individuels, who have filed this chair, have left me; but it would be wrong in me, now, to make professions, and therefore I can only hope, when I have the honour of meeting you at our next suni-versary, my conduct shall have been such es to have secured your approbation, and that will prove my bigbest reward. (Much spplauss.)

The REGISTRAN read the Minutes of the last meeting; he also read minutes of what took place respecting the transfer of offices. &c., last Monday, from which it nppeared that Mr. Greville Jooes delivered the oration at the nuniversary dinner, and that Dr. Stewart was chosen to deliver it nt

the next anniversary.

Mr. llownin rose to make some observations on the case lately brought before the Society by Dr. Johnstone. He had acen, in the last printed report of the Society's proccedings, that Dr. Ramadge had said, (in take possession of this chair, without thank- contradiction of Dr. Juliostone's statement,) ing you, in the warmest manaer, for the that the patient, in question, really had booour you have conferred upon mo, io fever, and that he (Dr. Ramadge) received electing me to fill it—an honour I appre- information of this from Mr. Howell. Dr. ciate, and trust I shall ever be sensible of Ramadge had also sinted that Mr. Howell Ramadge had also sinted that Mr. Howe'll I fear, however, that, in thos electing me, you have overlooked many other indi wished it to be understood, that he knew viduals, who are much better qualified to nothing of Dr. Ramadge. He was not fill it. This honour I feel the more, aware of any other Howell being in the Society but bimself, and he could assure the dividuals who were among my earliest and Society, that he had made no communication on the subject, nor had I e ever heard of the case until it was brought before the public in the manuer to which he alluled.

Mr. Gossert, however unwilling be was to cumplain, felt it his duty to object to the imperfect mauner in which the Registrar had taken a minute of the cases he had remy attention and zeal will be as much as lated to the Society a fortuight ago. When you can expect, and certainly as much as I he did himself the honour of relating the can pay. With respect to the Society itself, I particulars of those cases, he regarded them am happy to say it appears to me, there is as of some interest and importance; therebut one point on which all its members de fore he could not help thinking the Registration of seem agreed. Foeling that this Society, as the parent of such institutions in on this occasion to the Society, whereas, Loadon, should be distinguished and sup- in fact, he had given none. What made the ported in the best possible manner, I hope thing worse was, that he had taken u pretty you will all rander me your sasistance in full note of remarks made by Mr. Tyrrell meking and maintaining it what it ought to nodothers egainst the cases. This was very be. As far as I shall be able, I shall be, nt little cucouragement to Members to take all times, glad to do every thing I can, con- the trouble of collecting and deteiling facts; ducive to that object. I am convinced that for, in duing this, they incurred considerable nothing tacks so much to benefit us in our risk, as their cases were recorded in a views in our profession, as to have frequent garbled state, the opinions of others egainst meetings. Young as I sm in experience, them being given, while the real focts were it has taught me, the more we meet the withheld.

The REGISTRAM felt sorry for his omis-| moving eyes in cases in which it had not sion; hot the reason was, that the cases been necessary, manusicated to the Society by Mr. Gosset ength, from written papers, which were erwards retained in the possession of the author. When ouses were read, it was not customary to take minutes so fully of them, as if the particulars were detailed orally.

Mr. Gussair considered this a very alogular esplanation; for, in this view, it semed an essier matter to copy that which was said as it was read, than that which was delivered extemporaneously.

The RECEPTERS was willing, to the atmost of his power, to meet the wishes of the Society in his mede of taking minutes of the proceedings; but this ha found not very casy, for one member wished a full, and another a very curtallad, nota to be taken.

Mr. Suzaory thought, that when mentbers read cases to the Society, it would be much better for them to leave their papers with the Registrar, for him to take copies at his leisure.

The PRESIDENT was of opinion, that if all members were to fellow Mr. Gomett's plan of communicating the particulars of thair cases to the Society, it would prevent a great deal of time being consumed, hy gentlemen rising to put questions, the na cemity of which would be obvisted, but which often necessarily fellowed oral statemente.

The RECISTRAR, in a short time afterwards, found that he had taken a more full note of the particulars of Mr. Gossett's cases, than he had read, and which he then took the liberty of reading over to the Society.

Mr. County immediately rose and said, that what had been just read so much resembled that which appeared in Tun Lanver, that he should consider it wither had been copied from THE LANCET, or that the report in The Lancer had been made from lo fact, the two reports were word for word, end were asleulated to convey an errenema impression. In the first place, it was mest place, the subject of one of the cases LANCET. was represented to be "a young lady," Mr. Suxury thought the subject of and afterwardeshe was "the girl," whereas reporting pught to be set at rest; it was the Society would recallect that he had due to all that it should be so, and do would rect the error that had been failen into, as having the subject fully discound and it would be a very unpleasant thing for him to have it circulated, that he had been to

The REGISTRAR observed, that as fault me read by him, at very considerable had been found with the report of the cases in The Laucur, as well as with his minute of them, he would only take the liberty of hopiog, that wheo gentlemen nest read cases, they would take the trouble of leaving their papers with him.

> The Rapontan would not have addressed the Maeting, had it not been that the accuracy of his report in The LANCET was called ioto question. For many years ha had been in the constant babit of reportieg; he was perfectly competent, if neces-sary, to report every word that passed io the Society; he had also been accustomed to report, in a coodensed shape, the substance of meetings; he had no feeling hot that of impartiality and accuracy, and he insisted upon the raport in Tua Lancar heing substantially correct.

> Mr. Gosserr. Had he not had the papers still io his possession, from which he read the details of his cases, from the confident manner with which the gentlemen who last spoke had addressed himself, he (Mr. Gosset) should have been inclined to doubt his own noderstanding. He had distinutly stated, that io one of the cases the potiant lived eighteen months after the operation; that is the other, it was two years since the eperation was performed, and that the patient, op to this time, was perfectly well; neither of these facts appeared in the re-pert in Tas LANCET, and this, with the other imperfections attending the report of his cases, much surprised him, recollecting the usual accuracy of the reports in that unblication.

> The Reporter was about to make andther observation, when

The Presserer Intimated that he thought, particularly sa the subject of reporting was what he might call sub judice, it might be as well, that this discussion should not be preinoged.

The REPORTER was by no means anxious to prolong it. As to reporting, he was corsaid, that they were "cases of what he (Mr.) tain that Mr. Wakley would find very glad Gossett) considered melignant tumours," in if to have the question set at rest; and he he had bed some doubt upon the subject. was surficeled by Mr. Wakley to state, if More aspecially was this made to appear, by the Society said reports should not be Mr. Tyrrell lawing actually thrown out doubts made, another syllable of its proceedings as to the nature of the second case. In the should never spicer in the pages of Twa

styled her Mistress, mist. 41. He felt it right take upon himself to store that a general to make this representation, in order to core meeting should be called for the purpose of

Mr. Kingpon mid that the believe was

left in the hands of the President by the Council, for him to dispose of.

Dr. RYAN surely thought it due to the Members of the Society, that they should have something definite on the system of reporting, either from the President, Council, or somebody olse.

The Parsingur having looked at the rules, found it was competent for him to give notice, which he accordingly did, that on Monday next, at eight o'clock, a goosral moeting would be held, for the express purpose of taking into consideration the subject of reporting; as he was, sed should continue to be, very anxious to put a stop to every thing like a digression from discussions on strictly professional subjects.

Dr. WALSHMAN moved the thanks of the Society to Dr. Shearman, for his late very ohle services to the office of President.

Mr. Kinopon had great pleasure in seconding this motion, and moved that thanks should be returned to him, for his very excellent conduct sa their late Treasurer.

The resolution wes estried numimensly. Dr. Shearman appreciated the hosonr, and only wished that he had been better able to discharge the duties which dovolved

upon him.

Dr. STEWART moved the thanks of the Society to Mr. Greville Jenes, for the able Oration he had delivered on their anulyersary, and that that gentleman should be requested to print it.

Mr. Gesery seconded the motion.

The resolution was carried anso imously. Mr. Jones believed it was not costomery to assent or dissent to the latter part of this motion, notil it was egain mentioned to the orator by the Council. In his nestion, topics wern introduced, out of a political nature, but upon which many of the most highly respectable heads of the profession entertained contrary opinions; and if he were off-hand, at the request of the Society, to publish this oration, the public would regard those topics es sauctioned, sod the opinions as adopted by the Society. Under these circumstances, he begged to say nothing more until he should hear again from the Coppoil on this subject, and should the respons he again repeated, to have the oration published, he trusted the consequences would be previously well weighed. (Appiaore.)

The Pursibury draw the stigotion of the Society to a petition which laid on the table, for the signatures of members, to be presented to Parliament, on the subject of dis-

periods as would be most likely for th be met with at home.

Mr. Snearry thought it highly important that the petition should be presented form with. If the bill Mr. Warborton lastly brenght into the Hoose of Commons; it ed into a law, he (Mr. Shearly) sh himself have been able during the last few days to have delivered over one body for dissection. He was decidedly everse to the disinterring of the dead.

Mr. GOMETT made a few additional abservations on his cases, sed exhibited the preparations. He was still of opinion that the diseases were malignant, and that no exhibition of meloury would have to-

moved them.

Dr. WILLIAMS introduced for discussion, in absence of a botter subject, Fohris Infantile Remittens, which underwent a desultery discussion, and the Society broko

CASES OF INTEGMITTENT FRUER, IN WHICH BEERDING WAS EMPLOYED IN THE COLD

By JOHN MACKINTOSH, M.D., Lecturer on the Practice of Physic, &c., in Edinburgh.

(Concluded from page 781.)

Case 40. - Malignant, shivering latermittent, with hicoup. Stay in the heepital from 7th to the evening of 8th July. Au-

topey; eraclinitia, gastritis. Viocent Cula Paolo, of Rimini, set. 40, of a good constitution, residing at Roma Vecchia, untered the hespital on 7th July. Had been attacked with a paroxyam of fever oo the previous evening. On the morning of the 7th, his state was the following: hands colder than those of a dead persoe; pulse 108, small, contracted; hiccap regular inits retoros, fourteen times in the missie; position aupice; sighs drawn easily; snawers protty correctly, he experiences pain in the region of the liver. In the evening the at declined, and the hiccup disappeared.

On the moroing of the 8th complete retorn of senses, ond natural expression, which, during the peroxyem, assumed that particular aspect which characterises those labouring under the fever; hot the hands have always au ley coldness, which extends half way up the foreurn. According to his owo account, he is not aware of their being sold; but on placing them on his belly, he et ooce becomes seosible of their coldness; ha apeaks as in the state of health. At acotion; and, at the suggestion of Mr. nine o'clock, his appearance hecame as if Shearly, directed the Registrar to send it besetted; he replied with hesitation and seround to all the Members houses, who had luotance. Has an inclination to sign. He not signed it; for their signatures, at each lay on the side, with the logs bent upon the

tion of the arechnoid, which is thicker that more so than the right; it is of a livid no-asteral, red, and as if doubled by a sangui-lour. Temperature of the belly, of the cheat, solut falso membrane; the vessels dis-amost natural; face pain, dairium, agitaaddult false membrane; the vessels dis-almost natural; face pala, delirium, agita-tiblated upon the nicesurvolutions of the tion, inquintade. Decection of bark, 3viji; Brais are augorged; the atomach is much axtract of bark, therisque, a s. zij.; laud-indiamed in its pyloric half, the rest of the liq. andd. camph, mauls. a s. gr. xx.; blistational canal healthy.

then felt a great weakness, which was the the arms; bark gij. in the wine. predominant symptom during the six days a fittle later, return of the same sympprevious to his entering the heapital. His 
state had so little of a decided febrile character, thut, according to his account, the 
medical man could not tell him if he had 
bed the fever. He had a sense of geoeral 
macasiness; took on meatic and a purgative, ond returned to his work; but the 
moch highly inflamed but ween its great curmach previous current was a supplied to a light with the

DIFFERENT EFFECT OF POISON ON CARTIVO-ROPE AND HESBIYOROUS ANIMALS.

Paoranos Marre, of Bonn, found lately, by a series of experiments, that the axtract of coriorie myrifolic (myrile-leaved sumach) has a polsonous effect on carnivorous animals, an effect similar to that of the sorid vagetable poisons, and particularly of memis-permum occulus (coculus indicus.) It was only known by Sanvages and Pujade, that the berries of that plant, naually called tha trea of tamers, from its use in the aouth of France, had a poisonous power. It was mentioned also in the Journal de Chimie Medicale, September, 1827, that the infusion of folia senus parv. (senua) with a god uther carnivorous onimals, recover by few leaves of corlaria myrtifolia, produced the death of a man, who was drinking stomachs.

a great deal of that infusion. The aymotoms that Dr. Mayer observed in animals that, have been intoxicated by the extract of that plant, are shortly, enlivation, vomiturities (aven if the extract is only applied extra nully,) vehemant convulsions, which All the animal by exhausting all his nor oua atrength, becouse, in the agony, the covulsions become slight; the pulse and the respiration very weak and interrupted, the snimal grows quito cold, oud dies quietly. It is yet remarkable, that a large done of the axiract of the above plant has no mortal, or even seosible, sflect on herbivorous suimals, e. g. on rabbits: the extract moy be given to them to awallow, or may be applied by a wound of the skin. Dogs, vomiting the points introduced late their

## THE LANCET.

London, Saturday, March 28, 1829.

Mr. WARGURTON is about to bring under equalysame at a violetion of the lawe is the consideration of Parliament, that, like slweys pregnant with denger, and can never the bill for the removal of Catholic diechi- he justified, on the part of the state, by the lities, it is the result of intimidation. Burke and mercenary traffic-Hars, therefore, it is said, are the real would never have been sanctioned by the mey basold, should be the first object of the deliberative wisdom of Parliament, is about Legicinture in devicing e remedy for the ex-' quences to be stigmatized, as an unwarthy as it seems to have been conceded on all fear, and it would have been well if this encouraged, and as dissection was necessary . fear has been manifested and acted upon to the dua prosecution of suctomical studies,

and anatomiats, which the executive govern ment bas so long enferred to exist. Government is already, in a greet degree, responsible for the crime which it has fostered by its negligence, and even on-Ir has been objected to the measure which couraged by a system of forhestance; for could take upon himself to say, that there been made manifest, by how much would would be no renewal of the atrocities re- the responsibility of the Government be couly committed at Edinburgh; and Mr. increased, if it were to neglect the meane of PELL, however disinclined to legislete on thie preventing a repetition of crimes, against achiect before the crimes of Burke and Here the commission of which there exists no had been detected, zeelously ineisted on sufficient security, so lung as the dead body the necessity of providing an immediate of a human being is made an article of

To prevent the murder of the living for authors of the measure, and that which the aske of the price at which their corpses to be extorted from ite fears. We here no lieting evils. This object may be effected doubt that the dread of a repetition of the either by suppressing dissection altogether. Edinburgh atrocities has had a powerful or by legalising the dissection of unulaimed influence on the mlods of many who ere bodies; and we are not aware of any other naw for the first time disposed to support wey in which it can be effected. Whether a measure for facilitating buman dissections, it would be possible to suppress dissection and why, we should be glad to know, is so altogother in this country, is a question just and well-founded a dreed of conse- which it is the less necessary to consider, dement in the celculations of a legisletor, bands, in the discussion on Mr. Waraunor vbers would be the merit of insansibility ran'e metion, that each a question could to be danger? The fear which impele nut for a moment be entertained. Anetomy, men to evert evil, is a wise and salptary it was admitted, must be protected and before sizeen human beings had fallen vis- it followed that the practice of dissection time to the eupineness of the Government most be protected, and, under due regulaand the Lagrieture. It required no extra- tione, encouraged. In the House of Conordinery sagacity to foresee, that the worst mone no apposition has been made, or seems consequences must inevitably result from likely to be made, to the principle of the system of matte bet seen resurrectionists | Mr. Warsunron's bill; but the measure .

r

has been strongly opposed in some of the always will domand it; society can no more public journals, oo the acore of the outrage which it is supposed to offer to the feelings of the commonity. We have slready atoted that we should coosider the measure most objectionable io principle, if un secompaniod by the repeal of the clause in the act of Gro. Il., which makes dissection a part of the pooishment for the crime of murder: and we have admitted that the bill involves some degree of hardship opon the poor. which is ioseparable from the difficulty of legislating on this subject. But, admitting that no legislativo measure for regulating the practice of dissection, can be wholly reconciled with the feelings of the community, is it a sound conclusion that the practica of dissection should be suppressed? If the appropriation even of noelsimed bodies to the purposes of science be a measure too sbocking to humanity to be tolerated, there is oo alternative but the suppression of dissection. After the horrors disclosed et Edinburgh no mae in or out of Parliament, we presume, is prepared to say that things may be suffered to go oo as they are, or that it would oot be highly criminal in the Legislature to neglect taking some deciaivo step, for puttiog so sod to the truffio betweeo resurrectiooists and anatomists Wo heve never been wenting io zeal to promote the loterests of medical science, and we are most anxious to see due facilities afforded to the study of anetomy, and to the practico of dissection; but we esnuot take so ultra-professional a viow of the question as to suppose, with some contemporary writers, that dissection is one of those occessaries of the sipial system, of which the Legislature could no more oot off the supply than it could put down the practice of dining.

"Detestable and dangeroos," says writer in the Westminster Review, " as is the character of these men, (the resurrectioninta,) detectable and odious as to their traus, atili both must be tolereted, onless some botter mode of obtaiolog aubjects be devised. Dissection must be practised; the wasts of the community imperiously demand it, and

go oo without the supply of aubjects for the sostomist, than it can go on without the supply of corn for food."

Arguments of this extravagant descriptioo never sid a cause; by attempting to prove too much, the writer proves nothing. It is oot true, that the occassity which exists for the practice of dissection is a necessity of such a description as this writer represents it, nor can there be any doubt that it would be practicable for the Legislature, by diot of severe penal enactmeous against the porchasers, as well as against the veodors of dead bodies, to render the practice of dissection so bazardous, as cearly to effect its suppressioo. And if there were on other way of putting an end to the traffic between resurrectioniets and anatomists-if there wore no other means of putting down an organised gang of thieves ood barglars, and protecting the lives of the public against sassassiostion, can any man, whose view of this questiun is not distorted by a professional obliquity of vision, doobt that the Legislature would be justified in sobmitting to the lesser evil, for the sake of accomplishing the incomparably greater good? Happily, the substeetiel interests of the community are porfectly reconcileable with the progress of medical science, and with the encourage. ment which is justly due to the study of anatomy. If provision be made for the decent interment of all unclaimed bodies. which may be deveted to dissection, and oce of the most serious objections to .he principle of Mr. WARDURTON's bill be removed by the repeal of the clausen the act of Guo. 11., the mansure, if norwhally pelatable to the people, will at jest, we truet, be ucquiesced in, as on, which is not only celled for by the semands of science, but which, under /existing ciroumstacces, is best calculated to arrest the progress of crime. Non-professional writers, who cootand that the demand for sobjects is occasioned rether by the decline than by the advance of anatomical science; and that If

It were not for the iodolonce and ignorance | Admitting, with those who toke an excluat modern etodeots, anatomy might be learoed from written treatises, without the practice of dissection, should bear in mind that it is but fair to give due weight to the evidence of every artist in his particular craft or calling. Cuique sud arte credendum est, should be a rule in controversy, sa it is a maxim in law. Now all the members of the medical profession examined before the Parliamentary Committee, and all medical writers on the aobject, have knocurred in the oploion, that a knowledge of noatomy is not to be attained without the practice of dissection. Heoce it is obvious, that if dissection were auppressed, or laid under great diacouragement, many lives would be lost, which might be saved by the skilful performance of sergical operations. Cases may be imagined to which the feelings of surviviog relatives would be wounded by the disacction of the hodics of paupers, which auch relatives were not in e situation to claim; but eoch coses would curely not be entitled to so moch sympathy as rhose io which the lives of the poor would be lost for want of proper surgical assistance, which must soon be of frequent occurrence, if the atudy of anatomy, and the practice of dissection, be generally discouraged. Legislation constactly presents only a choice of evile, and the wisdom of legislators is eviceed in selecting that which is counteracted or redeemed by the greatest propora of good. It may be a hardship on the Por to subject their bodies to the procees of desection before burisl; but may it not ultimately be a greater injury to the poor to discourse a seience, the decline of which woold have the effect of occarigning many of them to so antimely grave? Let it be redead exists only in the imaginetion of the

sively sectimental view of this question, that the dissection of the dead body is chocking to the feelings, is not the prolongation of humso life a good for which it is worth while to pay the price of discection? Would any rational man hesitate between the alternative of a aborter life and burial of his noviolated remains, and a longer life at the expense of dissection after death? or, would he hesitate in making an election for the prolongation of life at the price of dissection, in the case of those who were neareet sod dearest to him? Now the avil or inecovacience which men woold aubmit to for the aske of procuring a greater good in their own case, or in the case of their nearest connexioos, the state may surely impose, withour incurring the charge of inhumanity. We may aid, too, that the horror with which the process of dissection is supposed to be regarded by the people of this country, bas been greatly exaggerated. Was soy such herror maolfeated, when a course of anatomical lectures was delivered two years ago, at the Mechanics' Icetitution, by Dr. Birkbeck, and when the parts of the human body were demonstrated, in the open theatre, olght after night, on the dead subject? Never was a course of lectures, at that lustitution, more numerously and regolarly atteoded, or listened to with dasper interest and more profound attention. The experiment proved, in a most striking manoer, how speedily the popular prejodices against dissection gave way to the interest excited in the minde of npwards of saven bundred mechanics, by a skilful exposition of the different atructores of the limits body.

We must again, with all deference, press opon Mr. Wannuaron's attention, the agcollected, to: that the sopposed injury to the pediency of enting up by the roots every species of traffic in the dead bodies of our eurylvor; while, by cutting short the term of fellow-countrymen. Let all unclaimed beexistence, a real sod substantial injury may dies, which are to be made available for the bedone to the living. "A live drummer," said purposes, of science, he conveyed to, and Napoleon, "is better than a grad emperor." distributed by, an officer in the pay of Go-

vernment, whose functions may be similar der consideration, can only be equalled by to those of the chef des truveux unatomiques at the unprincipled coxicty they have shown Paris; and let it be capressly provided that ne money be received for them. Such n provision would remove one of the strongest objectious which has been made to the measure, namely, that it is a bill for selling the bodies of the poor for the henefit of the rich. Let the sale of dead bodies be declared nniswful, and the buvers of them subjected to the same severity of punishment as the sellers. At present, the austemist separates his case from that of the body seatcher, by a defence similar to that conveyed in the words wherein King WILLIAM distinguished between a constitutional acceptance, and a tyrannical assumption, of the crewn, Recepi, non rapui. "The plain English of this," said Dean Swirr, " is that the receiver is as bad as the thicf;" and common sense suggests to us, that, if there he ne 1 .coivers of atelen or murdered bodies, the grave will be necuro from outrage, and the living from assassination.

A New System of Treating Humon Teeth. By J. PATERSON CLARK. London, Long-

Or all the diseases to which the human frame is liable, there are none more common than the affections of the teeth, and their relative parts. The young and the old, the rich and the poor, are all, more or less, the victima of these maladies ; which, when utattended to, or subjected to the manipulations of ignorant and illiterate pretenders, not unfrequently by the foundation for nome of the most appelling, malignant, and fatal diseases. It has been as unfortunate for the science of dentistry, as it has been for the health and confort of the public, that this department of the healing art should often have been consigned to the care of a set of unlicensed and ray actous practitioners, whose consumete ignorance of the diseases un-

in the support end diffusion of quackery. We shall not state whether these remarks have been elicited from an in consequence of pernsing Mr. Clark's work, or whether they have been anggested by the conduct of some of that class of practitioners to which the aother belongs.

"But," says Mr. Clark in his preface, "as many persons here lately began to announce the discuvery of cements, for the eure of toothach, end no there are various processes which, good, bad, or iedifferent, may be confuunded with the one pursued by the author, in the following treatise, he couecives that it is but doing common justice, both to the public and mrassers, in taking this opportunity to state, that he first began to opply successfully an amodyne coment for the cure of toothach, towards the close of the year 1825. That shortly skerwards, while residing in King-atreet, and, subsequently, in Percy-street, be announced his discovery by repested advertisements; that until the year 1828, no individual had ever applied the term cement to any substence used for stepping teeth; as, did occasion. call for such proof, he sould satisfactorily attest; that the soodyno cement is not, and never was intended as, a permanent stopping for teeth, but simply as alleying paid, and destroying the sensibility of tender teeth, and thereby permitting them to be cleaned and stopped with gold, or other foil, without pain."

Now, as Mr. Clark bas not disclosed the composition of this wonderful anodyne coment, we may venture to predict that it is at useless to his patients as his book is worthless to the profession; and that the pretensions of the author, therefore, as pompous displayed in said work, may be fairly/fegarded as puff, puff, puff!

COLLEGE OF PHYSICIANS.

Monday, March 23, 18/9.

POST-MORTEN EXAMINATION OF THE CELE-RRATED DR. SAMUEL JOHNSON.

Tue meeting this evening was very fully attended. Dr. Iteanna presided. A paper was read, the production of Dr. Charles Manafeld Clarke, on the efficiety of

The second paper, reed by Dr. Wilson, was one of extraordinary interest. It was a paper found by Dr. Wilson, among his stake the sense of the Society wpon this as father's (Dr. James Wilson's) MISS., de- wall as npon any other question, at such a tailing the post-mortem examination of the meeting. In the result the motion was to the celebrated Dr. Samuel Johnson. The particulars of the examination, conducted by Dr. James Wilson, Dr. Crulkshanks, and suothar, a few himra after Dr. Johnson's death, have nover before been published, and the paper was listened to with great interest. From the document, it would seem that the learned Doctor was, in a great measure, the cause of his own death. He was afflicted much with the drupsy, and having been disappointed in seaing his medical adviser so soon as he expected, he procured a lancet, and opened his legs himself, but produced a rapid flow of blood, which in a few hours caused death, By the post-morten szamination, was a great reduction in one of the testes, which was considerably abrunk; the other perfectly healthy. The heart of the Dector had considerably unlarged, and was much largar than that usually postessed by man, and in a state of perfect health. It is somewhat estraordinary that the post-unre-

The third paper was a detail of the opera-tion of lithntomy on a horse, hy a mamber of the Royal Voterinary College.

## LONDON MEDICAL SOCIETY. Monday, Murch 23, 1829,

CANERAL MERTIND

I take into consideration the propriety of allow

porting. The meeting was to have taken

desking cold water on the faces of patiants coeded far, a motion was made and accounted, habouring under obstinate, nervous, and continue attacks. Many esperiments had discussion of the night. Several spoke pressed in usefulness. yet been given to visiters at general meetings, but it was competent for any member

meeting. In the result the motion was loat, Dr. Churranauca's motion was to the effect, "That the Society does not recognise, per in any degree sanction, the reporting of its weekly proceedings." The Doctor aupported this resolution in a lengthened speech, He contended that raporting was against the rules of the Society (which, by the by, has the power of making within itself, any rules whatever, ad libitum). That the Society was orginated for the purpose of having confidential atatemants made to it; that it was impossible for gentlemen acting as reporters, not to have a feeling on the subject before them, that they could not remain unhanced, that the reports consequently could not be it appeared that me of the Doctor's kidneys sent forth to the public fairly, fully, and imhad been so much diseased as to have caused partially, and that under such circumstances it to ahriak to the size of a brew. The other if raporting were to he sanctioned and per-kidnay was perfectly healthy. The Doctor mitted to gn on, the originally intended conwas never known to complain of any pain is fidential statements would be withheld, and bla kidaays. The second remarkable leature, the Society injured.

Mr. Paocroa warmly seconded the mo-

Dr. CHOLMONDSLY was decidedly in favour of reporting. He admitted it was impossible to give a full report; and, indeed, he thought a full report, even could it be given, was not called for. A fair and im-partial anatement of what transpired, it was competent for a reporter to give, which he had always thought, and would continue to think, had been, and would go on to be, useful to the public, and advantageous to the Society. It was not likely that any thing of a confidential nature, and relating only to the Sociaty or its affairs, could be injured by reporting. Reporting would tend to prevent many deathory, uscless, and oninteresting conversations, hence the short time allowed for bringing forward subjects of importance would be husbanded, and in this, as well agin many other ways,

At the into consideration the propriety of allowing or disaltowing the Reporting of the Society would be benefited by reporting.

The set of Callawar, Esq., President, in the Chair.

The set of Callawar, Esq., President, in the Chair.

The set of Callawar, Esq., President, in the Chair.

The set of Callawar is set of the Society also more than the consideration of the Society also mother to reporting. The meeting was to have taken place at seven instead of eight o'clock, but no circumstances new existed, he consideration of the Society also more than the consideration of the Society also more than the consideration of the Society also such that the seminate of the Society is the consideration of the Society also such that the seminate of the Society is the consideration o

themselves of ) to bring forward to the notice of the Society, many cases in which there was acthing ossentially interasting for the purpose of gotting their names brought hofore the notice of the public, while more experienced individuels were prevented by this, from relating the results of their labours.

Mr. Loan was a fee to reporting. It might be that a medical mon might give a mistaken opinion on a case during life, that this judgment might be corrected by a postmortom inspection, and the whole heing domained in the Society, through the medium of the press, it might oll come hefore the eyes of the friends of the deceased, and cause confidence to the pressition of the deceased, and cause

Mr. Kinopon made a grave speech, against reporting.

Dr. James Johnstone had lost the opportunity of continuing to ettend o family entirely through reporting. Flu Considered that roporting might work mischief in more ways than this, ond, therefore, should give his vote for any thing calculated to losd to its appression.

Mr. Salmon scoffed of this spherent argument. He had actually just been in conversation with a gentleman on whose testimony he coald rely, and who had ossured him, that hat for having read it The Lancer the discussions of that Society on the huple use of the secule commune, six mothers must have perished (and probably their offspring too), but who, by the judicious use of that medicine, ser econumended in some specches to Tus Lancer, had been saved. After this, he knew not how any gentleman, who had the preservation of life and health at beent, could vote against reporting.

Dr. Ramadge, Mr. Weller, Mr. Ashwell, Mr. Lloyd, Mr. Shearly, Dr. Blick, and some others, pladged themselves to support to their utmost, reporting, looking upon it as both useful to the Society and the public.

Others having spaken against it, the bellot hox was at longth sent round.

One gentleman would not give his vote (a friend to the liberty of the press) because he had not had an opportunity of coproming his sentiments.

his sentiments.

Another professionen who meant to vote in favour at inflatting, was the late in presentfused, mad, therefore, his vote was refused.

The Pennium (who unducted himself throughout the rather noisy evening with the utment impartiality, and very properly shatained from giving any opinion during the disconsion of the question, so so to attempt to him members one way or the other) having counted the ballets, declared the numbers to be

For Dr. Cluttorbuck's motion - 22 Against it - 22

Loud cries now issued from overy quarter of the room for the President to exercise his right, in giving the easting vote.

The Pasams NY, then, without hesitation, having been assured that, by the rules of the Society, it rested with him to decide the question hy his voice, said, that however unplasant it might be for him to differ from Dr. Clutterbuck's views, yet he looked upon reporting as essentially nsoful both to the Society and the public, and consequently felt himself hound to give his vote in fevour of it.

The subject was then desired to be taken into the hands of the Council, and the Society broke up.

DEMARKS ON MR. SHUTE'S COMMUNICATION ON A CUBIOUS APPEARANCE OF TUE BLOOD,

## To the Editor of THE LANCET.

Hec scripsi non otif abundantia, sed amoria erga te,

On a perusal of the last volume of your spirited and independent Journal, which, in coosequence of some untoward circumstance, did oot reach me till last mouth, I was not a little as prised, as well as amused, at meeting the following communication from the pen of your very intelligent correspondent, Mr. Shate, of Watford, p. 630. A sain cama to him with pains in his

A size came to him with pains in his bead, cheat, ond heek; he advised him he loss blood; seven conces were taken, and Mr. Shuts transmits the account in consequence of the, "nuvelty of the peculiar spearances which followed its ebattaction. Before the arm was tied up, the blood assumed a peculiarly white him, obliterating sitegother the epasternee that Meed had been, drawn; for it resembled a basin of milk more than any thing alse." This "odd appearance" induced Mr. Shute to take five sunces more, and then onn cuace more, which had the same obsracter. As the blood cooled, the whitemes increased, and the erassameotum assumed a type of inflammatory covering, and it, became of a livid has, loss, to proportionste quantity, than the serum.

Now, Mr. Editor, to me it appears not a little catraordinary, that you, who, upon most occasions, have exhibited so greet a degree of discrimination to the nelection of matter for your ported Mr. Shue's commissication before you gave it issuertion, onless you were influenced with the hope of receiving a reply from some of your summorus readers. Considering the number of selectated physiologists that have

Shute could have discovered any phenomenon relative to this properties of this vital after making some common observations on the congulation of the blood, proceeds to atate, that " sa I never met with an iustance of the kind before, and find only two eases, recorded by Hewson, as something similar, I intend to repeat the bleeding at the end of a week, in order to stford suother specimen of se curious un appearance. Thus, Mr. Editor, singular enough, does it appear to mn that Mr. Shute, not quite satisfied at the recovery of his patient after the first bleeding, states his determination of performing a second and unmersuary operation at the expiration of a week, merely in order, as he says himself, to offered another specimen of blood of an curious an opposizance. From what cause Mr. Shute was unable to find a number of cases on record in which the blood presented the appearances under con-pausion of the horse's foot sideration, I am unable to comprehend, This assertion, and the naless I attribute it to bis intellectual faenlty for marvellousness having far outatripped his industry in the pursuit of mediearch. Qu referring to hir. Hewson's experimental inquiry into the properties of the blood, I find that this great man has devoted a whole chapter to this subject, in which, after having referred to a number of authors that have recorded cases, he relates aix cases bimself, and likewise says that he beard of the same appearance having been observed by the learned Sir John Pringle, Dr. Priceira, Dr. Hunter, Dr. Watson, Dr. Bromfield, Dr. Garthabere, and Dr. Fothergill of Northampton. I shall here, for Mr. Shute's information, refer to a few more authors where he may rusdily find some ses recorded, and at the same time astisfy himself that he has not the remotest elsim to be considered the discoverer of this pbenomenon a phenomenon that has been nesiced by authors out of num! c, from Hippocrates dewn to the present time. There are in Morgagni two instacens," in Tulph. one,† in the Philosophical Transactiona some instances,? in Sekenekiua's Observations two cases are related from other authors, in the twenty fifth volume

devoted their time and attention to the investigation of the properties of the bloodthe most important fluid in the cosmal of the Medico-Chirurgical Review some machine—that fluid which is the nearestone blood in also most oned by Dr. Vanables, in the frame, and from which all the secretions blood in also most oned by Dr. Vanables, in the work on dropsy. In constituting the track that the a minimum philosopher as Mr. Short and the secretions is the secretion of the secretion upon to make, in reply to Mr. Shutn's communication, i would periously outrest him to fluid, that was nut previously well known krop in mind the remark of the celebrated to svery tyre in the profession, of the fleeker that an uncultivated mind, like most ordinary espacity. Your correspondent, unmanured ground, will soon be overrun unmanured ground, will soon be overrun with weeds."

I remain, Sir, Your obedient servint, NARRATOR VERUS.

ON THE EXPANSION OF THE HOSSE'S FROT. By MR. G. CLARK, Veterinary Surgeon.

#### To the Editor of Twa Laucer.

Sis,-Bly attention has been drawn to a letter that recently appeared in your pages, from the peu of a Vaterinary Surgeon, who, as it were to despair, has had the holdness, i may say the effrontery, to deny the ax-

This assertion, and the "experiments," as they are salled, by which he attempts to substantiate it, would have deserved up reply from me, had it not been followed hy auether letter, (p. 685,) of very high pretensions to superior knowledge and success in practice; bence, lest any of your readers should suppose that his arguments are un-answerable, I shall offer a few observations respenting them.

In order to everthrow, or not saide, the clear proofs of its expansive powers, which anatemy and every-day experience afford to all who barn investigated the subject, Mr. Caleb Morgan thinks it amough to report the results of certain squivocal trials made with the eslipers, by himself and a mathematical friend, on the feet of some young hurses. Nubis had stated, in the Sporting Magasins. that the foot would axpend considerably under the weight of the horse, when quintly standing with one leg smeed from the ground. hir. Morgan states that this did not take place in the feet that he tried, and therefore denice the expansive quality in tele. Now, without refusing some degree of credit to both of those statements; we must remember that it is not avery one who can make an experiment properly, and also that the result depends very much on the manner in which it is done, and that nothing is sanier than to make an experiment not succeed when we wisk a different result. That this organ is naturally cleate there

<sup>\*</sup> Morgagni Ep. xlix. Art. 22,

<sup>†</sup> Tulph. Obs. lib. i. cap. 56. † Philosoph. Transact. Nos. 100 and 142. I Sekanekii. Obs. lib. iii. .

e be no doubt, nince we see in its compo- | fraught with proof sefficient of the existence

This is an experiment (requirisg some defound a different result.

With regard to the general question, I know not whether to attribute it to the dul-ness of his perceptions, or to the "mist"

gentleman if he has never seen a horse come up from grass, without shoes, with feet half some letters in the Sporting Magazine. or three quarters of en luch wider than they were befure? Ilan he never seen the heels ineffectual attempts of the foot to expand it spite of the nails! And, above all, has he never applied his thumb and finger to the heels of a well-worn, expansion shes, and seen the shoe and foot collapsing and expanding under the operation? If he has not done this, let him do It the first opportunity, and it will lend to a discovery which it seems

he could not make before.

The shove are evidences of the expensive comprehended by even the meanest groom's capacity. But there are others, drawn from his assertions are such as to make us forget that he is a veterinary practitioner, who has actually dissected the foot, and in so doing could hardly have avolded perceiving, when

it had been oues pointed but to bim, the cleatin principle, that personals, the cleatin principle, that personals, the cleating of the country is was cleft possibility beyond its centre, and was filled up by a highly cleatic organ, and was filled up by a largery elastic organ, who have tried and rejected it in the army, rendered still more so by a series of erches determine by what magical skill fir. A lorgan forming somewhat the figure of an inverted and his men can do what they and the college, and wan the original proposer, Lafonan being an elastic substance, nearly as much tion, with which he has forgetfully furnished as as Indian rubber, if it was not to append an elastic substance, nearly as much tion, with which he has forgetfully furnished as me. Any other fact he might? "In fact,' the foot is but this is alone sufficient. He says, at the

Mat parts, machinery expressly for this pur-tage pole, the frog being obviously given to fulfil lc ell feet; but as it is impossible, especially, this office; and in an experiment made with fur Mr. Calch Morgen, and those who are by care, by Mr. Brucy Clark himself, in the inclination blind, to see this expansion presence of Lord Morten, this expansion when the animal is trotting or galloping, was most upparent. creased force with which by such momengree of skill, end, if not well perfurmed, very turn it meets the ground, which must be incocclusive), which would succeed when many times that of the mers weight; so we tried on full-grown and alestic feet; in the are forced to draw such conclusions from cart horse it might possibly fail, from the the structure of the part, and the apparent thickness and rigidity of the horo, end slee intentions of neture. And how much greater in the young colt, from the imperfect de-velopment of the classic parts, and, most perfect rest, when the weight alone, opposed curiously, Mr. Morgen has selected this sore as it is by the friction that takes place between auriously, Mr. Morgen has selected this sort is it is by the friction that takes place between of foot for the purpose of his experiment; level surfaces (the is between the flat hoof had he known how to conduct it properly, and the flet stone), which might not in all cases and takes a full-grown foot, ha would have ha sufficient to produce a very sensible effect, and which friction abould be guarded against in making the experiment. But to return: we must not forget to consider the spirit, whether pertied or impartial, in which an which be seys " envalopes the subject," that experiment la performed. Now Mr. Morgan he "never could discover this much talked of reminds us of those reasoners who make all expansion, or opening and collapsing of the their facts bend to a predetermined opin-foot of the horse." I beg leeve to eak this ion, for he tells us "These experiments, &c., were originally intended as an neawer to

I shall not pretend to pursue this very candid writer through all his last desultory of a common shoe rubbed bright, by the communication; it seems to have been written without any very consistent motive, except that of persuading your readers that he amploys the best workpen in Loodon, and has been enabled to keep the feet sound, and in the same form as natere made them. This is effected, he states, by the use of "a modified specimen of Mr. Colemae's original tillu-heeled shos" which has produced the "happiest results." Now as this gentiemen has so great an antipathy to theory, or naturs of the foot, that have come under the any thing that hears the appearance of resobservation of most men, and ore easily soning, I shell not stop to prove, though it might be done ie a few words, that if he employs a shoo neiled in the common way. a consideration of its snatomical atracture, it must produce the same effect in contract-which I had almost forgotten to adduce, for ing the foot as the ordinary sloe of common farriers, whether mede with this heels or not. This question has been discussed. in Tue Lancer before, and need not be repented here. It is trifling to isquire whather the essertiums, for they are no other, which he seakes about his success in sheeing with the thin-heeled sime, are fallecious, or otherwise. Let Professor Colemen, and those who have tried and rejected it in the army,

conclusion of the first letter, p. 686, "I have woond. The pupits were natural; public 46, often occasion to resp the quarters to the and full. He was ordered to be hied to spinled, previously to turning out." Now for teen ounces, end, three hours afterwards what purpose, and in what cases, mey I ask, two ounces of the infinuice of senns were to its he "so often" obliged to "resp the be given, should it be required.

quarters to the blood, and ture out;" the manurer is increase of contraction! Every eight, and the pain in his head was more sentiment, who has have sent the contraction. entleman who has kept's stod knows, to his cost, that this is the last resource of tha ignorant farrier who has ruined his horse. and a futile one it is. To "rasp the quarters to the blood, and turn out !" These are the " happy results" of the thin-heeled system above alluded to.

I am, Sir, Yours, &c. CHARLES CLARK.

Veterinary Infirmary, Stamford-street, March 15, 1829.

#### GLASGOW ROYAL INFIRMARY.

COMPOUND COMMINUTED PRACTURE OF THE CRANIVA.

JOHN MALCOLM, aged 46, wes edmitted on the 11th of February, under the care of Dr. Couper, with a compound commineted fracture of the cranium. On the evacing of that day, while at work, a stone had fallen from a beight of fifty feet, and struck him on the head, directly over the sagittal suture. Both the parietal boses were fractured, and the pieces late which they ware divided, dopressed to a considerable depth. Notwithstanding the extent of the injury, the blacding bed been trifing; but his breathing, oo samisalon, was oppress-. ed and stertorous, the countenence glassly, and the pupils dilated. The arms and legs ware also effected with convulsive tremors. and the pulse small and frequent. A consultation was immediately summoned, and, in the mese time, till the arrival of the surons, warm haths were applied to the feet. Having met, Dt. Couper proceeded to en-large the wound of the scalp, and remove the fragments with the elevator sed forceps. A small opening west seen in the duro mater, having been perforated by a detached portion of home. The adjes of the wound being efferwards brought together, were retained by straps of adhesive plaster, sed over these a compress and bandage wore applied. Immediately after the operation,

severe. His bowels were open, but the psralysis of his left side contineed; his pulse was 100, and fall. Sixteen ouncas of blond were ordered to be taken from the arm, and, towards the evening, it was to be repeated, if necessary. Early the following morning be wes to have six grains of calonel, and, three hours afterwards, two ounces of the jefusion of scena.

15. As was directed, he was bled the day before to the extent of a pound; and it being again thought proper to repeat the vecescetion during the evening, a pound and a half more was taken away. To-dey the paid in his bend was considerably better; the dressings were removed; his pulse was 96, sed soft. The infusion of scous was ordered immediately, and, three hours afterwards, a

purging enema.

16. He was every way much altered for the worse; he had slept none, but continued raving during the whole of the night, and, at the usual visiting hour, was quite focoberent. The dressings were again changed; the wound looked healthy, and had adhered. The paralysis still continued, the eyes end muscles of the left being drawn over to the right sids of the face, His bowels were open, pulse 90, and full. The bleeding was repeated.

17. Some slight ralief was said to bave followed the bleeding, but during the even-ing it was ropeated without any benefit. To-day he is comatose, pupils dilated, and brenthing laborious; his pulse 120, and fee-

18. fle died at half past twelve, P.M.

 19. The body was inspected to-day twenty-four hours after death. The skull-cap being removed, the opening was seen to be of a triangulor form. A portion of the internal plate of the right parietal bose was depress-ed, without any corresponding appearance to the external side of the okuli. Oe removing the dura mater, a thick layer of pus was seen extending over the whole of the was seen extending over the wasses or on right, and, although not in such quantity, also over the left, liminaphere of the brains. The lower surface of the perobellum was slightly covered with bus, and between the crunium and have of the brain, there was an affubreathing earlier. He was ordered a purging bolus, to he taken early the naxt morning.

12. During the night he had alopt a little. Spearance le the ventralists. Betther the The bolus had produced a stool. The left chest nor abdomen was opened, nor were light and arm were partially paralysed. He the students suffered to examine the discussed somplained of pain in his head, around the eppearances, after Dr. County and left

# CENLARGEMENT OF THE GLANDS.—HERNIA.

the room; the skull-cap and brain being useless to detail the progress of the cur almost immediately afterwards wrapped up mere minutely, which merely consisted a to a cluth. It is to be hoped this will not removing the dressings every other day, he repeated; if so, the students ought instautly to addrags the Directors on the sub-

ENLARORMENT OF THE OLANOR OF THE RECE. AXILLA, AND OROIN.

John Macarthen, eged 55, was admitted by Dr. Couper on the 11th of February, with the glada of the neck, axills, and grote, in a state of enlargement. In the neck, these which are situated under the right portion of the inferior mexillary bone, had attained the greatest size. From these e chain, in a aimilarly diseased state, extended up along the right and left side of the face. All were A MIDBLE-AGER woman, whe, for a year of considerable magnitude, but one in particular, which lay on the inferior pertion of small orange in size. The glands ut the left see, and vemitieg, first, of hile, then uf axilla, and heth groins, were found in a simi- stercersceeus matter; the hernini tameur lar state. Those of the loft grein were par-was very painful, and, as was ascertained ticularly large, and aunther colargement, by a surgeun, irreducible. Being hraught which extended from the left hypechondrium to the Hutel-Dieu on the 5th, she was iuto near the umblicus, was, unlike the others, stantly bled, and put into the warm bath; 100, irregularly intermitting.

Befure any active treatment was adopted, the bowels were cleared out by two or three doses of easter oil. On the 14th, he was ordered to take six drops of the tincture swellings of the face and neck with an embrocatiee composed of half an eunce of the tincture of iodine, la four ounces of the sesp

liniment.

Feb. 24. Having felt siek on the 21st, which he attributed to the fodine, he was ordered to discontinue it internally. He hed still, however, continued rubbing the parts with evident savantage; the aveilings on the fane having not only become more relaxed, but also perceptible, smaller. His health being now also bettle is was directed to begin with the todine again, in its former

had here affected with a redecible crural heruis, was, on the 3d of December lust, the right masseter, was, at least, equal to a seized with violent colic pain, hiccup, neuto near the unsumuse, was, summer the owners, samily nice, and pin man the warm samilthe seat of severe dull pain, which became the taxis having been repeatedly tried, with aggraved during the night, and seutely pain—out any effect, M. Sanson proposed the full es pressure, or en attempt at full impli-operation. The disease had begun about twe elevation, to which, hewever, the patient, years befure his admission ieto the hespita, condition, strongly objected. On the meruasince which it had gradually increased. His iog of the tith, a slight amelioration had health was not much affected; his appetite, taken place; the vomiting had subsided, and however, was had, and howels habitually the pain was not so violent; the countecostive. His toogue was clean; and pulse insues was, however, iedicative of distress, nance was, however, iedicative of distress, the extremities celd, the pulse very small and frequent: and whee M. Dispuytren asw the patient, he insisted upon the immediate performance of the operation, as the only means of saving her his; the apparent reof indice, three times a day, and to rub the mission of the local symptoms he cocaldered se certain signs of approaching gangrene. The coesent of the patient having at last boen ehtained, a transverse incision was made through the ieteguments, the cellular tissue was carefully dissected from the tumoor; the asc being thus laid here, was opened, and a small quantity of yellow, leadurous liquid let unt; the incarcerated intestine was readily felt by the finger, but, on the introduction of a probeinto the sac to acceptain the situation of the stricture, a quantity of faccal matter auddenly rushed through a rupture of the anterior peries of the intestine, which, although violently injected, and covered with purulent matter, appeared to have not yet passed into gangreue. The stricture being found to exist at the neek of the hernlal sac, was freely divided upwards, and the intestine having been reduced as far as the laceration in its anterior paries admitted; James Barnie, whose eye was extirpated an alastic cannia was introduced ioto it, a

discharge through the grote had so far dimioished, that it was thought proper to reand began to heal; the opening to the to-. used, over which, in a few days, a truss was applied. On the 6th of January the wound had completely healed; the atoola were perfectly natoral, digestion was unaccompacted by any paio, and the patient was to leave the hospital within a few days .-Jours. Habdons.

#### STRANGULATED UMBILICAL ORBNIA.

C. S., a woman of about 60 years of age, very atout, and of plotheric habit, had, for fifteen years, been affected with an ambilical bernia of the size of a large apple, which had never been completely reduced, and caused frequent attacks of celio. On the Lith of January she was, without any obvious cause, seized with sickness; vomiting, first of bilious, then of fiscel, matter, biccop, and violent colio paio, especially in the hor-nial tumour, which had somewhat iccreased in aine. Several attempts to reduce the tamour, as well as the administration of a salise mixtore, had no effect, and the patient days had taken place .- Journ. Heddomed. continued in the above atato up to the 24th, when a remission began to take place lo tho symptoms, and the vomitiog altogether sed; she applied, however, at the Hôtel-Dien, and was admitted on the evening of the 29th of January. Oo examination, the tamoor was found tense, very painful oo pressure, and rather volumicous, being four inchos to diamater; it was of a circolar form, and surrounded the navel; the rest of tho abdeenes was free from pain; the poles was rather full, and the fees Sushed; no stools had been passed during the last 20 days. M. Du-paytren did not think himself justified io performing an operation, thore being no signs of atrangulation, except obstinate costivemets, and secordingly ordered fifteen lesches, and an emollient poultice, to the tumour, the warm bath, and an aperior injection.

patient passed a tranquil night; none of the place in the herais, and the glyster had shows symptoms returned; the pulsa rose, come away without any faces. The patient and the features resumed a more composed was bled to eighteen ounces, and placed for appearance. No atoola were passed through an hour in the warm bath, but without any the anua, but a great quantity, first of ster- relicf. About four o'clock in the afternoon coraceous, then morely of bilioon, matter, she was suddenly seized with hiccup, sterwas discharged through the opening in the coraceous vomiting, and violent colio pain groin. Under the use of glysters, the fasces over the whole abdoman, the skin of which began to come away through the natural passage, and so the 10th, the atercoraceous palatous redness; the operation was acpalatous redness; the operation was accordingly, without any delay, performed by M. Sacaco. The sac, which was much move the caoula, and to cover the would thickened, especially at its lower portion, with an emollient poultice, io order to lessee was found to contain a fold of Intestine, the irritation produced in the surrounding shout four inches to length, apparently port parts by the contact of the faces. On the of the tronsverse colon, of a dark-red colouf, 21d, the wound had a healthy appearance, and firmly adherent to the sac. The stricture having been divided upwards and to testino had very coonderably contracted, the left, the lottestica was redoced, after and the stools passed only by the outeral baving, with some difficulty, been detached way. A compressive bandage was now from its adhesions. About su hour after the operation, as the vomitiog still continued, some injections were administered, which produced five copious stools. During the oight, after the operation, the patient was very restless; the erysipeles rapidly spread over the whole obdomeo and part of the chest; the features were greatly altored; the pulse vory small, &c., and she died the following ereolog.

Oo examination, the large, cod lower parta of the small lotestimas were found violently inflamed, and covered with purulent matter; the harnia had consisted of the right colon, and a portion of the eniploon, which had protruded through a fissure in the lines of he,

half an ioch abovo the navel.

M. Dupnytren considered this a very remarkable case, on account of the long intermissico in the principal symptoms of straugulation; he observed, that he had seen many cases in which the vomiting had ceased for two or three days, but none where a complete intermission for eight

#### GUY'S HOSPITAL.

OPERATIONS. -- RABRLIP--STEAVONATOUS TOMOR &--- AMPRICATION OF THE LEG.

Ox Tuesday, March the 17th, Mr. Kay performed the operation for herelip, on a boy thirteen years of age, of healthy ap-pearance. The patient was placed on his back, horisontally, upon the table, the ope-rator atmiding behind his head, and laying hold of the right side of the desure with the fore finger and thumb of his left hand, he first thrust the knife through the upper part, carrying it downwards and forwards, and, afterwards, in a similar meaner, on the Ourthe following day no change had taken opposite side; the edges were then brought

together, and held in contact by means of | 16. Quite well, with the exception two sutures. In this state he was removed pains in the limbs. The patient states, that from the theatre to Luke's Ward, and put he has never been the subject of syphilis or to bed. The operation lasted teu minutes.

He next removed a stestomstous tumour frem a hoy, shout ten years of age, situated below the body of the pubes to the right side of, end extending below, the J. B., at, 47, was admitted into Abrascrotum. An incision was made from above bam's Ward, under the care of Mr. Green, downwards, and a fatty mass, consisting of on Thursday morning, February the 5th. about two ounces, dissected out. Two setures were used in bringing the edges of a blow received from a fall down a fil

Mr. Key afterwerds performed amputation below the knee, upon a young women, about twenty years of age, apparently in a healthy condition, for gangress of the feet, following typhus feer. In consequence of atiffness of the knee joint, the leg could not be held in the secustomed horizontal position. In using the sew, the operator first commenced on the outer side of the limb. and, lu doing so, its edge came in contact with, and oppeared slightly to lacerate the cost parts of the thigh. The sawing was then commenced on the unterior part of the tibia, and the limb removed in four minutes. Fifteen minutes were occupied in securing the vessels.

#### ST. THOMAS'S HOSPITAL

ORORE E'S WARD .- INCONTINENCY OF UNINE

JAMES LYDIA, set. 33, came into the Hospital on Thursday the 5th of March, with incontinenes of urine, which had existed for three weeks previous to his admission. On inquiry, it was ascertained that he had been the subject of stricture, for which he was in the Hospital in November last, where he remeined for siz wacks, under the eare of Mr. Travers, and discharged cured. First found himself unable to retain his unine after severe axertion in a corn gransry, where he has been aconstomed to work; complains of pains in the limbs generally, but mora especially in the lower extremi ties, which are worse at night, when warm in bed. There is a swelling in the right groln, about the size of a walaut. Ordered. by Mr. Green, on Friday the 6th, ten leeches to the groin, and stlerwards a poeltice; helf an ounce castor oil; occasionally; to have a bougle passed daily. 9. Swelling in the groto much less;

bowels open; can io part rethio his nriun.
13. Completely rethins his uriue, excapt-

ing that a little escapes after conghing.
14. Swelling in the groin has subsided; retains his wrine perfectly.

rheumatism.

CONTUSED WOUND OF THE SCALP, WITH EXTENSIVE LACEBATION.

He stated, that the cause of the injury was the wound together; the thighs suprox-imsted, and the patient was remeved from the table io about six minutes.

Mr. Key afterwerds performed amputssurure. On examination, the scalp was found to be separated for a considerable distance, towards the anterior portion of the os frontis, eo as completely to lay bare the pariersuium. He was put to bed, the wound carefully sponged, and its edges brooght together by means of adhesive straps. Ordered to take a dose of house medicine.

> 6. Bowsis have been acted on by the medicine; complains of pain in the head. 7. Pulse slow, rather full; tongue fur-red; puin in the head less; has slept but little during the night. Heuse medicine to be repeated.

> 9. Pulse ustural; tengue less furred : bowsle open. Appears to be going on well.

> 10. Wound dressed to-day; scheeness perfect and healthy.

> 11. Dose of house medicine, which has operated twice.

12. Going on remarkably well.

From this time the patient has continued to improve, without an unfavorrable symptom. He still remains in the Hospital, inconsequence of rheumetism of the lower extremities, for which he takes an occasional aperient, and is rubbieg in a liniment composed of

Liniment of ammonia, with Tincture of centharides.

GANGRANE OF THE NOSS, WITH EXTENSIVE SUPPURATION OF THE CELLULAR MEN-BRANE.

T. H., stat 17, a tailor, from Woolwich, came luto George's Ward, on Thursday the. 19th of March, under the care of Dr. Roots. It was stated by the father, that en Saturday. week ha was attacked by pain in the right. side, which appeared to have been in the region of the liver, extending posteriorly. towards the left side, and anteriorly towards. the right side of the chest; at the same time he had shivering, with great difficulty of breathing, but no coogh. On the followin day, having taken ten grains of mercurial

pill over night, he felt himself perfectly free | sulphate of quinine one grain; diloted selfrom every symptom of indisposition. On plurie soid, three drops; mint water-ons, Sunday night, the same symptoms raturned; ouoce, every foor hours; twenty-five minima. lecches were applied, and purgatives edministered, by which means the pain in the side and dyspness bad subsided by the end of the week. On Sunday last e pimple made its appearance on the right side of the nose, soon becoming larger, and discharging a small quantity of matter; the surrounding parts then became red and swollen, terminating in gangrene. The nese is now very much swol-len, end of a dark-brawn colour; the surface is dry and abiniog; a small quantity of pus discharged from the right side; there is elso a thinnish, dark-coloured discharge observed coming from different parts; the right eye is closed, and the left partly so; there are many amail eethymatous pustules seen on different parts of the body, but more especially over the forehead, which, together with the eyslids and surrounding integuments, exhibit s zed and puffy appearance; a dull sound is heard no percussion, on the right side of the chest; respiration et the lawer part is indistinct. Suppuration has taken place in the cellular membrane of both foresrms, and the back of the right hand. Pulse 136, full and sharp; tongue white, and rather dry; shout five weeks ago, was the subject of gnoorthees, fer which, it is supposed, he took mercury; the gums are now slightly tinged. Ordered bleeding from the arm, to fourteen occees; the absocs ses to he apened, and ponitices applied; list, dipped in chloride of sods, to he applied to the nose, and over it a stale beer ground poultice, to be renewed every bour; castor oil one ounce, immediately; milk, arrowront, and slops, for diet. Three longitudius incisions were made un the nose; the blued drawn from the arm was very much huffed and expped.

\$0. Has been purged during the night; both eyes closed; nose aloughing; pulse quick and sharp, 140; respiration hurried; pustules larger, sed more numerous, on different parts of the body; skin hot; has had little or an sleep during the night, and talked in se iocoherent manner; increased heat and swelling about the farehead. Dr. Roots naw him this nurning, end ordered sixteen leechen to be opplied to the temples; the take e dose of chalk mixture, with opium ; continue the chloride of sods, and poultice; a plut of strang beef tes, deily. On visition him this afternoon, we found the pulse more quick and fastering ; tongue dry and brown ; respiration 64; upper lip very much thickened; the nose and face exhibit a frightful appearance; suppurstion appeared to exist in appearance; suppurstion appeared to exist in head by surther man. Soon after admis-different parts of the cellular membrane; net sien, he was seen by Mr. Lawrence, who so much purged; has taken the chalk mix-said the symptoms retembled those of ope-

of tinetare of opium, to be added to the first dose; sil of turpentine to be applied on lint to the nose under the poulties. From this time he continued gradually to sink, and expired at half-past seven this morning, Satur-day, the 21st, forty-four hours after admis-Rioo.

#### Examination of the Body eight hours after Death.

On opening the chest, an chaceas was discovered at the lower part of the right lung, between it and the disphragm, to which the lung was alightly adherent; it hurst, and discharged shoet two cences of pus into the cavity of the chest; there were also found in the same long many small tobarcles, but none observed in the left; the bronchish tubes exhibited nn signs of infismmation; nothing unusual was observed about the heert; the liver was apparently heelthy, hut soft. On examining the mucous membrane of the stomach sed intestines, traces of infismmation were seen in patches throughout their whole extent. No morbid oppearances were perceived in the hraic or its mambraces. The abacom, which had heen opened on the back of the right hand, communicated with the joint at the meta-cerpel bone of the middlo fieger; but those on the erm did not communicate with the wrist or elbow. Several other small ones were found in different parts of the arms and lags. The veins of the thigh sod erm were examined, but nothing unosual discovered in them.

This case was considered of rare occurrence, and from the time of admission excited

a good deal of interest.

#### ST. BARTHOLOMEW'S HOSPITAL.

JAMES HERRIS, Stat. 62, o strong, and who appearently, had been a healthy mao of his age, was brought at 7, P.m., March 11, into Rahere's Ward, under the care of Mr. Lawrence. There was a wound extending through the scalp, over the left temporal, and part of the left perietal hones, as deep as the akult, but no fracture detected by the bouse surgeen. The patient breathing with difficulty, and comptone. He had been struck a violent blow, with a piece of wood, on the head by enother man. Soon after admissame, and optum, twice; is quite lonensible. plexy; and ordered a drop of crosses oil to Br. Moote again saw him, between eight he given every hour, antil the howels should and mine o'clook, and ordered him to take be moved. Four drops of it were exhibited

without producing my effect. The patient | tore can be detected. The left hand in remained in much the same condition, with much lacerated, broised, and awollen, supthe exception of the breathing becoming graduelly worse, until ten o'clock on the following morning, whom he expired.

#### Post-morten Examination.

The loft temporal home was fractored to a considerable distance, and the fracture extended into the hasis of the skull. The middle meningeal artery lacerated, and about five ounces of blood affused between the cranium and dura mater. Doubt existed as so whether the artery had been lacerated in the removal of the skull-cap, or hy the blow roceived during life. Considerable affusion of blood botween the dura mater and left temporal bone, and the appearance of a alight depression of a small portion of the inner table of this bone.

Thomas Lewes, selet. 32, was edmitted at o quarter pust eight o'clock, a.m., March 9, into Colston's Ward, under the care of Mr. Vincent, with fracture of the nlos, radius, several bones of the hand, and severe laceration of the soft perts of the right arm. accident occurred while in the act of cleaning a carding machine, called a devil; one of the teeth caught hold of the coat, drew in the hand oud arm, and literally amashed them to pieces. The accident occurred in Helmet Row, parish of St. Luke, and the gentlemen to whom the patient was a servaut, put him into a cart, and requested his carman to drive to St. Thomas's Hospital. Something, however, crossed the patient's saind, while in the act of being driven to St Thomas's, which induced him to make the carman change his direction, and drive to this Hospital. Mr. Vinceot was sent for, ond soon errived. From the extremely injored state of parts, the only course for him to adopt, was amputation. He accordingly immediately proceeded to remove the orm aued to do wall over since.

George Wright, et. 23, admitted into Rahere's Ward, No. 22, March 7, with a severe laceration of the scale and left hand. The patient was coming to town last night with a load of hay, from off which, at twolve o'clock, fia fell into the road, and was taken up in a state of inseeshilty. There is a wound of the scalp on the left side of the head, extending lo a semicircular form; the convexity downwards, from about midinferior angles of the parietal boos, across the temporal to the compital, but no frac-

posed to have been trod upon by a horse States that he must have lost a great deal of blood, particularly from the wound of the scalp. Brought to the hospital at eight o'clock this morning. The patient is a of the scale removed, and the edges of the wound hrought together by adhesive plaster. A large poulties applied to the hand. Bled to eighteen oueces from the left arm, and opening medicine administered.

9. In all respects recovering.

24. The wound of the scalp is slmost sutirely healed, over which cold letions, as well as adhesive plaster, have been kept applied; the hand, too, is much improved; its adomatons state in a great messure relieved. The limb will be preserved, though it may not again he found to be quite as useful as it has been. Every oppearance of cootinuing to do well.

William Christman, set. 24, a tailor, of sallow appearance, was admitted, on the 25th of December, into Colston's Ward, under the care of Mr. Vincent, with a fracture of the right femur, a few inches above the kase-joint. When five years of ago, hy o fall he hort the knee; a white awelling followed, and a contraction of the joint, and shortening of the limb, were the cousequesces.

On the 13th of March last year, by a fall, the tihis of the same leg was broken; after the usual period of quiatude, union took place, and the limb became atronger, in fact, then it had been before. Oo Christmas ove last, Mr. Christmas again onfortunately fall, at a little before eleven c'olock, while walking on the pavomeot, and tho present fracture was the consequence. On the morning ofter the accident, he was hrought into the hospital, and the limb was put up in Ameahnry's splints. In those aplints it was kept for a period of hetween seven and eight weeks. By this time Mr. Vincent considered that the bone had united. and ordered the splints to be removed. In and operation of the parish the patient having continued still to bed, the limb exhibited signs of non-union. Mr. Vineent having again in supposing it had aver united, sad in supposing it had aver united, sad in the patient of the the splints. The splints were accordingly applied for anothor week, during which they gave great pain to the patient, and were then removed. Mr. Vinceot attributed the way between the anterior superior and resistance of union of the frectured parts, to the previously diseased state of the list and, as he did not think union would in

place, suggested to the patient the conderation of heriog the leg removed.

Merch 21. To-day, at half past one, emputation was performed at about two or three iechee abova the knee-joint, by Mr. Vincent. He made the conical flap, tied six arteries, and the operation was completed to fifteen mleutes,

23. Os Sandey evening, a considerable quantity of blood flowed from the stump; the house-surgeon was called in, who repressed further bleeding, and since that the patient has proceeded to do well.
